NetScaler 10.0

2015-05-18 10:53:30 UTC

Release Notes

Release notes describe the enhancements, changes, bug fixes, and known issues for a particular release or build of the Citrix® NetScaler® 10 software. The release notes are categorized into:

- Main Release
- Maintenance Release
- Enhancement Release

Main Release

These topics describe enhancements in NetScaler® 10 nCore™ and NetScaler® 10 nCore™ VPX™ releases. The nCore NetScaler uses multiple CPU cores for packet handling, which greatly improves the performance of many NetScaler features.

Note: Beginning with this release, NetScaler® Classic™ is no longer available.

You can determine your NetScaler build type by looking at the build information on the banner of the NetScaler Graphical User Interface (GUI), or by issuing the `show version` command at the command line. The file extension indicates the build type. In the GUI, an nCore NetScaler has a `.nc` extension. On the command line, the tar file name for an nCore NetScaler contains `_nc`.

Main Release

These topics describe enhancements in NetScaler® 10 nCore™ and NetScaler® 10 nCore™ VPX™ releases. The nCore NetScaler uses multiple CPU cores for packet handling, which greatly improves the performance of many NetScaler features.

Note: Beginning with this release, NetScaler® Classic™ is no longer available.

You can determine your NetScaler build type by looking at the build information on the banner of the NetScaler Graphical User Interface (GUI), or by issuing the `show version` command at the command line. The file extension indicates the build type. In the GUI, an nCore NetScaler has a `.nc` extension. On the command line, the tar file name for an nCore NetScaler contains `_nc`.

Enhancements

The Citrix NetScaler 10 release provides enhancements for the following NetScaler features.

AAA-TM

The following AAA-TM feature enhancements are available in this release.

127-Character User Name and Password Support

The AAA-TM feature now supports user names and passwords up to 127 characters in length.

127-Character Support for RADIUS NAS ID

The AAA-TM feature now supports RADIUS NAS IDs (`radNASid`) up to 127 characters in length.

SAML 2.0 Consumer Support

The AAA-TM feature now accepts tokens in the Security Assertion Markup Language (SAML), version 2.0. This feature enables you to configure single sign-on (SSO) on your NetScaler appliance for users who log on through a third party authentication server that supports SAML.

To configure this feature, at the NetScaler command line, type the following command:

add authentication samlAction <*name*> [-samlIdPCertName <*string*>] [-samlSigningCertName <*string*>][-samlRedirectUrl <*string*>][-samlUserField<*string*>][-samlRejectUnsignedAssertion (ON | OFF)] [-samlIssuerName <*string*>]

Enhanced NTLMv2 Support

AAA-TM now fully supports NTLMv2 for its single sign-on (SSO) feature. The NetScaler appliance attempts to connect by using NTLMv2 first, and only if that fails does it then attempt to fall back to NTLMv1. This support resolves outstanding issues with accessing Microsoft Share point servers that are part of a private network behind a AAA-TM SSO configuration.

LDAP Referral Support

When AAA-TM receives an LDAP_REFERRAL response to a credential modify request, AAA-TM follows the referral to the indicated domain administration server, authenticates to that server, and performs the password change on that server.

Three caveats apply:

1. AAA-TM assumes that the domain administration server in the referral accepts the same bind credentials as the original server.

2. AAA-TM only follows LDAP referrals for password change operations. In other cases AAA-TM refuses to follow the referral.

3. AAA-TM only follows one level of LDAP referrals. If the second LDAP server also returns a referral, AAA-TM refuses to follow the second referral.

Support for Password Changes on Novell NDS

AAA-TM now fully supports password changes on Novell NDS. When a user responds to a Novell NDS password change prompt, AAA-TM no longer displays an error, but simply changes the password and authenticates the user.

Support for Password Changes on Microsoft RADIUS via MSCHAP

AAA-TM now supports password changes on Microsoft RADIUS by using MSCHAP. When a user authenticates with an expired password, AAA-TM parses the RADIUS authentication rejection message for the MSCHAP vendor identification string and the password-change-required error. If it finds these strings, it initiates the required password change and passes the changed password to the RADIUS server. It then authenticates the user.

Logging out AAA-TM Sessions

You can now configure a traffic management action on the NetScaler appliance to log out a AAA-TM session. At the NetScaler command line, type one of the following commands to add the action or modify an existing action:

add tm trafficAction <name> -initiateLogout (yes|no)
set tm trafficAction <name> -initiateLogout (yes|no)

To put the logout action into effect, associate it with a policy and bind the policy to Global or an appropriate bind point.

AGEE

The following AGEE enhancements are available in this release.

Apply the Citrix Receiver theme to the logon page

You can use the command line to overwrite the original Access Gateway logon page with the Citrix Receiver theme.

Enabling Access Interface Bookmarks

Access Gateway supports the following four services to enable bookmarks to appear in the Access Interface when users log on with Citrix Receiver: Enumeration, Check Protection, Ticketing, and Access.

AppExpert

The following AppExpert feature enhancements are available in this release.

Load Balancing Virtual Server Template Enhancements

In this release, the following enhancements are available for load balancing virtual server templates:

- Deployment files.
- Variables for non-string parameters.

Deployment Files

In NetScaler release 10, when you export a load balancing virtual server, a deployment file is created along with the template file. Both files are created in XML format. The template file contains configuration-specific information (load balancing configuration parameters, information on bound policies, and variable definitions) and the deployment file contains deployment-specific information (services, service groups, and the name-value pairs of variables). You can specify the deployment file when you import the template file to create an entity, or you can manually specify all the deployment information. If you specify the deployment file, the template import wizard prompts you for only the entity name, and uses the deployment information in the deployment file.

You can store the files either on the NetScaler appliance or in any directory/folder on your local drive. If you choose to save the files on the appliance, you can save the template file only to the `/nsconfig/nstemplates/entities/lb vserver/` directory. The deployment file is stored in the /nsconfig/nstemplates/entities/lb vserver/deployment_files directory. The string `_deployment` is automatically appended to the name of the template file to create the name of the deployment file.

Variables for Non-String Parameters

You can now create variables for non-string parameters such as IP addresses and ports. For more information about configuring variables in load balancing virtual server templates, see Configuring Variables in Load Balancing Virtual Server Templates.

SQL OK and SQL Error Response Types Options Added to GUI

You can now use the configuration utility to configure the Responder feature to send an SQL OK or SQL ERROR response. To do this, after enabling the responder feature, you configure a responder action with one of the following action types:

- **Respond with SQL OK**. Sends the designated SQL OK response defined by the Target expression. Use this type of action to send an SQL OK response to an SQL query.
- **Respond with SQL Error**. Sends the designated SQL Error response defined by the Target expression. Use this type of action to send an SQL Error response to an SQL query.

For more information, see Configuring a Responder Action.

Responder HTML Page Imports

The Responder feature can now respond to designated requests by sending the client an HTML-based web page that you upload to the NetScaler appliance. This is a new option. You still have the option of redirecting the request or responding with a response code and answer configured on the NetScaler itself.

To use this feature, first upload an HTML-based web page to the NetScaler by using either the NetScaler command line or the configuration utility. Next, configure a responder action with type set to `RespondWithHTMLPage` and the name of the HTML page. Finally, create a responder policy and bind it to the action.

To upload an HTML page to the Responder feature, at the NetScaler command prompt, type the following commands:

import responder htmlpage [<*src*>] <*name*> [-comment <*comment*>] [-overwrite]

show responder htmlpage f<*name*>]

For more information on configuring a responder action to use an imported HTML page, see Configuring a Responder Action.

Responder Action for Timeouts

You can now invoke a Responder action when an HTTP request times out. To configure this feature, first create the Responder action that you want to invoke. Then, configure the global HTTP timeout action.

To configure the global HTTP timeout action to invoke a Responder action by using the NetScaler command line, type the following command:

set ns httpProfile -reqTimeoutAction <responder action name>

Binding URL Transformation Policies

The URL transformation Global Bindings dialog box has been replaced by the URL Transformation Policy Manager dialog box. This dialog box provides access to the full range of bind points available for application firewall profiles. In addition to Global, you can now bind URL transformation policies to load balancing virtual servers, content switching virtual servers, and policy labels.

For more information, see Globally Binding URL Transformation Policies.

Expressions for Identifying the Protocol in an Incoming IP Packet

The following table lists the expressions that you can use to identify the protocol in an incoming packet.

Expression	Description
CLIENT.IP.PROTOCOL	Identifies the protocol in IPv4 packets sent by clients.
CLIENT.IPV6.PROTOCOL	Identifies the protocol in IPv6 packets sent by clients.
SERVER.IP.PROTOCOL	Identifies the protocol in IPv4 packets sent by servers.
SERVER.IPV6.PROTOCOL	Identifies the protocol in IPv6 packets sent by servers.

Arguments to the PROTOCOL() function

You can pass the Internet Assigned Numbers Authority (IANA) protocol number to the PROTOCOL() function. For example, if you want to determine whether the protocol in an incoming packet is TCP, you can use CLIENT.IP.PROTOCOL.EQ(6), where 6 is the IANA-assigned protocol number for TCP. For some protocols, you can pass an enumeration value instead of the protocol number. For example, instead of CLIENT.IP.PROTOCOL.EQ(6), you can use CLIENT.IP.PROTOCOL.EQ(TCP). The following table lists the protocols for which you can use enumeration values, and the corresponding enumeration values for use with the PROTOCOL() function.

Protocol	Enumeration value
Transmission Control Protocol (TCP)	TCP
User Datagram Protocol (UDP)	UDP
Internet Control Message Protocol (ICMP)	ICMP
IP Authentication Header (AH), for providing authentication services in IPv4 and IPv6	AH
Encapsulating Security Payload (ESP) protocol	ESP
General Routing Encapsulation (GRE)	GRE
IP-within-IP Encapsulation Protocol	IPIP
Internet Control Message Protocol for IPv6 (ICMPv6)	ICMPv6
Fragment Header for IPv6	FRAGMENT

Use Case Scenarios

The protocol expressions can be used in both request-based and response-based policies. You can use the expressions in various NetScaler features, such as load balancing, WAN optimization, content switching, rewrite, and listen policies. You can use the expressions with functions such as EQ() and NE(), to identify the protocol in a policy and perform an action.

Following are some use cases for the expressions:

- In Branch Repeater load balancing configurations, you can use the expressions in a listen policy for the wildcard virtual server. For example, you can configure the wildcard virtual server with the listen policy `CLIENT.IP.PROTOCOL.EQ(TCP)` so that the virtual server processes only TCP traffic and simply bridges all non-TCP traffic. Even though you can use an Access Control List instead of the listen policy, the listen policy provides better control over what traffic is processed.
- For content switching virtual servers of type `ANY`, you can configure content switching policies that switch requests on the basis of the protocol in incoming packets. For example, you can configure content switching policies to direct all TCP traffic to one load balancing virtual server and all non-TCP traffic to another load balancing virtual server.
- You can use the client-based expressions to configure persistence based on the protocol. For example, you can use `CLIENT.IP.PROTOCOL` to configure persistence on the basis of the protocols in incoming IPv4 packets.

HTML5 Parsing and Expression Support

The NetScaler expressions language contains new XPath expressions that parse HTML web pages and allow you to extract specific content from the HTML headers and body.

For more information, see XPath and HTML, XML, or JSON Expressions.

Packet Expression Support

The NetScaler default expressions language now contains expressions that perform any task that could be performed by using the NetScaler classic expressions language. In particular, the following new expressions have been added:

- **PACKET.SRCPORT**. Returns the TCP/UDP source port, as a `num_at` number.
- **PACKET.DSTPORT**. Returns the TCP/UDP destination port, as a `num_at` number.
- **PACKET.PORT**. Returns the packet port. Supports only `EQ` and `NE`.
- **PACKET.SRCIP**. Returns the IPv4 source IP.
- **PACKET.DSTIP**. Returns the IPv4 destination IP.
- **PACKET.IP**. Returns the packet IP. Supports only `EQ` and `NE`.
- **PACKET.VLANID**. Returns the Vlan ID, as a `num_at` number.
- **PACKET.INTF**. Returns the packet interface ID, as a `text_t` string.
- **PACKET.PPEID**. Returns the packet core ID, as a `num_at` number.
- **PACKET.CONNID**. Returns the packet connection ID, as a `num_at` number.
- **PACKET.SVCNAME**. Returns the packet service name, as a `text_t` string.

- **PACKET.SRCIPv6**. Returns the IPv6 source IP.
- **PACKET.DSTIPv6**. Returns the IPv6 destination IP.
- **PACKET.IPv6** Returns the packet IPv6 IP. Supports only `EQ` and `NE`.

SIP Expression Support

The NetScaler expressions language now contains a number of new expressions for Session Initiation Protocol (SIP) connections. These expressions are intended for use in policies for any supported protocol that operates on a request/response basis, such as application firewall, content switching, rate limiting, and responder policies. The header format used by the SIP protocol is similar to that used by the HTTP protocol, so many of the new expressions look and function much like their HTTP analogs. The NetScaler operating system currently supports only SIP over UDP, so the new expressions conform to that.

For more information, see SIP Expressions.

String Comparison Functions

You can now use the functions `NE()`, `GT()`, `GE()`, `LT()`, and `LE()` to compare a string to the string returned by an expression prefix. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with `SET_TEXT_MODE(IGNORECASE)` or `SET_TEXT_MODE(NOIGNORECASE)`, and with both ASCII and UTF-8 character sets.

MOD() Function for Data of Type Integer and Unsigned Long

You can use the `MOD()` function with data of type integer and unsigned long. The function divides the value returned by the preceding function by its argument and returns the remainder. The argument must be a non-zero value.

APPEND() String Function

You can use the `APPEND()` function to append the string representation of the argument to the string representation of the value returned by the preceding function. The preceding function can be one that returns a number, unsigned long, double, time value, IPv4 address, or IPv6 address. The argument can be a text string, number, unsigned long, double, time value, IPv4 address, or IPv6 address. The resulting string value is the same string value that is obtained by using the `+` operator.

NE() Function for Time Values

You can now use the `NE()` function for time values. The argument to the `NE()` function is compared with the value returned by the preceding function.

Command-Line Interface Support for Importing and Exporting AppExpert Applications

You can use the NetScaler command line interface (CLI) to export and import application configuration information to and from an AppExpert application template file. The template files are exported to and imported from the `/nsconfig/nstemplates/applications/` directory on the appliance. Deployment files are exported to and imported from the `/nsconfig/nstemplates/applications/deployment_files` directory. You cannot change the source and target directories.

When you use the command-line interface to import a template, you can configure deployment information only by specifying a deployment file in the import application command. If you do not specify a deployment file when importing a template, after you import a template, you must use the configuration utility to provide the deployment information.

To import an AppExpert application by using the NetScaler command line

At the NetScaler command line, type the following command to import an AppExpert application to the NetScaler appliance:

import application <apptemplateFilename> [-appname <string>] [-deploymentFilename <input_filename>]

To export an AppExpert application by using the NetScaler command line

At the NetScaler command line, type the following command to export an AppExpert application to the NetScaler appliance:

export application <appname> [-apptemplateFilename <input_filename>] [-deploymentFilename <input_filename>]

Application Firewall

The following Application Firewall feature enhancements are available in this release.

Variable Support for Application Firewall Configuration

Instead of using static values, to configure the application firewall's security checks and settings, you can now use standard NetScaler named variables. By creating variables, you can more easily export and then import configurations to new NetScaler appliances, or update existing NetScaler appliances from a single set of configuration files. This simplifies updates when you use a testbed setup to develop a complex application firewall configuration that is tuned for your local network and servers and then transfer that configuration to your production NetScaler appliances.

For more information, see Configuration Variable Support.

Support for CEF Format Logs

The application firewall can be configured to maintain logs in either the proprietary NetScaler log format or the Common Event Format (CEF), an open standard used by other security appliances and network devices. The use of CEF makes it possible to analyze application firewall logs along with logs produced by other security appliances and network devices.

CEF logs consist of three sections: the syslog prefix, the CEF header, and the CEF extension. An application firewall log in CEF format contains the following information:

Mon Day hh:mm:sss <hostname> CEF:<version>|<device vendor>|<device product>|<device version>|<module>|<event-type>|<severity>|<CEF extension>

Source Port and HTTP Method Added to Logs

The application firewall logs now contain the source port and the HTTP method used for the connection that generated the logged event.

For more information, see Logs, Statistics, and Reports.

Importing and Exporting Application Firewall Profiles

You can now import and export application firewall profiles from a local file. This allows you to configure the application firewall on one NetScaler appliance, and then duplicate that configuration on other NetScaler appliances. This permits use of a testbed setup to develop your application firewall configuration. You can then transfer the configuration to your production NetScaler appliances.

Resetting Learning Thresholds

You can now reset the learning thresholds to zero (0) for any profile, to force the application firewall to restart the learning process. This is helpful when you import a profile to a new NetScaler appliance or standalone Application Firewall appliance that is intended to protect different web sites.

To remove all learned data, in the Configure Application Firewall Profile dialog box, Learning tab, click Remove All Learned Data.

For more information, see Manual Configuration By Using the Configuration Utility.

Binding Application Firewall Policies

The application firewall Global Bindings dialog box has been replaced by the Application Firewall Policy Manager dialog box. This dialog box provides access to the full range of bind points available for application firewall profiles. In addition to Global, you can now bind application firewall policies to load balancing virtual servers, content switching virtual servers, and policy labels.

For more information, see Manual Configuration By Using the Configuration Utility.

Response-Side Signatures Check

The application firewall now supports signatures for response-side patterns as well as request-side patterns. This functionality allows the following types of checks:

- **Credit cards.** You can specify specific types of credit card numbers for signature checking, just as you currently do for the Credit Card security check.
- **Safe objects.** You can specify a pattern matching any type of sensitive private information that you want to prevent from being included in responses, such as social security numbers, or driver's license numbers.

For more information, see Signatures.

Sessionless URL Closure

The application firewall sessionless URL Closure feature supports a new type of URL closure. From the client's point of view, this type of URL closure functions in exactly the same way as standard, session-aware URL Closure. However, instead of using a cookie to track the user's session, it embeds the necessary information as a token in the response URL.

For more information, see Start URL Check.

CSRF Learning

Application firewall learning is now supported for the CSRF Form Tagging security check. If you enable learning for CSRF form tagging, the application firewall generates a list of URLs that violate this security check for your review.

Learning for the CSRF Form Tagging feature is enabled in exactly the same way as learning for the other features. You can enable learning by checking the Learn check box on either the Security Checks tab of the main Configure Application Firewall Profile dialog box or the General tab of the Modify Cross-Site Request Forgery dialog box. You can configure the Learning thresholds on the Learning tab of the Configure Application Firewall Profile dialog box, by selecting CSRF form tagging and then typing the appropriate values in the Learning Thresholds area.

For more information on application firewall learning, see Manual Configuration By Using the Configuration Utility. For more information on the CSRF Form Tagging check, see CSRF Form Tagging Check.

The Web Interface AppExpert Template

The Citrix Web Interface AppExpert template provides an alternative method to configure the application firewall feature on a new NetScaler appliance. It provides a simple configuration that is suitable for protecting most web site content. You can modify that configuration later to provide additional protection for more complex features.

For an overview of the application firewall-specific features of the Web Interface AppExpert template, see Configuring the Application Firewall. For information on installing and using an AppExpert template, see the AppExpert Applications and Templates.

Qualys Support

The QualysGuard(r) vulnerability scanner has been added to the list of vulnerability scanners whose scan results can be imported into the Application Firewall and then used to create signature rules. This allows users to use the QualysGuard scanner to detect exploitable vulnerabilities on their web sites and then feed the results into the application firewall to create signature rules tailored to protect their web sites.

For more information about application firewall support for external vulernability scanners and instructions on how to use this feature, see Updating a Signatures Object from a Supported Vulnerability Scanning Tool.

Application Firewall Support for Chunked POST Requests

The application firewall now supports HTTP 1.1 chunked POST requests. When the NetScaler appliance receives a chunked POST request, it calculates and adds an appropriate Content-Length header, removes the Transfer-Encoding header, and then performs the appropriate checks. The workarounds that were used in previous releases are no longer necessary.

Cache Redirection

The following Cache Redirection enhancement is available in this release.

Support for Fully Transparent Cache Redirection

The NetScaler appliance now supports transparent cache redirection with the Use Source IP (USIP) option enabled and Use Proxy Port option disabled. The NetScaler appliance preserves the client's IP address and port when forwarding a request to the cache server or origin server.

Cloud Bridge

The following Cloud Bridge enhancements are available in this release.

Cloud Bridge Set Up for SoftLayer Enterprise Cloud

The configuration utility now includes a wizard that helps you to easily configure a cloud bridge between a NetScaler appliance or a virtual appliance (VPX), on any network, and NetScaler VPX instances on the SOFTLAYER enterprise cloud.

For more information, see CloudBridge.

IKEv2 Liveliness Check for IPSEC Tunnels

For an IPSEC tunnel, the NetScaler appliance now performs the standard IKEv2 liveliness check on the peer at a regular interval, which is user configurable. As determined by the check, the NetScaler appliance displays the status of the tunnel as UP or DOWN.

Statistical Counters for IPSEC Tunnels

The following statistical counters have been introduced for IPSEC tunnels:

Bytes Received.

Total number of bytes received by the NetScaler appliance through all the configured IPSEC tunnels since the appliance was last started. Does not include bytes received during the following phases:

- Internet Key Exchange (IKE) authentication (pre-shared key or digital certificates) phase on any configured IPSEC tunnel.
- IKE Security Association (SA) establishment phase on any configured IPSEC tunnel.

Bytes Sent.

Total number of bytes sent by the NetScaler appliance through all the configured IPSEC tunnels since the appliance was last started. Does not include bytes sent during the following phases:

- Internet Key Exchange (IKE) authentication (pre-shared key or digital certificates) phase on any configured IPSEC tunnel.
- IKE Security Association (SA) establishment phase on any configured IPSEC tunnel.

Packets Received.

Total number of packets received by the NetScaler appliance through all the configured IPSEC tunnels since the appliance was last started. Does not include packets received during the following phases:

- Internet Key Exchange (IKE) authentication (pre-shared key or digital certificates) phase on any configured IPSEC tunnel.
- IKE Security Association (SA) establishment phase on any configured IPSEC tunnel.

Packets Sent.

Total number of packets sent by the NetScaler appliance through all the configured IPSEC tunnels since the appliance was last started. Does not include packets sent during the following phases:

- Internet Key Exchange (IKE) authentication (pre-shared key or digital certificates) phase on any configured IPSEC tunnel.
- IKE Security Association (SA) establishment phase on any configured IPSEC tunnel.

Clustering of NetScaler Appliances

You can now create a cluster of nCore NetScaler appliances and make them work together as a single system image. The traffic is distributed among the cluster nodes to provide high availability, high throughput, and scalability. A NetScaler cluster can include as few as 2 or as many as 32 NetScaler nCore hardware or virtual appliances.

Each NetScaler appliance that you intend to add to the cluster must satisfy the following criteria:

- Must be of the same platform type (physical appliance or VPX instance).
- Must be of the same hardware type (for physical appliances).
- Must have the same licenses (Standard, Enterprise, Platinum, or any add-on license).
- Must be on the same subnet.
- Must be of the same software version.

For more information, see Clustering.

Compression

The following compression enhancement is available in this release.

Renaming and Getting Compression Statistics

You can perform the rename and get statistics operations on the compression policy and the compression policy label by using the following commands:

- `rename cmp policy <name> <newName>`
- `rename cmp policylabel <labelName> <newLabelName>`
- `stat cmp policy <name>`
- `stat cmp policylabel <labelName>`

Configuration Utility

The following configuration utility enhancements are available in this release.

HTML Dashboard

The monitoring page is enhanced and renamed to “Dashboard.” The new Dashboard is HTML-based and replaces the Java-based Dashboard. The Dashboard displays critical performance statistics and provides real-time data. The data displayed is for approximately the last 5 minutes of operation and is updated every 7 seconds. This data is displayed in the form of graphs—linear and tabular.

Windows Gadget to Monitor NetScaler

A Windows gadget is available to monitor multiple NetScaler appliances from your desktop. The gadget is supported on Windows 7 and Windows XP operating systems. You can download the gadget from the Downloads page in the NetScaler configuration utility. The gadget displays the aggregate interface throughput, CPU usage, memory usage, rate of HTTP requests, and events (for example, a virtual server going down).

Pagination Support in Dashboard

Pagination is introduced for all entities, such as virtual servers and services, displayed in the Dashboard. The default is 25 entries per page.

SCOM Management Pack

You can now download the SCOM Management pack from the Downloads page in the NetScaler configuration utility.

The pack contains the Citrix NetScaler Operation Manager and The Citrix NetScaler Performance and Resource Optimization (PRO) Management Pack (MP).

The Citrix NetScaler Operation Manager pack provides monitors and rules for monitoring the NetScaler appliances deployed in your network. The Citrix NetScaler Performance and Resource Optimization (PRO) Management Pack (MP) provides monitors and rules for monitoring the health of the virtual servers configured on the managed NetScaler appliances. The MP uses the PRO feature of SCVMM to initiate corrective actions if the virtual servers become unhealthy.

Content Switching

The following content switching enhancements are available in this release.

Priority Based Sorting of Bound Policies

When you run the show cs vserver command, you can now view the associated content switching policies in the order of the priority of the policies instead of by the chronological order in which they are bound.

This enhancement can help you know the order in which the content switching polices are applied and, therefore, understand how client requests are routed. The configuration utility also shows the content switching policies in the order of their priority.

For more information, see Viewing the Properties of Content Switching Virtual Servers.

Identifying Connections with the 4-tuple and Layer 2 Parameters

You can now set the L2Conn option for a content switching virtual server. With the L2Conn option set, connections to the content switching virtual server are identified by the combination of the 4-tuple (<source IP>:<source port>::<destination IP>:<destination port>) and Layer 2 connection parameters. The Layer 2 connection parameters are the MAC address, VLAN ID, and channel ID. For more information, see Identifying Connections with the 4-tuple and Layer 2 Connection Parameters.

Enhanced Set of Counters for Virtual Servers

The following table lists the statistical counters that are now available for a content switching virtual server on the dashboard, on the Statistics page, and in the output of the stat cs vserver CLI command:

Table 1. New Counters Available for a Content Switching Virtual Server

Counter name	Description
Vserver hits	The total number of hits for the virtual server.
Total Packets rcvd	The total number of client-side packets received by the content switching virtual server.
Total Packets sent	The total number of packets sent by the content switching virtual server to clients.
Current client connections	The total number of client-side connections.
Current Client Est connections	The total number of connections that are in ESTABLISHED state.
Current server connections	The total number of server-side connections.

DataStream Enhancements

The following DataStream enhancements are available in this release.

Configuring Token Method of Load Balancing

You can configure the token method of load balancing for DataStream to base the selection of database servers on the value of the token extracted from the client (application or Web servers) requests. These tokens are defined by using SQL expressions. For subsequent requests with the same token, the NetScaler sends the requests to the same database server that handled the initial request. Requests with the same token are sent to the same database server until the maximum connection limit is reached or till the session entry has aged out. For more information, see Configuring the Token Method of Load Balancing for DataStream.

Responder Policy Support

You can now configure responder policies for DataStream. You can configure responder policies by using default syntax expressions that are provided for evaluating MYSQL/MSSQL client and query properties. You can then bind the policies to global bind points provided specifically for DataStream. You can also bind the policies to policy labels of type MYSQL or MSSQL.

Before creating a responder policy for DataStream, you create a responder action. In the policy, you define the rule by using one or more default syntax expressions for MYSQL or MSSQL, and you assign the action to the policy. Then, you bind the policy globally or to a

policy label. To apply the policies that you have bound to a policy label, you must call the policy label from another policy. For more information, see Responder.

Audit Log Message Support

You can now configure the NetScaler appliance to generate audit log messages for the DataStream feature. Audit log messages are generated when client-side and server-side connections are established, closed, or dropped. The categories of messages that you can log and view are ERROR and INFO. For more information, see Audit Log Message Support.

Configuring Content Switching Based on RPC for MS SQL Databases

You can use the following expressions to configure content switching based on remote procedure call (RPC) names or IDs:

MSSQL.REQ.RPC.NAME.

Returns the name of the procedure that is being called in a remote procedure call (RPC) request. The name is returned as a string.

MSSQL.REQ.RPC.IS_PROCID.

Returns a Boolean value that indicates whether the remote procedure call (RPC) request contains a process ID or an RPC name. A return value of TRUE indicates that the request contains a process ID and a return value of FALSE indicates that the request contains an RPC name.

MSSQL.REQ.RPC.PROCID.

Returns the process ID of the remote procedure call (RPC) request as an integer.

AppFlow Support

Appflow records can now export database information (such as database protocol, database request type, and database request string) to the AppFlow collectors. Following is an example of configuring the AppFlow action and policies for MS SQL:

```
> enable feature appflow
> add db user sa password freebsd
> add lb vserver lb0 MSSQL 10.102.147.97 1433 -appflowLog ENABLED
> add service sv0 10.103.24.132 MSSQL 1433 -appflowLog ENABLED
> bind lb vserver lb0 sv0
> add appflow collector col0 -IPAddress 10.102.147.90
> add appflow action act0 -collectors col0
> add appflow policy pol0 "mssql.req.query.text.contains(\"select\")" act0
> bind lb vserver lb0 -policyName pol0 -priority 10
```

When the NetScaler appliance receives a database request, the appliance evaluates the request against the configured policies. If a match is found, the details are sent to the AppFlow collector configured in the policy.

Microsoft SQL Server Version Setting

You can specify the version of Microsoft® SQL Server® for a load balancing or content switching virtual server that is of type MSSQL. The version setting is recommended if you expect some clients not to run the same version as your Microsoft SQL Server product. The version setting provides compatibility between the client-side and server-side connections by ensuring that all communication conforms to the server's version. For more information about configuring the server version setting for a load balancing virtual server, see Configuring the Microsoft SQL Server Version Setting. For more information about configuring the server version setting for a content switching virtual server, see Configuring the Microsoft SQL Server Version Setting.

SNMP Support for DataStream Rate Limiting

A new SNMP alarm, DATASTREAM-RATE-LIMIT-HIT, can generate a trap when the DataStream request rate exceeds the limit defined for the NetScaler appliance.

If you configure this SNMP alarm, the NetScaler appliance checks the DataStream request rate every second. When the DataStream request rate exceeds the limit defined, the NetScaler generates the following SNMP trap message:

- DataStreamRateLimitHit

Domain Name System

The following Domain Name System enhancements are available in this release.

Text (TXT) Record Support

Domain hosts store TXT records for informative purposes. A TXT record's RDATA component, which consists of one or more character strings of variable length, can store practically any information that a recipient might need to know about the domain, including information about the service provider, contact person, email addresses, and associated details. Sender Policy Framework (SPF) protection has been the most prominent use case for the TXT record. For more information, see Creating TXT Records for Holding Descriptive Text.

Rewriting NXDOMAIN Responses

You can evaluate a DNS response against certain predefined criteria, and then rewrite the A records and AAAA records in the response before forwarding it to the client. For rewrite to occur, queries must be of type A or AAAA. Other types of queries cannot be rewritten. They raise an `UNDEF` condition if they meet your defined criteria.

To rewrite the A or AAAA records in a DNS response that matches your criteria, do the following:

- Configure a DNS action with the `Rewrite_Response` action type. Provide the IPv4 and/or IPv6 addresses that you want to be sent to the client. If necessary, configure the time to live value for the rewritten records.
- Configure a DNS policy with criteria that must be met by a DNS response before it can be rewritten. Define the criteria in the policy rule. For example, to determine whether

the status of a DNS response is set to NXDOMAIN, use the DNS.RES.HEADER.RCODE.EQ(NXDOMAIN) expression. In this expression, the RCODE function returns the response code in the DNS response.

- Bind the policy to the global request bind point.

Note: If the appliance finds in its DNS cache an NXDOMAIN record for the domain in a query, the appliance does not send the query to the name server. The appliance sends the client the cached NXDOMAIN record. Consequently, the DNS policy that you configure for evaluating responses for the NXDOMAIN response code is not evaluated. To prevent NXDOMAIN records from being served from the appliance's DNS cache, after you bind the DNS policy to a bind point, flush the DNS cache by using the flush dns proxyRecords command.

Following is a sample configuration for rewriting DNS responses whose response code is NXDOMAIN. Policy mydnspolicy determines whether a DNS response is an NXDOMAIN response. Action mydnsaction rewrites the response to include the IP addresses that you want to send to the client. The policy is bound globally.

```
> add dns action mydnsaction Rewrite_Response -IPAddress 192.0.2.77 2001:DB8:: -TTL 36000
Done
> add dns policy mydnspolicy 'DNS.RES.HEADER.RCODE.EQ(NXDOMAIN)' mydnsaction
Done
> bind dns global mydnspolicy 10
Done
>
```

For more information about configuring a DNS action, configuring a DNS policy, and binding a DNS policy, see Configuring DNS Actions, Configuring DNS Policies, and Binding DNS Policies, respectively.

EdgeSight Monitoring

The following EdgeSight monitoring enhancement is available in this release.

Exporting EdgeSight Information to AppFlow Collector

You can now export web page monitoring information collected through EdgeSight Monitoring to AppFlow collectors so that you get an in-depth analysis of the web page monitoring data. To export web page monitoring statistics to AppFlow collectors, you have to associate an AppFlow action with the EdgeSight Monitoring responder policy.

You can also configure load balancing and content switching virtual servers to export EdgeSight Monitoring statistics to AppFlow collectors by associating an AppFlow action with the virtual servers.

Global Server Load Balancing

The following global server load balancing enhancements are available in this release.

Overriding Static Proximity Behavior by Configuring Preferred Locations

You might want to direct traffic from a local DNS (LDNS) server or network to a GSLB service other than the GSLB service that the static proximity method selects for that traffic. That is, you have a *preferred location* for that traffic. To override the static proximity method with preferred locations, you can do the following:

1. Configure a DNS action that consists of a list of preferred locations.
2. Configure a DNS policy to identify the traffic arriving from the LDNS server or network and apply the action in the policy.
3. Bind the policy to the global request bind point.

For more information, see Overriding Static Proximity Behavior by Configuring Preferred Locations.

Confirmation Prompt before Synchronization of Global Server Load Balancing Sites

Unlike in earlier releases, when you use the sync gslb config command or its alias, the sync config command, the NetScaler appliance displays a warning that the synchronization of GSLB sites can result in loss of configuration on remote sites and prompts you to confirm that you want to synchronize the sites. The prompt helps prevent unintentional synchronization that might result from accidental use of the command.

Option to Save the Configuration on All Nodes after Synchronization

If you specify the saveConfig option in the sync gslb config command, all the nodes that participate in the GSLB configuration synchronization process save their configuration automatically after synchronization completes. The master saves its configuration immediately before synchronization begins. Slave nodes save their configuration after the process of synchronization is complete. A slave node saves its configuration only if the configuration difference was applied successfully on it. The option is mutually exclusive with the preview option.

Integrated Caching

The following Integrated Caching enhancements are available in this release.

Seek Streaming of Large Content

The integrated cache can now serve partial content for byte-range requests greater than 9 MB, such as byte-range requests of PDF documents or HTML5 videos. For example, you can jump to any location within a video, and integrated caching fetches the video content from that location.

Multi-part Byte Range Requests Handling from Cache

The integrated cache can now serve partial content from the cache in response to multi-part byte-range requests. Therefore, you can now specify multiple ranges of content to be served. For example, you can specify that, within 1024 bytes of content, the content of bytes 50-100 and bytes 450-700 is to be served in one request.

Viewing Cache Objects

You can now view cache objects on the basis of HTTP status code by using the command `show cache object -httpStatus <status code>`.

Enabling Persistence based on ETag Header

The ETag header now includes information about the server that served the content. You can enable this feature by using the command `set ns httpprofile <profilename>-persistentETag enabled`. When persistent ETag is enabled, the cache validation conditional requests or browser requests, for that content, always hit the same server.

If the cache validation request hits another server that has the same content, the content is re-fetched from the other server, because the ETags would be different. For example, with load balancing, the integrated cache might cache the content from say, Server S1, with S1-ETag. For the next request for this content, the cache serves the content with the S1-ETag. When the S1-ETag must be revalidated in the cache, the NetScaler sends a request with the S1-ETag to a server that is determined by the load balancing virtual server. This means that the validation request can be received by any of the other servers available. If the request goes to a server besides S1, the server would serve the full response with S2-ETag, by virtue of the fact that the ETags are different (even though the content is the same).

The integrated cache removes the old content and replaces it with the new content, which results in serving the FULL content to the client.

For more information, see Configuring Connection Options with HTTP Profiles.

Caching of SQL Protocols

You can now cache responses of SQL protocol types such as MYSQL and MSSQL. When adding a cache content group, you must specify the response type, HTTP, MYSQL, or MSSQL, to be cached. By default, the content group is HTTP. Request based policies for SQL caching support actions CACHE and INVAL, while response based policies support only the NOCACHE action.

For more information about Caching of Database protocols, see Caching Support for Database Protocols.

Load Balancing

The following load balancing enhancements are available in this release.

Firewall Load Balancing

In a firewall load balancing setup in which a set of firewalls is configured on both sides (upstream and downstream) of the NetScaler appliance, if traffic is coming though one set of firewalls (for example, upstream), you can now perform load balancing on the other set of firewalls (for example, downstream). At the command line, type:

set lb parameter -vServerSpecificMac ENABLED

This parameter is DISABLED by default.

Connection Mirroring Support for Layer 2 Connection Parameters

The NetScaler appliance supports connection mirroring for Layer 2 connection parameters. When a failover occurs, the secondary appliance in the high availability (HA) pair picks up and manages the TCP connections that clients had established with the former primary appliance. Connection mirroring for Layer 2 connection parameters is required for resuming TCP connections in deployments that depend on those parameters for proper functioning. An example of such a deployment is the load balancing of Branch Repeater appliances.

To enable the secondary appliance in the HA pair to pick up and resume the TCP connections that the failed primary was handling, information associated with the following two pairs of connections must be synchronized with the secondary:

- The connection between the client and the NetScaler appliance and the connection between the NetScaler appliance and the Branch Repeater appliance.
- The connection between the Branch Repeater appliance and the NetScaler appliance and the connection between the NetScaler appliance and the server.

The first pair of connections is associated with the wildcard load balancing virtual server. Therefore, to synchronize the information associated with those connections, you must configure connection mirroring for the load balancing virtual server. Layer 2 connection parameters are also synchronized. For more information about configuring connection mirroring for a load balancing virtual server, see Configuring Connection Failover.

The second pair of connections is associated with the forwarding session. To synchronize the information associated with those connections, you must configure connection mirroring for the forwarding sessions. The connfailover parameter is applicable to all the connections that are associated with the forwarding session.

Note: Connection mirroring is available for both ACL based forwarding sessions (forwarding sessions for which the aclname parameter is set) and network based forwarding sessions (forwarding sessions for which the network parameter is set). Additionally, all bypassed traffic that meets the requirements of the ACL's are synchronized with the secondary appliance, even though that traffic does not match the wildcard virtual server.

For more information about configuring connection mirroring for forwarding sessions, see Configuring Forwarding Session Rules.

Finally, on the primary appliance, you must create a virtual router ID (VRID) and bind the VRID to the interface that communicates with the Branch Repeater appliances. For more

information about configuring a VRID and binding the VRID to an interface, see Configuring Virtual MAC Addresses.

Using a String as the Server ID for a Service

While adding or setting a service, you can now specify a string as a server ID. The string can have up to 47 characters and contain alphanumeric characters and dashes.

Use -customServerId <*string*> instead of the earlier option -serverId <*positive integer*>. The -serverId option will be deprecated.

Example

```
set service SE_WEB_SVR1 -customServerId 4324-7658-fer9-4324
```

For more information, see Custom Server ID Persistence.

Rule Based Persistence for a Virtual Server Group of Type ANY

You can configure rule-based persistence for a load balancing virtual server group to which virtual servers that use the ANY protocol are bound. For more information about rule based persistence, see Configuring Persistence Based on User-Defined Rules.

Virtual Server-Level Slow Start

You can configure the NetScaler appliance to gradually increase the load on a service (the number of requests that the service receives per second) immediately after the service is either added to a load balancing configuration or has a state change from DOWN to UP. You can either increase the load manually with load values and intervals of your choice (manual slow start) or configure the appliance to increase the load at a specified interval (automated slow start) until the service is receiving as many requests as the other services in the configuration. During the ramp-up period for the new service, the appliance uses the configured load balancing method.

This functionality is not available globally. It has to be configured for each virtual server. The functionality is available only for virtual servers that use one of the following load balancing methods:

- Round robin
- Least connection
- Least response time
- Least bandwidth
- Least packets
- LRTM (Least Response Time Method)

- Custom load

For more information, see Gradually Stepping Up the Load on a New Service with Virtual Server–Level Slow Start.

Automatic Domain Based Service Group Scaling

A domain based service group consists of members whose IP addresses are obtained by resolving the domain names of servers that are bound to the service group. The domain names are resolved by a name server whose details you configure on the appliance. A domain based service group can also include IP-address based members.

The process of name resolution for a domain based server might return more than one IP address. The number of IP addresses in the DNS response is determined by the number of address (A) records configured for the domain name, on the name server. Even if the name resolution process returns multiple IP addresses, only one IP address is bound to the service group. To scale up or scale down a service group, you need to manually bind and unbind additional domain based servers to and from the service group, respectively.

However, you can configure a domain based service group to scale automatically on the basis of the complete set of IP addresses returned by a DNS name server for a domain based server. To configure automatic scaling, when binding a domain based server to a service group, enable the automatic scaling option.

For more information, see Configuring Automatic Domain Based Service Group Scaling.

Increased Limits on the Number of Virtual Servers, Services, and Servers

The NetScaler appliance now supports a larger number of virtual servers, services, and servers. The following table shows the previous and current limits for each of these entities:

	Previous limit	Current limit
Virtual servers	8192	60000*
Services	30720	60000*
Servers	30720	60000
Bindings between virtual servers and services	46080	150000
Monitor bindings	61440	150000

* The sum total of virtual servers and services cannot exceed 60,000. For example, if you configure 4000 virtual servers, you cannot configure more than 56,000 services.

Rule Based Persistence for Load Balancing Virtual Servers of Type TCP and SSL_TCP

You can now configure a rule to define persistence criteria for load balancing virtual servers of type TCP and SSL_TCP. The persistence criteria can be based on TCP/IP protocol data, Layer 2 data, TCP options, and TCP payloads (even if the protocol that is encapsulated in the TCP payload is not HTTP).

In the add lb vserver or set lb vserver CLI command, set the `persistenceType` parameter to RULE, and then configure a rule for the rule parameter. You can define rules to configure persistence based on source and destination ports, source and destination IP addresses and IP octets, source and destination MAC addresses, VLAN IDs, payload content, and so on. Following are examples of expressions that you can use to define persistence criteria:

- `CLIENT.TCP.PAYLOAD(500).TYPECAST_NVLIST_T('=',';').VALUE("field1")`. The value of `field1`, obtained after casting the first 500 bytes of the TCP payload to a name-value list that consists of name-value pairs in the format `<name>=<value>;`.
- `CLIENT.TCP.SRCPORT`. The source port in the client request.
- `CLIENT.IP.DST`. The destination IP address in the client request.
- `CLIENT.IP.SRC.GET4`. The fourth octet (rightmost octet) of the source IP address in the client request.
- `CLIENT.ETHER.DSTMAC.GET5`. The fifth octet of the destination MAC address in the client request.
- `CLIENT.VLAN.ID`. The ID of the VLAN through which the request arrived.

Following is an example of a command that you can use to configure rule based persistence based on the destination IP address in the client request:

add lb vserver mylbvserver SSL_TCP 192.0.2.0 443 -persistenceType RULE -rule CLIENT.IP.DST

You cannot set the resRule parameter for load balancing virtual servers of type TCP or SSL_TCP.

For more information, see Configuring Persistence Based on User-Defined Rules. For a use case based on configuring rule based persistence based on a name-value pair in a TCP byte stream, see Configuring Rule Based Persistence Based on a Name-Value Pair in a TCP Byte Stream.

Wizard for Setting Up Branch Repeater Load Balancing

The NetScaler configuration utility now includes a wizard that you can use to set up a load balancing configuration for Branch Repeater appliances. You can use the Load Balancing Wizard for Citrix Branch Repeater to configure static mapping, where requests from specific clients are always forwarded to the same Branch Repeater appliance.

Note: Load balancing of Branch Repeater appliances is not supported in cluster deployments in this release.

To configure load balancing of Branch Repeater appliance by using the NetScaler configuration utility

1. In the navigation pane, click Load Balancing.
2. In the details pane, click Load Balancing wizard for Branch Repeater.
3. Follow the instructions on the screen.

NetScaler Online Help

The following enhancements are made to the NetScaler Online Help (OLH) engine:

- The search results now also display Citrix Blogs as one of the categories.
- Web search functionality is added to the search pane, which lets you perform a web search on the keywords from the OLH Window.
- Scrolling the search results pane now does not impact the position of the Search text box. The text box is made stationary.
- Functionality to collapse different categories of the search result is added to the search pane.

NetScaler SDX Appliance

The following NetScaler SDX appliance enhancements are available in this release.

Assign Multiple Cores to an Instance

When provisioning a NetScaler instance on an SDX appliance, you can now assign multiple cores to an instance. To do so, from the CPU list in the Resource Allocation page of the Provision NetScaler wizard or Modify NetScaler wizard, select the number of cores that you want to assign to the instance. You can assign a maximum of five cores to an instance. For each additional core that you assign to the instance, assign an additional 2048 MB of memory. If you modify the number of cores assigned to an existing instance, the instance implicitly stops and restarts to bring this parameter into effect.

Configuring Clock Synchronization

You can now configure your NetScaler SDX appliance to synchronize its local clock with a Network Time Protocol (NTP) server. As a result, the clock on the SDX appliance has the same date and time settings as the other servers on your network. The clock synchronization configuration does not change if the appliance is restarted, upgraded, or downgraded. However, the configuration does not get propagated to the secondary NetScaler instance in a high availability setup.

For more information, see Configuring Clock Synchronization.

New Wizards for Provisioning and Modifying a NetScaler Instance

Provisioning and modifying a NetScaler instance on the NetScaler SDX appliance is now made simple with the addition of two new wizards: the Provision NetScaler Wizard and the Modify NetScaler Wizard.

Installing an SSL Certificate on the SDX Appliance

You can now replace the default certificate that is shipped with the NetScaler SDX appliance with your own certificate. Installing an SSL certificate terminates all current client connections with the Management Service, so you have to log back on to the Management Service for any additional configuration tasks.

For more information, see Installing an SSL Certificate on the SDX Appliance.

Upgrading the XenServer Software

You can now upgrade to a later version of the XenServer software to enable functionality of some features, such as VLAN filtering, L2 mode, and VMAC support. The process of upgrading the XenServer software involves uploading the build file of the target build to the Management Service, and then upgrading the XenServer software. For more information, see Upgrading the XenServer Software.

Polling for SSL Certificates on the NetScaler Instances

You can now poll all of the NetScaler instances to check for new SSL certificates. You need to poll all of the instances if you add a new SSL certificate directly on a NetScaler instance after logging on to that instance because the Management Service is not aware of the new certificate. You can specify a polling interval or perform an immediate poll.

For more information, see Polling for SSL Certificates on the NetScaler Instances.

Allowing L2 Mode on a NetScaler Instance

A supplemental software pack supports L2 mode on NetScaler SDX appliances running XenServer 6.0. To upgrade to XenServer 6.0, see Upgrading the XenServer Software. To install the supplemental software pack, see http://support.citrix.com/article/ctx132877.

In Layer 2 (L2) mode, a NetScaler instance acts as a learning bridge and forwards all packets for which it is not the destination. Some features, such as Cloud Bridge, require that L2 mode be enabled on the NetScaler instance. With L2 mode enabled, the instance can receive and forward packets for MAC addresses other than its own MAC address. However, if a user wants to enable L2 mode on a NetScaler instance running on an SDX appliance, the administrator must first allow L2 mode on that instance. If you allow L2 mode, you must take precautions to avoid bridging loops. For more information about these precautions, see Allowing L2 Mode on a NetScaler Instance.

Configuring VMACs on an Interface

You can now configure VMACs on an interface assigned to an instance on the NetScaler SDX appliance. A NetScaler instance uses Virtual MACs (VMACs) for high availability (active-active or active-standby) configurations. A Virtual MAC address (VMAC) is a floating entity shared by the primary and the secondary nodes in a high availability setup. You must be careful when configuring VMACs. For more information, see Allowing L2 Mode on a NetScaler Instance.

Single Sign-On to the Management Service and the NetScaler Instances

Logging on to the Management Service gives you direct access to the NetScaler instances that are provisioned on the appliance, if you upgrade the Management Service and the NetScaler instances to this build. If you log on to the Management Service by using your user credentials, you do not have to provide the user credentials again for logging on to an instance. By default, the Timeout value is set to 30 minutes and the configuration tab is opened in a new browser window.

For more information, see Single Sign-On to the Management Service and the NetScaler Instances.

Backing Up and Restoring the Configuration Data of the SDX Appliance

The backup policy runs a backup at 00:30 A.M. every day, but you can create a backup file at any time if, for example, you want to immediately back up changes to the configuration.

You can use the backup file to restore the configuration data on the appliance. You can restore the configuration data of the XenServer, Management Service, and all of the NetScaler instances. Alternatively, you can restore only the NetScaler instances or selected NetScaler instances.

For more information, see Backing Up and Restoring the Configuration Data of the SDX Appliance.

Performing a Factory Reset

You can now reset the appliance to the factory default. Performing a factory reset terminates all current client sessions with the Management Service, so you have to log back on to the Management Service for any additional configuration tasks. When you are ready to restore the appliance, import the backup files by using the Management Service.

For more information, see Performing a Factory Reset.

Generating a Certificate Signing Request

You can now generate a certificate signing request (CSR) for a certificate on the NetScaler SDX appliance. A CSR is a collection of information, including the domain name, other important company details, and the private key to be used to create a certificate. To renew an existing certificate or obtain a new SSL certificate from an authorized certificate authority (CA), you must generate a CSR and submit the CSR to the CA. To generate a CSR, navigate to the NetScaler>SSL Certificates pane, select a certificate, and then click Generate CSR. Copy and paste the text directly in the order form that you send to the CA or save as a text file and send the file to the CA.

Viewing the SSL Certificates for the Management Service and the NetScaler Instances

The Management Service and the NetScaler instances use SSL certificates for secure client connections. You can now view certificate details, such as validity status, issuer, subject, days to expiration, valid from and to dates, version, and serial number. To view the SSL certificate for the Management Service, in System, under Setup Appliance, click View SSL Certificate. To view the SSL certificate for a NetScaler instance, navigate to NetScaler>SSL Certificates, select a certificate, and then click Details. You can also double-click a certificate to view the certificate details.

Monitoring CPU Core Usage on the NetScaler SDX Appliance

The CPU core usage page in the Monitoring tab of the Management Service user interface now provides the following details:

- Mapping of a core to a physical CPU.
- Hyper threads for each physical core.
- Instances running on each core.
- Average CPU usage for each core.

Initial Configuration through the Serial Console

A networkconfig utility has been added to simplify initial configuration of the SDX appliance through the serial console. For more information, see the *Citrix NetScaler SDX Quick Start Guide* for the related hardware platform.

Networking

The following Networking enhancements are available in this release.

Unsetting Parameters for any RPC Node by Using the Node IP Address

The IP address parameter of the unset rpcNode command is now a required parameter. This parameter specifies the RPC node for which you want to unset one or more of the optional parameters. Following is the synopsis of the unset rpcNode command:

unset ns rpcNode <*IPAddress*> [-password] [-srcIP] [-secure]

IS-IS Dynamic Routing Protocol

The NetScaler appliance supports the Intermediate System-to-Intermediate System (IS-IS or ISIS) dynamic routing protocol. This protocol supports IPv4 as well as IPv6 route exchanges. IS▫IS is a link state protocol and is therefore less prone to routing loops. With the advantages of faster convergence and the ability to support larger networks, ISIS can be very useful in Internet Service Provider (ISP) networks.

For more information, see Configuring ISIS.

IPv6 Support for Link Load Balancing

The NetScaler Link Load balancing (LLB) feature now supports IPv6 addresses. This support is required when Internet service providers (ISPs) assign IPv6 addresses to customers. Configuring an LLB setup with IPv6 addresses is similar to configuring a setup with IPv4 addresses, except that you now create an IPv6 service to represent your router or the next hop. Three new CLI commands (add lb route6 , show lb route6 , and rm lb route6) have been added for configuring an IPv6 route. The configuration utility has a new LLBv6 tab in the Network > Routes pane.

For more information, see Configuring an LLB Route.

Specifying IP Addresses for Backend Communication

You can specify an IP address that should be used by the NetScaler appliance as the source IP address for communication with the physical servers and peer devices. You can create IP sets, which are sets of IP addresses. You can create net profiles, which have an IP address or an IP Set, and bind a net profile to a service, service group, load balancing virtual server, or monitor. The NetScaler appliance uses the IP address specified in the net profile as the source IP address. For more information about configuring network profiles, see Using a Specified Source IP for Backend Communication.

Forwarding all Fragments of an ICMP Packet

In L3 mode, by default, the NetScaler appliance forwards only the first fragment of an ICMP request or response and drops the rest. In this mode, you can configure the appliance to forward all the ICMP fragments of an ICMP echo request that is destined for a network device. With this option enabled, the appliance also forwards all the ICMP fragments of the corresponding echo response.

One example of a situation in which this enhancement is useful is slow-link detection by a Windows 2000 Server. The Windows 2000 server sends out ICMP requests of size 2048 for

slow link detection. The NetScaler appliance can forward the fragments of the ICMP request to the destination network device and the fragments of the ICMP response from the network device to the Windows 2000 server.

IPv6 Extension Header Traversing

For simple ACL6s and ACL6s rules, the NetScaler appliance now supports traversing the extension headers (if present) of all the incoming IPv6 packets to identify the layer 4 protocol and take a specified action.

For more information on ACLs, see Access Control Lists.

ARP Response Suppression for Virtual IP Addresses (VIPs)

You can configure the NetScaler appliance to respond or not respond to ARP requests for a Virtual IP (VIP) address on the basis of the state of the virtual servers associated with that VIP.

For example, if virtual servers V1, of type HTTP, and V2, of type HTTPS, share VIP address 10.102.29.45 on a NetScaler appliance, you can configure the appliance to not respond to any ARP request for VIP 10.102.29.45 if both V1 and V2 are in DOWN state.

The following three options are available for configuring ARP-response suppression for a virtual IP address.

- NONE. The NetScaler appliance responds to any ARP request for the VIP address, regardless of the state of the virtual servers associated with the address
- ONE VSERVER. The NetScaler appliance responds to any ARP request for the VIP address if at least one of the associated virtual servers is in UP state
- ALL VSERVER. The NetScaler appliance responds to any ARP request for the VIP address if all of the associated virtual servers are in UP state.

For more information, see Configuring ARP response Suppression for Virtual IP addresses (VIPs).

SNIP Address Binding to Interfaces

You can now bind a NetScaler owned SNIP address to an interface without using Layer 3 VLANs. With this configuration, any packets related to the SNIP address go only through the bound interface.

This enhancement is useful in a scenario including a NetScaler appliance and an upstream L2 switch where the upstream switch does not support Link Aggregation channels and you want the NetScaler appliance to load balance traffic, originating from a server, across the four links to the upstream switch.

Route Monitors in High Availability in Non-INC

You can now add route monitors in a High Availability (HA) configuration in non-INC mode.

Route monitors are propagated and get synchronized only in the non-INC mode. Route monitors are useful in a non-INC mode HA configuration where you want the non-reachability of a gateway from a primary node to be one of the conditions for HA failover.

For more information, see Configuring Route Monitors.

Command Propagation changes in High Availability

In an HA configuration, when command propagation fails on the secondary node, the command still executes on the primary node.

VLAN as Gateway in the IPv6 Routes

You can now specify a VLAN instead of a gateway while adding IPv6 static routes. This option is required for adding directly connected IPv6 routes.

Also, the NetScaler appliance now supports adding directly connected routes, discovered by the dynamic routing protocols, that include a VLAN ID instead of a gateway.

Policy Based Routes for IPv6 Traffic

You can now add Policy based routes for outgoing IPv6 packets. Policy-based routing bases routing decisions on criteria that you specify. An IPv6 policy-based route (PBR6) specifies criteria for selecting IPv6 packets and, typically, a next hop to which to send the selected packets. For example, you can configure the NetScaler appliance to route outgoing IPv6 packets from a specific IPv6 address or range to a particular next hop router. Each packet is matched against each configured PBR6, in the order determined by the specified priorities, until a match is found. If no match is found, or if the matching PBR6 specifies a DENY action, the NetScaler applies the routing table for normal destination-based routing.

For more information, see Configuring a Policy-Based Routes (PBR6) for IPv6 Traffic.

Source IP selection based on a PBR

When an outgoing packet matches the rule in a PBR, the source IP selection for the packet is now based on the next hop selected. This helps in avoiding asymmetric routing.

For more information on PBRs, see Configuring Policy-Based Routes.

Load Balancing in DSR Mode for IPv6 Networks

The NetScaler now supports Load Balancing in Direct Server Return (DSR) mode for IPv6 networks by using the Type of Service (TOS) field when the NetScaler appliance and the servers are in different networks.

In this mode, when a client sends a request to a VIP6 address on a NetScaler appliance, the appliance forwards this request to the server by changing the destination IPv6 address of the packet to the IPv6 address of the server and setting an encoded value of the VIP6 address in the TOS (also called traffic class) field of the IPv6 header. You can configure the server to use the information in the TOS field to derive the VIP6 address from the encoded value, which is then used as a source IP address in response packets. Response traffic goes

directly to the client, bypassing the NetScaler.

For more information, see Configuring Load Balancing in DSR Mode for IPv6 Networks by Using the TOS Field.

Load Balancing in DSR Mode for IPv6 Networks by Using IP Tunnels

The NetScaler now supports Load Balancing in Direct Server Return (DSR) mode for IPv6 networks by using IP tunnels when the NetScaler appliance and the servers are in different networks.

The NetScaler appliance implements IP tunneling by encapsulating data packets that it receives. The encapsulation adds header information. The appliance then forwards the encapsulated data packets to the router, or appropriate server, using tunnels. The NetScaler can also act as a decapsulator if placed in front of the load balanced server.

Terminating Established Connections that Match Simple ACLs

For a simple ACL, the NetScaler appliance blocks any new connections that match the conditions specified in the ACL. The appliance does not block any packets related to existing connections that were established before the ACL was created.

However, you can immediately terminate the established connections by running a flush operation from the command line interface or the configuration utility.

Flush can be useful in the following cases:

- You receive a list of blacklisted IP addresses and want to completely block those IP addresses from accessing your servers. In this case, you create simple ACLs to block any new connections from those IP addresses, and then run flush to terminate any existing connections.
- You want to terminate a large number of connections from a particular network without taking the time to terminate them one by one.

For more information, see Terminating Established Connections.

Enable or Disable Established Parameter

You can now enable or disable the established parameter for previously configured extended ACLs or ACL6s from the command line interface by using the set and unset commands, respectively. (The parameter specifies that the ACL or ACL6 is for TCP response traffic only.)

Renaming Extended ACLs and ACL6s

You can now rename extended ACLs and ACL6s configured on the appliance.

Reverse Network Address Translation for IPv6 Traffic

You can now add Reverse Network Address Translation (RNAT) rules for IPv6 packets. These RNAT rules are called RNAT6s. When an IPv6 packet generated by the server matches the conditions specified in the RNAT6 rule, the appliance replaces the source IPv6 address of the IPv6 packet with a configured NAT IPv6 address before forwarding it to the destination. The NAT IPv6 address must be one of the NetScaler owned SNIP6 or VIP6 addresses.

When configuring an RNA6 rule, you can specify either an IPv6 prefix or an ACL6 as the condition:

IPv6 Prefix.

When you use an IPv6 prefix, the appliance performs RNAT processing on those IPv6 packets whose IPv6 address matches the prefix.

ACL6.

When you use an ACL6, the appliance performs RNAT processing on those IPv6 packets that match the conditions specified in the ACL6.

For more information, see Configuring RNAT for IPv6 Traffic.

Support for IPv4 Addresses with /31 Subnet Mask

The NetScaler now supports adding of IP addresses with /31 subnet mask compliant with RFC 3021. These IP addresses are useful on a point to point link. A /31 subnet has only two IP addresses, one can be assigned to the NetScaler appliance and the other to the peer node of a point-to-point link.

Note: The peer node of a point-to-point link should be compliant with RFC 3021.

NITRO API

The following NITRO API enhancements are available in this release.

Cluster APIs

You can use NITRO APIs to perform cluster operations such as adding cluster instances, adding cluster nodes, configuring the cluster IP address, and configuring linksets.

Display Warnings in Execution of APIs

You can now configure NITRO to display warnings that are thrown during API execution. Warnings are captured in the NITRO exception object with severity set as WARNING.

Display Paginated Statistics

You can now view statistics in a paginated manner. For example, if a query results in a large number of entries, you can display the results in multiple pages, where each page displays a specific number of entries.

Exception Handling in Bulk Operations

You can specify how exceptions are handled in bulk operations:

Exit.

Execution stops when the first error is encountered. The commands that were executed before the error are committed.

Rollback.

Execution stops when the first error is encountered. The commands that were executed before the error are rolled back. This option is supported for only the add and bind commands.

Continue.

All the commands in the list are executed even if some commands fail.

REST API Enhancements

The REST API has been enhanced for the following:

- Content-type/Accept are provided in the request header to identify object type.
- Authorization headers are provided in accordance with HTTP rules.
- Consistent use of the same URL across different methods (operations) on an object. This is applicable only if the new content-type/Accept header is used.
- Error codes and error messages are not returned in successful responses. Unsuccessful responses include the error codes and error messages. This is applicable only if the new content-type/Accept header is used.
- The HTTP status code indicates the status of the operation. It is returned in the response header.
- The cookie is now set in the request header.

Support for SDX Bulk Operations

You can now perform bulk operations on SDX appliances by using NITRO APIs. For example, when you want to provision multiple NetScaler instances on an SDX appliance, you can invoke a bulk add operation to add the NetScaler instances in a single operation.

Policy

The following Policy enhancement is available in this release.

Non-Blocking HTTP Callout

A new non-blocking version of the HTTP Callout feature is now available. Like standard HTTP Callout, the non-blocking version sends a request to the HTTP server. Unlike standard HTTP Callout, the initiator does not wait for the response. Any response is eventually dropped, although the response will be cached if cache policies are set up appropriately.

The syntax is exactly the same as the `http_callout()` function, except that the name of the function is `non_blocking_http_callout()`.

Since the initiator does not wait for the response message, non-blocking HTTP callout return a fixed response depending on the result type of the HTTP Callout. Possible responses are:

- Boolean true, for boolean results
- 0 (zero), for numeric results
- A zero-length string, for text results

Example:

```
HTTP.REQ.URL.PATH.GET_REVERSE(0) == "special" &&
SYS.NON_BLOCKING_HTTP_CALLOUT(myCallout)
```

Secure Sockets Layer (SSL)

The following Secure Sockets Layer enhancements are available in this release.

Default Syntax Policies Support for SSL

Default syntax policies are now supported for SSL. There are two types of SSL policies:

Control policy.

A control policy uses a control action. Built-in control actions:

- CLIENTAUTH-Perform client authentication.
- NOCLIENTAUTH-No client authentication.

Data policy.

A data policy uses a data action, such as inserting some data in the request or the response. An action defines the response of the NetScaler when a policy is hit. An action can be user-created or built-in. Built-in data actions are:

- RESET-Close the connection by sending a RST packet to the client.
- DROP-Drop all packets from the client. The connection remains open until the client closes it.
- NOOP-No operation is performed and the packet is forwarded.

You can add policies to a policy label and then invoke the policy label from another policy. There are two types of policy labels:

- Control policy label-holder for control policies.
- Data policy label-holder for data policies.

For more information, see Configuring SSL Actions and Policies.

Denying Nonsecure SSL Renegotiation

SSL and TLS renegotiations are vulnerable to an MITM attack that injects its own content as a prefix to a TLS connection. A new option addresses this vulnerability. If you specify `NONSECURE` as the value of the denySSLReneg parameter in the set ssl parameter command, any nonsecure renegotiations are denied. For more information about this attack, see RFC 5746. For more information about setting this parameter, see Configuring Advanced SSL Settings.

New SNMP Alarms in SSL

The following, new, SNMP alarms are added to indicate the rate of 1024, 2048, and 4096-bit key operations during SSL transactions and the number of current SSL sessions in use.

- 1024KEY-EXCHANGE-RATE
- 2048KEY-EXCHANGE-RATE
- 4096KEY-EXCHANGE-RATE
- SSL-CUR-SESSION-INUSE

SNMP

The following SNMP enhancements are available in this release.

IPv6 Based SNMP Managers

You can now add IPv6 based SNMP managers on the NetScaler appliance. You can set either of the following values for the IP Address parameter when adding IPv6 based SNMP managers.

IPv6 address of the SNMP manager.

The NetScaler appliance accepts and responds to SNMP queries from the device that is assigned this IPv6 address.

IPv6 network prefix.

The NetScaler appliance accepts and responds to SNMP queries from any device if its IPv6 address prefix matches this prefix.

Note: The NetScaler appliance does not support use of host names for SNMP managers that have IPv6 addresses. You must specify the IPv6 address.

For more information, see Specifying an SNMP Manager.

Logging SNMP Traps

You can now enable the NetScaler appliance to log any SNMP trap messages (for those SNMP alarms in which logging is enabled) even when no trap listeners are specified on the appliance. By default, the appliance logs any SNMP trap messages when at least one trap listener is specified.

For more information, see Enabling Unconditional SNMP Trap Logging.

SNMP Alarm for HA License Mismatch

A new SNMP alarm, HA-LICENSE-MISMATCH, has been introduced for detecting any mismatch between the two lists of licenses present in the two nodes of a High availability configuration.

This SNMP alarm, when configured, can generate the following SNMP trap message:

- `haLicenseCheck`

New SNMP Alarms for SSL

The following new SNMP alarms indicate the rate of 1024, 2048, and 4096-bit key operations during SSL transactions and the number of current SSL sessions in use.

- 1024KEY-EXCHANGE-RATE
- 2048KEY-EXCHANGE-RATE
- 4096KEY-EXCHANGE-RATE
- SSL-CUR-SESSION-INUSE

SNMP OID for Model number

A new SNMP OID, sysModelId (1.3.6.1.4.1.5951.4.1.1.16), returns the model number of the NetScaler appliance.

Stream Analytics

The performance of your web site or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about web site or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see Stream Analytics.

Surge Protection

The following Surge Protection enhancements are available in this release.

Flushing a Surge Queue without Having to Disable a Service

If you want to flush the surge queue of a service, service group, or a load balancing or content switching virtual server, now you do not need to disable the NetScaler entity. With this enhancement, you can manage the traffic in surge conditions without affecting the existing traffic.

Options are added to the command line interface and configuration utility to flush a surge queue. Flushing a surge queue does not affect the existing connections. Only the requests present in the surge queue get deleted. To get responses to those requests, the client has to send fresh requests.

When you flush the surge queue of a virtual server, the surge queues of all the services and service groups bound to it are flushed. When you flush the surge queue of a service group, the surge queues of all its members are flushed. You can flush the surge queue of one or more members of a service group without flushing the surge queues of all its members. You can flush the surge queue of a specific service.

In the configuration utility, when you select an entity, the Flush Surge Queue option is available in the action pane. In the command line interface, the flush ns surgeQ option is added with necessary options.

For more information, see Flushing the Surge Queue.

Virtual Server - Options of Response to PING

You can now configure the NetScaler not to respond to a ping message if the virtual server is DOWN. This is possible on load balancing, content switching, cache redirection, and VPN virtual servers. By default, the NetScaler responds to a ping message even if one or more virtual servers are DOWN. The option can be set at an IP address level or virtual server level. The option functions are described below.

Table 2. On an IP address:

Option	Effect
NONE	Always responds
ONE_VSERVER	Responds if at least one virtual server on this IP address is UP
ALL_VSERVER	Responds only if all the virtual servers on this IP address are UP
VSVR_CNTRLD	Responds according to the setting on the virtual servers

Table 3. On a virtual server:

Option	Effect
PASSIVE on all virtual servers	Always responds
ACTIVE on all virtual servers	Responds even if one virtual server is UP
ACTIVE on some and PASSIVE on others	Responds even if one virtual server set to ACTIVE is UP

This option can be set on an IP address only if it is a VIP.

CLI commands:

set ip <IPAddress> -icmpresponse (NONE | ONE_VSERVER | ALL_VSERVERS | VSVR_CNTRLD)

set lb vserver <name> -icmpVsrResponse (PASSIVE | ACTIVE)

You can replace lb with cs, cr, or vpn. You can configure this feature by using the configuration utility also.

System

The following System enhancements are available in this release.

TCP Westwood

The NetScaler appliance now supports TCP Westwood congestion avoidance algorithm. You can enable this algorithm by setting the Westwood option for the Flavor parameter while configuring TCP profiles.

For more information, see Configuring TCP Profiles.

Call Home

The new Call Home feature monitors the NetScaler appliance for common error conditions. If your appliance is registered with the Citrix Technical Support server, Call Home automatically uploads system data to that server in the event that one of the conditions occurs. The Appliance keeps a full log of all upload events so that you can review them. If you then contact the Citrix Technical Support team and open a case, the team can analyze the uploaded system logs and recommend possible solutions.

For more information, see Configuring Call Home.

Idle CLI Session Timeout for a System User

You can now specify a time-out value for inactive CLI sessions for a system user. If a user's CLI session is idle for a time that exceeds the time-out value, the NetScaler appliance terminates the connection.

The timeout can be defined in a user’s configuration, in a user-group configuration, and in the global configuration. The time-out for inactive CLI sessions for a user is determined by the following order of precedence:

1. Time-out value as defined in the user's configuration.
2. Time-out value as defined in the group configuration for the user’s group.
3. Time-out value as defined in the system global configuration.

For more information, see Configuring Users and Groups.

WebSocket Connection Support

The NetScaler appliance can now interpret WebSocket handshakes when the HTTP profile that is bound to the virtual server is configured to allow WebSocket connections.

For more information, see Configuring WebSocket Connections.

Web Interface

The following Web Interface enhancements are available in this release.

Customized Login Page Title for a Web Interface Site

You can now customize the Login page title for a Web Interface site. The custom title can consist of from 1 to 127 characters including letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters.

For more information, see Configuring the Web Interface.

Option for Activating Web Interface in Receiver Platforms

The "Enable access through mobile receiver" option has been introduced in the Web Interface GUI wizard for activating web interface sites for mobile and other receiver platforms. The option, which works with most mobile platforms, is known to work with the following:

- iPhone Receiver
- iPad Receiver
- Android Receiver
- Blackberry Receiver
- Mac Receiver
- iPad web browser
- Wyse Terminals

For more information, see Configuring the Web Interface.

Web Interface Tech Support

The show techsupport command is updated to collect the WebInterface.conf files from the NetScaler appliance.

Using the WebInterface.conf Dialog Box

The configuration utility now includes a dialog box that displays the content of the webinterface.conf file for a Web Interface site.

You can do the following from this dialog box:

- Search the WebInterface.conf file’s content for instances of a text string.
- Edit the WebInterface.conf file and save the changes.
- Easily save the WebInterface.conf file to your local computer.

For more information, see Using the WebInterface.conf Dialog Box.

Using the config.xml Dialog Box

The configuration utility now includes a dialog box that displays the content of the config.xml file for a Web Interface site of type XenApp/XenDesktop Services site.

You can do the following from this dialog box:

- Search the file’s content for instances of a text string.
- Edit the config.xml file and save the changes.

- Easily save the config.xml file to your local computer.

For more information, see Using the config.xml Dialog Box.

New Access Modes for Configuring Web Interface

The Web Interface on a NetScaler appliance now supports the following access modes:

- Direct Mode: Actual address of a XenApp or XenDesktop server is sent to the clients.
- Alternate Mode: Alternate address of a XenApp or XenDesktop server is sent to the clients.
- Translated Mode: Translated address, from the defined internal addresses to external addresses and ports mapping table, is sent to the clients from a specified network.
- Gateway Direct: Actual address of a XenApp or XenDesktop server is sent to Access Gateway.
- Gateway Alternate: Alternate address of a XenApp server is sent to Access Gateway. You cannot use this mode to access XenDesktop servers.
- Gateway Translated: Translated address, from the defined internal addresses to external addresses and ports mapping table, is sent to Access Gateway.

Note: Before you configure access method based on the client IP address, you must enable USIP mode on the web interface service to make the client's IP address available with the web interface.

For more information, see Configuring the Web Interface.

Idle Session Timeout for a Web Interface Client

You can now modify the time-out of idle Web Interface browser sessions for a client. If a client's session is idle for a time that exceeds the time-out value, the NetScaler appliance terminates the connection.

For more information, see Configuring the Web Interface.

Web Logging

The following Web Logging enhancements are available in this release.

Web Logging for an HTTP Profile

You can now log HTTP data for an HTTP profile and bind the profile to a virtual server. In the NetScaler command line, in the add ns httpprofile -name or set ns httpprofile -name command, specify the -webLog ENABLED option. In the configuration utility, navigate to System > Profiles. On the HTTP Profiles pane, add or open a profile and select **"Enable Weblogging."**

Support for Logging Source IP address in the Custom Header of a Given HTTP Request

The NSWL client can now log the originating source IP address from the custom header of a given HTTP request. You can use a new parameter in the HTTP profile where you specify an expression for extracting the custom header information from a particular HTTP request. The appliance then extracts the source IP address and sends it to the NSWL client.

A new custom log format specifier, %c, has been introduced in the NSWL client for logging the source IP address sent by the NetScaler appliance.

Logging Set-Cookie Headers

In a NetScaler Web Logging (NSWL) client, the custom log format specifier %{Foobar}o now supports the logging of information from the set cookie headers of HTTP responses.

Changes

The following changes are available in the Citrix NetScaler 10 release.

AppExpert

The following AppExpert feature changes are available in this release.

Entity Templates Feature Deprecated

In this release, the entity templates feature is deprecated. However, you can continue to create and use load balancing virtual server templates and AppExpert application templates. The documentation for this feature will be updated to reflect this change.

Limit Selector Commands are Deprecated

The limit selector commands are deprecated in this release. The autocomplete functionality of the NetScaler CLI does not work for limit selector commands, and if you use a command, the CLI displays a warning. However, the NetScaler appliance creates the limit selector so that there is no loss in functionality. Any limit selectors that are present in your configuration when you upgrade to the current release continue to function as expected after the upgrade.

Stream selectors are identical to rate limiting selectors. Therefore, you are recommended to use stream selectors in a rate limiting configuration. To configure rate limiting, do the following:

1. Create a stream selector.
2. Create a limit identifier that uses the stream selector.
3. Configure a policy that calls the limit identifier.

The following table maps each deprecated limit selector command to the stream selector command that you are recommended to use.

Deprecated limit selector command	Corresponding stream selector command
add ns limitSelector	add stream selector
rm ns limitSelector	rm stream selector
set ns limitSelector	set stream selector
show ns limitSelector	show stream selector

In the configuration utility, you can configure a selector in either of the following locations:

- **AppExpert** > **Rate Limiting** > **Selectors**
- **AppExpert** > **Stream Analytics** > **Selectors**

Compression

The following compression feature change is available in this release.

Compliance of “show cmp global” with Other “show” Commands

The output of the “show cmp global” command is now similar to the output of the “show” commands that you use for viewing global bindings for other types of default syntax policies. The “show cmp global” command continues to display all the globally bound classic policies along with their priority values. But, for default syntax policies, the command displays only those global bind points to which policies are bound, along with a count of the number of policies that are bound to each of them.

To view the details for a given global bind point, you can specify the bind point as the argument to the “type” parameter. When you specify a global bind point, the command displays all the policies that are bound to the bind point, along with their priorities and Goto expressions. Classic policy bindings are not displayed if you specify a global bind point.

Global Server Load Balancing

The following global server load balancing change is available in this release.

Backup Session Timeout Parameter is Deprecated

The global server load balancing (GSLB) parameter backupSessionTimeout is deprecated in this release. To achieve the functionality that the backupSessionTimeout parameter provided, you can use the spillover persistence parameter soPersistenceTimeout.

Load Balancing

The following load balancing changes are available in this release.

Work Load Manager Feature is Deprecated

As NetScaler Classic is no longer supported, the Work Load Manager (WLM) feature is deprecated.

Generic vserver Commands Deprecated

The set, unset, enable, disable, and rm vserver commands are deprecated on a standalone appliance and are not supported on a cluster. The show vserver command is supported.

Policies

The following policies change is available in this release.

Order of Evaluation of Operators and Operator Associativity

The order of evaluation of operators in the NetScaler policy infrastructure has been aligned with the standards set by other languages, including the C programming language and JavaScript. The following table summarizes the order of evaluation of operators and their associativity in NetScaler 10. The operators are listed in the ascending order of precedence (lowest to highest). When in doubt about the order of precedence, use parentheses to guarantee the order of evaluation that you want.

Table 1. Order of Evaluation of Operators and Their Associativity in NetScaler 10

Operator	Operator Symbol	Associativity
Logical OR	||	Left to right
Logical AND	&&	Left to right
Bitwise OR	|	Left to right
Bitwise XOR	^	Left to right
Bitwise AND	&	Left to right
Not equal to Equal to	!= ==	Non-associative
Less than Less than or equal to Greater than Greater than or equal to	< <= > >=	Non-associative
Bitwise left shift Bitwise right shift	<< >>	Left to right
Addition Subtraction	+ -	Left to right
Modulus Multiplication Division	% * /	Left to right
Logical NOT (negation) Logical bitwise NOT	! ~	Right to left
NetScaler ALT operator	ALT	Left to right

System

The following system change is available in this release.

Changes to the set ns config command

The parameters that were set with the set ns config command are now split across two commands: set ns config and set ns param. When executed on a cluster, the set ns param command is propagated to the cluster nodes. The set ns config command is not propagated to the cluster nodes.

Bug Fixes

The following issues have been fixed in this release.

Note: Unless stated otherwise, the bug fixes apply to Citrix® NetScaler® 10 nCore™ and NetScaler® 10 nCore™ VPX™.

AGEE Issues

Issue ID 0306678

If Access Gateway license is bound to any host name other than "ns" or "ANY", the license is considered to be inapplicable on Access Gateway.

System Issues

Issue ID 0290271 (nCore)

If a 1G e1k interface is reset, the hardware controller RX logic might write to the data area of a NetScaler packet buffer (NSB) after it has been returned to the NSB free pool. This can result in NSB corruption. An interface reset can be triggered by an event, such as changing the flow control settings by using the set interfacecommand.

Known Issues and Workarounds

The following known issues have been identified in this release. Workarounds are included where applicable.

AAA Issues

Issue IDs 0303465 and 0303507

The NetScaler 10 release contains an upgrade of the Likewise software, used to provide Kerberos support, from version 5.4 to version 6.1. Because of this upgrade, after upgrading a NetScaler appliance that uses Kerberos authentication to NetScaler 10, or when installing a new NetScaler appliance and configuring it to use Kerberos authentication, the NetScaler appliance does not rejoin the domain automatically. For Kerberos authentication to function properly, you must manually join your NetScaler appliance to the domain.

1. Before upgrading the Likewise server, log on to the windows active domain controller and do the following steps:

   a. In the Active Directory Users and Computers [file/dialog box/what?], remove the NetScaler appliance from the computer list.

   b. From the domain controller shell, type the following command to create the kerbtabfile.txt file:

   ```
   >ktpass –princ HTTP/kerberos.crete.example.com@crete.example.com
     -ptype KRB5_NT_PRINCIPAL -mapuser kerberos@crete.example.com
     -mapop set -pass Citrix1 -out C:\kerbtabfile.txt
   ```

   Note: Type the preceding command on a single line, although the display wraps to multiple lines.

2. After upgrading to Likewise 6.1, log onto the NetScaler appliance, open a shell, and do the following steps:

   a. Import the kerbtabfile.txt file from the domain controller to the /etc directory on the NetScaler appliance.

   b. At the shell prompt, run the necessary programs to rejoin the domain, as shown below.

   ```
   # cd /opt/likewise/bin/
   # ktutil
   # rkt /etc/kerbtabfile.txt
   # wkt /etc/krb5.keytab
   # list
   # domainjoin-cli join <EXAMPLE.COM> <DOMAINUSERNAME>
   ```

AGEE Issues

Issue ID 0251110

When you enable ICA proxy on Access Gateway and when users connect to XenDesktop, if users attempt to open a published application, the Secure Ticket Authority (STA) issues a session ticket with an invalid format and the connection fails.

Issue ID 0251596

After you configure Access Gateway to provide user connections through Citrix Receiver, when users right-click the Receiver icon in the notification area, the Log On option does not appear. Users must connect by using the Web browser or they must right-click the Receiver icon, click Preferences, and then click Plug-in status. You can also enable the Log Option to appear when users right-click the Receiver icon by adding the following settings in the registry:

1. Add the Receiver key (if the key doesn't already exist) under HKEY_CURRENT_USER\Software\Citrix\ as well as under HKEY_LOCAL_MACHINE\Software\Citrix\

2. Add the Inventory key under HKEY_CURRENT_USER\Software\Citrix\Receiver as well as under HKEY_LOCAL_MACHINE\Software\Citrix\Receiver

3. Configure following REG_SZ values under the Inventory key:

   - VPNAddress. Provide the value as the Web address for the server running Access Gateway; for example, `https://<AGEE-server-fqdn>/`.

   - VPNPrompt1. Provide the value as "UserName".

   - VPNPrompt3. Provide the value as "*Password".

Issue ID 0261547

When you enable Access Gateway as a reverse proxy and you enable basic preauthentication and post- authentication scans, as well as encryption and client choices, when users log on with the Access Gateway Plug-in, the preauthentication scan passes, but the post-authentication scan fails.

Issue ID 0285995

If you configure Access Gateway to assign an Intranet IP address to user devices that connect to Access Gateway, when users log on with the Access Gateway Plug-in, the secure DNS dynamic update does not occur and the Intranet IP address is not registered with the DNS Server.

Issue ID 0288469

After you configure a virtual server to use the Java client, when users log on with the Access Gateway Plug-in by using a browser that has a 64-bit Java Runtime Environment (JRE) installed, the Java client fails to establish a connection.

Issue ID 0290976

When you configure a post authentication policy on Access Gateway and configure the policy to redirect the connection to the Web Interface if the endpoint analysis fails, when users log on with the Access Gateway Plug-in, if the user device fails the endpoint analysis scan, users receive the Access Gateway logon page instead of the Web Interface.

Issue ID 0291264

If you create a Web Interface 5.4 site and enable authentication through Access Gateway, and you enable single sign-on with a smart card to the Web Interface that enables smart card pass-through, when users log on with the Access Gateway Plug-in, the users' desktops are not listed on the Web Interface.

Issue ID 0291821

If you create a Web Interface 5.4 site and enable authentication with a smart card through Access Gateway, and you configure the **Single Sign-on Domain** on the **Published Applications** tab using the format domainname.com instead of domainname, when users start a published application or desktop, authentication fails.

Issue ID 0291822

If you create a Web Interface 5.4 site and enable single sign-on with a smart card to the Web Interface that prompts user for a PIN, and if you do not configure the **Single Sign-on Domain** on the **Published Applications** tab, when users log on with the Access Gateway Plug-in and start a published application or desktop, authentication (directly or through single sign-on) fails. You must configure Single Sign-on Domain.

Issue ID 0292005

When users connect with clientless access and try to download a file larger than 1 gigabyte (GB) from the file share on the home page, as the file is downloading, if an upload is attempted, the download process fails but the upload continues.

Issue ID 0298971

When users log on with the Access Gateway Plug-in for Java and the Web Interface opens in Internet Explorer 9, if users do not turn on Compatibility View in Internet Explorer, when they click a published application, the following error appears: Resource shortcuts are not available.

Issue ID 0299515

If you configure an intranet IP address on Access Gateway, when users connect with the Access Gateway Plug-in on a computer running Windows XP SP3 and try to access a CIFS share hosted on a computer in the secure network, users receive an error that the share is inaccessible.

Issue ID 0300511

When users log on using clientless access and click a bookmark from the home page to open a Distributed File Share (DFS), if the target folder resides on a different computer than the computer where the domain DFS server resides, the share does not open.

Issue ID 0301060

When you configure IP pooling, enable intranet IP addresses, and disable spillover, when users log on with the Access Gateway Plug-in and then try to log on from a second user device, the Transfer Login page appears. However, the message appears incorrectly as text only on a blank page.

Issue ID 0301338

If a user password is longer than 31 characters, when users try to log on through the Access Gateway Plug-in logon dialog box rather than through a Web browser, logon fails. A message appears stating that the user name and password are invalid.

Application Firewall Issues

Issue ID 0291389

Logs sent to a remote auditlog server have missing and incorrect information.

Issue IDs 0299940, 0300223, 0302044, 0302053, 0302055, and 0302077

The UI display of the Type field for application firewall profile and some parameter settings may appear inaccurate but the underlying functionality works as expected.

Workaround: Click Refresh to display an updated profiles list or the UI display.

Issue ID 0300465

If you upgrade from NetScaler 9.3 to NetScaler 10, any existing user-created signature objects are not upgraded to the new schema format.

Workaround: After upgrading to NetScaler 10, open each signature object and click OK. The signature objects will be upgraded to the new version.

Issue ID 0300827

Regular Expressions are not supported in NetScaler expressions that are used in application firewall signatures.

Issue ID 0283780

To enable sessionless URL closure, you must first enable URL closure. If you do not, in the configuration utility the Sessionless URL Closure check box is selected, but the feature is not enabled.

Issue ID 0284009

If the sessionless URL closure option in the Start URL check is enabled, and blocking is not enabled for the Start URL check, then occasional Referer-Check violations might occur. This is harmless, and is consistent with the design of this feature. If you want to prevent any Referer-Check violations from appearing in the logs, set the Referer-Check option to none.

Issue IDs 0282932, 0301817, 0302748, 03022820, and 302295

Users must keep the following points in mind when configuring response-side Credit Card and Safe Object signature rules:

- Credit Card and Safe Object rules should be configured either as signature rules or as security check profile protections, but not both. If you configure both types of protection in the same profile, only the signature rules are applied. The security check profile protections are skipped.
- Every response-side signature rule must be associated with a request-side rule.
- Every response-side signature rule must contain at least one literal pattern.
- Although the configuration utility allows other choices, signature rules do not work unless the user sets the location to HTTP_RESP_BODY.
- Although the Max Length parameter is found under "optional parameters", Max Length must be specified.
- In Response Pattern, do not use the Expression pattern type.

Issue IDs 0302368 and 0302294

Certain learned rules that contain specific special characters and sequences cannot be skipped or removed, and may not be deleted from the learned rules list after being deployed.

Issue ID 0303049

When using the configuration utility, you can import application firewall profiles from your desktop, a local hard disk on your computer, or a remote location accessible by HTTP. You can also export profiles to your desktop or a local hard disk. When using the NetScaler command line, you can import and export profiles only to and from a hard drive or device on the NetScaler appliance.

To import a profile directly from your computer in one step, use the configuration utility. To store exported profiles on a remote server, you must use ftp or another utility to transfer them to that server.

Issue IDs 0303057 and 0301813

If the user enables transformation of SQL Injection and Cross-Site Scripting special characters, common event format (CEF) logs of violations of the HTML SQL Injection and HTML Cross-Site Scripting checks cannot be click-deployed as exemptions (relaxations) from the log viewer. The same issue affects logs of many Cross-Site Request Forgery (CSRF) violations.

Issue ID 0303044

Only QualysGuard WAS 1.0 scan reports are supported when importing signature rules. WAS 2.0 scan reports are not supported.

Cluster Issues

Issue ID 0269773

On some switches like Extreme, PTP multicast packets are processed by the CPU and are dropped if the switch does not understand the packet.

Workaround: There is an option on Extreme switch where you can disable multicast packets reaching CPU: ipmcforwarding to-cpu off ports 41-48 (specify the backplane interfaces)

Issue ID 0276162

Cluster commands are not propagated from the configuration coordinator to other nodes, when you log on to the cluster IP address using the Password Authentication mechanism. However, the commands are propagated when you log on to the cluster IP address using the Keyboard Interactive mechanism.

Issue ID 0290504

You cannot form a cluster of NetScaler appliances by using the configuration utility if you are accessing the configuration utility over a secure channel (https instead of http).

Issue ID 0302924 (nCore)

In the configuration utility, the NetScaler appliances that are added to the cluster by using the 'Discover NetScalers' option, are not automatically saved and rebooted.

Workaround: You must manually save the configuration and then warm reboot the appliances that are added.

Command-Line Interface Issues

Issue ID 0262838

The CLI man page for the `set dns parameter` command has the following errors:

- It displays ENABLED as the default value for the cacheRecords parameter. The possible values are only YES and NO, and the default value is YES.
- It displays NS_FOUR as the default value for the resolutionOrder parameter. The only possible values are OnlyAQuery, OnlyAAAAQuery, AThenAAAAQuery, and AAAAThenAQuery. The default value is OnlyAQuery.

Issue ID 0299716

In a cluster setup, the 'bind vlan' command throws an error when interface and IP address are specified together.

Workaround: Bind the interface and IP address individually, by using separate 'bind vlan' commands.

Configuration Utility Issues

Issue ID 0251463

When you click the Applications node in AppExpert, the configuration utility throws a null pointer exception. The issue occurs sporadically.

Issue ID 0278097

In the configuration utility, when a user clicks **Application Firewall** in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node are not visible. The user has to manually scroll down to view the subnodes.

Issue ID 0298686 (nCore)

If the number of records displayed exceeds the details pane area, the header row is not visible if you scroll down.

Issue ID 0300506

On the MPX 17000 platform, if you use the configuration utility to upgrade from release 9.2 build 55.5 to release 10, the appliance does not restart automatically after the upgrade.

Workaround: Restart the appliance manually by using the command line or the configuration utility.

Issue ID 0302742

If you use the configuration utility to bind a compression policy (for example, app_cmp) to an AppExpert application, the following error message appears: `Policy "app_cmp" cannot be inserted. It does not have expression with advanced syntax.`

Issue ID 0303279

In the configuration utility, in the Rewrite Policies pane, when the user clicks Add, the Create Rewrite Policy dialog box is not displayed, but the main configuration utility window is disabled.

Issue ID 0438216

In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation Issues

Issue ID 0277923

The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server, and the policy's Goto expression specifies END if it evaluates to TRUE, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated.

Domain Name System Issues

Issue ID 0291053

Under the following sequence of events, the NetScaler appliance sends the client a cached NXDOMAIN response instead of the IP addresses that are configured in the DNS action for response rewrite:

1. A security-aware name server sends the appliance a DNSSEC-enabled NXDOMAIN response for a non-existent domain. The appliance, which is designed to not rewrite DNSSEC-enabled responses, relays the negative response to the client without modifying it. The appliance also caches the response.

2. A client sends the appliance a request for the same domain, but it does not set the DNSSEC OK EDNS header bit.

This behavior is expected, and ensures that security-aware and security-oblivious clients receive the same response.

Issue ID 0301348

Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing Issues

Issue IDs 0287825 and 0287827

If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

Integrated Caching Issues

Issue ID 0278377 (nCore)

Cache policy labels cannot be bound to MYSQL or MSSQL virtual servers.

Issue ID 0288716

In a cluster setup, when there is a delay in processing the cache invalidation request originating from other cluster nodes, if the client sends a request before the cache invalidation request is processed on the node, the cache will serve old content.

Load Balancing Issues

Issue ID 89129/0248646

For non-HTTP load balancing virtual servers for which rule based persistence has been configured, the appliance does not automatically refresh the session time-out setting during a file download. Therefore, if the download is not completed before the session times out (and another request does not arrive before the session times out), the time-out setting is not refreshed, and requests that arrive during what would otherwise have been the extended time-out interval are forwarded to whatever server is selected by the configured load balancing method.

A consequence of this behavior is failure to accelerate some Repeater Plug-in connections in a WAN optimization configuration. If a persistence session that was created for a request from a Repeater Plug-in expires before the complete response is sent to the client, the next request from the Repeater Plug-in is sent to a different Branch Repeater appliance and is therefore not accelerated. When that happens, the Branch Repeater graphical user interface indicates that the reason for the connection not being accelerated is "Not enough room left in the TCP packet header to append unit specific options (5)."

Issue ID 90395/0249705

If the rule that is used for creating rule based persistence sessions is a compound expression, the `show lb persistentSessions` CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

Issue ID 90875/0250110

On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

Issue ID 91711/0250846

If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR("string2").AFTER_STR("string1") if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

Issue ID 0285672

When using load balancing of Branch Repeaters in a cluster setup, there is no response from the server and the request hangs.

Issue ID 0289339

Service group members that that are configured to scale automatically are not synchronized correctly with the secondary appliance in a high availability pair. The issue can lead to appliance failure during a failover event.

Issue ID 0351632

A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

NetScaler SDX Appliance Issues

Issue ID 0261232

If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type : `#/etc/rc.d/svmd restart`

NetScaler VPX Virtual Appliance Issues

Issue ID 0302377

If you install a NetScaler VPX virtual appliance on Microsoft Server 2008 R2 by using Hyper-V Manager, or if you install a NetScaler VPX virtual appliance on VMware ESX 3.5 or 4.0, you are not prompted to specify the IP address, subnet mask, and gateway. The appliance starts with the default IP address of 192.168.100.1.

Networking Issues

Issue ID 0276933

When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.

System Issues

Issue ID 0290271 (nCore)

If a 1G e1k interface is reset, the hardware controller RX logic might write to the data area of a NetScaler packet buffer (NSB) after it has been returned to the NSB free pool. This can result in NSB corruption. An interface reset can be triggered by an event, such as changing the flow control settings by using the set interface command.

Web Interface Issues

Issue ID 86463/0246466

The new option **Make Site Path Case Insensitive** on the **Web Interface** wizard does not work as expected.

This option is expected to enable the NetScaler appliance to ignore case sensitivity in the site name part of the URL request for a Web Interface site configured on the NetScaler appliance.

Issue ID 86538/0246528

The following dialog boxes under **Upload Plugins** available in the **Web Interface** pane of the configuration utility do not work as expected:

- Windows Client
- Linux Client
- Macintosh Client

These dialog boxes are added to enable you to upload XenApp plugins for the Windows, Linux, and Macintosh platforms, respectively, to the NetScaler appliance. The plugins appear as downloadable links on the specified Web Interface sites.

Maintenance Release

This section describes the enhancements, changes, fixed issues, and known issues provided in the maintenance releases of the Citrix NetScaler, Citrix NetScaler SDX, and Citrix Access Gateway software.

Build 78.6

Release version: Citrix NetScaler, version 10 build 78.6

Replaces build: None

Release date: October 2013

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler.

Changes and Fixes

Application Firewall

- Issue ID 0303060: Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.
- Issue IDs 0370771 and 0417720: On a NetScaler appliance with the NetScaler classic operating system installed and the application firewall enabled and configured, an error in an internal pattern checking routine might cause memory corruption, which in turn might cause the appliance to crash.
- Issue IDs 0391317 and 0423289: On a NetScaler appliance with both the application firewall and integrated caching enabled, a memory leak might occur. To work around this issue, disable integrated caching.
- Issue ID 0403054: On a NetScaler appliance with the application firewall enabled, certain POST requests that lack Content-Length headers are blocked in error.
- Issue ID 0406202: On a NetScaler appliance with the application firewall enabled and a profile name that contains at least one upper-case letter, learned rules cannot be skipped, deployed, or exported. To work around this issue, ensure that all profile names use lower-case letters only.
- Issue ID 0406904: On a NetScaler appliance with the application firewall enabled, the statistics do not count hits on classic policies. Classic policies otherwise work correctly; any request that matches a classic policy is filtered correctly by the specified profile.
- Issue IDs 0422919 and 0423289: On a NetScaler appliance with the application firewall enabled and configured, if a protected web site contains a multipart web form, after repeated processing of requests and responses that contain the multipartweb form a memory leak can gradually consume available memory.

Application Firewall Signatures

- Issue ID 0376437: To improve performance, when the application firewall processes buffer overflow signatures it does not evaluate PCRE expressions unless the minLength parameter is set.

Command Line Interface

- Issue ID 0379234: The show ns runningConfig command displays the current time instead of the time at which the configuration was last modified.

Configuration Utility

- Issue ID 0416451: On the reporting tab of the NetScaler VPX configuration utility, the option for enabling the nscollect process when it is disabled rejects the user's user name and password as incorrect.
- Issue IDs 0361970, 0387024, 0397473, and 0400307: When a NetScaler session expires, a session expiry message appears in the graphical user interface, and the user has to manually enter the IP address or the domain name of the NetScaler appliance in the address bar to log back on.
- Issue IDs 0413169 and 0420113: In the configuration utility, an attempt to bind an application firewall policy to a profile results in an error message.
- Issue ID 0426594: The NetScaler configuration utility is not compatible with JRE version 7.45.

Content Switching

- Issue ID 0329544: A transaction might fail if the request is evaluated by a location based expression--CLIENT.IP.SRC.MATCHES_LOCATION(<location>)--that is bound to a content switching virtual server of type SIP_UDP, UDP, or ANY.

Global Server Load Balancing

- Issue ID 0299642: If static proximity is configured as the primary GSLB method, and it returns multiple GSLB services, the NetScaler appliance implements round robin load balancing on those services, regardless of which GSLB method is configured as the backup method. Additionally, the appliance does not consider any weights that might be configured for those GSLB services.
- Issue ID 0408374: If a configuration has a large number of GSLB services and the add location file command is used to add the location database, some of the services might not be assigned a location from the database.

High Availability

- Issue IDs 0380302, 0399048, 0400142, 0406408 and 0401234: In a high availability configuration, as a result of an internal connection timeout event, the sync ha files command might fail and display the following warning message when you run the command from the primary node: Warning: Command failed on secondary node, but succeeded on primary node. Configuration will be synchronized to ensure secondary and primary have same configuration.

- Issue IDs 0357841 and 0408502: In a high availability configuration, on a connection to an FTP virtual server with the stateful connection failover option enabled, if the FTP control connection is closed before the passive mode FTP data connection is opened, the secondary node might become unresponsive.

- Issue IDs 0420089 and 0425486: The synchronization of files in a HA setup stops working after the nsinternal user is disabled.

Load Balancing

- Issue ID 0390545: In an interactive voice response (IVR) setup, the option selected by a user is not communicated to the server because the RTSP packet is corrupted. As a result, the user is repeatedly asked to select an option from the same list.

- Issue ID 0399955 (MPX 7500): When an RTSP packet reaches NetScaler, it inserts data into the packet. If the size of the packet exceeds the limit, NetScaler splits the RTSP packet, for example, in Pkt1 and Pkt2. The NetScaler crashes when it tries to access a split RTSP packet which does not exist if the packet size is within limits.

- Issue ID 0409028: If you unbind a load balancing (LB) monitor from its service, all the connections to the configured destination IP address (destip) and port (destport) of the LB monitor are closed. In a typical L3 direct server return (DSR) deployment, the destip address and destport of the LB monitor are actually the IP address and port of the virtual server. Therefore, in a typical L3 DSR deployment, if you unbind an LB monitor from its service, all the existing connections to the virtual server are closed. As a result, performance temporarily decreases. The same behavior occurs if you delete a service.

- Issue ID 0409055: If you run a custom health monitoring script that does not require an argument, the NetScaler appliance sends an incorrect timeout to the script. As a result, the script continues to run for longer than expected. After some time, the maximum limit for the number of scripts allowed on the appliance is reached and new scripts cannot be run.

- Issue ID 0410711: If a diameter packet is received by a diameter load balancing virtual server on which persistency is enabled, and that packet contains multiple full requests and a partial request, the NetScaler fails to recognize the partial request and sends it to the server. The result is an invalid packet being sent to the server, and the NetScaler sends a 5xxx message to the client.

Load Balancing/MSSQL

- Issue ID 0401118: On a NetScaler appliance or VPX virtual appliance that is configured for load balancing in an environment that includes a Microsoft SQL server database, if a client sends a large number of long queries to the MSSQL database, the appliance might become unresponsive or fail.

Monitoring

- Issue ID 0406391: If you bind monitors to services, and then bind a DoS or SureConnect policy to one of those services, save the configuration, and restart the appliance, you lose information about monitors bound to any services created after the service to which you bound the policy was created. Also, if you run the show ns runningConfig command before restarting the appliance, the monitor binding information does not appear.

NetScaler SDX Appliance

- Issue ID 0413123: When you display the running configuration of a NetScaler instance in the Service Management interface, the double quotation marks (“) are replaced with HTML code (;quot&).

Networking

- Issue ID 0401303: When the conditions specified in an ACL rule include the != operator, the NetScaler appliance might not properly filter packets based on the ACL rule.
- Issue ID 0404861: If the NetScaler appliance has redundant L2 connectivity with a switch, the NetScaler appliance might mark its link-local IPv6 addresses as duplicate during the DAD (Duplicate address detection) process.
- Issue ID 0404849: The NetScaler appliance might restart if it receives a duplicate IPv6 fragment within a very short interval of receiving an original IPv6 fragment.
- Issue ID 0405190: When IP fragments are received on a load balancing virtual server on which the client timeout parameter set to zero, the NetScaler appliance might dump core and then restart.

Policies

- Issue ID 0410624: When a filter policy is globally bound to a NetScaler, application firewall or compression or authorization policies that are bound to a content switching virtual server are not saved in the running configuration. However, these bindings are displayed when you run the show cs vserver command.

Platform

- Issue ID 0409202: The NetScaler license is not processed if the configuration file (ns.conf) contains multiple instances of the host name, or if the host name in the ns.conf file is different from the host name in the rc.conf file. With this fix, if the ns.conf file contains multiple host names, only the name set by the set ns hostname command is used. Also, the host name in ns.conf no longer takes precedence over the host name in rc.conf.

Rewrite

- Issue ID 0401455: Modifying the content with more than one callout results in incorrect computation of the content length. This issue is not observed if all the callouts use GET requests.

SSL

- Issue IDs 0386750 and 0408393: If, when adding an entity that requires user interaction, you abort the operation before providing the requested value, a subsequent attempt to add an entity that requires user interaction fails, and the following message appears:

  User requested abort.

System

- Issue ID 0346267: The Call Home feature can be enabled by running the enable feature callhome command.
- Issue IDs 0369909 and 0381906: If you use a SNIP address for which management access is enabled as the IP address of an HTTP or HTTPS service, and the service is deleted, the NetScaler appliance fails if HTTP or HTTPS traffic is sent to that SNIP address.
- Issue ID 0391632: Stat-command output specified with the -fullValues parameter is aligned incorrectly.
- Issue ID 0391754: On a NetScaler MPX system, the SNMP count for the appliance's hardware memory and the show system memory display are incorrect. The amount of memory shown is larger than the actual amount.
- Issue ID 0401526: On a NetScaler appliance, an invalid HTTP range request results in a large amount of memory usage and the following error appears: "ERROR: Communication error with the packet engine."
- Issue ID 0407868: Remote monitoring of a high capacity appliance, such as a NetScaler MPX 22000, might indicate a drop in performance even though performance remains robust. The apparent problem is the result of a pause in the stream of monitoring data, not an actual drop in throughput.
- Issue ID 0412681: If changes are made in the nsconfig/resolv.conf file, the appliance fails to override the default DNS configurations.
- Issue ID 0415623: If you specify an invalid IPv4 address in a command that can accept either IPv4 or IPv6 address, the NetScaler shell exits automatically, because of memory corruption.

SQL DB

- Issue ID 0394093: NetScaler was buffering the query with the query length exceeding 65535 characters. This causes the NetScaler TCP window size to go down to zero, making the client to wait indefinitely.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0283556: Currently the SAML implementation supports only RSA digital signatures. DSA digital signatures are not supported.
- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberos authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, and then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.
- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

Action Analytics/Rate Limiting

- Issue ID 91353/0250526: If multiple stream identifiers and/or rate limiting identifiers evaluate a connection, the NetScaler appliance updates the counters for bandwidth, response time, and number of concurrent connections for only the identifier that evaluates the connection first. Those statistical counters are not updated for the other identifiers. However, the counter for number of requests is updated for all the identifiers that evaluate the connection.

AppFlow

- Issue ID 0327439: AppFlow records generated by the NetScaler appliance cannot be seen on SPLUNK.
- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0272715: If you use the Google Chrome browser with the default Chrome PDF plugin to view the PCI-DSS report, certain links and pages do not render correctly. Workaround: Disable Chrome PDF and install the Adobe Acrobat Reader plugin for Chrome.
- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), you must also add at least one request pattern in addition to one or more response patterns. If you do not add a request pattern, the configuration utility displays an error message when you try to save the new signature rule, and the rule is not saved.
- Issue ID 0283780: When you enable the sessionless URL closure feature, you must also enable the URL closure feature. If you do not enable URL closure, the sessionless URL closure feature does not work.
- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked. Workaround: If you configure Sessionless URL Closure, set Validate Referer Header to Off.
- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importation as application firewall signature rules. WAS 2.0 scan reports are not supported.
- Issue ID 0313950: On a NetScaler appliance that has the application firewall configured and the Safe Object check configured, processing extremely large web pages can cause the NetScaler appliance to crash.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped. Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

Cluster

- Issue ID 0324865 (nCore VPX): In a cluster of VPX appliances that are deployed on HyperV, steered packets are dropped. Workaround: Enable MAC spoofing on the HyperV backplane interfaces.
- Issue ID 0390677: On a cluster IP address, the show interface cla/x command cannot retrieve the physical properties of the channel's member interfaces. Workaround: Use the show channel cla/x command instead.

Command Line Interface

- Issue ID 0382182 : When the output of a CLI command is piped to another command more than once, the NetScaler appliance treats the second (and later) pipes as arguments to the first piped command, instead of treating them as separate commands. This results in an invalid command and an error is thrown.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click 'Application Firewall' in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0303279: In the configuration utility, in the Rewrite Policies pane, clicking Add does not display the Create Rewrite Policy dialog box. Instead it disables the main configuration utility window.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the Create DNS View dialog box, the "Service(s) in this view" and "Policy(s) in this view" lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0333048: If you access the configuration utility through Internet Explorer 8, an attempt to bind 250 or more VIP addresses to a VLAN results in an error message about an unresponsive script.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

  Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs. Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0338513: If you use Internet Explorer 8 or Internet Explorer 9 to log on to the NetScaler configuration utility, the browser displays a blank screen, because it is displaying the compatibility view.

  Workaround: In the Compatibility View Settings dialog box, change to the standard view by clearing the Display all websites in Compatibility View check box.

- Issue ID 0352307: If you access the NetScaler configuration utility from a Mac machine with a client environment running JRE 1.7 or later, you cannot select the fields in the Java based configuration views. Workaround: Install Java 7, update 21.

- Issue ID 0353015: Load balancing virtual servers that are used by AppExpert applications are displayed in nodes other than the AppExpert node. For example, they are displayed in the Available Virtual Servers list in the Create Persistency Group dialog box (Load Balancing > Persistency Groups > Add and in the Create Persistency Group dialog box list that appears when you click the Name button in the list Create Content Switching Action dialog box Content Switching > Add > Actions).

- Issue ID 0375277: If a NetScaler connection from a client is closed without the client logging out, the session created for that connection remains active until the configured timeout period elapses. If this happens frequently, after about the 20th occurrence the user might get a "Connection limit to CFE exceeded" error message.

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to that virtual server when policy evaluation is terminated. This behavior is expected.

Domain Name System

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If the primary GSLB method fails, the backup GSLB method also fails under the following set of conditions: - A GSLB virtual server's primary GSLB method is set to round trip time (RTT) and the backup GSLB method is set to static proximity, - The primary GSLB method is set to static proximity and backup GSLB method is set to RTT, -Source IP persistence is enabled Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

Load Balancing

- Issue ID 91711/0250846: If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR("string2").AFTER_STR("string1") if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

- Issue ID 0261175: In a high availability or cluster setup, communication between a NetScaler appliance and a peer node fails if the IP address of the peer node matches the IP pattern configured for a virtual server on the appliance. Communication failure can also occur between the appliance and any IP address that is owned by a peer node, if that IP address matches the IP pattern configured for the virtual server.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

- Issue ID 0351870: If you change the load balancing group of a virtual server that has a large number of SSL sessions, the appliance might fail.

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the "show lb persistentSessions" CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the 'client.tcp.payload(n)' rule, and a request is received in multiple parts such that there is a delay between the parts, and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

Load Balancing/SSL

- Issue ID 0331621: During creation of SSL or load balancing virtual servers with the default responder action, the NetScaler appliance throws a “No such resource” error. This issue is observed only in a cluster setup.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface. Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type: `#/etc/rc.d/svmd restart`

- Issue ID 0309711: If you create an nCore VPX instance on XenServer 5.6, the instance might not start. Workaround: Upgrade to XenServer 6.0

- Issue ID 0337386: When restored from a backup, a NetScaler instance is reprovisioned by using the NetScaler XVA image currently available on the appliance, even if the backup was taken from an upgraded configuration. If multiple XVA images are available, the XVA image that was used to originally provision the instance is used, if available, to reprovision the instance. If that image is not available, any XVA image is used.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: If you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.
- Issue IDs 0283035 and 0299716: In a cluster setup, the bind vlan command throws an error when interface and IP address are specified together.
- Issue ID 0288450: The show lacp command does not display the lacp configurations. This issue is observed only in a cluster setup.
- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command set ptp -state disable and configure NTP to synchronize the time across the cluster nodes.
  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
- Issue ID 0318684: In an HA configuration in INC mode where both the nodes run the OSPF routing protocol, the secondary node drops all the L3 traffic that has the destination that was advertised by the secondary node.

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed. Workaround: Copy the certkey in the /nsconfig/ssl/ folder to all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.
- Issue ID 0343395: On the NetScaler appliance, TLS protocol version 1.2 does not support a client certificate with an RSA 4096-bit key.

System

- Issue ID 0382647: The stat system -detail command does not display the number of CPUs.

XML API

- Issue ID 0321005: The set ns hostname API now includes the ownernode parameter to specify the node for which the hostname is configured. The API is not compatible with earlier versions.

Build 77.5

Release version: Citrix NetScaler, version 10 build 77.5

Replaces build: None

Release date: August 2013

Release notes version: 2.0

Language supported: English (US)

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler.

Changes and Fixes

AppFlow

- Issue ID 0357496: If you enable AppFlow in Syslog, the NetScaler appliance might fail to respond. The cause is invalid typecasting of a pointer.

- Issue ID 0388650: If you enable AppFlow from a NetScaler Insight Center virtual appliance while traffic is flowing through a monitored NetScaler appliance, NetScaler Insight Center disables and then reenables the AppFlow feature for every virtual server on the NetScaler appliance. Doing that while traffic is flowing through the appliance puts some pointers out of sync. As a result, the appliance does not respond properly.

Application Firewall

- Issue ID 0236218: When configuring the Safe Commerce (credit card) check, you can now configure the application firewall to check the MIME/type of HTTP responses and skip responses that are not of the appropriate content type for Safe Commerce filtering. You can use this configuration option to prevent false positives.

  To enable MIME/type checking, at the NetScaler command line type the following command:

  bind appfw profile <name> -inspectResContentType <type>

  For <name>, substitute the name of the profile. For <type>, substitute a string that matches the MIME/type. For example, to check for and skip PDF content sent to the library profile, you would type the following:

  bind appfw profile library -inspectResContentType "text/PDF"

  To disable a MIME/type rule that you have previously enabled, use the unbind command:

  unbind appfw profile <name> -inspectResContentType <type>

- Issue ID 0383140: Relaxation rules for cross-site scripting that have special characters in field names are not honored when the application firewall action is “Transform cross-site scripts.”

- Issue ID 0390804 : If you configure an application firewall profile but do not bind any signatures to it, the NetScaler appliance becomes unresponsive or fails if a user sends a request with a JSON body to a web site protected by that profile.

- Issue ID 0403027: The application firewall includes an extraneous line break in the hidden field that it adds to forms as part of the form field consistency check. This line break is not javascript-compliant and can cause issues with javascript-enhanced forms.

Configuration Utility

- Issue ID 0360163: You cannot configure a GSLB service for which a server is not configured on the NetScaler appliance. The configuration utility displays the message `Server must be specified`.
- Issue ID 0390478: In the NetScaler configuration utility, when you modify AppFlow settings under Settings > AppFlow, the modified settings are not saved.
- issue ID 0395142: In the NetScaler configuration utility, virtual servers whose names begin with APP, AP, app, or ap are not displayed.

Content Switching

- Issue IDs 0364831 and 0386963: In random cases, if you unbind a content switching policy from a content switching virtual server, the appliance might fail.
- Issue ID 0393487: While binding a content switching policy to a content switching policy label or virtual server, you cannot specify the invoke parameter without first specifying a GotoPriorityExpression.

Global Server Load Balancing

- Issue ID 0394328: On a NetScaler appliance that has both a monitor and a GSLB view bound to a GSLB service, occasionally the view binding is not visible from the command line and is not saved in ns.conf, even though the GSLB service is properly configured and UP.

Load Balancing

- Issue ID 0335841: For MSSQL Monitor, When the data type is of type NCHAR for the column of the table, the evalRule was working fine but the evalRule failed when the data type for the other column of the table is of type CHAR.
- Issue ID 0349420: If the length of the Send String is greater than 430 characters for a HTTP-ECV load balancing monitor, it gets truncated after set lb monitor command is issued. If the send string is less than or equal to 430 chars, the Content is intact. Since we allow 512 chars to be added originally, we should ensure that 512 chars are retained throughout, even after set lb monitor cmd is issued.
- Issue ID 0349955: After you restart the appliance, the domain-based service group is shown as DOWN and the following error message appears: “Domain name cannot be resolved.”
- Issue ID 0351870: If you change the load balancing group of a virtual server that has a large number of SSL sessions, the appliance might fail.
- Issue ID 0387253: Occasionally, when you create a new load balancing virtual server in the configuration utility, a series of error messages appear. The message indicates that the load balancing feature is not licensed, and you are unable to create the virtual server.
- Issue ID 0391273: When you add a new server to an existing service group, the services in the group might be designated as DOWN even though monitoring probes succeed.
- Issue ID 0393963: If a packet engine receives a user logon request with a support-session (TASS) cookie from a session that was owned by a different packet engine, the appliance might fail.

Load Balancing/AAA-TM

- Issue ID 0390037: After authentication, if AAA generates the URL redirect, it rewrites the query portions of certain URLs into base 8 ASCII string equivalents instead of transmitting the original strings.
- Issue ID 0391105: A NetScaler appliance that has AAA-TM configured for authentication with a RADIUS Server might generate intermittent logon failures with the error message `HTTP/1.1 Internal Server Error 6`.
- Issue ID 0402472: A NetScaler appliance or VPX instance that has AAA-TM enabled and integrated caching disabled might exhibit high load or crash due to a buffer overflow if you attempt to create a KCD service account.

Load Balancing/DNS

- Issue ID 0376173: If two NetScaler appliances in a high-availability configuration have TCPB mode enabled globally, and you create a DNS TCP service, the service might be successfully created on the primary NetScaler appliance but fail on the secondary appliance.

NetScaler SDX Appliance

- Issue ID 0382221: A backup of the configuration file is created by default. If the configuration file is accidentally deleted, the backup is used when the appliance restarts.
- Issue ID 0385037: If the /var/mps/policy/mps_policy_backup.xml file is empty or corrupted, the appliance performs a core dump and the Management Service user interface becomes blank.
- Issue ID 0400164: You cannot change the default SSL certificate that is used for secure access to the Management Service.

Networking

- Issue ID 0366321: The Network Visualizer does not display the bound IP addresses of a configured VLAN.

Policy

- Issue ID 0375689: On a NetScaler appliance that has both the Responder and Application Firewall features enabled, a responder policy that accesses geolocation databases might cause the appliance to hang.
- Issue ID 0378685: The NetScaler appliance fails to respond when HTTP callouts are configured with IP address and port instead of a virtual server and if a virtual server based expression (in particular, when NetScaler evaluates the expression, even if the request comes from the callout) is configured on the appliance.

Platform

- Issue ID 0358346: NetScaler classic build is not supported on the newer NetScaler MPX platforms.
- Issue ID 0360223: In certain cases, error messages on the console of an MPX 5550/5650 or MPX 8200/8400/8600 appliance continuously scroll if the physical registers are not correctly read.
- Issue ID 0373125: The NetScaler hardware might sometimes report incorrect values for system health counters. The health counters are read over the SMBus, which is prone to reporting wrong or zero values.

SSL

- Issue ID 0333936 (nCore): If an SSL chip fails on the NetScaler MPX platform, the software attempts to reinitialize the chip and restore its operation.
- Issue ID 0352959: A memory leak occurs if a 1-byte SSL record is processed.
- Issue ID 0392328: If the case of the domain name provided in the SNI extension from the client does not match the case of the common name in the server certificate, the SSL handshake fails. The SNI extension check is not case-sensitive.
- Issue ID 0392683: In some cases, parsing an incorrectly formatted client certificate might take more than a few seconds. The delay can trigger the monitoring logic to terminate the process and restart the appliance.

System

- Issue ID 0360751: The month displayed on the CLI prompt on issuing the set prompt %d command is incorrect.
- Issue ID 0380623 (nCore): The NetScaler appliance cannot generate reports for some counters (for example, average server TTFB).
- Issue ID 0380937: Configd logs that are logged through syslog do not appear in the ns.log file, because of a conflict with library linkages.
- Issue ID 0384153: When selective acknowledgment (SACK) and partial buffering are enabled on the appliance, acknowledgments with incorrect TCP checksum are forwarded to the server.
- Issue ID 0390257: SNMP returns incorrect values for the ifOutOctets and ifInOctets counters.
- Issue ID 0392293: The NetScaler appliance wrongly advertises TCP buffer size to the client side when dynamic windows management is enabled and the service-side buffer size is larger than 40k. This problem occurs when two different TCP profiles are bound to the virtual server (buffer size is 8k) and to the service (buffer size > 40k). It causes failure when the appliance is uploading files.
- Issue ID 0394724: The SNMP module allocates memory for all OIDs in an SNMP request and queues them for further processing. This leads to memory build up in the SNMP module when there are large number of SNMP requests (each request with 100s of OIDs). This leads to memory shortage that in turn leads to memory allocation failures.

Web Interface

- Issue ID 0380241: When using Citrix Receiver for Java-client-only sites, users are unable to access their applications, because Web Interface on NetScaler fails to detect Java version 1.7.

- Issue ID 0384255: T If you access the NetScaler configuration utility by using a hostname instead of an IP address, virtual servers that are assigned to access the Web Interface sites are not displayed.

XML API

- Issue ID 0283923: The addrewriteaction API does not include the pattern argument, which is mandatory for actions of type replace_all.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0283556: Currently the SAML implementation supports only RSA digital signatures. DSA digital signatures are not supported.
- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberos authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, and then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.
- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

Action Analytics/Rate Limiting

- Issue ID 91353/0250526: If multiple stream identifiers and/or rate limiting identifiers evaluate a connection, the NetScaler appliance updates the counters for bandwidth, response time, and number of concurrent connections for only the identifier that evaluates the connection first. Those statistical counters are not updated for the other identifiers. However, the counter for number of requests is updated for all the identifiers that evaluate the connection.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

AppFlow

- Issue ID 0327439: AppFlow records generated by the NetScaler appliance cannot be seen on SPLUNK.
- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0272715: If you use the Google Chrome browser with the default Chrome PDF plugin to view the PCI-DSS report, certain links and pages do not render correctly.

  Workaround: Disable Chrome PDF and install the Adobe Acrobat Reader plugin for Chrome.

- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), you must also add at least one request pattern in addition to one or more response patterns. If you do not add a request pattern, the configuration utility displays an error message when you try to save the new signature rule, and the rule is not saved.

- Issue ID 0283780: When you enable the sessionless URL closure feature, you must also enable the URL closure feature. If you do not enable URL closure, the sessionless URL closure feature does not work.

- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, requests that contain web forms with action URLs are blocked.

  Workaround: If you configure Sessionless URL Closure, set Validate Referer Header to Off.

- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importing as application firewall signature rules. WAS 2.0 scan reports are not supported.

- Issue ID 0303060: Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.

- Issue ID 0313950: On a NetScaler appliance that has the application firewall configured and the Safe Object check configured, processing extremely large web pages can cause the NetScaler appliance to crash.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

Cluster

- Issue ID 0324865 (nCore VPX): In a cluster of VPX appliances that are deployed on HyperV, steered packets get dropped.

  Workaround: Enable MAC spoofing on the HyperV backplane interfaces.

- Issue ID 0390677: On a cluster IP address, the show interface cla/x command cannot retrieve the physical properties of the channel's member interfaces.

  Workaround: Use the show channel cla/x command instead.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click 'Application Firewall' in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0303279: In the configuration utility, in the Rewrite Policies pane, clicking Add does not display the Create Rewrite Policy dialog box but disables the main configuration utility window.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0333048: If you access the configuration utility through Internet Explorer 8, an attempt to bind 250 or more VIP addresses to a VLAN results in an error message about an unresponsive script.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

  Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the Create DNS View dialog box, the "Service(s) in this view"

and "Policy(s) in this view" lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs.

  Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0338513: When you log on to NetScaler configuration utility using Internet Explorer 8 or Internet Explorer 9, the web browser displays a blank screen as the browser is displaying the compatibility view.

  Workaround: Change to the standard view, in the Compatibility View Settings dialog box, by clearing the Display all websites in Compatibility View check box.

- Issue ID 0352307: If you access the NetScaler configuration utility from a Mac machine with a client environment running JRE 1.7 or later, you cannot select the fields in the Java based configuration views.

  Workaround: Install Java 7, update 21.

- Issue ID 0353015: Load balancing virtual servers that are used by AppExpert applications are displayed in nodes other than the AppExpert node. For example, they are displayed in the Available Virtual Servers list in the Create Persistency Group dialog box (Load Balancing > Persistency Groups > Add and in the Create Persistency Group dialog box list that appears when you click the Name button in the list Create Content Switching Action dialog box Content Switching > Actions > Add).

- Issue ID 0375277: If a NetScaler connection from a client is closed without the client logging out, the session created for that connection remains active until the configured timeout period elapses. If this happens frequently, after about the 20th occurrence the user might get a "Connection limit to CFE exceeded" error message.

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to that virtual server when policy evaluation is terminated. This behavior is expected.

Domain Name System

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If the primary GSLB method fails, the backup GSLB method also fails under the following set of conditions:

  - A GSLB virtual server's primary GSLB method is set to round trip time (RTT) and the backup GSLB method is set to static proximity,

  - The primary GSLB method is set to static proximity and backup GSLB method is set to RTT,

  - Source IP persistence is enabled,

  Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

High Availability

- Issue ID 0399048: In a high availability configuration, as a result of an internal connection timeout event, the sync ha files command might fail and display the following warning message when you run the command from the primary node:

  Warning: Command failed on secondary node, but succeeded on primary node. Configuration will be synchronized to ensure secondary and primary have same configuration.

  Workaround: Run the sync ha files command from the secondary node.

Load Balancing

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the "show lb persistentSessions" CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the 'client.tcp.payload(n)' rule, and a request is received in multiple parts such that there is a delay between the parts, and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

- Issue ID 91711/0250846: If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR("string2").AFTER_STR("string1") if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

- Issue ID 0261175: In a high availability or cluster setup, communication between a NetScaler appliance and a peer node fails if the IP address of the peer node matches the IP pattern configured for a virtual server on the appliance. Communication failure can also occur between the appliance and any IP address that is owned by a peer node, if that IP address matches the IP pattern configured for the virtual server.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

Load Balancing/SSL

- Issue ID 0331621: While creating SSL or load balancing virtual servers with default responder action, the NetScaler appliance throws a “No such resource” error. This issue is observed only in a cluster setup.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type:

  ```
  #/etc/rc.d/svmd restart
  ```

- Issue ID 0309711: If you create an nCore VPX instance on XenServer 5.6, the instance might not start.

  Workaround: Upgrade to XenServer 6.0

- Issue ID 0337386: When restored from a backup, a NetScaler instance is reprovisioned by using the NetScaler XVA image currently available on the appliance, even if the backup was taken from an upgraded configuration. If multiple XVA images are available, the XVA image that was used to originally provision the instance is used, if available, to reprovision the instance. If that image is not available, any XVA image is used.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: If you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.
- Issue IDs 0283035 and 0299716: In a cluster setup, the bind vlan command throws an error when interface and IP address are specified together.
- Issue ID 0288450: The show lacp command does not display the lacp configurations. This issue is observed only in a cluster setup.
- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command set ptp -state disable and configure NTP to synchronize the time across the cluster nodes.
  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
- Issue ID 0318684: In an HA configuration in INC mode where both the nodes run the OSPF routing protocol, the secondary node drops all the L3 traffic which has the destination that was advertized by the secondary node.

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed.

  Workaround: Copy the certkey in the /nsconfig/ssl/ folder to all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.
- Issue ID 0343395: On the NetScaler appliance, TLS protocol version 1.2 does not support a client certificate with an RSA 4096-bit key.
- Issue ID 0345883 On the NetScaler appliance, TLS protocol version 1.2 does not support ephemeral Diffie-Hellman cipher suites.

XML API

- Issue ID 0321005: The set ns hostname API now includes the ownernode parameter to specify the node for which the hostname is configured. The API will not be compatible with earlier versions.

Build 76.7

Release version: Citrix NetScaler, version 10 build 76.7

Replaces build: None

Release date: May 2013

Release notes version: 3.0

Language supported: English (US)

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler.

Changes and Fixes

Application Firewall

- Issue ID 0333655: When the application firewall parses multipart POST requests to identify boundary text, instead of attempting to match the string "; boundary=", it instead searches for the string "boundary" within the Content-type HTTP header. The relevant RFCs permit whitespace between the semicolon (";") and the string "boundary", between the string "boundary" and the equals sign, and between the equals sign and the beginning of the boundary text value, so searching for an exact string that includes the semicolon or equals sign fails when unexpected whitespace is present. This change ensures that the application firewall correctly identifies boundary text.

- Issue ID 0369529: If an application firewall profile has the HTML cross-site scripting check configured to transform unsafe HTML, in some situations the application firewall might transform all HTML tags, including allowed HTML tags and attributes.

- Issue ID 0377610: The application firewall might crash if certain signatures are enabled and a protected web server sends a compressed response.

Configuration Utility

- Issue ID 0363408: When using the Load Balancing Wizard for Citrix XenDesktop to configure load balancing for Citrix XenDesktop, if you specify a wildcard port (*) for a load balancing virtual server, the wizard inserts an asterisk in the name of the virtual server, in the name of the associated service group, and in the name of the monitor. Because the asterisk is an invalid character for an entity name, you cannot perform any operation (such as rename, set, or remove) on those entities.

- Issue ID 0369583: If you use the configuration utility to view a Responder action, the Responder Actions page is reloaded.

- Issue ID 0376543: The View Persistence Sessions dialog box in the NetScaler configuration utility displays negative values for destination port numbers that are greater than 32767.

- Issue ID 0381521: The System Time that is displayed in the NetScaler > System Information page is incorrect.

- Issue ID 0383237: In an HA configuration, when you make configuration changes in the secondary node by using the configuration utility, the utility does not display any warning message that the configuration changes will not be propagated to the primary node.

DataStream

- Issue ID 0367120: Reference count for 'special queries'(USE/SET) stored in Netscaler were not incremented correctly, because of which Netscaler freed 'special query' even though there was a client connection referring to it. Later when a query is received on this client connection and Netscaler tries to replay the special queries linked with the connection, it crashes.

Domain Name System

- Issue ID 0292217: The NetScaler appliance functioning as a DNS proxy server and running a GSLB configuration fails under the following sequence of events:
  - The DNS virtual server receives a query for a CNAME record that does not exist on the DNS server. The queried record might or might not be associated with the domain name that is bound to the GSLB virtual server.
  - The DNS server sends a NODATA response for the CNAME record, and the appliance caches that negative response.
  - A load balancing virtual server that is part of the GSLB configuration (it is represented by a GSLB service) receives an HTTP request for the domain name for which the appliance cached the NODATA response.

Global Server Load Balancing

- Issue ID 0372920: If the NetScaler appliance has run out of memory, and you create a CNAME-based GSLB service, the appliance fails and dumps core.
- Issue ID 0378578: If a GSLB configuration includes DNS views and a GSLB virtual server that is configured with the dynamic RTT load balancing method, the NetScaler appliance does not respond with the IP address that is configured for the DNS policies. But, after the appliance stops responding with the configured IP addresses, if you configure persistence for the GSLB virtual server, the issue persists for a while, and then gets resolved automatically.

Load Balancing

- Issue ID 0335230: The NetScaler appliance fails if a client sends an RTSP load balancing virtual server an RTSP request in which the SDP content-length header has a value of 0.

- Issue ID 0349517: Sometimes, the show lb vserver <name> command does not display the content switching policies associated with the load balancing virtual server. At other times, the command displays content switching policies that are associated with other load balancing virtual servers but not with the load balancing virtual server specified in the command.

- Issue ID 0363680: CPU spikes occur on a NetScaler appliance if a load balancing virtual server and content switching virtual server are configured as follows:

  1. The load balancing virtual server is specified as a target for the content switching virtual server.

  2. Spillover persistence is configured for the load balancing virtual server.

  3. The load balancing virtual server does not have a backup virtual server.
- Issue ID 0370327: In a High Availability configuration, if some traffic is passing through a content switching virtual server for which some spillover sessions are present in the primary node, and you run the force failover command on the primary node, the node does not properly run the failover command. The secondary node then becomes unresponsive.

Monitoring

- Issue ID 0363664: The secondary appliance in a high availability configuration might fail after an upgrade if you have configured, on the appliances, an SNMP manager with a host name.

- Issue ID 0366073: IPv6 monitors of type SMTP fail if a mapped IP address is not consistent across all the processor cores in the NetScaler appliance.

NetScaler SDX Appliance

- Issue ID 0334671: If your password to log on to the Management Service contains a colon (:), you cannot create a VPX instance. With this fix, when you configure a user account on an SDX appliance, a colon is not allowed in the account password.
- Issue ID 0346496: The Management Service utility's home page does not display critical events for interfaces that are not assigned to any VPX instances.
- Issue ID 0367664: The XenServer upgrade fails in the following circumstances:
  - When the 0/2 interface is configured as the management interface instead of 0/1
  - If the IP address used for XenServer management interface is also assigned to some other device.
- Issue ID 0367788: The NetScaler appliance does not properly handle the client certificate chain with the policy mappings extension in the intermediate certificate.
- Issue ID 0371351: The Management service utility intermittently displays the state of the NetScaler instance as **Out of Service**. The state of the instance is changed back to **UP** within a minute.
- Issue ID 0372528: The SDX appliance sends power supply failure trap messages even when there is no power supply failure.

NetScaler VPX Appliance

- Issue ID 0329237: On a NetScaler VPX virtual appliance installed on VMWare ESX, if you modify the VPX to create a virtual CPU (VCPU) in addition to the two CPUs already allotted to the VPX, the appliance fails.

Networking

- Issue ID 0315773: In an Equal-cost multi-path protocol (ECMP), route selection changes with change in metric. The NetScaler may become unresponsive when the route information present in the data structure and the current selected route are different.
- Issue ID 0350486: When you set the speed of an interface to AUTO, and disable and then enable the interface, the interface comes up with a speed of 100 Mbps.
- Issue ID 0360291: An RNAT rule with RNAT IP address and a DNS service are configured on the NetScaler appliance. For DNS requests from a client, hitting the service and whose source IP address matches the RNAT rule, the NetScaler appliance forwards the DNS requests to the DNS server with source IP address field set to the RNAT IP and SNIP IP address, alternatively.
- Issue ID 0368683: For a recursive BGP route that depends on an IGP route for information, if there is some change in information in the IGP route, the NetScaler appliance does not properly update the BGP routes in its routing table.
- Issue ID 0379172: When a virtual server, which is configured as the nexthop for a PBR rule, is DOWN and non -TCP or non-UDP or non-ICMP traffic, for example GRE traffic, hits the PBR rule, the NetScaler appliance becomes unresponsive.
- Issue ID 0380685: The NetScaler becomes unresponsive when a non -TCP or non-UDP or non-ICMP traffic, for example GRE traffic, does not match any PBR rules configured on the appliance.

Platform

- Issue ID 0371521: On the MPX 8200/8400/8600 appliance, if you execute the `./ns_hw_err.bash` script, the appliance might perform a core dump and restart because of the smartctl commands present in the script.

Policies

- Issue ID 0376175: Each of the following typecasts from string (text_t or a subclass of it) simply returns the original value, if the value is not of the correct format for the type it is cast to.
  - typecast_num_t - Should check that it is a proper number (num_at)
  - typecast_unsigned_long_t - Should check that it is a proper unsigned long (unsigned_long_at)
  - typecast_double_t - Should check that it is a proper double (double_at)

Rewrite

- Issue ID 0301481: On a NetScaler appliance that has a response-side rewrite policy configured and bound to a load balancing virtual server, a request sent to the virtual server might trigger a sequence of events that causes the NetScaler appliance to fail.

SSL

- Issue ID 0275357: The NetScaler appliance fails if you add a certificate revocation list (CRL) that contains a NULL value in the nextUpdate field.
- Issue ID 0333936: If an SSL chip fails on the NetScaler MPX platform, the software now attempts to reinitialize the chip and restore its operation.
- Issue ID 0342706: If you bind a cipher or cipher group to a virtual server, service group, or service, and then save the configuration, the cipher group binding is missing from the configuration after you restart the appliance.
- Issue ID 0385542: In cluster setup, encrypted passwords are not stored in proper format.

System

- Issue ID 0333300: An LACP channel created with all of its interfaces in the UP state is shown as PARTIAL-UP instead of UP.
- Issue ID 0346613: The configuration utility displays the time for the Australia time zone as advanced by one hour.
- Issue ID 0374221: When an audit policy and a service are bound to the same virtual server, if you are modifying the syslog or nslog action, make sure that the service type, IP address and the port of the action does not match the corresponding parameters of the service.

  Note: The service type for syslog is UDP and for nslog it is TCP.
- Issue ID 0372251: When using classic and advanced policies alternatively to specify filter expression for the start nstrace command, the NetScaler appliance stops responding.
- Issue ID 0372744: A NetScaler appliance with HTML injection and AppFlow enabled, fails to respond when a web page contains an embedded URL that is longer than 4K bytes.

XML API

- Issue ID 0381778: To prevent loops when transforming a URL, you can no longer remove the priority assigned to an existing transform action. You can change an existing priority, but you cannot remove it entirely. The unset transform action command no longer accepts the -priority parameter, and the unsettransformaction_priority API has been removed from XML-API.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0283556: Currently the SAML implementation supports only RSA digital signatures. DSA digital signatures are not supported.
- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberoes authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, and then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.
- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

Action Analytics/Rate Limiting

- Issue ID 91353/0250526: If multiple stream identifiers and/or rate limiting identifiers evaluate a connection, the NetScaler appliance updates the counters for bandwidth, response time, and number of concurrent connections for only the identifier that evaluates the connection first. Those statistical counters are not updated for the other identifiers. However, the counter for number of requests is updated for all the identifiers that evaluate the connection.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

AppFlow

- Issue ID 0327439: AppFlow records generated by the NetScaler appliances cannot be seen on SPLUNK.
- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0272715: If you use the Google Chrome browser with the default Chrome PDF plugin to view the PCI-DSS report, certain links and pages do not render correctly.

  Workaround: Disable Chrome PDF and install the Adobe Acrobat Reader plugin for Chrome.

- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), in addition to one or more response patterns you must also add at least one request pattern. If you do not, then when you try to save the new signature rule, the configuration utility displays an error message and does not save the rule.

- Issue ID 0283780: When you enable the sessionless URL closure feature, you must also enable the URL closure feature. If you do not enable URL closure, the sessionless URL closure feature does not work.

- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked.

  Workaround: If you configure Sessionless URL Closure, set Validate Referer Header to Off.

- Issue ID 0303060: Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.

- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importing as application firewall signature rules. WAS 2.0 scan reports are not supported.

- Issue ID 0313950: On a NetScaler appliance that has the application firewall configured and the Safe Object check configured, processing extremely large web pages can cause the NetScaler appliance to crash.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

Cluster

- Issue ID 0324865 (nCore VPX): In a cluster of VPX appliances that are deployed on HyperV, steered packets are getting dropped.

  Workaround: Enable MAC spoofing on the HyperV backplane interfaces.

Command Line Interface

- Issue ID 92269/0251344: If you upgrade from an earlier build to a later build within release 9.2 or release 9.3, or upgrade from release 9.2 to release 9.3, or upgrade from an earlier release to release 10, the time zone settings may be lost on upgrade.

  Workaround: Delete the time zone from the configuration (ns.conf), upgrade to the target build or release, and then reconfigure the time zone.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click 'Application Firewall' in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0303279: In the configuration utility, in the Rewrite Policies pane, clicking Add does not display the Create Rewrite Policy dialog box but disables the main configuration utility window.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0333048: If you access the configuration utility through Internet Explorer 8, an attempt to bind 250 or more VIP addresses to a VLAN results in an error message about an unresponsive script.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

  Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the Create DNS View dialog box, the "Service(s) in this view"

and "Policy(s) in this view" lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs.

  Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0338513: When you log on to NetScaler configuration utility using Internet Explorer 8 or Internet Explorer 9, the web browser displays a blank screen as the browser is displaying the compatibility view.

  Workaround: Change to the standard view, in the Compatibility View Settings dialog box, by clearing the Display all websites in Compatibility View check box.

- Issue ID 0352307: If you access the NetScaler configuration utility from a Mac machine with a client environment running JRE 1.7 or later, you cannot select the fields in the Java based configuration views.

  Workaround: Install Java 7, update 21.

- Issue ID 0353015: Load balancing virtual servers that are used by AppExpert applications are displayed in nodes other than the AppExpert node. For example, they are displayed in the Available Virtual Servers list (Load Balancing > Persistency Groups > Add > Create Persistency Group dialog box), and in the Target LB Virtual Server list (Content Switching > Actions > Add > Create Content Switching Action dialog box > Name option button).

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated. This behavior is expected.

Domain Name System

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If a GSLB virtual server's primary GSLB method is set to round trip time (RTT) and backup GSLB method is set to static proximity, or if the primary GSLB method is set to static proximity and backup GSLB method is set to RTT, and source IP persistence is enabled, when the primary GSLB method fails, the backup GSLB method also fails.

  Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

High Availability

- Issue ID 0399048: In a high availability configuration, as a result of an internal connection timeout event, the sync ha files command might fail and display the following warning message when you run the command from the primary node:

  Warning: Command failed on secondary node, but succeeded on primary node. Configuration will be synchronized to ensure secondary and primary have same configuration.

  Workaround: Run the sync ha files command from the secondary node.

Load Balancing

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the "show lb persistentSessions" CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 91711/0250846: If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR("string2").AFTER_STR("string1") if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

- Issue ID 0261175: In a high availability or cluster setup, communication between a NetScaler appliance and a peer node fails if the IP address of the peer node matches the IP pattern configured for a virtual server on the appliance. Communication failure can also occur between the appliance and any IP address that is owned by a peer node, if that IP address matches the IP pattern configured for the virtual server.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

Load Balancing/SSL

- Issue ID 0331621: While creating SSL or load balancing virtual servers with default responder action, the NetScaler appliance throws a “No such resource” error. This issue is observed only in a cluster setup.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type: `#/etc/rc.d/svmd restart`

- Issue ID 0309711: If you create an nCore VPX instance on XenServer 5.6, the instance might not start.

  Workaround: Upgrade to XenServer 6.0

- Issue ID 0337386: When restored from a backup, a NetScaler instance is reprovisioned by using the NetScaler XVA image currently available on the appliance, even if the backup was taken from an upgraded configuration. If multiple XVA images are available, the XVA image that was used to originally provision the instance is used, if available, to reprovision the instance. If that image is not available, any XVA image is used.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.
- Issue IDs 0283035 and 0299716: In a cluster setup, the bind vlan command throws an error when interface and IP address are specified together.
- Issue ID 0288450: The show lacp command does not display the lacp configurations. This issue is observed only in a cluster setup.
- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command set ptp -state disable and configure NTP to synchronize the time across the cluster nodes.
  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ```
    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
    ```
- Issue ID 0318684: In an HA configuration in INC mode where both the nodes run the OSPF routing protocol, the secondary node drops all the L3 traffic, the destination which was advertized by the secondary node.

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator, and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed.

  Workaround: Copy the certkey under /nsconfig/ssl/ folder on all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.
- Issue ID 0343395: On the NetScaler appliance, TLS protocol version 1.2 does not support a client certificate with RSA 4096-bit key.
- Issue ID 0345883: On the NetScaler appliance, TLS protocol version 1.2 does not support ephemeral Diffie-Hellman cipher suites.

XML API

- Issue ID 0321005: The API to set the hostname for a NetScaler appliance is changed to include the owner node parameter for a cluster node. This will cause incompatibility of the API.

Build 75.7

Release version: Citrix® NetScaler®, version 10 build 75.7

Replaces build: None

Release date: April 2013

Release notes version: 2.0

Language supported: English (US)

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler.

Changes and Fixes

AAA Application Traffic

- Issue ID 0371118: When a user of the Google Chrome browser, version 25v or later, authenticates to a resource that is protected by AAA-TM, the user is redirected back to the login page every time he or she clicks a link after authenticating.

AppFlow

- Issue ID 0359760: The AppFlow feature is now available on ByteMobile T1100 platform with standard license.
- Issue ID 0364924: If you remove an AppFlow action while AppFlow enabled traffic is flowing through the NetScaler appliance, the appliance might fail.

Application Firewall

- Issue ID 0350947 (MPX-5500): On a NetScaler appliance with the application firewall enabled and the sessionless Form Field Consistency check enabled, if the default charset in a POST request is anything other than the expected charset, the request might be blocked.
- Issue ID 0364099: On a NetScaler appliance that has the application firewall's XML Validation security check enabled, the application firewall might hang during validation.

Configuration Utility

- Issue ID 0349711: In the upgrade wizard, selecting the **Automatically reboot** check box does not cause the appliance to automatically reboot after the software upgrade.
- Issue ID 0356683: In the NetScaler configuration utility, you can configure a feature even if the feature is not licensed.
- Issue ID 0361066: In the configuration utility, the **Location** subnode is now under the **AppExpert** node.
- Issue ID 0367612: If you use the configuration utility's **System** > **Settings** > **Configure Advanced Features** screen to change settings, and one of your changes is to unset the callhome feature, an `All commands failed [14] error` message appears.
- Issue ID 0368947: If you navigate to System > Licenses, and then in the details pane click Licenses, the Manage License view does not open.
- Issue ID 0369583: If you use the configuration utility to view a Responder action, the Responder Actions page is reloaded.
- Issue ID 0372196: On an appliance running version 10.0.73.5 of the NetScaler software, if the number of application firewall profiles on an appliance is large, you cannot use the configuration utility to display a list of the profiles. The utility throws an error.

DataStream

- Issue ID 0372380: If the NetScaler appliance delays the transmission of an MSSQL PRELOGIN response because of network congestion, it assigns an incorrect state to the MSSQL connection. Due to the incorrect connection state, the appliance fails when it receives the client's LOGIN packet.

Domain Name System

- Issue ID 0337088: A NetScaler appliance that is functioning as an end resolver might fail if it does not receive a response to one or more of the DNS queries that it generates.

Global Server Load Balancing

- Issue ID 0365173: After a persistence session of type SSLSESSION or CALLID is created for a load balancing virtual server, persistence sessions are not created for global server load balancing virtual servers. Consequently, for a global server load balancing virtual server, the NetScaler appliance uses the configured load balancing method.

Load Balancing

- Issue ID 0317281: The bind serviceGroup command, which can be used to specify either a member of or a monitor for a service group, includes two identically named parameters called state. One parameter specifies the state of a service group member's binding with the service group, and the other parameter specifies the state of a monitor's binding with the service group. When you use the command with a state parameter, the command-line interface (CLI) sometimes interprets the parameter as being associated with a member of the service group and at other times as being associated with a monitor bound to the service group. Consequently, if you use the command to specify a member, the CLI might interpret the state parameter as being associated with a monitor, and it might display an error message saying that the name of a monitor is required.

- Issue ID 0340506: A memory leak might occur on one of a pair of NetScaler appliances that are deployed as follows:

  - A RADIUS load balancing virtual server is created on one appliance, and RADIUS services are bound to the virtual server.

  - On the other NetScaler appliance, a service is created to represent the RADIUS load balancing virtual server, and a UDP-ECV monitor is bound to the service.

  The memory leak occurs on the appliance on which the RADIUS load balancing virtual server is configured.

- Issue ID 0350241: The NetScaler appliance might fail in the following set of circumstances:

  - A load balancing virtual server has a backup chain consisting of multiple backup virtual servers.

  - One or more of those backup virtual servers are dummy virtual servers (that is, their IP address and port combination is 0.0.0.0:0).

  - You disable a dummy backup virtual server or the service group bound to it, or the state of either the backup virtual server or the service group transitions to DOWN.

Monitoring

- Issue ID 0363709: If you run the clear ns config command and configuration commands for IPv6 service group members multiple times, alternately and in rapid succession, the NetScaler user interface displays incorrect details for monitors that are bound to IPv6 service group members.

NetScaler SDX Appliance

- Issue ID 0329618: If you upgrade a NetScaler SDX appliance from XenServer version 5.6 to XenServer version 6.0 and then try to modify the nsroot password, an error message appears. The error occurs because the nsroot user entry is deleted when you perform the upgrade.

- Issue ID 0330559: If you upgrade a NetScaler SDX appliance from XenServer version 5.6 to XenServer version 6.0 and then try to modify the nsroot password, an error message appears. The error occurs because the nsroot user entry is deleted when you perform the upgrade. Now, the Management Service creates an entry for nsroot if it does not find an entry in the /etc/passwd directory.

- Issue ID 0357270: If the Management Service fails to correctly apply the admin configuration, specifically the username and password, the entry for the username and password for the VPX instance is deleted from the database. If you try to modify the instance, the username field in the Modify NetScaler Wizard dialog box is blank.

- Issue ID 0360716: With NetScaler release 10 build 72.5, if you try to upload an XVA file by using Internet Explorer version 8, the following error message appears even though the file is not present on the appliance “File xxxxx.xva already exists. Do you want to overwrite?” If you click “yes," the upload is successful.

- Issue ID 0372045: If you change the system time to a future date, the backup operation runs continuously.

Networking

- Issue ID 0352992: BGP process on the NetScaler appliance may consume high CPU if advertisement interval is set to zero. With this situation, if a new process is started that consumes high CPU, the BGP process may not send out keep alive messages resulting in adjacency loss with neighbor device.

- Issue ID 0353362: For a RNAT rule, the NetScaler appliance performs RNAT processing on packets related to new connections that match the conditions specified in the RNAT rule. However, the appliance does not perform RNAT processing on packets related to existing connections that were established before the RNAT rule was created.

- Issue ID 0356664: After you restart a NetScaler appliance that has an SSL FIPS card, any delay in the initialization of the FIPS card can prevent the BGP daemon from starting.

- Issue ID 0366145: A NetScaler appliance configured for link load balancing and RNAT might fail to establish an active FTP connection from a client to an FTP server.

- Issue ID 0367266: If an RNAT rule includes an extended ACL that has some TCP parameters set, the RNAT rule may get deleted after the appliance is restarted.

- Issue ID 0369312: When you clear the configuration on a NetScaler appliance, the appliance deletes the virtual servers before the PBRs. The appliance might become unresponsive if any of the configured PBRs still includes a reference to any of the deleted virtual servers.

- Issue ID 0372754: If a service of type ANY, with the USIP parameter set to enabled and the client timeout parameter set to some value, is bound to a virtual server of type ANY, and the NetScaler appliance receives a request for a connection to the service, the TCP packet that the appliance sends to the service has the source MAC address field set to the MAC address of the next hop router.

Policy

- Issue ID 0339824: The NetScaler appliance does not respond when RESET is used as the response side action (resAction) in bidirectional policies (having request side rule).
- Issue ID 0366159: On a NetScaler appliance with a responder action for an encoded URL, the appliance might fail to recognize that the URL is encoded and therefore handle the URL improperly, causing the responder action to fail.

  The cause is that HTTP.REQ.URL implicitly sets the text mode to URL Encoded. Most operations must be performed on a decoded (plain text) URL. For example, the CONTAINS() operation needs to examine a decoded URL for the text string that it is attempting to match. If the URL is not decoded, the match might not occur if one or more characters is encoded. However, the NetScaler appliance does not decode URLs before concatenation operations. It treats an operation as a concatenation operation if the left operand, the right operand, or both are URL encoded. Not decoding URLs allows modification of the encoded URL when doing concatenation of some other portion of a URL, such as the prefix and/or suffix.

  If the user wants to concatenate using a decoded URL, the user should use the DECODE_USING_TEXT_MODE function.
- Issue ID 0370770: If an expression was URL encoded, such as in HTTP.REQ.URL, and if this expression was used to look up in a string map by using MAP_STRING(), the appliance can fail or the expression could evaluate to an incorrect value. An example expression is HTTP.REQ.URL.MAP_STRING("myMap").

SSL

- Issue ID 0352334: TLS protocol, version 1.2, handshake fails if all the following conditions are met:
  - The Client browser is Internet Explorer.
  - Client authentication is set to mandatory on the virtual server.
  - The configured client certificate on IE browser is not signed by SHA256 hash algorithm.
- Issue ID 0355336: If crypto resources are not available to a packet engine because a number of SSL cards are DOWN, all SSL virtual servers configured on the appliance are marked DOWN. The threshold value for cards going DOWN depends on the number of cores and the number of crypto cards in the appliance.
- Issue ID 0361974: If the crypto cards take longer to start than do the Access Gateway virtual servers, the virtual servers are marked DOWN.
- Issue ID 0370650 (VPX): The NetScaler VPX appliance might fail if both of the following conditions are met:
  1. OCSP is used to check for revoked certificates.
  2. Client sends the client certificate and key in the same record.

System

- Issue ID 0346613: The configuration utility displays the time for the Australia time zone as advanced by one hour.
- Issue ID 0356430: SNMP traps are not being sent when memory utilization exceeds the threshold limit.
- Issue IDs 0326105, 0370128, and 0370181: The NetScaler appliance fails to respond and then reboots on a race condition between the aggregator and the packet engine.

Web Interface

- Issue ID 0308398: The application does not load when one of the farms which is bound is a valid XenApp farm (not observed in case of invalid XenApp farm) is down or is unavailable.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0283556: Currently the SAML implementation supports only RSA digital signatures. DSA digital signatures are not supported.
- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberoes authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, and then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.
- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

Action Analytics/Rate Limiting

- Issue ID 91353/0250526: If multiple stream identifiers and/or rate limiting identifiers evaluate a connection, the NetScaler appliance updates the counters for bandwidth, response time, and number of concurrent connections for only the identifier that evaluates the connection first. Those statistical counters are not updated for the other identifiers. However, the counter for number of requests is updated for all the identifiers that evaluate the connection.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

AppFlow

- Issue ID 0327439: AppFlow records generated by the NetScaler appliances cannot be seen on SPLUNK.
- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0272715: If you use the Google Chrome browser with the default Chrome PDF plugin to view the PCI-DSS report, certain links and pages do not render correctly. To work around this issue, disable Chrome PDF and install the Adobe Acrobat Reader plugin for Chrome.

- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), in addition to one or more response patterns you must also add at least one request pattern. If you do not, then when you try to save the new signature rule, the configuration utility displays an error message and does not save the rule.

- Issue ID 0283780: When you enable the sessionless URL closure feature, you must also enable the URL closure feature. If you do not enable URL closure, the sessionless URL closure feature does not work.

- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked. To work around this issue, if you configure Sessionless URL Closure, set Validate Referer Header to Off.

- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importing as application firewall signature rules. WAS 2.0 scan reports are not supported.

- Issue ID 0303060: Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.

- Issue ID 0313950: On a NetScaler appliance that has the application firewall configured and the Safe Object check configured, processing extremely large web pages can cause the NetScaler appliance to crash.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

Cluster

- Issue ID 0324865 (nCore VPX): In a cluster of VPX appliances that are deployed on HyperV, steered packets are getting dropped.

  Workaround: Enable MAC spoofing on the HyperV backplane interfaces.

Command Line Interface

- Issue ID 92269/0251344: If you upgrade from an earlier build to a later build within release 9.2 or release 9.3, or upgrade from release 9.2 to release 9.3, or upgrade from an earlier release to release 10, the time zone settings may be lost on upgrade.

  Workaround: Delete the time zone from the configuration (ns.conf), upgrade to the target build or release, and then reconfigure the time zone.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click 'Application Firewall' in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0303279: In the configuration utility, in the Rewrite Policies pane, clicking Add does not display the Create Rewrite Policy dialog box but disables the main configuration utility window.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0333048: If you access the configuration utility through Internet Explorer 8, an attempt to bind 250 or more VIP addresses to a VLAN results in an error message about an unresponsive script.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

  Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the Create DNS View dialog box, the "Service(s) in this view"

and "Policy(s) in this view" lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs.

  Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0338513: When you log on to NetScaler configuration utility using Internet Explorer 8 or Internet Explorer 9, the web browser displays a blank screen as the browser is displaying the compatibility view.

  Workaround: Change to the standard view, in Tools > Compatibility View Settings dialog box, by clearing the Display all websites in Compatibility View check box.

- Issue ID 0352307: If you access the NetScaler configuration utility from a Mac machine with a client environment running JRE 1.7 or later, you cannot select the fields in the Java based configuration views.

  Workaround: Install Java 7, update 21.

- Issue ID 0353015: Load balancing virtual servers that are used by AppExpert applications are displayed in nodes other than the AppExpert node. For example, they are displayed in the Available Virtual Servers list (Load Balancing > Persistency Groups > Add > Create Persistency Group dialog box), and in the Target LB Virtual Server list (Content Switching > Actions > Add > Create Content Switching Action dialog box > Name option button).

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated. This behavior is expected.

Domain Name System

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If a GSLB virtual server's primary GSLB method is set to round trip time (RTT) and backup GSLB method is set to static proximity, or if the primary GSLB method is set to static proximity and backup GSLB method is set to RTT, and source IP persistence is enabled, when the primary GSLB method fails, the backup GSLB method also fails.

  Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

Load Balancing

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the "show lb persistentSessions" CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 91711/0250846: If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR("string2").AFTER_STR("string1") if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

- Issue ID 0261175: In a high availability or cluster setup, communication between a NetScaler appliance and a peer node fails if the IP address of the peer node matches the IP pattern configured for a virtual server on the appliance. Communication failure can also occur between the appliance and any IP address that is owned by a peer node, if that IP address matches the IP pattern configured for the virtual server.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

Load Balancing/SSL

- Issue ID 0331621: While creating SSL or load balancing virtual servers with default responder action, the NetScaler appliance throws a “No such resource” error. This issue is observed only in a cluster setup.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type: `#/etc/rc.d/svmd restart`

- Issue ID 0309711: If you create an nCore VPX instance on XenServer 5.6, the instance might not start.

  Workaround: Upgrade to XenServer 6.0

- Issue ID 0337386: When restored from a backup, a NetScaler instance is reprovisioned by using the NetScaler XVA image currently available on the appliance, even if the backup was taken from an upgraded configuration. If multiple XVA images are available, the XVA image that was used to originally provision the instance is used, if available, to reprovision the instance. If that image is not available, any XVA image is used.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.
- Issue IDs 0283035 and 0299716: In a cluster setup, the bind vlan command throws an error when interface and IP address are specified together.
- Issue ID 0288450: The show lacp command does not display the lacp configurations. This issue is observed only in a cluster setup.
- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command set ptp -state disable and configure NTP to synchronize the time across the cluster nodes.
  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ```
    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
    ```

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator, and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed.

  Workaround: Copy the certkey under /nsconfig/ssl/ folder on all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.
- Issue ID 0343395: On the NetScaler appliance, TLS protocol version 1.2 does not support a client certificate with RSA 4096-bit key.
- Issue ID 0345883: On the NetScaler appliance, TLS protocol version 1.2 does not support ephemeral Diffie-Hellman cipher suites.

XML API

- Issue ID 0321005: The API to set the hostname for a NetScaler appliance is changed to include the owner node parameter for a cluster node. This will cause incompatibility of the API.

Build 74.4

Release version: Citrix® NetScaler®, version 10 build 74.4

Replaces build: None

Release date: February 2013

Release notes version: 3.0

Language supported: English (US)

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler.

Changes and Fixes

AAA Application Traffic

- Issue ID 0349418: The NetScaler appliance now supports the exclusive normalization method with SAML. For that reason, assertions posted by any SAML 2.0 compliant IDP (such as the Pingone IDP server or Oracle ID server) are now handled correctly.

AppExpert

- Issue ID 0243716: You can now configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

Application Firewall

- Issue ID 0338443: The application firewall cannot use negated (!) literal strings in a fastmatch signature pattern. If you include a negated literal string in a fastmatch-designated pattern in a signatures file, the application firewall displays an error message and does not bind the signatures file to the specified profile.

- Issue ID 0360302: On a NetScaler appliance with the application firewall enabled, the cookies generated by the cookie consistency check to verify the integrity of server cookies do not have the secure flag set, as it should be for HTTPS connections.

- Issue ID 0361617: On a NetScaler appliance that has Edgesite configured, if the application firewall learning feature is enabled, it might crash intermittently. To work around this problem, disable the learning feature or reboot the NetScaler appliance.

Cluster

- Issue ID 0360131: In a cluster setup, some TCP sessions initiated by the Flow Processor are failing as Bridge Access Control Lists are applied on the Flow Receiver.

Configuration Utility

- Issue ID 0334042: The configuration utility does not display a details panel for all the entities.
- Issue ID 0349813: If you use the configuration utility to unbind all the cipher suites from a user-defined SSL cipher group, the user-defined cipher group is deleted from the appliance.
- Issue ID 0361670: If multiple domain based services are bound to a service group, and the domain name of a member cannot be resolved (its IP address is displayed as 0.0.0.0), you cannot unbind that member from the service group.
- Issue ID 0363408: When using the Load Balancing Wizard for Citrix XenDesktop to configure load balancing for Citrix XenDesktop, if you specify a wildcard port (*) for a load balancing virtual server, the wizard inserts an asterisk in the name of the virtual server, in the name of the associated service group, and in the name of the monitor. Because the asterisk is an invalid character for an entity name, you cannot perform any operation (such as rename, set, or remove) on those entities.

DataStream

- Issue ID 0357185: The MYSQL-ECV monitor closes the TCP connection with a FIN without first issuing the quit command to close the MySQL session. As a result, the `aborted_clients` counter for MYSQL servers is incremented.

High Availability

- Issue ID 0287765: In a high availability setup, SNMP traps netScalerConfigChange and netScalerConfigSave are getting generated on the secondary appliance. High Cpu usage in stats sync on 7 seconds boundary were causing latency in some transactions.

Integrated Caching

- Issue ID 0322506 (nCore): When users upgrade from 9.1 to 9.3, the number of objects being cached is reduced because of architectural changes.

Load Balancing

- Issue ID 0348302: Stateful connection failover is now supported on Layer 3 Direct Server Return (DSR) configuration that uses IP tunneling.

  Connection failover helps prevent disruption of access to applications deployed in a distributed environment. In a NetScaler High Availability (HA) setup, connection failover (or connection mirroring-CM) refers to keeping active an established TCP or UDP connection when a failover occurs.

  In stateful failover, to maintain current information about the mirrored connections, the primary appliance sends messages to the secondary appliance. The secondary appliance maintains the data related to the packets but uses it only in the event of a failover. If a failover occurs, the new primary (old secondary) appliance starts using the stored data about the mirrored connections and accepting traffic.

Monitoring

- Issue ID 0354059: The `Last response` field in the output of the show service command should indicate that a probe timed out if the following sequence of events occurs:

  1. The monitor bound to the service fails due to an internal error (for example, an unavailable ARP table entry).

  2. The error condition is corrected.

  3. Probes are successfully sent to the service, but they time out.

  Instead of text indicating that the most recent probe timed out, the content of the Last response field is `Internal error: resource unavailable to send probe`.

Networking

- Issue ID 0283793: If the NetScaler appliance receives an ICMPv6 `Packet Too Big` error for a UDP packet, it does not fragment the remaining packets to be sent to the client.

- Issue ID 0288356: With MAC-Based Forwarding (MBF) enabled, new connections to a server fail through a Virtual IP (VIP) address, if the server is configured to reach over the newly added Subnet IP (SNIP) addresses that are bound to a Layer 3 (L3) VLAN.

- Issue ID 0347842: When the NetScaler appliance reestablishes OSPF adjacency with a peer router, latency might delay the Link State (LS) updates sent by the appliance. The delay might cause the peer router to install invalid Link State Advertisements (LSAs) for a short period of time. As a result, traffic arriving during this period encounters a black-hole.

Platform

- Issue ID 0333400 The Citrix NetScaler SDX 8400/8600 platform supports NetScaler release 10 build 74.x and later.
- Issue ID 0344262: 1G copper SFP transceivers are now supported on the ixgbe (ix) interfaces. These transceivers are hot-swappable on this interface. However, fiber SFP transceivers are not supported.

  The following SFP+ and SFP transceivers, and direct access cables, are supported:

  - Intel fiber SFP+: "FTLX8571D3BCV-IT"
  - Intel fiber SFP+: "FTLX8571D3BCV-I3"
  - Finisar fiber SFP+: "FTLX8571D3BCV"
  - Intel fiber SFP+ (LR): "FTLX1471D3BCV-IT"
  - Finisar fiber SFP+ (LR): "FTLX1471D3BCV "
  - Finisar copper SFP: "FCLF-8521-3"
  - Avago copper SFP: "ABCU-5710RZ"
  - Methode DAC cable: "DM-255-100 "
  - Methode DAC cable: "DM-255-300 "
  - Methode DAC cable: "DM-255-500 "

  Note:

  - Only 10G ports support DAC cables.
  - Fiber SFPs are not supported.
- Issue ID 0357030: NetScaler release 10 build 74.x is supported on the SDX 11500/13500/14500/16500/18500/20500 NEBS platform.

Policies

- Issue ID 0334472: In some deployments you cannot remove string patterns from string maps.
- Issue ID 0342589: Existing compression policies cannot be disabled without changing the priority value.

SSL

- Issue ID 0352611: If you log on to a NetScaler account other than the administrative account and enter the show ssl service command or show running config command, the command output appears repeatedly.

System

- Issue ID 0288067: By default, the Precision Time Protocol daemon (PTPd) is disabled on a NetScaler appliance. However, if you add the node to a cluster, PTPd is automatically enabled on that node.
- Issue ID 0350189: Latency in some transactions because of high CPU usage on the 7 seconds boundary while synchronizing statistics.
- Issue ID 0353546: When you try to add a second name-based SNMP manager, you get an error message that says an SNMP manger with that name already exists.
- Issue ID 0356420: A large number of routine system health check messages are continually added to the system log.
- Issue ID 0356430: SNMP traps are not being sent.
- Issue ID 0358197: SNMP cannot complete in the 5 minutes window between polling period because it sends the request to aggregator and waits for response.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0283556: Currently the SAML implementation supports only RSA digital signatures. DSA digital signatures are not supported.
- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberoes authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, and then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.
- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

Action Analytics/Rate Limiting

- Issue ID 91353/0250526: If multiple stream identifiers and/or rate limiting identifiers evaluate a connection, the NetScaler appliance updates the counters for bandwidth, response time, and number of concurrent connections for only the identifier that evaluates the connection first. Those statistical counters are not updated for the other identifiers. However, the counter for number of requests is updated for all the identifiers that evaluate the connection.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

AppFlow

- Issue ID 0327439: AppFlow records generated by the NetScaler appliances cannot be seen on SPLUNK.
- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0272715: If you use the Google Chrome browser with the default Chrome PDF plugin to view the PCI-DSS report, certain links and pages do not render correctly.

  Workaround: Disable Chrome PDF and install the Adobe Acrobat Reader plugin for Chrome.

- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), in addition to one or more response patterns you must also add at least one request pattern. If you do not, then when you try to save the new signature rule, the configuration utility displays an error message and does not save the rule.

- Issue ID 0283780: When you enable the sessionless URL closure feature, you must also enable the URL closure feature. If you do not enable URL closure, the sessionless URL closure feature does not work.

- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked. To work around this issue, if you configure Sessionless URL Closure, set Validate Referer Header to Off.

- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importing as application firewall signature rules. WAS 2.0 scan reports are not supported.

- Issue ID 0303060: Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.

- Issue ID 0313950: On a NetScaler appliance that has the application firewall configured and the Safe Object check configured, processing extremely large web pages can cause the NetScaler appliance to crash.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

Cluster

- Issue ID 0324865 (nCore VPX): In a cluster of VPX appliances that are deployed on HyperV, steered packets are getting dropped.

  Workaround: Enable MAC spoofing on the HyperV backplane interfaces.

Command Line Interface

- Issue ID 92269/0251344: If you upgrade from an earlier build to a later build within release 9.2 or release 9.3, or upgrade from release 9.2 to release 9.3, or upgrade from an earlier release to release 10, the time zone settings may be lost on upgrade.

  Workaround: Delete the time zone from the configuration (ns.conf), upgrade to the target build or release, and then reconfigure the time zone.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click 'application firewall' in the navigation pane, the scroll bar moves up and the subnodes of the application firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0303279: In the configuration utility, in the Rewrite Policies pane, clicking Add does not display the Create Rewrite Policy dialog box but disables the main configuration utility window.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0333048: If you access the configuration utility through Internet Explorer 8, an attempt to bind 250 or more VIP addresses to a VLAN results in an error message about an unresponsive script.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

  Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the Create DNS View dialog box, the "Service(s) in this view"

and "Policy(s) in this view" lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs.

  Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0338513: When you log on to NetScaler configuration utility using Internet Explorer 8 or Internet Explorer 9, the web browser displays a blank screen as the browser is displaying the compatibility view.

  Workaround: Change to the standard view, in the Compatibility View Settings dialog box, by clearing the Display all websites in Compatibility View check box.

- Issue ID 0352307: If you access the NetScaler configuration utility from a Mac machine with a client environment running JRE 1.7 or later, you cannot select the fields in the Java based configuration views.

  Workaround: If you click outside and return to the browser window, you will be able to select the fields in the configuration views.

- Issue ID 0353015: Load balancing virtual servers that are used by AppExpert applications are displayed in nodes other than the AppExpert node. For example, they are displayed in the Available Virtual Servers list (Load Balancing > Persistency Groups > Add > Create Persistency Group dialog box), and in the Target LB Virtual Server list (Content Switching > Actions > Add > Create Content Switching Action dialog box > Name option button).

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated.

Domain Name System

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If a GSLB virtual server's primary GSLB method is set to round trip time (RTT) and backup GSLB method is set to static proximity, or if the primary GSLB method is set to static proximity and backup GSLB method is set to RTT, and source IP persistence is enabled, when the primary GSLB method fails, the backup GSLB method also fails.

  Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

Load Balancing

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the show lb persistentSessions CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 91711/0250846: If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR("string2").AFTER_STR("string1") if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

- Issue ID 0261175: In a high availability or cluster setup, communication between a NetScaler appliance and a peer node fails if the IP address of the peer node matches the IP pattern configured for a virtual server on the appliance. Communication failure can also occur between the appliance and any IP address that is owned by a peer node, if that IP address matches the IP pattern configured for the virtual server.

- Issue ID 0317281: The bind serviceGroup command, which can be used to specify either a member of or a monitor for a service group, includes two identically named parameters called state. One parameter specifies the state of a service group member’s binding with the service group, and the other parameter specifies the state of a monitor’s binding with the service group. When you use the command with a state parameter, the command-line interface (CLI) sometimes interprets the parameter as being associated with a member of the service group and at other times as being associated with a monitor bound to the service group. Consequently, if you use the command to specify a member, the CLI might interpret the state parameter as being associated with a monitor, and it might display an error message saying that the name of a monitor is required.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout

values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

Load Balancing/SSL

- Issue ID 0331621: While creating SSL or load balancing virtual servers with default responder action, the NetScaler appliance throws a “No such resource” error. This issue is observed only in a cluster setup.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type: `#/etc/rc.d/svmd restart`

- Issue ID 0337386: When restored from a backup, a NetScaler instance is reprovisioned by using the NetScaler XVA image currently available on the appliance, even if the backup was taken from an upgraded configuration. If multiple XVA images are available, the XVA image that was used to originally provision the instance is used, if available, to reprovision the instance. If that image is not available, any XVA image is used.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.
- Issue IDs 0283035 and 0299716: In a cluster setup, the bind vlan command throws an error when interface and IP address are specified together.
- Issue ID 0288450: The show lacp command does not display the lacp configurations. This issue is observed only in a cluster setup.
- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command set ptp -state disable and configure NTP to synchronize the time across the cluster nodes.
  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ```
    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
    ```

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator, and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed.

  Workaround: Copy the certkey under /nsconfig/ssl/ folder on all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.
- Issue ID 0343395: On the NetScaler appliance, TLS protocol version 1.2 does not support a client certificate with RSA 4096-bit key.
- Issue ID 0345883: On the NetScaler appliance, TLS protocol version 1.2 does not support ephemeral Diffie-Hellman cipher suites.
- Issue ID 0352334: TLS protocol, version 1.2, handshake fails if all the following conditions are met:
  - The Client browser is Internet Explorer.
  - Client authentication is set to mandatory on the virtual server.
  - The configured client certificate on IE browser is not signed by SHA256 hash algorithm.

XML API

- Issue ID 0321005: The API to set the hostname for a NetScaler appliance is changed to include the owner node parameter for a cluster node.

Build 73.5

Release version: Citrix® NetScaler®, version 10 build 73.5

Replaces build: None

Release date: January 2013

Release notes version: 2.0

Language supported: English (US)

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.

Changes and Fixes

Access Gateway

- **Documentation:** Starting with this maintenance release, for Access Gateway issues, see http://support.citrix.com/article/CTX133966.

Application Firewall

- Issue ID 0348647: On a NetScaler appliance that has the application firewall configured, if the client sends a web form with data that contains a plus sign (+), that form field triggers a form field consistency violation. This applies for data that the user types into the form, and for data in hidden fields that was generated by a javascript or sent to the user from the server. To work around this issue, ensure that no field contains a plus sign, or temporarily disable blocking for the form field consistency check.

- Issue ID 0354289: On a NetScaler appliance that has the application firewall configured, chunked requests sent by mobile devices to XML services might receive 400-level HTTP responses. This occurs only for requests that do not contain web forms.

Cluster

- Issue ID 0343137: The configuration utility does not display the Add button while configuring linksets.

Configuration Utility

- Issue ID 0324797: The NetScaler configuration utility does not display the queue depth value for the configured priority queuing policies. This issue is observed only in a cluster setup.
- Issue ID 0334292: If you navigate to HTTP Compression > Policies or HTTP Compression > Actions, the Remove button is disabled in the task pane.
- Issue ID 0346094: The Configured table on the Monitors tab of the Configure Service dialog box does not display the correct states for monitors that are bound to a service. Any check boxes that you selected earlier, in the State column, are shown as unselected the next time you open the Configure Service dialog box for that service. However, the monitors remain active and continue to check the health of the service.
- Issue ID 0345888: If you log off and then log back on to the NetScaler configuration utility, an “Invalid username or password" error is logged in the ns.log file.
- Issue ID 0351805: The Monitor Name column of the Monitor details for service group member dialog box displays the name of the server instead of the name of the monitor.
- Issue ID 0355097: If you use the configuration utility to modify the security settings of profiles for the application firewall feature, the changes are not saved.

DataStream

- Issue ID 0354182: The flush cache contentGroup command does not flush objects that are cached in a content group of type MYSQL.

Global Server Load Balancing

- Issue ID 0344759: If you attempt to create a CNAME based GSLB service with a CNAME that is already associated with another service, the NetScaler appliance not only disallows creation of the new service, but also removes the CNAME record for that CNAME. A subsequent attempt to create a GSLB service with that CNAME is successful, and creates a new CNAME record. Therefore, two GSLB services (the previously existing service and the new one) are associated with the same CNAME.

Integrated Caching

- Issue ID 0337778: If both the rewrite feature and the Integrated caching feature are configured, the integrated caching feature might not function normally, and as a result the NetScaler appliance might fail. The problem can occur if objects are stored in selector based content groups and heavy traffic causes a server to respond slowly.
- Issue ID 0347120: For HTTP callout caching, if a response gets cached in a content group that has the minimum number of hits set to a non-zero value, the show cache object command fails.

Load Balancing/AAA Application Traffic

- Issue ID 0346093: The traffic management policy hit count shows no hits ("0") even when traffic management policies are functioning and matching traffic.

Load Balancing

- Issue ID 0278377 (nCore): Cache policy labels cannot be bound to MYSQL or MSSQL virtual servers.
- Issue ID 0330173: If a domain based service is configured with a wildcard port, its domain name does not get resolved to an IP address. Therefore, the service does not come up.
- Issue ID 0331414: The states and port numbers of load balancing virtual servers and services are not included in log entries in the newnslog file.
- Issue ID 0338196: The NetScaler appliance might fail during active-mode FTP transactions.
- Issue ID 0350458: The servicegroupbindings NITRO request (URL: `http://<NS_IP>/nitro/v1/config/servicegroupbindings/<servicegroupname>`) does not retrieve the names of t group is bound.

NetScaler SDX Appliance

- Issue ID 0318968: If you log on to a NetScaler VPX instance and change the password for access to the instance, instead of changing the password from the Management Service, connectivity from the Management Service to the instance is lost. With this release, you can restore connectivity by creating a new profile from the Management Service, assigning it the same password that you specified on the NetScaler VPX instance, and then binding the new profile to the NetScaler VPX instance.

  To create a new administrator profile, log on to the Management Service and, on the Configuration tab, navigate to NetScaler > Admin Profiles. In the details pane, click Add. In the Create NetScaler Admin Profile dialog box, type the new profile name and password. Then navigate to NetScaler > Instances and select the instance to which you want to bind the new profile. Click Modify to open the Modify NetScaler wizard and, from the Admin Profile list, select the new profile. You do not need to restart the instance for this change to take effect.

  You can also lose connectivity to XenServer by changing the password on XenServer instead of from the Management Service. To restore connectivity, you can now change the password for XenServer from the Management Service.

  To change the password, log on to the Management Service and, on the Configuration tab, navigate to System > Users. Select the nsroot user, and then click Modify. In the Modify System User dialog box, type the same password that you specified when you were logged directly on to XenServer.

- Issue ID 0329597: In certain cases, the status of a storage disk present in the SDX appliance might appear as "Missing" in the Management Service User interface under Monitoring > System Health > Storage > Disk node.

- Issue ID 0336831: If you bind a new interface to a NetScaler instance, the physical to virtual interface mapping does not change. However, if you modify a NetScaler instance that involves disabling a virtual interface, the physical interface to virtual interface mapping on the instance might change.

Networking

- Issue ID 0342151: The set l4 parameter command has a new parameter,l2connMethod, for specifying the MAC address, channel number, and VLAN ID attributes for the L2 Conn option behavior in a virtual server.

  For a load balancing virtual server with L2 Conn enabled and l2connMethod parameter of the set l4 parameter command is set to Channel or Vlan or VlanChannel, a client MAC address change no longer causes the NetScaler appliance to create a new session entry. Instead, the appliance updates the existing session entry with the new MAC address. This update resolves issues (especially with MBF) that were caused by the appliance using the old session entry instead of the new one.

- Issue IDs 0343485 and 0358382: The NetScaler appliance becomes unresponsive when highly demanding traffic (~5000 HTTP threads at a request rate of 100 KB/s) is sent through GRE and IPsec tunnels.

- Issue ID 0343789: In an High Availability configuration, BGP peer of the secondary node stays in open sent state.

- Issue ID 0346654: The NetScaler appliance does not ignore some unsupported capabilities. It might reset BGP connections even when strict-capability-match is not configured on the appliance.

NITRO API

- Issue ID 93372/0257279: You can now view the virtual servers to which a specified service is bound. The REST URL for this is `http//<nsip>/nitro/v1/config/svcbindings/svcname`.

- Issue ID 0318912: On the NetScaler appliance versions 9.2, 9.3, and 10, incorrect values are returned for cpuusagepcnt and rescpuusagepcnt on the following query: /nitro/v1/stat/system.

SSL

- Issue ID 0342706: If you bind a cipher or cipher group to a virtual server, service group, or service, and then save the configuration, the cipher group binding is missing from the configuration after you restart the appliance.

- Issue ID 0344323: An attempt to add a CA certificate fails if the modulus value of the public key is not a multiple of 512 bits.

- Issue IDs 0352611, 0357697, and 0358026: If you log on to a NetScaler account other than the administrative account and enter the show ssl service command or show running config command, the command output appears repeatedly.

- Issue ID 0353680: The add ssl certkey command fails if the private key file does not have a newline at the end of the file.

- Issue ID 0357528: On a FIPS platform, if an SSL renegotiation request is received on an SSL virtual server, the appliance fails.

System

- Issue ID 0301065: When using the HTTP monitor, the NetScaler appliance might send SYN packets from a port on which an earlier session was not closed by the server. The server then responds with a bad syn ack response, which causes the NetScaler appliance to send a RST to the server.
- Issue ID 0334500: High disk usage as the newnslog log files of NetScaler appliance version 9.2 are not automatically cleaned up on upgrade to NetScaler appliance version 9.3.
- Issue ID 0335155: When USIP is enabled, the Netscaler appliance sends a probe to the server using the client IP address as the source IP address. If the server responds to the probe with a packet having incorrect acknowledgement number, the appliance tries to probe the server again using MIP address instead of client IP address.
- Issue IDs 0355812 and 0357937: If you log on to a NetScaler appliance using an account other than the administrative account, when you execute the show monitor command, not all monitors are displayed.

Web Interface

- Issue ID 0353708: If you modify a web interface services site (for access via Citrix receiver) using the configuration utility, on a NetScaler version 10 appliance running a build older than 72.6, the services site might stop working.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0283556: Currently the SAML implementation supports only RSA digital signatures. DSA digital signatures are not supported.
- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberoes authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, and then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.
- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

Action Analytics/Rate Limiting

- Issue ID 91353/0250526: If multiple stream identifiers and/or rate limiting identifiers evaluate a connection, the NetScaler appliance updates the counters for bandwidth, response time, and number of concurrent connections for only the identifier that evaluates the connection first. Those statistical counters are not updated for the other identifiers. However, the counter for number of requests is updated for all the identifiers that evaluate the connection.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

AppFlow

- Issue ID 0327439: AppFlow records generated by the NetScaler appliances cannot be seen on SPLUNK.
- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0272715: If you use the Google Chrome browser with the default Chrome PDF plugin to view the PCI-DSS report, certain links and pages do not render correctly. To work around this issue, disable Chrome PDF and install the Adobe Acrobat Reader plugin for Chrome.

- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), in addition to one or more response patterns you must also add at least one request pattern. If you do not, then when you try to save the new signature rule, the configuration utility displays an error message and does not save the rule.

- Issue ID 0283780: When you enable the sessionless URL closure feature, you must also enable the URL closure feature. If you do not enable URL closure, the sessionless URL closure feature does not work.

- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked. To work around this issue, if you configure Sessionless URL Closure, set Validate Referer Header to Off.

- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importing as application firewall signature rules. WAS 2.0 scan reports are not supported.

- Issue ID 0303060: Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.

- Issue ID 0313950: On a NetScaler appliance that has the application firewall configured and the Safe Object check configured, processing extremely large web pages can cause the NetScaler appliance to crash.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

Command Line Interface

- Issue ID 92269/0251344: If you upgrade from an earlier build to a later build within release 9.2 or release 9.3, or upgrade from release 9.2 to release 9.3, or upgrade from an earlier release to release 10, the time zone settings may be lost on upgrade.

  Workaround: Delete the time zone from the configuration (ns.conf), upgrade to the target build or release, and then reconfigure the time zone.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click 'Application Firewall' in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0303279: In the configuration utility, in the Rewrite Policies pane, clicking Add does not display the Create Rewrite Policy dialog box but disables the main configuration utility window.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0333048: If you access the configuration utility through Internet Explorer 8, an attempt to bind 250 or more VIP addresses to a VLAN results in an error message about an unresponsive script.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

  Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0334042: The configuration utility does not display a details panel for all the entities.

Workaround: Click 'Edit' to display the details.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the Create DNS View dialog box, the "Service(s) in this view" and "Policy(s) in this view" lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs.

  Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0338513: When you log on to NetScaler configuration utility using Internet Explorer 8 or Internet Explorer 9, the web browser displays a blank screen as the browser is displaying the compatibility view.

  Workaround: Change to the standard view, in the Compatibility View Settings dialog box, by clearing the Display all websites in Compatibility View check box.

- Issue ID 0349813: If you use the configuration utility to unbind all the cipher suites from a user-defined SSL cipher group, the user-defined cipher group is deleted from the appliance.

- Issue ID 0352307: If you access the NetScaler configuration utility from a Mac machine with a client environment running JRE 1.7 or later, you cannot select the fields in the Java based configuration views.

  Workaround: If you click outside and return to the browser window, you will be able to select the fields in the configuration views.

- Issue ID 0353015: Load balancing virtual servers that are used by AppExpert applications are displayed in nodes other than the AppExpert node. For example, they are displayed in the Available Virtual Servers list (Load Balancing > Persistency Groups > Add > Create Persistency Group dialog box), and in the Target LB Virtual Server list (Content Switching > Actions > Add > Create Content Switching Action dialog box > Name option button).

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated.

Domain Name System

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If a GSLB virtual server's primary GSLB method is set to round trip time (RTT) and backup GSLB method is set to static proximity, or if the primary GSLB method is set to static proximity and backup GSLB method is set to RTT, and source IP persistence is enabled, when the primary GSLB method fails, the backup GSLB method also fails.

  Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

Load Balancing

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the "show lb persistentSessions" CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 91711/0250846: If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR("string2").AFTER_STR("string1") if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

Load Balancing/SSL

- Issue ID 0331621: While creating SSL or load balancing virtual servers with default responder action, the NetScaler appliance throws a “No such resource” error. This issue is observed only in a cluster setup.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type: `#/etc/rc.d/svmd restart`

- Issue ID 0337386: When restored from a backup, a NetScaler instance is reprovisioned by using the NetScaler XVA image currently available on the appliance, even if the backup was taken from an upgraded configuration. If multiple XVA images are available, the XVA image that was used to originally provision the instance is used, if available, to reprovision the instance. If that image is not available, any XVA image is used.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.
- Issue IDs 0283035 and 0299716: In a cluster setup, the bind vlan command throws an error when interface and IP address are specified together.
- Issue ID 0288450: The show lacp command does not display the lacp configurations. This issue is observed only in a cluster setup.
- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command set ptp -state disable and configure NTP to synchronize the time across the cluster nodes.
  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ```
    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
    ```

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator, and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed.

  Workaround: Copy the certkey under /nsconfig/ssl/ folder on all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.
- Issue ID 0343395: On the NetScaler appliance, TLS protocol version 1.2 does not support a client certificate with RSA 4096-bit key.
- Issue ID 0345883: On the NetScaler appliance, TLS protocol version 1.2 does not support ephemeral Diffie-Hellman cipher suites.
- Issue ID 0352334: TLS protocol, version 1.2, handshake fails if all the following conditions are met:
  - The Client browser is Internet Explorer.
  - Client authentication is set to mandatory on the virtual server.
  - The configured client certificate on IE browser is not signed by SHA256 hash algorithm.

XML API

- Issue ID 0321005: The API to set the hostname for a NetScaler appliance is changed to include the owner node parameter for a cluster node.

Build 72.5

Release version: Citrix® NetScaler®, version 10 build 72.5

Replaces build: None

Release date: November 2012

Release notes version: 5.0

Language supported: English (US)

Review the following sections:

- Changes
- Bug Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.

Changes

Configuration Utility

- Issue ID 0317403: On the Monitoring tab, when you disable a virtual server or a service, a confirmation window is displayed to confirm the disable operation.

Content Switching

- Issue ID 0248750: In this release, for a content switching policy that uses a default syntax rule, you can specify the target load balancing virtual server in a content switching action. In the content switching action, you can specify the name of the target load balancing virtual server, or you can configure a request-based expression that, at run time, computes the name of the load balancing virtual server to which to send the request. The expression option can drastically reduce the size of your content switching configuration, because you need only one policy per content switching virtual server. Content switching policies that use an action can also be bound to multiple content switching virtual servers, because the target load balancing virtual server is no longer specified in the content switching policy. The ability to bind a single policy to multiple content switching virtual servers helps to further reduce the size of your content switching configuration.

  You can also, for a content switching policy that uses a default syntax rule, specify the target load balancing virtual server when binding the policy to a content switching virtual server, as you would in earlier releases, without the need for a separate action. For domain-based and URL-based policies, an action is not available, and you continue to specify the name of the target load balancing virtual server when binding the policy to a content switching virtual server.

  For more information, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-map/ns-cs-basicconfig-config-cs-action-con.html.

Load Balancing

- Issue ID 0345300: If a UDP connection that is being managed by a load balancing virtual server of type UDP, SIP_UDP , DNS, RADIUS , or ANY is blocked pending a decision on persistence, and the associated protocol control block is freed before all the NetScaler buffers that reference the protocol control block are processed, the appliance might fail.

SSL

- Issue ID 0236585: You can now load a certificate bundle containing one server certificate, up to nine intermediate certificates, and optionally, a server key. Separate steps for loading and linking the certificates are no longer required.

- Issue ID 0338862: If you unbind all the cipher suites from a user-defined cipher group by using the command line, the user-defined cipher group is not deleted from the appliance.

Bug Fixes

AAA Application Traffic

- Issue IDs 0272417 and 0344661: SSO using 401-based authentication fails when an initial user request is redirected to another URL.
- Issue ID 0345220: If a AAA virtual server is configured for two-factor authentication with RADIUS challenge/response in a single-signon (SSO) environment, with the SSO name extracted from the primary authentication service and the second factor from RADIUS challenge/response, the wrong user name might be extracted. This can result in intermittent authentication failures.

Access Gateway

- Issue ID 0330636: When users log on with the Access Gateway Plug-in to an nCore Access Gateway appliance, occasionally when server-initiated connections occur, depending on the core through which the traffic is passed, the user device may fail.
- Issue IDs 0332483 and 0336091: If you have a VLAN configuration on the NetScaler appliance, when users log on with the Access Gateway Plug-in, occasionally server-initiated connections to the user device fail.
- Issue ID 0337609: When you integrate Access Gateway with a SharePoint site, after users log on successfully, when they open a Microsoft Office document, the session ends and the logon page appears.
- Issue IDs 0340122 and 0337613: After users upgrade to Access Gateway 10, Build 70.7, if you have a high availability configuration that includes an FTP server, when users log on with the Access Gateway Plug-in and initiate an FTP session, occasionally Access Gateway fails on both primary and secondary appliances while the FTP connection is active.
- Issue ID 0348694: If a published application is configured to require a user name with both capital and lower-case letters and is configured for single sign-on, after users log on with the Access Gateway Plug-in with the same user name, when they open a published desktop from the Web Interface and try to open the published application, they are prompted to enter their credentials again.
- Issue ID 0349178: After users log on to the StoreFront-based store remotely over Access Gateway from a browser and then select Log out under the users' name on the page, a page appears with message "Logoff is successful" and includes a Log on button. If users click Log on, the Storefront store-based web page is available again and authentication is not required.

AppFlow

- Issue ID 0344666: When the appflow policy evaluation fails, the NetScaler appliance sometimes continues to attempt “Appflow Logging” because of which it fails.

Application Firewall

- Issue ID 0346118: If sessionless form field consistency is enabled, a memory leak can cause fill up on the NetScaler appliance’s memory.
- Issue ID 0346384: If the Start URL feature is configured to use an uploaded HTML error object instead of an error URL, the start URL feature cannot block access to "/" even if you exclude "/" from the start URLs list.

CloudBridge

- Issue ID 0325718 (nCore): The amount of memory allocated to a packet engine can be retrieved by using show ns stat command (value of InUseMemory) or by SNMP polling (value of resMemUsage). There was a mismatch in InUseMemory and resMemUsage value for the same packet engine due to difference method used to calculate the allocated memory. This mismatch problem is now resolved and both the methods return the correct value.

Cluster

- Issue ID 0343514: The cluster instance view in the configuration utility does not display which node is the configuration coordinator.

Configuration Utility

- Issue ID 0329547 (nCore): In some cases, the value to which you set the prefetchPeriodMilliSec parameter for a cache content group might not be saved in the nsconfig file.
- Issue ID 0332839: If you access the configuration utility through Internet Explorer 8, the System > Settings > Configure TCP Parameters, dialog box has no spaces between field names and fields.
- Issue ID 0334292: If you navigate to HTTP Compression > Policies or HTTP Compression > Actions, the 'Remove' button is disabled in the task pane.

  Note: You can access the command line interface from the configuration utility. Navigate to System > Diagnostics > Command Line interface.
- Issue ID 0335701: You cannot add an SSL service with the Clear Text Port option in the configuration utility, because the option is disabled.
- Issue ID 0336854: When you open a log file in Syslog messages viewer, all the logs are not displayed when the uncompressed log file size is more than 10MB.
- Issue ID 0342735: Users might not be able to enable or disable NTP synchronization by using the configuration utility.
- Issue ID 0345828: When you log on to the NetScaler configuration utility by using certain versions of Internet Explorer 8, the web browser does not load the configuration utility.
- Issue ID 0346060: When you access the NetScaler configuration utility from a client environment using JRE 7, in certain configurations, the NetScaler configuration utility displays "Operation in Progress" message when you open a load balancing virtual server configuration.

Content Switching

- Issue ID 0315161: A NetScaler appliance fails under the following sequence of events:

  1. You associate an HTTP load balancing virtual server with an HTTP profile and a backup load balancing virtual server of type TCP.
  2. You configure a content switching virtual server to switch requests on the basis of content switching policies, and you set the load balancing virtual server as a target for the content switching virtual server.
  3. The HTTP load balancing virtual server goes down.
  4. When the content switching virtual server receives a request, it happens to select the load balancing virtual server.
  5. Because the HTTP virtual server is down, the content switching virtual server selects the backup load balancing virtual server, which is of type TCP.
  6. The appliance attempts to access the HTTP profile, which cannot be associated with a load balancing virtual server of type TCP.
- Issue ID 0344944: When you remove a content switching virtual server, the NetScaler appliance fails to remove some or all of the configuration information that binds load balancing virtual servers to the content switching virtual server. Consequently, if the state of a load balancing virtual server changes, the appliance attempts to update the state of the content switching virtual server, which no longer exists. When attempting such a state update, the appliance fails.

Domain Name System

- Issue IDs 0330529 and 0322151: The following message might be displayed if you disable a virtual server-based DNS name server: 'ERROR: Name server does not exist. [nsnet_recvrpcioctl]'

Global Server Load Balancing

- Issue ID 0308555: In certain scenarios, if the primary and backup GSLB methods are static proximity and dynamic RTT, respectively, requests for domain name resolution are not processed correctly. As a result, the appliance can fail.

Integrated Caching

- Issue ID 0331520: After an upgrade to 10.0, the NetScaler appliance might occasionally fail because of internal memory handling issues.

Load Balancing

- Issue ID 0333200: If rule based persistence is configured for a load balancing virtual server, and the virtual server receives traffic from a content switching virtual server, the load balancing virtual server's persistence sessions expire at the end of the configured timeout period, even if new requests arrive before session expiry.

Load Balancing/AAA Application Traffic

- Issue ID 0346093: The traffic management policy hit count shows no hits ("0"), even when traffic management policies are functioning and matching traffic.

Monitoring

- Issue ID 0339736: The NetScaler appliance might fail when generating the SNMP trap described in the following scenario:
  - You set the response timeout threshold parameter for a monitor that is bound to a domain based service.
  - You configure the MONITOR-RTO-THRESHOLD SNMP alarm on the NetScaler appliance.
  - The response timeout threshold is exceeded by a domain based service, and the appliance attempts to generate the monRespTimeoutAboveThresh trap.

Networking

- Issue ID 0334312: During a warm restart of the NetScaler appliance, a daemon might fail to start. After not receiving heartbeats from the daemon, the Pitboss process restarts the appliance.
- Issue ID 0336136: If a NetScaler appliance acting as a DHCP relay agent receives DHCP Discover traffic that is not from a Layer 3 VLAN, the appliance might disconnect from the default gateway and remain disconnected for some time.
- Issue ID 0336886: When a VIP with OSPF LSA TYPE-1 exists on the NetScaler appliance, any new VIPs configured with TYPE-5 are saved as TYPE-1.
- Issue ID 0341895: The state of the IPSEC tunnel becomes DOWN and SA reformation/rekeying does not happen after the IKE lifetime expires.
- Issue ID 0343578: The NetScaler appliance drops an ARP request if it arrives on a VLAN to which two different subnets are bound and the source IP address and the destination IP address in the ARP request packet belongs to these different subnets bound to the VLAN.

Policies

- Issue ID 0291487: NetScaler appliances running version 9.2 build 52.1 or later and have a large number (in the hundreds) of policy bindings can experience performance issues on 'save ns config' and 'show config' operations. This can lead to interruption in services.
- Issue IDs 0332600 and 0335877: The running configuration does not show the command used to bind a policy to a load balancing virtual server, in the following scenarios:
  - When a policy is globally bound.
  - When a service is bound to same load balancing virtual server.

SSL

- Issue ID 0302532: The NetScaler appliance fails if all of the following conditions are met:
  - A certificate revocation list (CRL) is present and linked with a CA certificate, and the CA certificate is continuously updated.
  - The CRL is uploaded by using HTTP, and auto refresh is enabled on the CRL.
  - Client authentication is enabled. Therefore, the client is verified for every GET request.

System

- Issue ID 0241964: The SNMP engine ID does not get saved to the ns.conf file after the configurations are saved. Hence the engine ID is not retained across reboots. Also, the default SNMP engine ID is not displayed on issuing the 'show snmp engineid' command.
- Issue ID 0306237: If the number of dynamic services running on the NetScaler appliance exceeds 64k, any service created could not be accessed even after when the number of services is less than 64k.
- Issue ID 0334585: The NetScaler appliance runs out of memory when processing the traffic management logout URL.

Web Interface

- Issue ID 0341459: An invalid argument error is thrown when you try to create a web interface site with default access method selected as 'GatewayDirect' and authentication point selected as 'Web Interface'.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0283556: Currently, the SAML implementation supports only RSA digital signatures. DSA digital signatures are not supported.
- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberoes authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, and then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.
- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

Access Gateway

- Issue ID 92543/0251596: After you configure Access Gateway to provide user connections through Citrix Receiver, when users right-click the Receiver icon in the notification area, the Log on option does not appear. Users must connect by using the Web browser or they must right-click the Receiver icon and then, depending on the version of Receiver they are using, click About or Preferences from the Receiver menu and Plug-in Status or Advanced from the Receiver panel. You can also enable the log on option to appear when users right-click the Receiver icon by adding the following settings in the registry:
  - Add the Receiver key (if the key does not already exist) under the following registry locations:
    - `HKEY_CURRENT_USER\Software\Citrix\`
    - `HKEY_LOCAL_MACHINE\Software\Citrix\`
  - Add the Inventory key in the following registry locations:
    - `HKEY_CURRENT_USER\Software\Citrix\Receiver`
    - `HKEY_CURRENT_USER\Software\Citrix\Receiver`
  - In the Inventory key, configure the following **REG_SZ** values:
    - **VPNAddress**. Provide the value as the Web address for the Access Gateway appliance; for example, https://<AccessGatewayFQDN>.
    - **VPNPrompt1**. Provide the value as 'UserName'.
    - **VPNPrompt2**. Provide the value as '*Password'.

      Note: To mask the password, enter an asterisk (*) before the word.

      In addition, if you configure double-source authentication that requires authentication with LDAP plus RSA authentication, you need to also add the following as **REG_SZ**:
    - **VPNPrompt3**. Provide the value as '*Passcode'.
- Issue ID 0261547: When you enable Access Gateway as a reverse proxy and you enable basic preauthentication and post- authentication scans, as well as encryption and client choices, when users log on with the Access Gateway Plug-in, the preauthentication scan passes, but the post-authentication scan fails.
- Issue ID 0275079: When users access applications published on XenApp, each user consumes multiple Access Gateway licenses per application. Instead, one session ID should be shared across the applications the user accesses. As a result, users exceed their allocated license count and an SSL error occurs.
- Issue ID 0278218: If you configure an endpoint policy, the preauthentication policy runs as expected. When users try to log on with the Access Gateway Plug-in, however, occasionally the post-authentication policy does not work as expected and authentication fails.
- Issue ID 0285995: If you configure Access Gateway to assign an intranet IP address to user devices that connect to Access Gateway, when users log on with the Access

Gateway Plug-in, the secure DNS dynamic update does not occur and the intranet IP address is not registered with the DNS Server.

- Issue ID 0288469: After you configure a virtual server to use the Access Gateway Plug-in for Java, when users log on with the Access Gateway Plug-in by using a browser that has a 64-bit Java Runtime Environment (JRE) installed, the plug-in fails to establish a connection.

- Issue ID 0291264: If you create a Web Interface 5.4 site and enable authentication through Access Gateway, and you enable single sign-on with a smart card to the Web Interface that enables smart card pass-through, when users log on with the Access Gateway Plug-in, the users' desktops are not listed on the Web Interface.

- Issue ID 0291821: If you create a Web Interface 5.4 site and enable authentication with a smart card through Access Gateway, and you configure the 'Single Sign-on Domain' on the 'Published Applications' tab using the format domainname.com instead of domainname, when users start a published application or desktop, authentication fails.

- Issue ID 0292005: When users connect with clientless access and try to download a file larger than 1 gigabyte (GB) from the file share on the home page, as the file is downloading, if an upload is attempted, the download process fails but the upload continues.

- Issue ID 0298971: When users log on with the Access Gateway Plug-in for Java and the Web Interface opens in Internet Explorer 9, if users do not turn on Compatibility View in Internet Explorer, when they click a published application, the following error appears: Resource shortcuts are not available.

- Issue ID 0299515: If you configure an intranet IP address on Access Gateway, when users connect with the Access Gateway Plug-in on a computer running Windows XP Service Pack 3 and try to access a CIFS share hosted on a computer in the secure network, users receive an error that the share is inaccessible.

- Issue ID 0300511: When users log on using clientless access and click a bookmark from the home page to open a Distributed File Share (DFS), if the target folder resides on a different computer than the computer where the domain DFS server resides, the share does not open.

- Issue ID 0309017: When you configure a preauthentication and post-authentication policy with an expression to scan a user device for a file, Access Gateway does not check for expression syntax. As a result, Access Gateway accepts inappropriate syntax configuration and the scan fails.

- Issue ID 0327433: If you configure a virtual server by using the Remote Access wizard and configure a Secure Ticket Authority (STA), the status of the server appears as UP. However, in the configuration utility, on the Home tab, under Alerts, a message states that the STA server is not configured. You must bind the server globally in order to clear the message.

- Issue ID 0337886: If users select Automatically detect settings in Internet Explorer on a computer running Windows XP, when users log on with the Access Gateway Plug-in and then log off from Access Gateway, the Automatically detect settings check box is not restored to the previously configured setting.

- Issue ID 0338451: If hundreds of concurrent sessions occur, the generation of a support file takes several hours.

- Issue ID 0340346: If you configure a session time-out setting, after users connect to Access Gateway, even though the session expires according to the value you enter, the actual process of closing the session takes longer.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

AppFlow

- Issue ID 0327439: AppFlow records generated by the NetScaler appliances cannot be seen on SPLUNK.
- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0272715: If you use the Google Chrome browser with the default Chrome PDF plugin to view the PCI-DSS report, certain links and pages do not render correctly.

  Workaround: Disable Chrome PDF and install the Adobe Acrobat Reader plugin for Chrome.
- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), in addition to one or more response patterns you must also add at least one request pattern. If you do not, then when you try to save the new signature rule, the configuration utility displays an error message and does not save the rule.
- Issue ID 0283780: If you enable the sessionless URL closure feature, you must also enable the URL closure feature. If you do not, the sessionless URL closure feature does not work.
- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked. To work around this issue, if you configure Sessionless URL Closure, set Validate Referer Header to Off.
- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importing as application firewall signature rules. WAS 2.0 scan reports are not supported.
- Issue ID 0303060: Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

Cluster

- Issue ID 0343137: The configuration utility does not display the "Add" button while configuring linksets.

Command Line Interface

- Issue ID 92269/0251344: If you upgrade from an earlier build to a later build within release 9.2 or release 9.3, or upgrade from release 9.2 to release 9.3, or upgrade from an earlier release to release 10, the time zone settings may be lost on upgrade.

  Workaround: Delete the time zone from the configuration (ns.conf), upgrade to the target build or release, and then reconfigure the time zone.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click 'Application Firewall' in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0303279: In the configuration utility, in the Rewrite Policies pane, clicking Add does not display the Create Rewrite Policy dialog box but disables the main configuration utility window.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0324797: The NetScaler configuration utility does not display the queue depth value for the configured priority queuing policies. This issue is observed only in a cluster setup.

  Workaround: You can view the queue depth of the policy by using the 'show pq policy' command on the command line interface.

- Issue ID 0333048: Using the Configuration Utility in Internet Explorer version 8, when you attempt to bind 250 or more VIP addresses to a VLAN, the Configuration Utility displays an unresponsive script error.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

  Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0334042: The configuration utility does not display a details panel for all the entities.

  Workaround: Click 'Edit' to display the details.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the 'Create DNS View' dialog box, the 'Service(s) in this view' and 'Policy(s) in this view' lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs.

  Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0338513: When you log on to NetScaler configuration utility using Internet Explorer 8 or Internet Explorer 9, the web browser displays a blank screen as the browser is displaying the compatibility view.

  Workaround: Change to the standard view, in the Compatibility View Settings dialog box, by clearing the Display all websites in Compatibility View check box.

- Issue ID 0349813: If you use the configuration utility to unbind all the cipher suites from a user-defined SSL cipher group, the user-defined cipher group is deleted from the appliance.

- Issue ID 0352307: If you access the NetScaler configuration utility from a Mac machine with a client environment running JRE 1.7 or later, you cannot select the fields in the Java based configuration views.

  Workaround: If you click outside and return to the browser window, you will be able to select the fields in the configuration views.

- Issue ID 0353015: Load balancing virtual servers that are used by AppExpert applications are displayed in nodes other than the AppExpert node. For example, they are displayed in the Available Virtual Servers list (Load Balancing > Persistency Groups > Add > Create Persistency Group dialog box), and in the Target LB Virtual Server list (Content Switching > Actions > Add > Create Content Switching Action dialog box > Name option button).

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated.

Domain Name System

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If a GSLB virtual server’s primary GSLB method is set to round trip time (RTT) and backup GSLB method is set to static proximity, or if the primary GSLB method is set to static proximity and backup GSLB method is set to RTT, and source IP persistence is enabled, when the primary GSLB method fails, the backup GSLB method also fails.

  Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

Load Balancing

- Issue ID 0278377 (nCore): Cache policy labels cannot be bound to MYSQL or MSSQL virtual servers.
- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the 'show lb persistentSessions' CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.
- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).
- Issue ID 91711/0250846: If the string (or 'token') that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR('string2').AFTER_STR('string1') if the string that is enclosed by 'string1' and 'string2' is not larger than 64 KB.
- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.
- Issue ID 0278377 (nCore): Cache policy labels cannot be bound to MYSQL or MSSQL virtual servers.
- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

Load Balancing/SSL

- Issue ID 0331621: While creating SSL or load balancing virtual servers with default responder action, the NetScaler appliance throws a 'No such resource' error. This issue is observed only in a cluster setup.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type : #/etc/rc.d/svmd restart

- Issue ID 0337386: When restored from a backup, a NetScaler instance reverts to the release and build in which it was originally provisioned, even if the backup was taken from an upgraded configuration.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.

- Issue IDs 0283035 and 0299716: In a cluster setup, the 'bind vlan' command throws an error when interface and IP address are specified together.

- Issue ID 0288450: The 'show lacp' command does not display the lacp configurations. This issue is observed only in a cluster setup.

- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command 'set ptp -state disable' and configure NTP to synchronize the time across the cluster nodes.

  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ```
    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
    ```

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator, and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed.

  Workaround: Copy the certkey under /nsconfig/ssl/ folder on all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.
- Issue ID 0343395: On the NetScaler appliance, TLS protocol version 1.2 does not support a client certificate with RSA 4096-bit key.
- Issue ID 0345883: On the NetScaler appliance, TLS protocol version 1.2 does not support ephemeral Diffie-Hellman cipher suites.
- Issue ID 0352334: TLS protocol, version 1.2, handshake fails if all the following conditions are met:
  - The Client browser is Internet Explorer.
  - Client authentication is set to mandatory on the virtual server.
  - The configured client certificate on IE browser is not signed by SHA256 hash algorithm.

XML API

- Issue ID 0321005: The API to set the hostname for a NetScaler appliance is changed to include the owner node parameter for a cluster node.

Build 71.6

Release version: Citrix® NetScaler® release 10 build 71.6

Replaces build: None

Release date: October 2012

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Changes
- Bug Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.

Changes

Configuration Utility

- Issue ID 0319070: The Setup wizard is not launched automatically if a mapped IP (MIP) address or a Subnet IP (SNIP) address is not configured on the NetScaler appliance.

NetScaler SDX Appliance

- Issue ID 0332251: You can now configure LACP from within a NetScaler VPX instance hosted on a NetScaler SDX appliance. Make sure that the interfaces that are part of the channel are not shared with other instances, and a dedicated channel is configured for an instance. For more information, see Configuring LACP on a NetScaler VPX Instance.

Bug Fixes

AAA Application Traffic

- Issue ID 0319434: If 401 basic authentication is enabled on a load balancing virtual server, and authentication fails either due to invalid credentials or a Kerberos authentication failure, the NetScaler packet engine might crash.

Access Gateway

- Issue ID 82828/0243556: You can configure a forced time-out to disconnect the Access Gateway Plug-in automatically with a value (in minutes) that exceeds 255. You can now enter a value as high as 3,000 (in minutes, which is equivalent to 50 hours).
- Issue ID 0331288: When split tunneling is OFF, when users try to connect with an Access Gateway Plug-in, occasionally host routes added by the plug-in may block communication between the Internet IP address and the Domain Name Server. Users may experience network connectivity issues, such as the inability to access file shares on the network.
- Issue ID 0329113: When you configure Intranet IP addresses on Access Gateway and bind the addresses to a virtual server, the bound IPs addresses do not appear in the configuration utility.
- Issue ID 0329603: When you enable a preauthentication scan, and you enable the user device to connect through a proxy server, when users log on with the Access Gateway Plug-in for the Mac OX X Version 2.1.3, Access Gateway fails.
- Issue ID 0336499: When users log on to Access Gateway by using Citrix Receiver and then log off by using the Receiver icon in the taskbar, the computer loses network access. To restore network access, users must either disable and then enable their network interface or restart their computer. To avoid the issue, users can log off from the Access Interface home page.
- Issue ID 0338220: If you configure client certificate-based expressions for preauthentication or post-authentication scans, when users try log on to Access Gateway, occasionally, the scan fails. To avoid the issue, you can use the classic or MPX 5500 platforms or you can bind the certificate-based policy globally to a virtual server.

Application Firewall

- Issue ID 0329401: On a NetScaler appliance that has the Application Firewall enabled and both cookie transformation and encryption on, secure memory usage increases slowly and continuously until the NetScaler appliance starts to drop connections.
- Issue ID 0332176: On a NetScaler appliance that has the application firewall enabled, user logons can be extremely slow. The cause is that a back-end server does not set a Content-Length header that the NetScaler expects. As a result the NetScaler appliance does not close the connection with the user's browser. To work around this issue, you can do one of the following:
  - Add a rewrite policy to the configuration that appends a content-length header of zero ('Content-Length: 0') to the logon page.
  - Disable the application firewall.
- Issue ID 0333332: When signatures that work on post body are enabled, a large post request may cause an HA failover.
- Issue ID 0335102: On a NetScaler appliance that has the application firewall enabled, adding a large number of signatures objects can cause high CPU loads.

CloudBridge

- Issue ID 0313629: When the time on a NetScaler is modified, either due to Network Time Protocol Daemon (NTPD) or other external factors to the time lesser than the boot time, the iked process may start consuming 100% of CPU resources.
- Issue ID 0334949: If you use configuration utility to remove an IPv4 tunnel for CloudBridge from a NetScaler appliance, the remove process succeeds but the following Java exception is displayed 'ClassNotFoundException'.

Cluster

- Issue ID 0332594: The RIP (Routing Information Protocol) and Cache Redirection features cannot be enabled in a NetScaler cluster setup.

Configuration Utility

- Issue ID 93754/0257608: When you view the configuration difference between files, the corrective commands generated for bind or unbind commands of load balancing and content switching virtual servers might not be accurate in some cases.
- Issue ID 0305248: In the Reporting tool, when users try to generate a 'system entities statistics' report for load balancing virtual servers, the load balancing virtual servers configured on the appliance might be displayed as being inactive. Users cannot choose the virtual server to view the statistics.
- Issue ID 0310203: In the Reporting tool, when users try to generate a custom report for load balancing virtual servers, the virtual servers might be displayed as being inactive. Users cannot choose the virtual server to view the statistics.
- Issue ID 0333577: When configuring the Transformation URL Profile, an error occurs if you set Priority to a value higher than 2147483647 (maximum allowed value).
- Issue ID 0333836: If you have configured global server load balancing by using the GSLB wizard, Wizard for Citrix XenApp, or Wizard for Citrix XenDesktop, and you attempt to view the GSLB Visualizer, Prefuse information might be logged to the Java console. However, you can view the GSLB Visualizer, and the functionality is not affected.
- Issue ID 0334280: After you rename a compression policy, the new name might not be reflected in the configuration utility.
- Issue ID 0334284 If you navigate to HTTP Compression > Policies and click Policy Manager in the task pane, the following error message might appear: No such policy exists.
- Issue ID 0334773: In the Synchronize 'GSLB Configuration' dialog box, the Command parameter is unavailable when the 'Synchronization Option' parameter is set to its default value (automatic synchronization).
- Issue ID 0335008: The exception 'netscape.javascript.JSException' is logged to the Java console when you create a DNS key by using the NetScaler configuration utility. However, the DNS key is created, and there is no loss in functionality.
- Issue ID 0335235: The NetScaler configuration utility does not show globally bound AppFlow policies in the policy manager. This issue is observed only in a cluster setup.
- Issue ID 0335701: You cannot add an SSL service with the Clear Text Port option in the configuration utility, because the option is disabled.
- Issue ID 0335719: The exception 'netscape.javascript.JSException' is logged to the Java console when you sign a DNS zone by using the NetScaler configuration utility, and the browser’s status bar does not report the status of the zone-signing operation. However, the zone is signed, and there is no loss in functionality.
- Issue ID 0335913: In a cluster setup, you cannot enable a server entry that is disabled, because the 'Enable' button is unavailable. However, you can disable a server entry by using the NetScaler command line interface.

Domain Name System

- Issue IDs 0268748 and 0333310: In a cluster setup, if you save the configuration and reboot an appliance, the default name-server records for the thirteen root servers, and their associated address records, become unavailable. If you need them, you have to add them manually after you perform a reboot.
- Issue ID 0318199: If core memory is not available when the NetScaler appliance is processing an RRSIG record received in a response, the appliance fails.
- Issue ID 0319100: Default DNS actions, policies, and policy bindings are not displayed in a cluster setup.

Integrated Caching

- Issue ID 0334895: On a NetScaler appliance configured with five policy engines, responses might not be cached even if memory is available for caching.
- Issue ID 0337446: When a byte-range request sent to integrated cache is larger than the size of cached object and the if-range header is also set, the NetScaler appliance fails.

Load Balancing

- Issue ID 0314738: If you issue the 'force HA sync -force' command when HA synchronization is disabled on both nodes, the services on the secondary node are marked as DOWN. The services remain in that state until after a failover. When a failover occurs, the failover of some services might be delayed by a few seconds while monitors learn the actual states of those services. Until the monitors learn and correct the states, new connections to those services might be rejected. Consequently, you might also observe a brief period of outage following a failover.
- Issue ID 0318310: While creating a load balancing monitor, you cannot specify a send string that has a length of more than 76 characters. This issue is observed only in a cluster setup.
- Issue ID 0336400: In a two-node cluster that has been configured with a small number of services, if you restart a node or disable and reenable a node, the node might indefinitely remain in the service-state-synchronization stage.

NetScaler SDX Appliance

- Issue ID 0331900: If you try to upload a file larger than 300 MB to the NetScaler SDX appliance, the upload fails.
- Issue ID 0332313: 100 percent CPU usage is observed when the Management Service takes daily backup.
- Issue ID 0332819: If you try to create a high availability pair between two VPX instances without explicitly logging on to the second instance, an error message appears.
- Issue ID 0334340: If you upgrade the Management Service on which a NetScaler instance with a description of greater than 32 characters is provisioned, the instance is not migrated, and therefore, complete data related to the instance is not available in the database. Later, if you delete this instance and provision a new instance with the same IP address, the operation fails.
- Issue ID 0337090: A NetScaler VPX instance provisioned on an SDX appliance might fail if a warm restart is performed on the instance.

Networking

- Issue ID 0322026: In an L2 DSR configuration, packets arriving on the loop back interface are dropped even when the traffic rate on the interface is low.

Platform

- Issue ID 0321989: NetScaler release 10 build 71.x is supported on the new MPX 5550/5650 platforms.

Policies

- Issue ID 0291975: The SYS.VSERVER('<vserver_name>').THROUGHPUT expression returns an incorrect throughput value.
- Issue ID 0337576: The Netscaler might become unresponsive, if you used a request URL with encoding (for example, using %20) in an expression to the left of ALT, &&, or ||, and clauses to the right used strings. In addition, if the request URL was concatenated with another string, the final result would incorrectly contain a decoded URL, not the encoded one.
- Issue ID 0338916: Policies that are bound to policy labels are not available in the ns.conf file after saving the configurations. As a result, these bindings are lost after the appliance is rebooted.

SSL

- Issue ID 0257122: The close-notify parameter setting for an entity no longer has to be inherited from the global settings. You can set the close-notify parameter at the entity (virtual server, service, or service group) level. This enhancement provides the flexibility to set this parameter for one entity and unset it for another entity. However, make sure that you set this parameter at the global level. Otherwise, the setting at the entity level does not apply.
- Issue ID 0336920: On a cluster setup, replicating session entries across the nodes of the cluster is not supported.

System

- Issue ID 0277102: When you execute the 'show events' command, the NetScaler appliance might fail if the number of events to be displayed is more than 2^31.
- Issue ID 0333385: A hash collision might put the NetScaler aggregator into a recursive loop, causing the aggregator to fail. The NetScaler appliance might also fail, because of the aggregator failure.
- Issue ID 0336838: If HTML Injection and EdgeSight Monitoring are enabled on a NetScaler appliance and an HTTP request with a blank referer header is received, the appliance fails.
- Issue ID 0338244: The CallHome feature checks for compact flash drive and hard disk drive errors every six minutes instead of every six hours. If any errors are found, the appliance's data is uploaded to the Citrix Technical Support server.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberoes authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, and then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.

- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

- Issue ID 0327446: On an Outlook for Web Access (OWA) 2010 server that is protected by AAA-TM with single sign-on (SSO) enabled, when a user who uses the Firefox or Chrome browsers logs off, some OWA 2010 images do not appear.

- Issue ID 0334363: In the Citrix NetScaler configuration utility, when a user clicks the AAA-Application Traffic Wizard link, the configuration utility displays error message of 'Unknown Error'. The browser is then frozen til the session times out.

Access Gateway

- Issue ID 0340346: If you configure a session time-out setting, after users connect to Access Gateway, even though the session expires according to the value you enter, the actual process of closing the session takes longer.

- Issue ID 0278218: If you configure an endpoint policy, the preauthentication policy runs as expected. When users try to log on with the Access Gateway Plug-in, however, occasionally the post-authentication policy does not work as expected and authentication fails.

  - Issue ID 0327433: If you configure a virtual server by using the Remote Access wizard and configure a Secure Ticket Authority (STA), the status of the server appears as UP. However, in the configuration utility, on the Home tab, under Alerts, a message states that the STA server is not configured. You must bind the server globally in order to clear the message.
- Issue ID 0275079: When users access applications published on XenApp, each user consumes multiple Access Gateway licenses per application. Instead, one session ID should be shared across the applications the user accesses. As a result, users exceed their allocated license count and an SSL error occurs.

- Issue ID 92543/0251596: After you configure Access Gateway to provide user connections through Citrix Receiver, when users right-click the Receiver icon in the notification area, the Log on option does not appear. Users must connect by using the Web browser or they must right-click the Receiver icon and then, depending on the version of Receiver they are using, click About or Preferences from the Receiver menu and Plug-in Status or Advanced from the Receiver panel. You can also enable the log on option to appear when users right-click the Receiver icon by adding the following settings in the registry:

  - Add the Receiver key (if the key does not already exist) under the following registry locations:

    - `HKEY_CURRENT_USER\Software\Citrix\`

    - `HKEY_LOCAL_MACHINE\Software\Citrix\`
  - Add the Inventory key in the following registry locations:

    - `HKEY_CURRENT_USER\Software\Citrix\Receiver`

    - `HKEY_CURRENT_USER\Software\Citrix\Receiver`
  - In the Inventory key, configure the following **REG_SZ** values:

    - **VPNAddress**. Provide the value as the Web address for the Access Gateway appliance; for example, https://<AccessGatewayFQDN>.

    - **VPNPrompt1**. Provide the value as 'UserName'.

    - **VPNPrompt2**. Provide the value as '*Password'.

      Note: To mask the password, enter an asterisk (*) before the word.

      In addition, if you configure double-source authentication that requires authentication with LDAP plus RSA authentication, you need to also add the following as **REG_SZ**:

    - **VPNPrompt3**. Provide the value as '*Passcode'.

- Issue ID 0261547: When you enable Access Gateway as a reverse proxy and you enable basic preauthentication and post- authentication scans, as well as encryption and client choices, when users log on with the Access Gateway Plug-in, the preauthentication scan passes, but the post-authentication scan fails.

- Issue ID 0285995: If you configure Access Gateway to assign an intranet IP address to user devices that connect to Access Gateway, when users log on with the Access Gateway Plug-in, the secure DNS dynamic update does not occur and the intranet IP address is not registered with the DNS Server.

- Issue ID 0288469: After you configure a virtual server to use the Access Gateway Plug-in for Java, when users log on with the Access Gateway Plug-in by using a browser that has a 64-bit Java Runtime Environment (JRE) installed, the plug-in fails to establish a connection.

- Issue ID 0291264: If you create a Web Interface 5.4 site and enable authentication through Access Gateway, and you enable single sign-on with a smart card to the Web Interface that enables smart card pass-through, when users log on with the Access Gateway Plug-in, the users' desktops are not listed on the Web Interface.

- Issue ID 0291821: If you create a Web Interface 5.4 site and enable authentication with a smart card through Access Gateway, and you configure the 'Single Sign-on Domain' on the 'Published Applications' tab using the format domainname.com instead of domainname, when users start a published application or desktop, authentication fails.

- Issue ID 0292005: When users connect with clientless access and try to download a file larger than 1 gigabyte (GB) from the file share on the home page, as the file is downloading, if an upload is attempted, the download process fails but the upload continues.

- Issue ID 0298971: When users log on with the Access Gateway Plug-in for Java and the Web Interface opens in Internet Explorer 9, if users do not turn on Compatibility View in Internet Explorer, when they click a published application, the following error appears: Resource shortcuts are not available.

- Issue ID 0299515: If you configure an intranet IP address on Access Gateway, when users connect with the Access Gateway Plug-in on a computer running Windows XP Service Pack 3 and try to access a CIFS share hosted on a computer in the secure network, users receive an error that the share is inaccessible.

- Issue ID 0300511: When users log on using clientless access and click a bookmark from the home page to open a Distributed File Share (DFS), if the target folder resides on a different computer than the computer where the domain DFS server resides, the share does not open.

- Issue ID 0309017: When you configure a preauthentication and post-authentication policy with an expression to scan a user device for a file, Access Gateway does not check for expression syntax. As a result, Access Gateway accepts inappropriate syntax configuration and the scan fails.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

AppFlow

- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), in addition to one or more response patterns you must also add at least one request pattern. If you do not, then when you try to save the new signature rule, the configuration utility displays an error message and does not save the rule.

- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked. To work around this issue, if you configure Sessionless URL Closure, set Validate Referer Header to Off.

- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importing as application firewall signature rules. WAS 2.0 scan reports are not supported.

- Issue ID 0303060: Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.

Cache Redirection

- Issue ID 0287688: If you set the 'L2Conn' parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the 'L2Conn' parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

Cluster

- Issue ID 0343514: The cluster instance view in the configuration utility does not display which node is the configuration coordinator.
- Issue ID 0343137: The configuration utility does not display the "Add" button while configuring linksets.

Command Line Interface

- Issue ID 92269/0251344: If you upgrade from an earlier build to a later build within release 9.2 or release 9.3, or upgrade from release 9.2 to release 9.3, or upgrade from an earlier release to release 10, the time zone settings may be lost on upgrade.

  Workaround: Delete the time zone from the configuration (ns.conf), upgrade to the target build or release, and then reconfigure the time zone.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click 'Application Firewall' in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0303279: In the configuration utility, in the 'Rewrite Policies' pane, clicking 'Add' does not display the 'Create Rewrite Policy' dialog box but disables the main configuration utility window.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0324797: The NetScaler configuration utility does not display the queue depth value for the configured priority queuing policies. This issue is observed only in a cluster setup.

  Workaround: You can view the queue depth of the policy by using the 'show pq policy' command on the command line interface.

- Issue ID 0332839: If you access the configuration utility through Internet Explorer 8, the System > Settings > Configure TCP Parameters, dialog box has no spaces between field names and fields.

- Issue ID 0333048: Using the Configuration Utility in Internet Explorer version 8, when you attempt to bind 250 or more VIP addresses to a VLAN, the Configuration Utility displays an unresponsive script error.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0334042: The configuration utility does not display a details panel for all the entities.

  Workaround: Click 'Edit' to display the details.

- Issue ID 0334292: If you navigate to HTTP Compression > Policies or HTTP Compression > Actions, the 'Remove' button is disabled in the task pane.

  Workaround: Use the command line interface to remove the policy or action.

  Note: You can access the command line interface from the configuration utility. Navigate to System > Diagnostics > Command Line interface.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the 'Create DNS View' dialog box, the 'Service(s) in this view' and 'Policy(s) in this view' lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs.

  Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0335701: You cannot add an SSL service with the Clear Text Port option in the configuration utility, because the option is disabled.

- Issue ID 0338513: When you log on to NetScaler configuration utility using Internet Explorer 8 or Internet Explorer 9, the web browser displays a blank screen as the browser is displaying the compatibility view.

  Workaround: Change to the standard view, in the Compatibility View Settings dialog box, by clearing the Display all websites in Compatibility View check box.

- Issue ID 0342735: Users might not be able to enable or disable NTP synchronization using the configuration utility.

  Workaround: Use command-line interface to enable or disable NTP synchronization.

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated.

Domain Name System

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

- Issue IDs 0330529 and 0322151: The following message might be displayed if you disable a virtual server-based DNS name server: 'ERROR: Name server does not exist. [nsnet_recvrpcioctl]'

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If a GSLB virtual server’s primary GSLB method is set to round trip time (RTT) and backup GSLB method is set to static proximity, or if the primary GSLB method is set to static proximity and backup GSLB method is set to RTT, and source IP persistence is enabled, when the primary GSLB method fails, the backup GSLB method also fails.

  Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

Load Balancing

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the 'show lb persistentSessions' CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 91711/0250846: If the string (or 'token') that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR('string2').AFTER_STR('string1') if the string that is enclosed by 'string1' and 'string2' is not larger than 64 KB.

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

- Issue ID 0278377 (nCore): Cache policy labels cannot be bound to MYSQL or MSSQL virtual servers.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

Load Balancing/SSL

- Issue ID 0331621: While creating SSL or load balancing virtual servers with default responder action, the NetScaler appliance throws a 'No such resource' error. This issue is observed only in a cluster setup.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type:

  #/etc/rc.d/svmd restart

- Issue ID 0337386: When restored from a backup, a NetScaler instance reverts to the release and build in which it was originally provisioned, even if the backup was taken from an upgraded configuration.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.
- Issue ID 0283035 and 0299716: In a cluster setup, the 'bind vlan' command throws an error when interface and IP address are specified together.
- Issue ID 0288450: The 'show lacp' command does not display the lacp configurations. This issue is observed only in a cluster setup.
- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command 'set ptp -state disable' and configure NTP to synchronize the time across the cluster nodes.
  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ```
    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
    ```

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator, and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed.

  Workaround: Copy the certkey under /nsconfig/ssl/ folder on all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.

XML API

- Issue ID 0321005: The API to set the hostname for a NetScaler appliance is changed to include the owner node parameter for a cluster node.

Build 70.7

Release version: Citrix® NetScaler® release 10 build 70.7

Replaces build: None

Release date: September 2012

Release notes version: 4.0

Language supported: English (US)

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.

Changes and Fixes

AAA Application Traffic

- Issue ID 0327114: On a NetScaler appliance with NetScaler 10 build 69.4 nc installed, if you use the configuration utility to configure authentication on a load-balancing virtual server, the following error message appears:

  No Authentication Host specified

  The configuration utility then removes the authentication host from the configuration. This behavior occurs regardless of whether you are configuring authentication host settings on the virtual server for the first time, or modifying existing authentication host settings on the virtual server.

Access Gateway

- Issue ID 0308733: If you configure Access Gateway with additional appliances in which global server load balancing (GSLB) is enabled, when users log on with the Access Gateway Plug-in, occasionally the connection times out, a time-out error appears, such as 'Your Citrix Access Gateway session timed-out and you are not connected,' and the session disconnects.

- Issue ID 0319901: If you enable Integrated Caching and Web Interface on Netscaler on an Access Gateway appliance, and then change the URL for the Web Interface, Access Gateway might fail.

- Issue ID 0320210: When users connect with the Access Gateway Plug-in on a computer running Windows XP, the Group Policy Object is not applied.

- Issue ID 0321425: If you configure a virtual server with a default authentication type by using the Access Gateway wizard, if Access Gateway restarts, the configuration is not maintained and authentication fails.

- Issue ID 0329621: If you configure an endpoint policy and bind the policy to a virtual server, the preauthentication policy is not working as expected. Users with devices that meet the requirements may not be able to log on to Access Gateway.

AppFlow

- Issue ID 0288343: You can now configure the source IP address (SNIP or MIP address), to be used for AppFlow traffic. When you add an Appflow collector by using the add appflow collector command, you can use the -netprofile option to associate a netprofile to which the source IP address is bound. By default, the Appflow exporter takes NSIP address as the source IP address if you do not specify the -netprofile option.

  > add appflow collector <col_name> -IPAddress <IP_addr> [-netprofile {netprofile_name}]

- Issue ID 0311033 (nCore): AppFlow records can now log X-Forwarded-For HTTP header information. You can enable the logging with the set appflow param -httpXForwardedFor ENABLED command or by using the configuration utility.

- Issue ID 0313091: AppFlow records might not display the start time of the current transaction. Instead, they display the start time of the previous transaction due to reuse of connections.

- Issue ID 0320239 (nCore): HTTP method names might be occasionally truncated in the AppFlow records.

Application Firewall

- Issue ID 0299940: The change profile type command does not work correctly.

  - If you try to change a profile type to Web 2.0, the profile type remains HTML.

  - If you try to change a profile type to XML, the Profile Type field disappears completely.

  When you use the configuration utility to change the profile type, the profile type is actually changed correctly, but the display is incorrect. When you use the NetScaler command line, the actual profile type is set as shown above.

- Issue ID 0302294: Learned relaxations are sometimes not removed from the review list after they have been deployed. To manually remove a learned relaxation that has already been deployed, in the Manage Learned Rules dialog box select the relaxation and then click Skip.

- Issue ID 0329539 (nCore): On a NetScaler appliance with the application firewall enabled, occasionally the NetScaler appliance crashes when retrieving a page from a protected web site that sets one or more cookies.

- Issue ID 0330642: On a NetScaler appliance with both the application firewall and Integrated Caching features enabled, the NetScaler appliance might experience occasional resets when its memory fills up. The cause is a small memory leak.

- Issue ID 0331112 (nCore): In the NetScaler 9.3 58.2.nc build, when applying the HTML or XML SQL Injection check the application firewall does not transform special strings even when Transformation is enabled. This issue was fixed in build 58.4.nc.

Cache Redirection

- Issue ID 0328353: When you use the configuration utility to bind a cache redirection policy to a cache redirection virtual server, the policy is added to the content switching (CSW) policy tab instead of cache redirection (CRD) policy tab. If you try to resolve this issue by using the CR virtual server wizard, the following error message appears: 'Please specify Target.'
- Issue ID 0330033: Tabs for filter/compression policy bindings are not displayed for a cache redirection virtual server, and it is not possible to bind those policies to a cache redirection virtual server.
- Issue ID 0330139: If you use the configuration utility to unset a cache virtual server for a cache redirection virtual server, the process fails and the following error message appears: invalid argument.

Call Home

- Issue ID 0311617: When upgrading the NetScaler appliance to 10.70 or a later build, the appliance prompts you to enable the Call Home feature.

Cloud Gateway

- Issue ID 0327119: When you create policy rules from the configuration utility, an error occurs and the policies are not configured.

Configuration Utility

- Issue ID 0298686 (nCore): If the details pane contains too may records to display on one screen, the header row moves off the screen if you scroll down.
- Issue ID 0311358: The NetScaler configuration utility fails to load when accessed from Internet Explorer version 7 browser running on Windows 2003 or Windows XP.
- Issue ID 0314769: When the certificate used to sign the JAR files expires, the application's digital signature cannot be verified. An error is displayed when the user tries to access the NetScaler GUI.
- Issue ID 0319061: The configuration utility does not throw the 'Feature not supported' prompt when configuring the following unsupported features on a NetScaler cluster: Bridge groups, Network Bridge, VMAC6, and FIS.
- Issue ID 0322821: When the SRADV (Static Route Advertisement) mode is ON, the static routes which are not explicitly disabled for advertisement will be advertised using all the routing protocols. However, the advertised protocols column for route in the configuration utility does not show any protocol list. This issue is observed only in a cluster setup.
- Issue ID 0322894: The configuration utility displays an inappropriate error message when adding a forwarding session that has an invalid subnet mask. This issue is observed only in a cluster setup.
- Issue ID 0322914: When the IP is not resolved for a hostname based SNMP manager, the 'Resolved IP' column of the SNMP Manager table is shown as blank instead of 'Unresolved IP'. This issue is observed only in a cluster setup.
- Issue ID 0323175: The configuration utility displays a negative value for the index of the data set or pattern set, when the index is set to its maximum value. The command line interface displays the correct value.
- Issue ID 0325400: After adding a local authentication policy by using the configuration utility, the request profile field is showing blank. By default, the request profile must be Local. This issue is observed only in a cluster setup.
- Issue ID 0326018: The dashboard does not display the Precision Time Protocol (PTP) counters for the cluster node. This issue is observed only in a cluster setup.
- Issue ID 0326354: In System > Settings > Change global system settings, regardless of the base threshold value configured for surge protection, the value is displayed as 0. This issue is observed only in a cluster setup.
- Issue ID 0326413: An error occurs if you use the NetScaler configuration utility to configure a large preauthentication policy (for example, a policy with 900 characters).
- Issue ID 0327136: The configuration utility does not allow you to set the 'Max Clients' parameter of a service to its maximum value of 4294967294. This issue is observed only in a cluster setup.
- Issue ID 0327551: In the configuration utility, all features appear to be enabled even when the features are disabled.

- Issue ID 0328660: In the configuration utility, when you view the virtual server persistence sessions, a persistence type setting of DIAMETER is displayed as SOURCE IP.

- Issue ID 0328715: In the configuration utility, the details of the monitor bound to a service do not include response codes for a monitor of type DIAMETER.

- Issue ID 0328747: In the Reporting tool, when users try to generate 'system entities statistics' report for GSLB domains, the GSLB domain names configured on the appliance might not be displayed in the entities list.

- Issue ID 0328844: While configuring the OCSP responder through the configuration utility, the default value of the HTTP response timeout is erroneously taken as 0ms. The default value of the HTTP response timeout must be 2000ms. This issue is observed only in a cluster setup.

- Issue ID 0329154: In System > Auditing > Recent audit messages, when you set number of audit messages to be displayed to 256 (maximum allowed value), a 'Value entered is out of range' error message is displayed on clicking Refresh. This issue is observed only in a cluster setup.

- Issue ID 0329826: If you use the configuration utility to view the license for features, warning messages are seen for the features that are licensed but not supported. This issue is observed only in a cluster setup.

- Issue ID 0331158: When you access NetScaler configuration utility from Internet Explorer 8 or Internet Explorer 9, the web browser displays only a grey bar at the top of the screen as the browser is displaying the compatibility view.

- Issue ID 0331604: If you access a load balancing virtual server after a NOPOLICY is bound to it, the configuration utility might display the following error: 'no such policy exists'

- Issue ID 0332795: On systems that have JRE 1.6.0_24 and 1.7.0_06, the configuration utility cannot load the Java applet. Therefore, you cannot perform any operations on the configuration utility.

- Issue ID 0332876: When you use the configuration utility to change the password of a user, the Change Password dialog displays encrypted password in the Password and Confirm Password fields.

- Issue ID 0333026: On a system running the Windows 7, 64-bit operating system, the configuration utility cannot load the Java applet. Therefore, you cannot perform any operations on the configuration utility.

Content Switching

- Issue ID 0230903: The content switching feature now supports the ability to bind a policy to multiple virtual servers or policy labels. To support multiple policy bind functionality, the target load balancing virtual server is specified in the action and attached to the policy. This enhancement enables you to reuse an existing policy by binding it to the virtual servers. You can also combine multiple policies in a policy label and apply the policy label to the virtual server.

- Issue ID 0330045: The configuration changes made by using the bind cs vserver and bind cs policylabel commands are not saved in the configuration file. Therefore, the CS policy bindings are lost the first time the NetScaler appliance is restarted after an upgrade to release 10.

- Issue ID 0330290: You cannot use the configuration utility to bind a content switching policy to a content switching virtual server if the policy is configured with only a domain value. The bind fails, and the following error message appears: 'Priority cannot be specified for URL-based content switching policy.'

- Issue ID 0331029: If you use the configuration utility to open a content switching virtual server that has a default policy bound to it, the process fails and the following error message appears: No Such Resource.

DataStream

- Issue ID 0323442: The DataStream feature does not support dynamic stored procedures. Consequently, dynamic stored procedures fail if they use the sp_prepexec and sp_prepare stored procedures.

Global Server Load Balancing

- Issue ID 0324486: When creating a local GSLB site in the NetScaler configuration utility, if you set the Trigger Monitors option to MEPDOWN, the GSLB site does not appear in the details pane until after you click 'Refresh'.

- Issue ID 0326364: Even though a GSLB virtual server is configured with the static proximity method, and some requests match a DNS policy whose action uses a DNS view to restrict matching requests to only a subset of the bound services, the NetScaler appliance uses the round robin method to load balance requests across all of the GSLB services that are bound to the GSLB virtual server. The issue can occur if the locations that correspond to the source IP addresses in the DNS requests are not found in the location database.

- Issue ID 0328911: When configuring monitoring for a GSLB service by using the NetScaler configuration utility, if you include monitors that cannot be used with GSLB services (for example, ARP monitors) along with monitors that can be used with GSLB services (for example, TCP monitors), the configuration utility displays an error message for the invalid monitor bindings, but the valid bindings succeed. When you unbind an invalid monitor from the service, the message 'Error' is displayed. No further information is provided in the message.

Integrated Caching

- Issue ID 0329485: When the NetScaler appliance responds to a byte range request, it might get into an infinite loop for one specific request, which might cause the appliance to fail.

Load Balancing

- Issue ID 0314738: If you issue the 'force HA sync -force' command when HA synchronization is disabled on both nodes, the services on the secondary node are marked as DOWN. The services remain in that state until after a failover. When a failover occurs, the failover of some services might be delayed by a few seconds while monitors learn the actual states of those services. Until the monitors learn and correct the states, new connections to those services might be rejected. Consequently, you might also observe a brief period of outage following a failover.

- Issue ID 0323317: The configuration commands for binding views to GSLB services are not shown in the output of the show ns runningConfig or show gslb runningConfig commands. Additionally, the configuration commands are lost during a reboot or upgrade.

- Issue ID 0323891: The NetScaler CLI and configuration utility display incorrect values for the following counters, which are used for monitoring services, including GSLB services :

  - Total number of monitoring probes sent

  - Total number of failed probes

  - Current number of failed probes
- Issue ID 0324061: When you configure a SIP-UDP load balancing virtual server by using the NetScaler command-line interface, the default setting for persistence type is CALLID. However, when you use the configuration utility to configure a SIP-UDP virtual server, the default setting for persistence type is NONE.

- Issue ID 0324576: The automatic domain based service group scaling option (the autoScale parameter) has been moved from the bind serviceGroup command to the add serviceGroup command. The possible values of the parameter have changed from YES and NO to DNS and DISABLED, respectively.

  To configure a service group to scale automatically, using the NetScaler command line, at the NetScaler command prompt, type the following command:

  add serviceGroup <serviceGroupName>@ <serviceType> -autoScale DNS

  To configure a service group to scale automatically, using the NetScaler configuration utility, go to Load Balancing > Service Groups > Add. In the Create Service Group dialog box, on the Advanced tab, from the Auto Scale Mode list, select DNS.

- Issue ID 0329191 (nCore): If an AppExpert application that was used to load user configuration to the NetScaler appliance is removed, the appliance becomes unavailable.

- Issue ID 0330276: The virtual router IDs (VRIDs) that are configured on the NetScaler appliance are not available in the Virtual Router ID list in the Create IP and Configure IP dialog boxes (Network > IPs > Add/Open). Consequently, you cannot use the configuration utility to bind a VRID to a virtual server.

Monitoring

- Issue ID 0320571: The state of a service is shown as UP even when the service is down. Consequently, the NetScaler appliance continues to forward requests to that service, and clients do not receive responses to their requests.

NetScaler SDX Appliance

- Issue ID 0326655: If you upgrade the Management Service from an earlier build to build 56.x or 57.x, restarting the appliance while data migration is in progress might corrupt your data contents.
- Issue ID 0326663: In release 9.3, the upgrade process fails if you attempt to upgrade the Management Service from build 48.6 to build 56.5 or 57.5.
- Issue ID 0326878: The Management Service shows duplicate entries for NetScaler VPX instances because of intermittent database connection failures. This is only a display issue. However, if a VPX instance is configured with an external authentication server for the nsroot (administrator) user, the authentication server might show several authentication failures.
- Issue ID 0327984: You can now apply a hotfix for XenServer from the Management Service. On the Configuration tab, expand Management Service, and then click XenServer Files. In the details pane, click Hotfixes, and then click Upload. After uploading the hotfix to the appliance, click Apply. If an error occurs in the process of applying the hotfix, an error message displays the cause of the problem.

NetScaler VPX Appliance

- Issue ID 0328540: After you install the initial NetScaler virtual appliance, if you try to save the configuration and licenses are not present on the appliance, the appliance becomes unresponsive. Restart the appliance and load the licenses. Restart the appliance again for the changes to take effect. Then save the configuration.
- Issue ID 0329966: After you install the initial NetScaler virtual appliance (.xva image) for build 69.4, if you run the 'save config' command and licenses are not present on the appliance, the appliance becomes unresponsive. Restart the appliance and load the licenses. Restart the appliance again for the changes to take effect. Then run the 'save config' command.

Networking

- Issue ID 0321868: BGP does not advertise default route to the peer, with default-originate flag, if the state of a learnt default route toggles.
- Issue ID 0324432: The NetScaler appliance forwards (L3 mode) certain response packets with IP header checksum value 0xFFFF, which is an invalid value according to RFC 1624. As a result, the router drops these packets.
- Issue ID 0330118: OSPF maximum age link-state advertisements (LSAs) are not removed from the NetScaler appliance because the maximum age walker processes suspended indefinitely.
- Issue ID 0330165: After upgrading the Netscaler appliance to 10.69.4 build, the appliance does not learn a ARP entry from a ARP reply packet, if the MAC addresses in the Ethernet header (Source MAC) and ARP header(Sender MAC) of the ARP reply packet are different.

Platform

- Issue ID 0276184: NetScaler release 10 build 70.x is supported on the new MPX 8200/8400/8600 platform.

Policy

- Issue ID 0291487: NetScaler appliances running version 9.2 build 52.1 or later and have a large number (in the hundreds) of policy bindings can experience performance issues on 'save ns config' and 'show config' operations. This can lead to interruption in services.
- Issue ID 0322964: Removed the 'unset audit syslogPolicy' and 'unset audit nslogPolicy' commands from NetScaler release 10 build 70 onwards.
- Issue ID 0324700: Removed the 'unset filter policy' command from NetScaler release 10 build 70 onwards.

Responder

- Issue ID 0324200 (nCore): On a NetScaler appliance with the responder feature configured to redirect requests from authenticated members of a particular group to a custom web page, the redirections sometimes fail. The reason is that, when the responder feature is invoked before the AAA session is completely established (as is the case when a user selects a choice after initial logon), the user's AAA session is not transferred from one core to the other. Responder therefore fails to identify the user as a member of the targeted group.
- Issue ID 0330133: On a NetScaler appliance with the responder feature enabled and a respondWith response configured, if a user sends a request with a large Content-Length header, the NetScaler appliance might appear to hang. The cause of the apparent hang is that the NetScaler appliance expects a request of the specified Content-Length, and waits for the rest of the request before responding to it.

Rewrite

- Issue ID 0301481: On a NetScaler appliance that has a response-side rewrite policy configured and bound to a load balancing virtual server, a request sent to the virtual server might trigger a sequence of events that causes the NetScaler appliance to fail.

SSL

- Issue ID 0327173: The ciphers bound to an SSL virtual server are not displayed in the configuration utility.

System

- Issue ID 0271783: If you configure an RNAT rule and enable the TCP proxy option for RNAT, the NetScaler appliance functions as a proxy for internal clients and maintains separate client-side and server-side connections. In certain scenarios, this behavior might result in a service type mismatch between the client-side and server-side connections, and the appliance might reboot with a core dump.

- Issue IDs 0306352 and 0332253: When using the configuration utility or SSH to log on to the appliance, the "Connection limit to CFE exceeded" message might be displayed. This message is displayed if an earlier session was closed without logging out of the session.

- Issue ID 0306660 (nCore): You can now use the 'set ns tcpparam connFlushIfNoMem <connFlushIfNoMem>' command on a NetScaler appliance to close existing connections if memory is not available for a new connection. When using this command, you must specify the type of connection to be closed. By default, this feature is disabled on the appliance.

- Issue IDs 0312893 and 0331073: When you run the 'show run' command, the NetScaler appliance might fail even if the you have permission to run the command.

- Issue ID 0325665: An unrelated error code is displayed on executing the ‘set filter prebodyinjection/postbodyinjection’ commands.

- Issue ID 0323190: In rare cases, the NetScaler appliance fails when some pages are recovered from the free queue before the page table scan is complete.

- Issue ID 0327118: In the configuration utility, the minimum and maximum values allowed for number of audit messages is incorrect. The maximum and minimum values displayed are 255 and 0, but the correct values are 256 and 1.

- Issue ID 0330336 (nCore): IPv6 addresses might occasionally be captured in the audit log, even though IPv6 addresses are not configured.

Web Interface

- Issue ID 0306731: If the Rewrite feature is not enabled, the Enable access through receiver client option for a Web Interface(WI) site does not work. This is because the functionality of the option depends on some rewrite policies on the appliance.

- Issue ID 0315502: The Configuration Utility displays an error message when you try to disable the Web Interface feature.

- Issue ID 0315951: If the Responder feature is not enabled, the Make Site Path Case Insensitive option for a Web Interface(WI) site does not work. This is because the functionality of the option depends on some Responder polies on the appliance.

- Issue ID 0324373: In the Web Interface (WI) configuration wizard, for a WI site in gateway direct mode, the state of the Enable Access through Receiver Client option is shown selected even when there are no rewrite policies bound to the selected Access Gateway virtual server.

- Issue ID 0331904: In the Web Interface (WI) configuration wizard, the Enable Access through Receiver Client option remain selected even when you try to clear the option.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberoes authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, adn then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.

- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

- Issue ID 0327446: On an Outlook for Web Access (OWA) 2010 server that is protected by AAA-TM with single sign-on (SSO) enabled, when a user who uses the Firefox or Chrome browsers logs off, some OWA 2010 images do not appear.

- Issue ID 0334363: In the Citrix NetScaler configuration utility, when a user clicks the AAA-Application Traffic Wizard link, the configuration utility displays error message of 'Unknown Error'. The browser is then frozen til the session times out.

Access Gateway

- Issue ID 0249975: When users log on with the Access Gateway Plug-in, the 'File Transfer' tab on the Access Interface is available, but the 'File Transfer option' is not available if users right-click the Access Gateway icon in the notification area.

- Issue ID 92543/0251596: After you configure Access Gateway to provide user connections through Citrix Receiver, when users right-click the Receiver icon in the notification area, the Log on option does not appear. Users must connect by using the Web browser or they must right-click the Receiver icon and then, depending on the version of Receiver they are using, click About or Preferences from the Receiver menu and Plug-in Status or Advanced from the Receiver panel. You can also enable the log on option to appear when users right-click the Receiver icon by adding the following settings in the registry:

  - Add the Receiver key (if the key does not already exist) under the following registry locations:

    - `HKEY_CURRENT_USER\Software\Citrix\`

    - `HKEY_LOCAL_MACHINE\Software\Citrix\`
  - Add the Inventory key in the following registry locations:

    - `HKEY_CURRENT_USER\Software\Citrix\Receiver`

    - `HKEY_CURRENT_USER\Software\Citrix\Receiver`
  - In the Inventory key, configure the following **REG_SZ** values:

    - **VPNAddress**. Provide the value as the Web address for the Access Gateway appliance; for example, https://<AccessGatewayFQDN>.

    - **VPNPrompt1**. Provide the value as 'UserName'.

    - **VPNPrompt2**. Provide the value as '*Password'.

      Note: To mask the password, enter an asterisk (*) before the word.

      In addition, if you configure double-source authentication that requires authentication with LDAP plus RSA authentication, you need to also add the following as **REG_SZ**:

    - **VPNPrompt3**. Provide the value as '*Passcode'.
- Issue ID 0261547: When you enable Access Gateway as a reverse proxy and you enable basic preauthentication and post- authentication scans, as well as encryption and client choices, when users log on with the Access Gateway Plug-in, the preauthentication scan passes, but the post-authentication scan fails.

- Issue ID 0275079: When users access applications published on XenApp, each user consumes multiple Access Gateway licenses per application. Instead, one session ID should be shared across the applications the user accesses. As a result, users exceed their allocated license count and an SSL error occurs.

- Issue ID 0278218: If you configure an endpoint policy, the preauthentication policy runs as expected. When users try to log on with the Access Gateway Plug-in, however, occasionally the post-authentication policy does not work as expected and

authentication fails.

- Issue ID 0285995: If you configure Access Gateway to assign an intranet IP address to user devices that connect to Access Gateway, when users log on with the Access Gateway Plug-in, the secure DNS dynamic update does not occur and the intranet IP address is not registered with the DNS Server.

- Issue ID 0288469: After you configure a virtual server to use the Access Gateway Plug-in for Java, when users log on with the Access Gateway Plug-in by using a browser that has a 64-bit Java Runtime Environment (JRE) installed, the plug-in fails to establish a connection.

- Issue ID 0291264: If you create a Web Interface 5.4 site and enable authentication through Access Gateway, and you enable single sign-on with a smart card to the Web Interface that enables smart card pass-through, when users log on with the Access Gateway Plug-in, the users' desktops are not listed on the Web Interface.

- Issue ID 0291821: If you create a Web Interface 5.4 site and enable authentication with a smart card through Access Gateway, and you configure the 'Single Sign-on Domain' on the 'Published Applications' tab using the format domainname.com instead of domainname, when users start a published application or desktop, authentication fails.

- Issue ID 0292005: When users connect with clientless access and try to download a file larger than 1 gigabyte (GB) from the file share on the home page, as the file is downloading, if an upload is attempted, the download process fails but the upload continues.

- Issue ID 0298971: When users log on with the Access Gateway Plug-in for Java and the Web Interface opens in Internet Explorer 9, if users do not turn on Compatibility View in Internet Explorer, when they click a published application, the following error appears: Resource shortcuts are not available.

- Issue ID 0299515: If you configure an intranet IP address on Access Gateway, when users connect with the Access Gateway Plug-in on a computer running Windows XP Service Pack 3 and try to access a CIFS share hosted on a computer in the secure network, users receive an error that the share is inaccessible.

- Issue ID 0300511: When users log on using clientless access and click a bookmark from the home page to open a Distributed File Share (DFS), if the target folder resides on a different computer than the computer where the domain DFS server resides, the share does not open.

- Issue ID 0309017: When you configure a preauthentication and post-authentication policy with an expression to scan a user device for a file, Access Gateway does not check for expression syntax. As a result, Access Gateway accepts inappropriate syntax configuration and the scan fails.

- Issue ID 0319607: If an authentication server and Access Gateway reside in the same domain, the appliance may fail.

- Issue ID 0327433: If you configure a virtual server by using the Remote Access wizard and configure a Secure Ticket Authority (STA), the status of the server appears as UP. However, in the configuration utility, on the Home tab, under Alerts, a message states that the STA server is not configured. You must bind the server globally in order to clear the message.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

AppFlow

- Issue ID 0333560 (nCore): AppFlow records generated by the NetScaler appliance might contain junk characters.

Application Firewall

- Issue ID 0282932: If you use the Signature Editor to add a signature rule for a response-side check (such as the Credit Card or Safe Object check), in addition to one or more response patterns you must also add at least one request pattern. If you do not, then when you try to save the new signature rule, the configuration utility displays an error message and does not save the rule.

- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked. To work around this issue, if you configure Sessionless URL Closure, set Validate Referer Header to Off.

- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported for importing as application firewall signature rules. WAS 2.0 scan reports are not supported.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

CloudBridge

- Issue ID 0334949: If you use configuration utility to remove an IPv4 tunnel for CloudBridge from a NetScaler appliance, the remove process succeeds but the following Java exception is displayed: 'ClassNotFoundException'.

Cluster

- Issue ID 0332594: The RIP (Routing Information Protocol) and Cache Redirection features cannot be enabled in a NetScaler cluster setup.

Command Line Interface

- Issue ID 92269/0251344: If you upgrade from an earlier build to a later build within release 9.2 or release 9.3, or upgrade from release 9.2 to release 9.3, or upgrade from an earlier release to release 10, the time zone settings may be lost on upgrade.

  Workaround: Delete the time zone from the configuration (ns.conf), upgrade to the target build or release, and then reconfigure the time zone.

Configuration Utility

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278002: If you use the configuration utility to enable or disable an extended ACL or ACL6, the utility does not warn you that the change does not take effect until you apply ACLs.

- Issue ID 0278097: In the configuration utility, if you click Application Firewall in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0307039: The expression builder dialog does not show the possible functions in the following scenarios:

  - When '.' is entered after the (<expression>)

  - When '.' is entered in the expression which is used as function parameter.
- Issue ID 0319070: The Setup wizard is not launched automatically if a mapped IP (MIP) address or a Subnet IP (SNIP) address is not configured on the NetScaler appliance.

- Issue ID 0323172: The NetScaler configuration utility cannot group the neighbors according to the cluster node to which they belong. This issue is observed only in a cluster setup.

  Workaround: You must use the 'show nd6' command to view the neighbors node-wise.

- Issue ID 0323213: In a cluster setup, globally bound DNS policies are listed multiple times in the Bind/Unbind DNS Policy(s) to Global dialog box.

- Issue ID 0324797: The NetScaler configuration utility does not display the queue depth value for the configured priority queuing policies. This issue is observed only in a cluster setup.

  Workaround: You can view the queue depth of the policy by using the 'show pq policy' command on the command line interface.

- Issue ID 0332839: If you access the configuration utility through Internet Explorer 8, the 'System' > 'Settings' > 'Configure TCP Parameters,' dialog box has no spaces between field names and fields.

- Issue ID 0333048: Using the Configuration Utility in Internet Explorer version 8, when you attempt to bind 250 or more VIP addresses to a VLAN, the Configuration Utility displays an unresponsive script error.

- Issue ID 0333834: If the PDF reader plug-in is not set in your browser and you try to open an HTML document from the Downloads tab of the NetScaler configuration utility, you are prompted to open the document in Adobe Reader.

- Issue ID 0333836: If you have configured global server load balancing by using the GSLB wizard, Wizard for Citrix XenApp, or Wizard for Citrix XenDesktop, and you attempt to

view the GSLB Visualizer, Prefuse information might be logged to the Java console. However, you can view the GSLB Visualizer, and the functionality is not affected.

- Issue ID 0334042: The configuration utility does not display a details panel for all the entities.

  Workaround: Select the entity and click 'Open' to display the details.

- Issue ID 0333745: When you access the NetScaler configuration utility from a Mac machine, the keyboard short cut keys may be unresponsive. In the NetScaler configuration utility, short cut keys work differently in Java and HTML views. For example, in Java based views, short cut keys for the copy-paste functions are <CRTL C> and <CRTL V> and in HTML based views they are <CMD C> and <CMD V>.

  Workaround: Use the <CRTL key> short cut keys if the <CMD key> short cut keys are not working and vice-versa. For example, if <CRTL C> shortcut key is not working, use <CMD C> and vice-versa.

- Issue ID 0334280: After you rename a compression policy, the new name might not be reflected in the configuration utility.

  Workaround: Refresh the page to see the renamed policy.

- Issue ID 0334284: If you navigate to HTTP Compression > Policies and click 'Policy Manager' in the task pane, the following error message might appear: No such policy exists.

  Workaround: Refresh the page and try again.

- Issue ID 0334292: If you navigate to HTTP Compression > Policies or HTTP Compression > Actions, the Remove button is disabled in the task pane.

  Workaround: Use the command line interface to remove the policy or action.

  Note: You can access the command line interface from the configuration utility. Navigate to System > Diagnostics > Command Line interface.

- Issue ID 0334773: In the Synchronize GSLB Configuration dialog box, the Command parameter is unavailable when the Synchronization Option parameter is set to its default value (automatic synchronization).

- Issue ID 0335008: The exception 'netscape.javascript.JSException' is logged to the Java console when you create a DNS key by using the NetScaler configuration utility. However, the DNS key is created, and there is no loss in functionality.

- Issue ID 0335013: If no services are configured for a DNS view, and you use Windows Internet Explorer 9 to view the Create DNS View dialog box, the 'Service(s) in this view' and 'Policy(s) in this view' lists in the dialog box are not rendered correctly. The display issue is resolved if at least one service is configured for the DNS view.

- Issue ID 0335235: The NetScaler configuration utility does not show globally bound AppFlow policies in the policy manager. This issue is observed only in a cluster setup.

- Issue ID 0335701: You cannot add an SSL service with the Clear Text Port option in the configuration utility, because the option is disabled.

- Issue ID 0335719: The exception “netscape.javascript.JSException” is logged to the Java console when you sign a DNS zone by using the NetScaler configuration utility, and the browser’s status bar does not report the status of the zone-signing operation. However, the zone is signed, and there is no loss in functionality.

- Issue ID 0333577: When configuring the Transformation URL Profile, an error occurs if you set Priority to a value higher than 2147483647 (maximum allowed value).

- Issue ID 0335526: If you access the configuration utility through an Internet Explorer browser that has the Java Runtime Environment (JRE) disabled, an error occurs.

  Workaround: Make sure that at least one JRE is present and enabled under the Java Runtime Environment Settings, in the Java console, on the Java tab.

- Issue ID 0335913: In a cluster setup, you cannot enable a server entry that is disabled, because the Enable button is unavailable. However, you can disable a server entry by using the NetScaler command line interface.

- Issue ID 0338513: When you log on to NetScaler configuration utility from Internet Explorer 8 or Internet Explorer 9, the web browser displays a blank screen as the browser is displaying the compatibility view.

  Workaround: Change to the standard view, in the 'Compatibility View Settings' dialog box, by clearing the 'Display all websites in Compatibility View' check box.

- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated.

Domain Name System

- Issue IDs 0268748 and 0333310: In a cluster setup, if you save the configuration and reboot an appliance, the default name-server records for the thirteen root servers, and their associated address records, become unavailable. If you need them, you have to add them manually after you perform a reboot.

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

- Issue ID 0330529: The following message might be displayed if you disable a virtual server-based DNS name server: 'ERROR: Name server does not exist. [nsnet_recvrpcioctl]'

Global Server Load Balancing

- Issue ID 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0291053: The NetScaler appliance does not rewrite responses that are DNSSEC-enabled and/or sent over TCP. So, when a security-aware DNS server sends the NetScaler appliance a DNSSEC-enabled NXDOMAIN response, or when a DNS server sends the appliance an NXDOMAIN response over TCP, the appliance relays the negative response to the client and caches the negative response. For subsequent requests for the same non-existent domain, the appliance responds with the cached, DNSSEC-enabled response, even if the clients are security-oblivious or use UDP. This behavior is expected, and ensures that all clients receive the same response.

- Issue ID 0326001: If a GSLB virtual server’s primary GSLB method is set to round trip time (RTT) and backup GSLB method is set to static proximity, or if the primary GSLB method is set to static proximity and backup GSLB method is set to RTT, and source IP persistence is enabled, when the primary GSLB method fails, the backup GSLB method also fails.

  Workaround: If you use RTT as the primary GSLB method, do not use static proximity as the backup GSLB method. Similarly, if you use static proximity as the primary GSLB method, do not use RTT as the backup GSLB method.

Load Balancing

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the 'show lb persistentSessions' CLI command displays an internal representation of thepersistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 91711/0250846: If the string (or 'token') that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR('string2').AFTER_STR('string1') if the string that is enclosed by 'string1' and 'string2' is not larger than 64 KB.

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

- Issue ID 0318310: While creating a load balancing monitor, you cannot specify a send string that has a length of more than 76 characters. This issue is observed only in a cluster setup.

- Issue ID 0331621: While creating SSL or load balancing virtual servers with default responder action, the NetScaler appliance throws a 'No such resource' error. This issue is observed only in a cluster setup.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type : #/etc/rc.d/svmd restart

- Issue ID 0337386: When restored from a backup, a NetScaler instance reverts to the release and build in which it was originally provisioned, even if the backup was taken from an upgraded configuration.

NetScaler VPX Appliance

- Issue ID 0326388: In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might be observed in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

Networking

- Issue ID 0276933: When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.

- Issue ID 0283035 and 0299716: In a cluster setup, the 'bind vlan' command throws an error when interface and IP address are specified together.

- Issue ID 0288450: The 'show lacp' command does not display the lacp configurations. This issue is observed only in a cluster setup.

- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command 'set ptp -state disable' and configure NTP to synchronize the time across the cluster nodes.

  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ```
    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
    ```

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.

- Issue ID 0283661: In a cluster setup, if you add an SSL certificate on the configuration coordinator, and immediately execute the add certkey command, the command succeeds on the configuration coordinator but might fail on the other cluster nodes if the certificates on the configuration coordinator are not synchronized with the other cluster nodes before the command is executed.

  Workaround: Copy the certkey under /nsconfig/ssl/ folder on all the cluster nodes or confirm that the certificates are synchronized before executing the add certkey command on the configuration coordinator.

System

- Issue ID 0338244: The CallHome feature checks for compact flash drive and hard disk drive errors every six minutes instead of every six hours. If any errors are found, the appliance's data is uploaded to the Citrix Technical Support server.

Build 69.4

Release version: Citrix® NetScaler®, version 10 build 69.4

Replaces build: None

Release date: August 2012

Release notes version: 3.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Changes
- Bug Fixes
- Known Issues and Workarounds

Note: Unless stated otherwise, an issue applies to all build types (nCore and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.

Enhancements

Smart Card Authentication for Web Interface Site using Access Gateway (Issue ID 0287639)

The NetScaler appliance now supports smart card authentication for web interface on NetScaler through Access Gateway. On using this enhancement, you can configure a web interface site that can be accessed by logging into an Access Gateway virtual server by using a smart card. To use this enhancement, you must upgrade the NetScaler to the latest build and install the new web interface tar file 'nswi-1.5.tgz'. For more information, see the 'Using Smart Card Authentication for Web Interface on NetScaler' topic in the 'Web Interface' chapter of the *Citrix NetScaler Administration Guide*.

Automatically Populating the Default Value of a Virtual Server on a Web Interface Site (Issue ID 0300470)

While modifying a web interface site configured in Direct mode, the default value for the virtual server is now automatically populated with one of the load balancing virtual servers configured during the creation of the web interface site.

Case Sensitivity on the Web Interface Wizard (Issue ID 0246466)

An option 'Make Site Path Case Insensitive' on the web interface wizard has been introduced. When you enable this option, the NetScaler appliance ignores case sensitivity in the site name part of the URL request for a web interface site configured on the NetScaler appliance.

Multiple Binding of Content Switching PI Policies to Content Switching Virtual Servers and Policy-labels (Issue ID 67323/0230903)

The multiple policy binding feature enables you to bind a policy to multiple virtual servers or policy labels. Earlier, you could bind a policy only to a single virtual server or policy label and to reuse an existing policy, you needed to create a copy of the same policy with a different name before attaching it to another virtual server. With the multiple policy binding feature, you can reuse an existing policy for multiple virtual servers.

Global State Update Option for Content Switching (Issue ID 0274449)

You can now enable the state update option globally for content switching virtual servers configured on the NetScaler appliance. If a specific virtual server's local state update option is set to DISABLED, that setting is overridden by a global ENABLED setting. However, a local setting of ENABLED overrides a global setting of DISABLED for the state update option. As shown in the following table, state update is not disabled for a virtual server unless both the global and local options are set to DISABLED.

Global state update setting	Virtual server state update setting	Effective state update setting on the virtual server
ENABLED	ENABLED	Enabled
ENABLED	DISABLED	Enabled
DISABLED	ENABLED	Enabled
DISABLED	DISABLED	Disabled

To configure the state update option globally by using the NetScaler command line, at the NetScaler command prompt, type the following command:

```
set cs parameter [-stateupdate ( ENABLED | DISABLED )]
```

To configure the state update option globally by using the NetScaler configuration utility

1. In the navigation pane, click 'Content Switching'.
2. In the details pane, click 'Configure Content Switching parameter'.
3. In the 'Set Content Switching Parameters' dialog box, select the 'State Update' check box.
4. Click 'OK'.

Support for Load Balancing Diameter Traffic (Issue ID 86737/0246690)

You can now load balance Diameter traffic. The Diameter protocol is a next generation Authentication, Authorization, and Accounting (AAA) signaling protocol mainly used on mobile devices such as laptops and mobile phones. It is a peer-to-peer protocol as opposed to the traditional client-server model that is used by most other protocols. For more information, see the 'Configuring Diameter Load Balancing' topic in the Load Balancing' chapter of the *Citrix NetScaler Traffic Management Guide*.

Stateless Connection Failover Supported for IPv6 (Issue ID 0276300)

You can now bind an IPv6 service to a load balancing virtual server with connection failover set to stateless.

Options for Branch IP Address in the Load Balancing wizard for Branch Repeater (Issue ID 0275289)

In the 'Load Balancing wizard for Branch Repeater', when specifying a branch whose traffic is to be accelerated, you can specify either the primary IP address or the accelerated pair A (apA) IP address of a Branch Repeater appliance.

NetScaler SDX - System Health Monitoring (Issue ID 0291018)

A supplemental software pack supports system health monitoring on the NetScaler SDX appliance for hardware and software components, disks, fan, voltage, temperature, and power supply sensors, and interfaces. For more information about this enhancement, see the 'System Health Monitoring' chapter in the *Citrix NetScaler SDX Administration Guide*. To install the supplemental software pack, see http://support.citrix.com/article/ctx132877.

New Health Monitoring Gadget on the NetScaler SDX Appliance (Issue ID 0313835)

You can now view the top 25 critical health monitoring events in the Health Monitoring gadget on the Home tab in the Management Service user interface. Select an event to view details or to delete the event.

Session Management for Communication with NetScaler Instances (Issue ID 0287133)

All HTTP and HTTPS communication between the Management Service and a NetScaler VPX Instance is now through a persistent session. A session ID is associated with each VPX instance and all HTTP and HTTPS communication between the Management Service and the instance uses this session ID.

Session Management for Communication with XenServer (Issue ID 0303527)

With XenServer version 6.0 and later, HTTP communication between the Management Service and XenServer is now over a persistent session. All HTTP communication between the Management Service and XenServer uses one session ID. For earlier versions of XenServer, basic authentication (user name and password) is used.

SNMP Support on the NetScaler SDX Appliance (Issue ID 94071/0257902)

You can now configure a Simple Network Management Protocol (SNMP) agent on the Citrix NetScaler SDX appliance to generate asynchronous events, which are called traps. For more information about this enhancement, see the 'SNMP' chapter in the *Citrix NetScaler SDX Administration Guide*.

Installing a Supplemental Pack for XenServer (Issue ID 0303515)

You can now install the NetScaler SDX supplemental packs from the Management Service without manually opening an ssh connection to XenServer. To install this pack, on the configuration tab, in the navigation pane, expand Management Service, and then click XenServer Files. In the details pane, click 'Supplemental Packs'. You can upload the supplemental pack to the SDX appliance and also download it to create a backup on your client.

Change Management on the NetScaler SDX Appliance (Issue ID 0291024)

You can now track any changes to the configuration on a NetScaler VPX instance from the Management Service. To view these changes, on the configuration tab, in the navigation pane, expand NetScaler, and then click Change Management. The details pane lists the device name with IP address, date and time when it was last updated, and whether there is a difference between the saved configuration and running configuration. Select a device to view its running configuration, saved configuration, revision history of configuration changes, and difference between the configuration before and after an upgrade. You can download the configuration of a NetScaler VPX instance to your client. By default, the Management Service polls all the instances every 24 hours but you can change this interval by clicking Configure Poll Interval in the details pane.

Configuring Tagged VLANs on the NetScaler SDX Appliance (Issue IDs 0278369 and 0284146)

You can now configure a tagged VLAN, without configuring an NSVLAN, at the time of provisioning a NetScaler instance. For more information about this enhancement, see the 'Provisioning NetScaler Instances' chapter in the *Citrix NetScaler SDX Administration Guide*.

Cloud Bridge CLI Commands Simplified (Issue ID 0307496)

Simplified the Cloud Bridge CLI commands for configuring IPSec Tunnel.

Filtering out Connection Table using CSW/LB vserver Policy Expressions (Issue ID 0302889)

Added policy expressions for the 'show connectiontable' command to filter out connections of a specific content switching or load balancing virtual server.

For example: `show connectiontable CONNECTION.LB_VSERVER.NAME.EQ("v1")`

Configuration Utility Simplified (Issue ID 0306109)

Simplified the configuration utility to ease the process to connect to the cloud service providers.

Application Firewall - Learning from Trusted Clients/Networks Only (Issue ID 86758/0246711)

You can now configure the application firewall learning feature to learn from trusted clients or networks only, instead of learning from all traffic that it processes. By restricting learning to trusted clients, you can prevent attacks against your protected web sites and web services from being learned as normal use and therefore not blocked. Currently trusted learning can be configured only from the NetScaler command line.

To configure the application firewall to learn from trusted clients or networks only, first enable the trusted learning feature. Next, add your trusted clients and networks. To add a trusted client, add the client's IP. IPv4 and IPv6 IPs are both supported. You can use a prefix of /0 after the IP, but that is not necessary. To add a trusted network, add the network in CIDR format.

To enable and configure trusted learning, at the NetScaler command line type the following commands:

set appfw profile <profileName> -enabletrustedLearning (on|off)
bind appfw profile <profileName> -trustedLearningClients (<ip_addr>|<ipv6_addr>|<cidr/prefix>) -state (ena

For <profileName>, substitute the name of the application firewall profile that you want to associate with these trusted learning settings. If you want to add a trusted client or network to the configuration but not configure the application firewall to learn from it yet, set state to disabled. You can add an optional comment to document which client or network you added and why.

The following commands enable trusted learning, add a trusted client at 10.178.16.34, and add a trusted network at 10.102.30.0/24.

set appfw profile TestProfile -enabletrustedLearning on
bind appfw profile TestProfile -trustedLearningClients 10.178.16.34 -state enabled -comment "Trusted client
bind appfw profile TestProfile - trustedLearningClients 10.102.30.0/24 -state enabled -comment "Trusted ne

New TACACS+ Configuration Parameter (Issue ID 0257671)

If you configure a TACACS+ server for authentication, when users without the appropriate permissions enter a command, the command does not execute, but the command is recorded in an accounting log. A new configuration parameter corrects this behavior.

New Syntax for Binding Content Switching Policies and Load Balancing Virtual Servers to a Content Switching Virtual Server (Issue ID 0291791)

For the 'bind cs vserver command', the 'targetVserver' parameter is now deprecated. If you attempt to set the parameter, the following warning appears: “Warning: Argument deprecated [targetVserver].”

This release introduces the 'lbvserver' parameter, for binding the default load balancing virtual server to the content switching virtual server, and the 'targetLBVserver' parameter, for binding other load balancing virtual servers through content switching policies.

In the NetScaler configuration utility, there are no changes in how you bind a default load balancing virtual server or a load balancing virtual server that is not the default.

To specify a default load balancing virtual server by using the NetScaler command line, at the NetScaler command prompt, type the following command:

```
bind cs vserver <csvservername> -lbvserver <targetVservername>
```

To specify a load balancing virtual server other than the default virtual server by using the NetScaler command line, at the NetScaler command prompt, type the following command:

```
bind cs vserver <csvservername> -policyName <policyname> [-priority <positive_integer>] -targetLBVserve
```

Application Firewall Profile Comment Support (Issue ID 0291927)

You can now add a comment to an archived application firewall profile to describe the contents and state of the archive more fully. The comment can be from 1 to 255 characters in length, and can contain letters, numbers, and most punctuation. In the configuration utility, you add a comment on the Export Application Firewall Profile dialog box, in the Comments text box. At the NetScaler command line, you add a comment by typing the following command:

archive appfw profile -comment "<string>"

For <string>, substitute the comment.

Rich policy support for SIP-UDP (Issue ID 0309107)

RULE based persistence now support SIP based policies as part of rule based persistence for SIP-UDP virtual servers. You can configure SIP based policies using the add lb vserver command. For example, the following code shows how to configure RULE based persistence for SIP-UDP virtual server:

add lb vserver sipvip1 SIP_UDP 10.102.27.68 5060 -persistenceType RULE -lbMethod CALLIDHASH -rule sip.re

Note: Only SIP request based policies are supported, rate limiting policies cannot be configured as part of the rule.

Option to Save the Config in Remote GSLB Sites after Config Synchronization (Issue ID 0287324)

The new Save Configuration option specifies that all participating nodes automatically save their configurations after synchronization. The master saves its configuration immediately before synchronization begins. Slave nodes save their configurations after the synchronization process is complete. A slave node saves its configuration only if it is successfully updated to match the master node's configuration. If synchronization fails on a slave node, you must manually investigate the cause of the failure and take corrective action.

To specify the option when using the NetScaler configuration utility to synchronize GSLB configurations, select the Save Configuration check box in the Save GSLB Configuration dialog box. If using the CLI, specify the saveConfig option for the sync gslb config command. The saveConfig option is mutually exclusive with the command's preview option.

SAML IDP and SP-Initiated Logouts Support for AAA-TM (Issue ID 0286268)

Support for SAML IDP- and SP-initiated logouts has been added to AAA-TM. An SP-initiated logout is performed when a user logs out of a AAA-TM session, but not when a user's AAA-TM session times out or when the 'kill aaa sessions' command is used. An IDP-initiated logout is performed when the IDP sends a 'clear session' request to the NetScaler appliance.

Searching NetScaler Entities in the Configuration Utility

You can use the 'Search' functionality to search for NetScaler entities displayed in the details or the data pane of the NetScaler configuration utility. If you want to perform string matching operations that are more complex than the operations that you perform with the simple CONTAINS search, you can use regular expressions.

Support for AES Ciphers on SSLv3 (Issue ID 0302510)

The following AES ciphers are now supported on the SSLv3 protocol.

1. Cipher Name: TLS1-AES-256-CBC-SHA

   Description: TLSv1 Kx=RSA Au=RSA Enc=AES(256) Mac=SHA1

2. Cipher Name: TLS1-AES-128-CBC-SHA

   Description: TLSv1 Kx=RSA Au=RSA Enc=AES(128) Mac=SHA1

3. Cipher Name: TLS1-DHE-DSS-AES-256-CBC-SHA

   Description: TLSv1 Kx=DH Au=DSS Enc=AES(256) Mac=SHA1

4. Cipher Name: TLS1-DHE-DSS-AES-128-CBC-SHA

   Description: TLSv1 Kx=DH Au=DSS Enc=AES(128) Mac=SHA1

5. Cipher Name: TLS1-DHE-RSA-AES-256-CBC-SHA

   Description: TLSv1 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1

6. Cipher Name: TLS1-DHE-RSA-AES-128-CBC-SHA

   Description: TLSv1 Kx=DH Au=RSA Enc=AES(128) Mac=SHA1

7. Cipher Name: TLS1-ADH-AES-128-CBC-SHA

   Description: TLSv1 Kx=DH Au=None Enc=AES(128) Mac=SHA1

8. Cipher Name: TLS1-ADH-AES-256-CBC-SHA

Description: TLSv1 Kx=DH Au=None Enc=AES(256) Mac=SHA1

Changes

Compression

- Issue ID 0299887: The output of the 'show cmp global' command is now similar to the output of the 'show' commands that you use for viewing global bindings for other types of default syntax policies. The 'show cmp global' command continues to display all the globally bound classic policies along with their priority values. But, for default syntax policies, the command displays only those global bind points to which policies are bound, along with a count of the number of policies that are bound to each of them.

  To view the details for a given global bind point, you can specify the bind point as the argument to the 'type' parameter. When you specify a global bind point, the command displays all the policies that are bound to the bind point, along with their priorities and Goto expressions. Classic policy bindings are not displayed if you specify a global bind point.

  Example:

  ```
  > sh cmp global -type RES_DEFAULT
  ```

  Advanced Policies:

  1. Policy Name: ns_adv_nocmp_xml_ie

     Priority: 8700

     GotoPriorityExpression:END

  2. Policy Name: ns_adv_nocmp_mozilla_47

     Priority: 8800

     GotoPriorityExpression: END

  3. . . .

     Done

     >

Load Balancing

- Issue ID 0302112: The use of SIP rate limiting expressions for rewrite policies is disabled to prevent the NetScaler from becoming unavailable.

SSL

- Issue ID 0316577: The SSL crypto card instrumentation is enhanced to provide more information on error status during initialization and at runtime.
- Issue ID 0325800: There are changes to the 'add ssl cipher' and 'bind ssl cipher' commands in NetScaler release 10 build 69.4. Now, there are two commands to create a cipher group and bind ciphers to this cipher group. The command to bind an SSL cipher to a virtual server or service has also changed. For more information about these changes, see http://support.citrix.com/article/CTX134118.

XML API

- Issue ID 0299194: The following XML APIs related to ACL and PBR features are deprecated:
  - unsetnspbr6_icmptype
  - unsetnspbr6_nexthopval
  - setnspbr_state
  - setnsacl_state
  - setnspbr6_state
  - setnsacl6_state

Bug Fixes

AAA Application Traffic

- Issue ID 0288572: On a NetScaler appliance with AAA-TM enabled and Kerberos/NTLM authentication configured, Likewise support fails to start, and the following error message is displayed: /libexec/ld-elf.so.1: Shared object 'libkrb5support.so' not found, required by 'libgssapi_krb5.so'

- Issue ID 0307258: When you create a AAA-TM profile by using the configuration utility, the configuration utility displays the global persistency settings as the settings that it assigned to the profile. However, instead of actually deriving the persistency values from the global persistency settings, it sets persistency for the profile to zero (0). You can verify this issue by typing the following command at the NetScaler command line:

  show tm sessionaction <profileName>

  You can fix the persistency settings for any AAA-TM profile that is affected by this issue by typing the following command at the NetScaler command line:

  set tm sessionAction <profileName> -persistentCookie ENABLED -persistentCookieValidity <positive_integ

  For <positive_integer>, substitute the number of minutes that the persistency cookie is to remain valid. Then, use the 'show tm sessionaction' command to verify your changes.
- Issue ID 0313931: On a NetScaler appliance that has AAA-TM enabled, if a user takes more than four minutes to finish authenticating and the AAA session expires, the user is unable to authenticate. When the user clicks the 'click here' link to return to the logon page, instead of being redirected to the logon page, the user is redirected to the 'Expired Session' page repeatedly.

- Issue ID 0314561: On a NetScaler appliance with AAA-TM enabled and single sign-on (SSO) configured, if a user who uses the Google Chrome browser takes more than four minutes to authenticate and the session expires, the browser displays a blank page instead of the Session Expired page.

- Issue ID 0322445: On a NetScaler appliance that has AAA-TM enabled and a load balancing virtual server configured to support 401 basic authentication, if a user sends a GET request that does not contain a Host header, the NetScaler appliance crashes.

Access Gateway

- Issue ID 90726/0249979: If you configure client certificate-based expressions for preauthentication or post-authentication scans and if users log on with a client certificate on an nCore Access Gateway model MPX 7500 appliance or higher, the scan fails and users cannot log on. This issue does not occur on the MPX 5500 appliance.

- Issue ID 0289662: If you disable split tunneling, When users log on with the Access Gateway Plug-in and try to make a Voice over Internet Protocol (VoIP) call to a mobile phone by using Cisco Unified Personal Communicator application, the call does not connect.

- Issue ID 0289686: If users connect with the Access Gateway Plug-in for Mac and then log off from the Web Interface, if users log on again within five minutes, the connection fails. This only occurs if you enable ICA proxy in Access Gateway.

- Issue ID 0290220: When users log on to Access Gateway with the Access Gateway Plug-in for Mac OS X, the home page is slow to appear or does not appear in the Web browser.

- Issue ID 0290976: When you configure a post authentication policy on Access Gateway and configure the policy to redirect the connection to the Web Interface if the endpoint analysis fails, when users log on with the Access Gateway Plug-in, if the user device fails the endpoint analysis scan, users receive the Access Gateway logon page instead of the Web Interface.

- Issue ID 0299406: If you configure a policy to restrict access to certain files, when users log on with clientless access and try to access the file, Access Gateway fails.

- Issue ID 0300221: When users log on to an nCore Access Gateway model MPX 7500 or higher, if there is high memory usage, the Access Gateway might fail. This issue does not occur on the MPX 5500.

- Issue ID 0301060: When you configure address pools, enable intranet IP addresses, and disable spillover, when users log on with the Access Gateway Plug-in and then try to log on from a second user device, the Transfer Login page appears. However, the message appears incorrectly as text only on a blank page. When users click 'Cancel', the button is disabled, rather than redirecting users to the logon page again.

- Issue ID 0301338: If a user password is longer than 31 characters, when users try to log on through the 'Access Gateway Plug-in logon' dialog box rather than through a Web browser, logon fails. A message appears stating that the user name and password are invalid.

- Issue ID 0301557: If users connect with the Access Gateway Plug-in and two network adapters have active connections on the user device, DNS resolution does not occur and users cannot access internal resources. If users disable one network adapter, users can then access internal resources.

- Issue ID 0301799: Access Gateway might not release all user sessions, which results in maximum usage of the licenses. When this occurs, users cannot log on and you must restart Access Gateway.

- Issue ID 0302268: After the preauthentication scan passes and users log on, if an internal processing error occurs, Access Gateway fails.

- Issue ID 0302490: If users log on with Receiver for Chromebook through Access Gateway, when users log off, Access Gateway does not release the session. Users must close the Web browser to log on again.
- Issue ID 0303265: If servers in the internal network return a UDP packet with zero length, Access Gateway fails.
- Issue ID 0306346: When users log on to the configuration utility, the following issues occur:
  - When using an Internet Explorer 8 Web browser, a blank page appears.
  - When using a Firefox 11 Web browser, many features in the navigation tree do not appear.
  - When using a Google Chrome Web browser, the only features that appear in the navigation tree are System, Network, DNS, SSL, VPN, and AppExpert.
- Issue ID 0320493: If your authentication policies include the rules REQ.SSL.CLIENT.CERT.EXISTS and REQ.SSL.CLIENT.CERT.NOTEXISTS, and users log on with a smart card, the following might occur:
  - If smart card authentication fails, users are redirected to the Web Interface and prompted again for the smart card credentials.
  - If users do not enter smart card credentials, they are redirected to the Web Interface and prompted for their user name and password in order to authenticate with RADIUS.

AppFlow

- IssueID 0301461 (nCore): If you enable the 'clientTrafficOnly' parameter when the AppFlow feature is enabled, the NetScaler appliance fails. By default, the 'clienttrafficonly' parameter is disabled.
- Issue ID 0302578 (nCore): If you enable AppFlow when the NetScaler device is in transparent mode, or when the load balancing virtual servers use wildcards for the IP address and port to dynamically learn the backend services, the NetScaler device fails.

Application Firewall

- Issue ID 51944/0219171: Imported application firewall objects -- such as WSDLs and XML Schemas -- cannot be removed from the NetScaler appliance by using the 'clear config' command. You must explicitly remove these objects. To remove an imported object by using the NetScaler command line, open a Unix shell and type 'rm <objectFilename>'. To remove an imported object by using the configuration utility, select the object, and then click Remove.

- Issue ID 85151/0245424: You can now add a comment to an application firewall profile to describe it more fully. The comment can be from 1 to 255 characters in length, and can contain letters, numbers, and most punctuation. In the configuration utility, you add a comment on the Create Application Firewall Profile dialog box or Configure Application Firewall Profile dialog box, General tab, in the Comments text box. At the NetScaler command line, you add a comment by typing the following command:

  ```
  set appfw profile -comment "<string>"
  ```

  For <string>, substitute the comment.

- Issue ID 87741/0247559: Handling of half-width and double-width characters by the HTML SQL Injection check transformation feature has been modified to ensure that these characters are identified as special characters, preventing inappropriate blocking and transformation.

- Issue ID 0284784: When a web site sends a MIME-encoded web form to a user with the MIME boundary enclosed in double quotations, and the user returns the web form as a POST request, the application firewall resets the connection with a reset code of 9845.

- Issue ID 0291389: When you configure an audit policy to send the application firewall logs to a remote Syslog server, the logs do not contain the profile name and URL of the connection that generated the log, and field names and values are incorrect. If you configure the audit policy to create local logs, the missing information is included in the logs.

- Issue ID 0300223: In the configuration utility, 'Application Firewall Profiles' pane, when you import a profile, the configuration utility is not automatically refreshed, giving the impression that the import failed. The profile is actually imported successfully. To see it in the Profiles list, click 'Refresh'.

- Issue ID 0300383: On a NetScaler classic build that has the application firewall learning feature enabled, under heavy load the configuration utility can become unavailable and the NetScaler can freeze or hang.

- Issue ID 0300465: When upgrading from the NetScaler 9.3 to the NetScaler 10 release, all signature rules, SQL special strings, and SQL keywords are now automatically upgraded to the new schema.

- Issue IDs 0301817 and 0302295: Local safe object signature rules work only if the Location is set to HTTP_RESP_BODY, and maxLength is defined.

- Issue ID 0302282: If a local safe object signature rule is defined, and the signatures object is bound to a profile, the safe object check is not run on traffic that is processed through that profile.

- Issue ID 0302368: In the 'Manage Learned Rules' dialog box, you might not be able to deploy or remove certain learned relaxations that contain special characters.
- Issue ID 0303057: If a log for a Transform action has missing parameters, the fields that contain those parameters are not clickable in the Syslog Viewer, and that log cannot be deployed to create a new rule or relaxation.
- Issue ID 0307082: When the NetScaler appliance sends an HTTP/1.0 100-Continue response on behalf of a protected web server, it now also sets the TCP Push flag in the response packet. This change resolves certain performance issues that might have been encountered when enabling the application firewall for some XML-based web services.
- Issue ID 0307542: If a hostname greater than 93 characters in length is assigned to a NetScaler appliance that has the application firewall enabled, the application firewall learning feature crashes.
- Issue ID 0309289: When a client sends a chunked POST request to an application firewall-protected web server, the request might not be correctly transmitted to the web server, resulting in a failed connection.
- Issue ID 0319787: On a NetScaler appliance with the application firewall feature enabled, the comment stripping feature does not correctly parse web pages that have an HTML comment that is terminated with two hyphens, a space, two more hyphens, and a greater-than symbol (-- -->). In other words, you cannot have a string consisting of two hyphens and a space immediately preceding the usual comment termination string (-->). If you do, the comment stripping feature does not detect the final two hyphens and greater-than symbol as a comment terminator. The comment stripping feature therefore strips all content that follows the missed comment terminator.
- Issue ID 0320145: If a user requests a URL from an application-firewall protected web site, and the requested web page has embedded URL links that contain hash (#) characters, the request might trigger a Start URL check violation. If blocking is enabled for the Start URL check, the request might be blocked.

Cluster

- Issue ID 0276162: Cluster commands are not propagated from the configuration coordinator to other nodes, when you log on to the cluster IP address using the Password Authentication mechanism. However, the commands are propagated when you log on to the cluster IP address using the Keyboard Interactive mechanism.
- Issue ID 0290504: You cannot form a cluster of NetScaler appliances by using the configuration utility, if you are accessing the configuration utility over a secure channel (https instead of http.)
- Issue ID 0302924: In the configuration utility, the NetScaler appliances that are added to the cluster by using the 'Discover NetScalers' option, are not automatically saved and rebooted.
- Issue ID 0318723: When a new node joins the cluster or an existing node is rebooted, the ACL, ACL6, SIMPLEACL, and SIMPLEACL6 configurations with TTL value are not automatically synchronized on that node.

Command Line Interface

- Issue ID 0262838: The CLI man page for the set dns parameter command has the following errors:
  - It displays 'ENABLED' as the default value for the 'cacheRecords' parameter. The possible values are only 'YES' and 'NO', and the default value is 'YES'.
  - It displays NS_FOUR as the default value for the 'resolutionOrder' order parameter. The possible values are only 'OnlyAQuery', 'OnlyAAAAQuery', 'AThenAAAAQuery', and 'AAAAThenAQuery'. The default value is 'OnlyAQuery'.

Configuration Utility

- Issues IDs 0244945, 0245825, and 0273344: When viewed in Internet Explorer version 8 or 9, the Dashboard page has several display issues (for example, excessive scroll bars, inconsistent column width, horizontal scroll bar missing from the Vserver view).
- Issue ID 0299883: When users access NetScaler using the configuration utility, the following issues are observed:
  - When you select a policy on the DNS Policies page, the Global Bindings button becomes inactive.
  - On the 'Virtual Servers' page, under 'Load Balancing', the header bar in the details pane moves off the page if you scroll down.
  - The configuration difference command produces an error message: Secondary NS not found.
- Issue ID 0300376: If you create an SSL service by modifying an existing virtual server and set some parameters in the 'Advanced' tab, the service is not created. The service is created if you do not set any advanced parameters or do not click the 'Advanced' tab.
- Issue ID 0302742: If you use the configuration utility to bind a compression policy (for example, app_cmp) to an AppExpert application, the following error message appears: Policy 'app_cmp' cannot be inserted. It does not have expression with advanced syntax.
- Issue ID 0303492: Creating an IP entity does not update the table that displays information about the configured IP addresses.
- Issue ID 0303494: Cache update causes issues with removal of an IP object.
- Issue ID 0303495: If you remove an IP object, cache-update issues cause Internet explorer to display unknown error.
- Issue ID 0303504: You cannot use the numeric keypad to specify values in the following text boxes:
  - Destination IP Address, in either the 'Create SNMP Trap Destinations' or the 'Configure Trap Destinations' dialog box.
  - IP Address, in the Create SNMP Managers dialog box.
- Issue ID 0303910: The Configuration page does not load if accessed from Internet Explorer 9 on a client machine running JRE 1.6 build 14.
- Issue ID 0308459: In 'Enable/disable service group member' view, the 'Enable' and 'Disable' buttons are inactive when the state of a service group member is one of the following - 'GOING OUT OF SERVICE', 'DOWN WHEN GOING OUT OF SERVICE' or 'GOING OUT OF SERVICE (graceful)'.
- Issue ID 0314258: When you modify any PBR rule from the configuration utility, the NetScaler appliance changes the APPLIED status of the PBR to NOTAPPLIED.
- Issue ID 0323197: An HTTP monitor with extended 'respCode' range cannot be configured through the configuration utility. If it is configured through the CLI, an error occurs when it is viewed in the configuration utility.

- Issue ID 0323890: An error occurs when a user tries to remove the monitors from a load balancing service by using the 'Remove' button in the configuration utility's Configure Service window.

Content Switching

- Issue ID 0308757: A TCP content switching virtual server with a wildcard port fails to respond to clients with a SYN-ACK. Consequently, the content switching functionality fails for the virtual server.

DataStream

- Issue ID 0303980: A monitor of type MSSQL becomes unavailable if you replace the existing query with a shorter query.

HTML Injection

- Issue ID 0302088: When HTML Injection is enabled for web forms that use the 'GET' method, ES monitoring does not function properly.

Integrated Caching

- Issue ID 0288716 (Cluster): In cases, where there is a delay in processing the cache invalidation request originating from other cluster nodes, if the client sends a request before the cache invalidation request is processed on the node, the cache will serve old content.

Load Balancing

- Issue ID 89129/0248646: For non-HTTP load balancing virtual servers for which rule based persistence has been configured, the appliance does not automatically refresh the session time-out setting during a file download. Therefore, if the download is not completed before the session times out (and another request does not arrive before the session times out), the time-out setting is not refreshed, and requests that arrive during what would otherwise have been the extended time-out interval are forwarded to whatever server is selected by the configured load balancing method.

  A consequence of this behavior is failure to accelerate some Repeater Plug-in connections in a WAN optimization configuration. If a persistence session that was created for a request from a Repeater Plug-in expires before the complete response is sent to the client, the next request from the Repeater Plug-in is sent to a different Branch Repeater appliance and is therefore not accelerated. When that happens, the Branch Repeater graphical user interface indicates that the reason for the connection not being accelerated is 'Not enough room left in the TCP packet header to append unit specific options (5).'

- Issue ID 0278377 (nCore): Cache policy labels cannot be bound to MYSQL or MSSQL virtual servers.

- Issue ID 0285672: When using load balancing of Branch Repeaters in a cluster setup, there is no response from the server and the request hangs.

- Issue ID 0289339: Service group members that are configured to scale automatically are not synchronized correctly with the secondary appliance in a high availability pair. The issue can lead to appliance failure during a failover event.

- Issue ID 0304847: In the load balancing monitor structure in the XML API, the 'flags' field is now deprecated.

- Issue ID 0305045: The WI-Extended monitor sends probes to port 80 regardless of the port number for which it is configured.

- Issue ID 0309954: A GSLB virtual server becomes unavailable if you use the same IP address as the public IP address for both a local and a remote GSLB service, bind monitors to the services, and then bind the services to the virtual server.

- Issue ID 0318838: A NetScaler policy or action fails if it uses a SIP expression that is based on the Contact header. For example, a rewrite action does not work if it is configured to rewrite the Contact header.

NetScaler SDX Appliance

- Issue ID 88556/0248194: When provisioning a NetScaler instance, if you have entered invalid NetScaler settings for any of the IP address, Netmask, or Gateway parameters, you cannot modify the values for those parameters.

- Issue ID 90586/0249864: Log on to the Management Service user interface fails after 25 days.

- Issue ID 0289151: If you provision a NetScaler VPX instance with approximately 12288MB (12GB) of memory and then upgrade the instance, the upgrade operation fails and the following error message appears:

  ERROR: NetScaler on nCore VPX requires minimum 2 Gigabytes and 2 CPUs to start.

- Issue ID 0310014: If you have provisioned a NetScaler VPX instance running release 9.3 on a NetScaler SDX appliance running release 10, and the instance is restarted, the existing session between the Management Service and the VPX instance expires and an error message appears if you try to modify any settings on that instance after it restarts.

- Issue ID 0313155: NTP synchronization might fail if you add a new NTP server by using the Management Service user interface because the default contents of the ntp.conf file are not flushed.

NetScaler VPX Appliance

- Issue ID 0302377: If you install a NetScaler VPX virtual appliance on Microsoft Server 2008 R2 by using Hyper-V Manager, or if you install a NetScaler VPX virtual appliance on VMware ESX 3.5 or 4.0, you are not prompted to specify the IP address, subnet mask, and gateway. The appliance starts with the default IP address of 192.168.100.1.

Networking

- Issue ID 0243105: When there are ECMP routes for a prefix, for every new route addition or deletion, the NetScaler appliance withdraws all the UP routes and adds them back again to its routing table. This results in a period of time when there are no routes to the prefix.
- Issue ID 0277297: NetScaler APIs do not display some of the attributes that are displayed in the output of 'show connectiontable -detail full' command.
- Issue ID 0300820: When the NetScaler appliance receives an unpredicted flow of SYNs, it blocks the connect system calls used by OSPF daemon. This causes delay in sending out the hello packets resulting in adjacency failure.
- Issue ID 0302613: When an OSPF connection times out, the NetScaler appliance removes and applies back the router configuration. This causes an adjacency flap which momentary drops all the advertised routes.
- Issue ID 0305420: If the NetScaler appliance receives any traffic which hits a virtual server of type ANY then only for the first packet of this traffic the TTL value set to 255 and for the remaining packets, belonging the same session, the TTL value remains same. This applies to even fragment packets, where only for the first fragment of the packet the TTL value is set to 255 and for the remaining fragments the TTL value is unchanged.
- Issue ID 0311243: When a virtual server, which has a listen policy bound to it, receives IPv4 fragments of a request that evaluates the policy to TRUE, the NetScaler appliance becomes unresponsive while performing service lookup on the received IPv4 fragments
- Issue ID 0312412: The command 'sh ip ospf <1-65535> database', in the VTYSH command prompt, displays the database for all the OSPF processes instead of just for the process id specified.
- Issue ID 0318668: A virtual server of type ANY drops the IPv6 ECHO reply if the ECHO request didn't pass through the appliance and the related IPv6 to IPv4 mapping is not present in appliance.

Platform

- Issue ID 0275149 (nCore): On a NetScaler appliance that has LACP configured and interface speed set to AUTO, if the link speed on one of the interfaces in a channel is reduced after autonegotiation with the device at the other end, the interface is treated as DOWN by the LACP channel on the peer device. However, the NetScaler appliance does not identify the new reduced link speed and continues to treat the interface as UP.

Policy

- Issue ID 0291487: NetScaler appliances running version 9.2 build 52.1 or later and have a large number (in the hundreds) of policy bindings can experience performance issues on 'save ns config' and 'show config' operations. This can lead to interruption in services.
- Issue ID 0291975: The SYS.VSERVER('<vserver_name>').THROUGHPUT expression returns an incorrect throughput value.
- Issue ID 0311268: You cannot add a rule of the form 'HTTP.REQ/RES.BODY(<num>).CONTAINS(<string2>)' where <string2> has the property that its length is greater than the length of <string1>. <string1> is already existing string in the already configured policy expression 'HTTP.REQ/RES.BODY(<num>).CONTAINS(<string1>)'.

  For example, the second command provided below might not succeed if there exists some request for which the evaluation of rule in cs_example is in progress.

  -> add cs policy cs_example -rule 'HTTP.REQ.BODY(1000).CONTAINS("MyLengthIs12")
  -> add cs policy cs_example_break -rule 'HTTP.REQ.BODY(1000).CONTAINS("MyLengthIsBIG15")

Reporting

- Issue ID 0313793: You can now include period (.), colon (,), and hyphen (-) special characters in report titles.

SNMP

- Issue ID 0309930: The SNMP OID for vsvrCurSslVpnUsers is getting counter values only from core 0.

SSL

- Issue ID 0316577: The SSL crypto card instrumentation is enhanced to provide more information on error status during initialization and at runtime.

Stream Analytics

- Issue ID 0307283: NetScaler supports a maximum of 500 stream session records. Stream records beyond the maximum supported value are not tracked. The statistics command, 'stat stream identifier', displays a maximum 500 stream records.

System

- Issue ID 93169/0257092 (nCore): NetScaler nCore appliances now support keep-alive for TCP connections. When this feature is enabled, with the default settings, the appliance probes any TCP connection that has been idle for 15 minutes. If the appliance does not receive a response from the peer within 75 seconds, it sends a second probe. If no response to that probe is received within 75 seconds, the appliance sends a third, final probe. If no response to the final probe is received within 75 seconds, the appliance resets the connection.

  By default, this feature is disabled. In addition to enabling the feature, you can change the default values for connection idle time, number of probes to send to the peer, and the interval at which to send probes. In the CLI, use the following command to change the default settings:

  set ns tcpProfile <name> [-KA ENABLED] [-KAconnIdleTime <positive_integer>] [-KAmaxProbes <positive_

  In the configuration utility, you can change the settings in the System > Profiles > TCP Profiles > Add TCP Profile or Configure TCP Profile dialog box.

- Issue ID 0270163: When the NetScaler appliance runs processes such as gzip, the usage of the management CPU increases. Hence, high CPU usage alerts may get generated even though the packet engines are not actively processing packets.

- Issue ID 0275501: A user can view all of the virtual servers configured on the NetScaler appliance, even though the user is bound to a command policy that has a condition for restricting the user to view only a set of virtual servers.

- Issue ID 0285015: Requests buffers larger than 24KB lead to buffer overflow and result in the web log module not working.

- Issue ID 0302004: For load balancing virtual servers that have SOURCEIP persistence configured, client IP header insertion might fail for HTTP CONNECT requests sent to that virtual server.

- Issue ID 0319417: Server response in which the HTTP header spans more than 16 nsbs is reset even if the 'drop invalid requests' flag is disabled.

Web Interface

- Issue ID 86538/0246528: The following dialog boxes under 'Upload Plugins' available in the 'Web Interface' pane of the configuration utility do not work as expected:

  - Windows Client

  - Linux Client

  - Macintosh Client

- Issue ID 0322207: In a high availability setup, delays in Apache Tomcat start-up might prevent the propagation of web interface configurations to the secondary appliance. As a result, the web interface configurations are not available when the secondary appliance becomes primary.

XML

- Issue ID 0304314: SOAP requests that do not conform to a WSDL are not handled properly by the XML validation module.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0303507: NetScaler automatic domain join is failing with Likewise 6.1. If you attempt to create a Kerberoes authentication action, the attempt fails with the following error message:

  ```
  LsaAdJoinDomain (40041) Invalid parameter
  ```

  To work around this issue, at the NetScaler command line open a Unix shell, adn then type the following command to manually join the domain:

  ```
  /opt/likewise/bin/domainjoin-cli join <DOMAINNAME>
  <DomainUserName>
  ```

  Note: You must issue this command after each reboot.

- Issue ID 0310205: If you attempt to kill a user session by using the username parameter with either the NetScaler command line 'kill session' command or the configuration utility, the session is not terminated on either the NetScaler appliance or the client.

- Issue ID 0327114: On a NetScaler appliance with NetScaler 10 build 69.4 nc installed, if you use the configuration utility to configure authentication on a load-balancing virtual server, the following error message appears:

  No Authentication Host specified

  The configuration utility then removes the authentication host from the configuration. This behavior occurs regardless of whether you are configuring authentication host settings on the virtual server for the first time, or modifying existing authentication host settings on the virtual server.

Access Gateway

- Issue ID 90722/0249975: When users log on with the Access Gateway Plug-in, the 'File Transfer' tab on the Access Interface is available, but the 'File Transfer option' is not available if users right-click the Access Gateway icon in the notification area.

- Issue ID 92543/0251596: After you configure Access Gateway to provide user connections through Citrix Receiver, when users right-click the Receiver icon in the notification area, the Log on option does not appear. Users must connect by using the Web browser or they must right-click the Receiver icon and then, depending on the version of Receiver they are using, click About or Preferences from the Receiver menu and Plug-in Status or Advanced from the Receiver panel. You can also enable the log on option to appear when users right-click the Receiver icon by adding the following settings in the registry:

  - Add the Receiver key (if the key does not already exist) under the following registry locations:

    - `HKEY_CURRENT_USER\Software\Citrix\`

    - `HKEY_LOCAL_MACHINE\Software\Citrix\`
  - Add the Inventory key in the following registry locations:

    - `HKEY_CURRENT_USER\Software\Citrix\Receiver`

    - `HKEY_CURRENT_USER\Software\Citrix\Receiver`
  - In the Inventory key, configure the following **REG_SZ** values:

    - **VPNAddress**. Provide the value as the Web address for the Access Gateway appliance; for example, https://<AccessGatewayFQDN>.

    - **VPNPrompt1**. Provide the value as 'UserName'.

    - **VPNPrompt2**. Provide the value as '*Password'.

      Note: To mask the password, enter an asterisk (*) before the word.

      In addition, if you configure double-source authentication that requires authentication with LDAP plus RSA authentication, you need to also add the following as **REG_SZ**:

    - **VPNPrompt3**. Provide the value as '*Passcode'.
- Issue ID 0261547: When you enable Access Gateway as a reverse proxy and you enable basic preauthentication and post- authentication scans, as well as encryption and client choices, when users log on with the Access Gateway Plug-in, the preauthentication scan passes, but the post-authentication scan fails.

- Issue ID 0275079: When users access applications published on XenApp, each user consumes multiple Access Gateway licenses per application. Instead, one session ID should be shared across the applications the user accesses. As a result, users exceed their allocated license count and an SSL error occurs.

- Issue ID 0285995: If you configure Access Gateway to assign an intranet IP address to user devices that connect to Access Gateway, when users log on with the Access Gateway Plug-in, the secure DNS dynamic update does not occur and the intranet IP

address is not registered with the DNS Server.

- Issue ID 0288469: After you configure a virtual server to use the Access Gateway Plug-in for Java, when users log on with the Access Gateway Plug-in by using a browser that has a 64-bit Java Runtime Environment (JRE) installed, the plug-in fails to establish a connection.

- Issue ID 0291264: If you create a Web Interface 5.4 site and enable authentication through Access Gateway, and you enable single sign-on with a smart card to the Web Interface that enables smart card pass-through, when users log on with the Access Gateway Plug-in, the users' desktops are not listed on the Web Interface.

- Issue ID 0291821: If you create a Web Interface 5.4 site and enable authentication with a smart card through Access Gateway, and you configure the 'Single Sign-on Domain' on the 'Published Applications' tab using the format domainname.com instead of domainname, when users start a published application or desktop, authentication fails.

- Issue ID 0292005: When users connect with clientless access and try to download a file larger than 1 gigabyte (GB) from the file share on the home page, as the file is downloading, if an upload is attempted, the download process fails but the upload continues.

- Issue ID 0298971: When users log on with the Access Gateway Plug-in for Java and the Web Interface opens in Internet Explorer 9, if users do not turn on Compatibility View in Internet Explorer, when they click a published application, the following error appears: Resource shortcuts are not available.

- Issue ID 0299515: If you configure an intranet IP address on Access Gateway, when users connect with the Access Gateway Plug-in on a computer running Windows XP Service Pack 3 and try to access a CIFS share hosted on a computer in the secure network, users receive an error that the share is inaccessible.

- Issue ID 0300511: When users log on using clientless access and click a bookmark from the home page to open a Distributed File Share (DFS), if the target folder resides on a different computer than the computer where the domain DFS server resides, the share does not open.

- Issue ID 0308733: If you configure Access Gateway with additional appliances in which global server load balancing (GSLB) is enabled, when users log on with the Access Gateway Plug-in, occasionally the connection times out, a time-out error appears, such as 'Your Citrix Access Gateway session timed-out and you are not connected,' and the session disconnects.

- Issue ID 0309017: When you configure a preauthentication and post-authentication policy with an expression to scan a user device for a file, Access Gateway does not check for expression syntax. As a result, Access Gateway accepts inappropriate syntax configuration and the scan fails.

- Issue ID 0319607: If an authentication server and Access Gateway reside in the same domain, the appliance may fail.

- Issue ID 0319901: If you enable Integrated Caching and Web Interface on Netscaler on an Access Gateway appliance, and then change the URL for the Web Interface, Access Gateway might fail.

AppExpert

- Issue ID 0323436: The NetScaler configuration utility can display a maximum of 4500 bound patterns of a pattern set.

Application Firewall

- Issue ID 0284009: If sessionless URL closure is enabled, and Validate Referer Header is set to If Present, a spurious Referer header check error is generated and logged when a web form with an action URL is submitted. If blocking is enabled for the Start URL check, then requests that contain web forms with action URLs are blocked. To work around this issue, if you configure Sessionless URL Closure, set Validate Referer Header to Off.

- Issue ID 0299940: The change profile type command does not work correctly.

  - If you try to change a profile type to Web 2.0, the profile type remains HTML.

  - If you try to change a profile type to XML, the Profile Type field disappears completely.

  When you use the configuration utility to change the profile type, the profile type is actually changed correctly, but the display is incorrect. When you use the NetScaler command line, the actual profile type is set as shown above.

- Issue ID 0301813: When deploying a learned Cross-Site Request Forgery relaxation from the Syslog Viewer, the configuration utility does not deploy the relaxation, but displays the following error message: 'CSRF Tag validation failed'.

- Issue ID 0302294: Learned relaxations are sometimes not removed from the review list after they have been deployed. To manually remove a learned relaxation that has already been deployed, in the Manage Learned Rules dialog box select the relaxation and then click 'Skip'.

- Issue ID 0303044: Only QualysGuard WAS 1.0 scan reports are supported when importing signature rules. WAS 2.0 scan reports are not supported.

Cache Redirection

- Issue ID 0287688: If you set the L2Conn parameter for a cache redirection virtual server before you finish setting up the cache redirection configuration (including the other participating entities, such as the load balancing virtual server and the services that should be bound to the load balancing virtual server), the NetScaler appliance sends clients the SYN-ACK segments that it receives from the cache or origin servers during connection establishment with those servers. Clients respond to the SYN-ACK segments with a TCP RESET. Consequently, the requests are dropped.

  Workaround: Enable the L2Conn parameter for the cache redirection virtual server after you finish setting up the cache redirection configuration.

- Issue ID 0328353: When you use the configuration utility to bind a cache redirection policy to a cache redirection virtual server, the policy is added to the content switching (CSW) policy tab instead of cache redirection (CRD) policy tab. If you try to resolve this issue by using the CR virtual server wizard, the following error message appears: 'Please specify Target.'

- Issue ID 0330033: Tabs for filter/compression policy bindings are not displayed for a cache redirection virtual server, and it is not possible to bind those policies to a cache redirection virtual server.

- Issue ID 0330139: If you use the configuration utility to unset a cache virtual server for a cache redirection virtual server, the process fails and the following error message appears: invalid argument.

Command Line Interface

- Issue ID 92269/0251344: If you upgrade from an earlier build to a later build within release 9.2 or release 9.3, or upgrade from release 9.2 to release 9.3, or upgrade from an earlier release to release 10, the time zone settings may be lost on upgrade.

  Workaround: Delete the time zone from the configuration (ns.conf), upgrade to the target build or release, and then reconfigure the time zone.

Configuration Utility

- Issue ID 0251463: When you click the Applications node in AppExpert, the configuration utility throws a null pointer exception. The issue occurs sporadically.

- Issue ID 0269337: If you use the Google Chrome browser, with the toolbars installed, to access the configuration utility, the toolbars distort the views.

  Workaround: Hide the toolbars in Chrome browser when you access the configuration utility.

- Issue ID 0278097: In the configuration utility, if you click Application Firewall in the navigation pane, the scroll bar moves up and the subnodes of the Application Firewall node disappear. You have to scroll down to view the subnodes.

- Issue ID 0298686: If the details pane contains too may records to display on one screen, the header row moves off the screen if you scroll down.

- Issue ID 0300506: On the MPX 17000 platform, if you use the configuration utility to upgrade from release 9.2 build 55.5 to release 10, the appliance does not restart automatically after the upgrade.

  Workaround: Restart the appliance manually by using the command line or the configuration utility.

- Issue ID 0303279: In the configuration utility, in the Rewrite Policies pane, clicking Add does not display the Create Rewrite Policy dialog box but disables the main configuration utility window.

- Issue ID 0311358: The NetScaler configuration utility fails to load when accessed from Internet Explorer version 7 browser running on Windows 2003 or Windows XP.

  Workaround: Use Internet Explorer version 8 and above.

- Issue ID 0319061: The configuration utility does not throw the 'Feature not supported' prompt when configuring the following unsupported features on a NetScaler cluster: Bridge groups, Network Bridge, VMAC6, and FIS. This issue is observed only in a cluster setup.

- Issue ID 0322821: When the SRADV (Static Route Advertisement) mode is ON, the static routes which are not explicitly disabled for advertisement will be advertised using all the routing protocols. However, the advertised protocols column for route in the configuration utility does not show any protocol list. This issue is observed only in a cluster setup.

- Issue ID 0322894: The configuration utility displays an inappropriate error message when adding a forwarding session that has an invalid subnet mask. This issue is observed only in a cluster setup.

- Issue ID 0322914: When the IP is not resolved for a hostname based SNMP manager, the 'Resolved IP' column of the SNMP Manager table is shown as blank instead of 'Unresolved IP'. This issue is observed only in a cluster setup.

- Issue ID 0323175: The configuration utility displays a negative value for the index of the data set or pattern set, when the index is set to its maximum value. The command line

interface displays the correct value.

- Issue ID 0325400: After adding a local authentication policy by using the configuration utility, the request profile field is showing blank. By default, the request profile must be Local. This issue is observed only in a cluster setup.

- Issue ID 0326354: In System > Settings > Change global system settings, regardless of the base threshold value configured for surge protection, the value is displayed as 0. This issue is observed only in a cluster setup.

  Workaround: You can view the base threshold vale by using the 'show ns spParams' command.

- Issue ID 0326018: The dashboard does not display the Precision Time Protocol (PTP) counters for the cluster node. This issue is observed only in a cluster setup.

  Workaround: PTP counters can be viewed by using the 'stat cluster node' command.

- Issue ID 0327136: The configuration utility does not allow you to set the 'Max Clients' parameter of a service to its maximum value of 4294967294. This issue is observed only in a cluster setup.

  Workaround: You can set the maximum value by using the “set service” command.

- Issue ID 0327551: In the configuration utility, all features appear to be enabled even when the features are disabled.

- Issue ID 0328660: In the configuration utility, when you view the virtual server persistence sessions, a persistence type setting of DIAMETER is displayed as SOURCE IP.

- Issue ID 0328715: In the configuration utility, the details of the monitor bound to a service do not include response codes for a monitor of type DIAMETER.

- Issue ID 0328844: While configuring the OCSP responder through the configuration utility, the default value of the HTTP response timeout is erroneously taken as 0ms. The default value of the HTTP response timeout must be 2000ms. This issue is observed only in a cluster setup.

  Workaround: You must explicitly set the HTTP response timeout in the configuration utility.

- Issue ID 0329154: In System > Auditing > Recent audit messages, when you set number of audit messages to be displayed to 256 (maximum allowed value), a 'Value entered is out of range' error message is displayed on clicking Refresh. This issue is observed only in a cluster setup.

- Issue ID 0329826: If you use the configuration utility to view the license for features, warning messages are seen for the features that are licensed but not supported. This issue is observed only in a cluster setup.

- Issue ID 0332768: On Internet Explorer 8, the configuration utility does not show the pop-up for installing the JRE plugin.

- Issue ID 0332795: On systems that have JRE 1.6.0_24 and 1.7.0_06, the configuration utility cannot load the Java applet. Therefore, you cannot perform any operations on the configuration utility.

Workaround: Uninstall JRE 1.6.0_24 and 1.7.0_06 and install JRE 1.6.0_31.

- Issue ID 0332876: When you use the configuration utility to change the password of a user, the Change Password dialog displays encrypted password in the Password and Confirm Password fields.
- Issue ID 0333026: On a system running the Windows 7, 64-bit operating system, the configuration utility cannot load the Java applet. Therefore, you cannot perform any operations on the configuration utility.
- Issue ID 0438216: In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

Cloud Gateway

- Issue ID 0327119: When you create policy rules from the configuration utility, an error occurs and the policies are not configured.

Content Switching

- Issue ID 0330290: You cannot use the configuration utility to bind a content switching policy to a content switching virtual server if the policy is configured with only a domain value. The bind fails, and the following error message appears: 'Priority cannot be specified for URL-based content switching policy.'
- Issue ID 0331029: If you use the configuration utility to open a content switching virtual server that has a default policy bound to it, the process fails and the following error message appears: No Such Resource.

Documentation

- Issue ID 0277923: The documentation for the Content Switching feature states that if a policy that is bound to a content switching virtual server evaluates to TRUE, and the policy's Goto expression specifies END, policy evaluation terminates at that policy. However, the documentation does not mention that, if the content switching virtual server has a default virtual server, the request is forwarded to the default load balancing virtual server when policy evaluation is terminated.

Domain Name System

- Issue ID 0291053: Under the following sequence of events, the NetScaler appliance sends the client a cached NXDOMAIN response instead of the IP addresses that are configured in the DNS action for response rewrite:

  1. A security-aware name server sends the appliance a DNSSEC-enabled NXDOMAIN response for a non-existent domain. The appliance, which is designed to not rewrite DNSSEC-enabled responses, relays the negative response to the client without modifying it. The appliance also caches the response.

  2. A client sends the appliance a request for the same domain, but it does not set the DNSSEC OK EDNS header bit.

  This behavior is expected, and ensures that security-aware and security-oblivious clients receive the same response.

- Issue ID 0301348: Even though the NetScaler user interface allows you to create DNS policy labels, the DNS policy label functionality is not supported in this release.

Global Server Load Balancing

- Issue IDs 0287825 and 0287827: If the master node and slave node in a Global Server Load Balancing (GSLB) configuration are running different NetScaler releases, the site synchronization process fails when the master node is collecting GSLB configuration information from the slave node. The issue is specific to NetScaler releases 9.2, 9.3, and 10. The issue occurs if one node (either the master or the slave) is running NetScaler release 10 and the other node is running NetScaler release 9.2 or 9.3.

- Issue ID 0324486: When creating a local GSLB site in the NetScaler configuration utility, if you set the Trigger Monitors option to MEPDOWN, the GSLB site does not appear in the details pane until after you click Refresh.

- Issue ID 0326001: If a GSLB virtual server's primary and backup GSLB methods are both set to round trip time (RTT) or static proximity and source IP persistence is enabled, when the primary GSLB method fails, the backup GSLB method also fails.

  Workaround: If you use RTT or static proximity as the primary GSLB method, do not use the same method as the backup GSLB method.

- Issue ID 0328911: When configuring monitoring for a GSLB service by using the NetScaler configuration utility, if you include monitors that cannot be used with GSLB services (for example, ARP monitors) along with monitors that can be used with GSLB services (for example, TCP monitors), the configuration utility displays an error message for the invalid monitor bindings, but the valid bindings succeed. When you unbind an invalid monitor from the service, the message 'Error' is displayed. No further information is provided in the message.

Load Balancing

- Issue ID 0248750: NetScaler now supports dynamic selection of a load balancing virtual server. The lb virtual server is identified at the run time using an expression in the content switching action.

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the 'show lb persistentSessions' CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n).

- Issue ID 91711/0250846: If the string (or 'token') that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000).BEFORE_STR('string2').AFTER_STR('string1') if the string that is enclosed by 'string1' and 'string2' is not larger than 64 KB.

- Issue ID 94405/0258207: If you specify a persistence rule for a load balancing virtual server without specifying a persistence type or setting the load balancing method to TOKEN, the NetScaler appliance discards the rule without checking its validity. This behavior is by design.

- Issue ID 0324061: When you configure a SIP-UDP load balancing virtual server by using the NetScaler command-line interface, the default setting for persistence type is CALLID. However, when you use the configuration utility to configure a SIP-UDP virtual server, the default setting for persistence type is NONE.

- Issue ID 0330276: The virtual router IDs (VRIDs) that are configured on the NetScaler appliance are not available in the Virtual Router ID list in the Create IP and Configure IP dialog boxes (Network > IPs > Add/Open). Consequently, you cannot use the configuration utility to bind a VRID to a virtual server.

- Issue ID 0351632: A NetScaler nCore appliance uses multiple CPU cores for packet handling. Every session on the appliance is owned by a CPU core. If the appliance receives a request for which a session does not already exist, a session is created, and one of the cores is designated as the owner of that session. Subsequent requests that belong to that session might not always arrive at and be handled by the owner core. In that case, inter-core messaging ensures that the session information on the owner core is always current. However, when a core receives a request that belongs to a persistence session owned by another core, the inter-core messaging does not refresh the timeout value for the persistence session. Consequently, in the output of successively executed show lb persistentSessions commands, which display timeout values from owner cores only, the timeout value for a persistence session might diminish to 0 (zero), even if the persistence session continues to be active.

NetScaler SDX Appliance

- Issue ID 0261232: If you set the date on the Management Service to an earlier date, the inventory and stats are not updated in the Management Service user interface.

  Workaround: Log on to the Management Service by using an SSH client, such as PuTTY. At the shell prompt, type: #/etc/rc.d/svmd restart

Networking

- Issue ID 0276933: When you change the next hop parameter of a PBR for IPv4 traffic, the new hop is taken into account even if you have not applied the PBRs.
- Issue ID 0299716: In a cluster setup, the 'bind vlan' command throws an error when interface and IP address are specified together.

  Workaround: Bind the interface and IP address individually, by using separate 'bind vlan' commands.
- Issue ID 0316144: In a cluster setup, the Precision Time Protocol (PTP) time across cluster nodes will not be synchronized when PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment.

  Workaround:

  - Disable PTP using the command 'set ptp -state disable' and configure NTP to synchronize the time across the cluster nodes.
  - If the backplane switch is like the Extreme switch, disable the multicast PTP packets from reaching the CPU by using the following command (this might cause some relevant features, such as routing, from not working):

    ```
    ipmcforwarding to-cpu off ports 41-48 <backplane-interfaces>
    ```

Rewrite

- Issue ID 0305831: The man pages for add and set rewrite action do not include xpath_html (xp<delimiter>xpath expression<delimiter>) as a search expression.

SSL

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 0327173: The ciphers bound to an SSL virtual server are not displayed in the configuration utility.

System

- Issue ID 0325665: An unrelated error code is displayed on executing the 'set filter prebodyinjection/postbodyinjection' commands.

- Issue ID 0327118: In the configuration utility, the minimum and maximum values allowed for number of audit messages is incorrect. The maximum and minimum values displayed are 255 and 0, but the correct values are 256 and 1.

Web Interface

- Issue ID 0306731: If the Rewrite feature is not enabled, the Enable access through receiver client option for a Web Interface(WI) site does not work. This is because the functionality of the option depends on some rewrite policies on the appliance.

- Issue ID 0315502: The Configuration Utility displays an error message when you try to disable the Web Interface feature.

- Issue ID 0315951: If the Responder feature is not enabled, the Make Site Path Case Insensitive option for a Web Interface(WI) site does not work. This is because the functionality of the option depends on some Responder polies on the appliance.

  Workaround: Enable the Responder feature before you select the Make Site Path Case Insensitive option for a WI site.

- Issue ID 0324373: In the Web Interface (WI) configuration wizard, for a WI site in gateway direct mode, the state of the Enable Access through Receiver Client option is shown selected even when there are no rewrite policies bound to the selected Access Gateway virtual server.

- Issue ID 0331904: In the Web Interface (WI) configuration wizard, the Enable Access through Receiver Client option remain selected even when you try to clear the option.

Enhancement Releases

This section describes the enhancements, changes, bug fixes, and known issues provided in the enhancement releases of the Citrix® NetScaler® and Citrix® NetScaler® SDX.

Build 75.7007.e

Release version: Citrix NetScaler release 10.e build 75.7007.e

Replaces build: None

Release date: July 2013

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Bug Fixes
- Known Issues and Workarounds

Note:

- This release is based on Citrix NetScaler release 10 build 75.7. The release notes are available in the Build 75.7 section on Citrix eDocs.
- The enhancements, bug fixes, and known issues in this release apply to Citrix NetScaler 10.e nCore™.

Enhancements

CloudBridge Release 7.0

- To learn about the enhancements in CloudBridge Release 7.0, see the "Enhancements" section of the CloudBridge 7.0 release notes at Citrix CloudBridge 7.0 Release Notes.

Bug Fixes

AAA Application Traffic

- Issue ID 0372362: When Kerberos Constrained Delegation is configured with a content switching virtual server, the NetScaler appliance might hang or crash. The cause is a GET request with multiple authorization headers. (Only one authorization header is expected.)

- Issue ID 0387076: On a NetScaler appliance with AAA enabled and Kerberos Constrained Delegation single sign-on configured, after several single sign-on requests are successfully authenticated, the virtual server principle can unexpectedly become blank. When this happens, subsequent authentication requests fail.

Known Issues and Workarounds

Application Firewall

- Issue ID 0363711: On a NetScaler appliance that has AAA, Kerberos authentication, KCD, and MSSQL monitor enabled, each monitor probe causes a memory leak that eventually results in the NetScaler appliance experiencing an out-of-memory condition that requires a restart to clear.

NetScaler VPX on AWS

- Issue ID 0337614: Custom scriptable monitors do not work on NetScaler VPX on AWS.
- Issue ID 0340395: While configuring HA between two VPX instances in AWS, if you first configure HA on the VPX instance with a single ENI, HA configuration does not work as expected.

  Workaround: Configure the instance with two or more ENIs before configuring HA on the instance with one ENI.
- Issue ID 0344678: If you remove HA configuration from the primary instance first, HA configuration is not removed and causes the primary instance to reboot.

  Workaround: Remove HA configuration from the secondary instance first before removing HA configuration from the primary instance.
- Issue ID 0346689: In INC mode, HA configuration between two NetScaler VPX instances in AWS does not work properly.

Networking

- Issue ID 0331220: In a stateless NAT46 configuration, the NetScaler appliance translates corrupted ICMPv4 error messages instead of dropping them.
- Issue ID 0334959: When configuring an INAT rule for stateless NAT46 translation, the NetScaler appliance accepts a VIP address for the Public IPv4 parameter even if the VIP is already set for a non-wildcard load balancing virtual server.
- Issue ID 0336393: In a stateless NAT46 configuration, the NetScaler appliance sets an incorrect value for the MTU field of the translated ICMPv4 messages when the appliance receives ICMPv6 'packet too big' error messages that have dummy fragment headers.

Build 74.4006.e

Release version: Citrix NetScaler release 10.e build 74.4006.e

Replaces build: None

Release date: April 2013

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Known Issues and Workarounds

Note:

- This release is based on Citrix NetScaler release 10 build 74.4. The release notes are available in the Build 74.4 section on Citrix eDocs.
- The enhancements and known issues in this release apply to Citrix NetScaler 10.e nCore™.

Enhancements

Offload DNSSEC Operations to the NetScaler Appliance

- Issue IDs 0246717 and 0249691: For DNS zones for which your DNS servers are authoritative, you can offload DNSSEC operations to the NetScaler appliance. When a DNS server sends a response, the appliance signs the response on the fly before relaying it to the client. The appliance also caches the signed response. Apart from reducing the load on the DNS servers, offloading DNSSEC operations to the appliance gives you the following benefits:

  - You can sign records that the DNS servers generate programmatically. Such records cannot be signed by routine zone signing operations performed on the DNS servers.

  - You can serve signed responses to clients even if you have not implemented DNSSEC on your servers.

  To configure DNSSEC offloading for a zone, you add the zone to the NetScaler appliance and set the zone's Proxy Mode and DNSSEC Offload parameters to YES and ENABLED, respectively. Optionally, you configure NSEC record generation for that zone.

  To enable DNSSEC offload for a zone by using the NetScaler command line

  At the NetScaler command line, type:

  add dns zone <zoneName> **-proxyMode YES -dnssecOffload ENABLED [-nsec (ENABLED | DISABLED)]**

  To enable DNSSEC offload for a zone by using the configuration utility

  1. In the navigation pane, expand DNS, and then click Zones.

  2. In the details pane, do one of the following:

     - To create a zone on the appliance, click Add.

     - To configure DNSSEC offloading for an existing zone, click the zone, and then click Open.

  3. In the Create DNS Zone or Configure DNS Zone dialog box, select the Proxy Mode and DNSSEC Offload check boxes.

  4. Optionally, if you want the NetScaler appliance to generate NSEC records for the zone, select the NSEC check box.

  5. Click OK.

  You must also generate DNS keys for the zone, add the keys to the zone, and then sign the zone with the keys. These configuration tasks are the same as the tasks you perform for configuring DNSSEC on the NetScaler appliance.

  After you configure DNS offload, you must flush the DNS cache on the appliance. Flushing the DNS cache ensure that any unsigned records in the cache are removed and subsequently replaced by signed records.

  Note: DNSSEC offload is supported on all NetScaler MPX platforms, except the NetScaler MPX 9700/10500/12500/15500 FIPS platform. The feature is also supported on NetScaler VPX appliances hosted on NetScaler SDX platforms.

DNSSEC offload is not supported in a NetScaler cluster.

Known Issues and Workarounds

Application Firewall

- Issue ID 0363711: On a NetScaler appliance that has AAA, Kerberos authentication, KCD, and MSSQL monitor enabled, each monitor probe causes a memory leak that eventually results in the NetScaler appliance experiencing an out-of-memory condition that requires a restart to clear.

Domain Name System

- Issue ID 0376662: The NetScaler appliance might fail in the following scenario:
  - You have configured DNSSEC offload and enabled NSEC record generation for a zone on the appliance.
  - The appliance receives a DNS NODATA/NXDOMAIN query for that zone, over TCP, and the DNSSEC OK bit in the query is set.

NetScaler VPX on AWS

- Issue ID 0337614: Custom scriptable monitors do not work on NetScaler VPX on AWS.
- Issue ID 0340395: While configuring HA between two VPX instances in AWS, if you first configure HA on the VPX instance with a single ENI, HA configuration does not work as expected.

  Workaround: Configure the instance with two or more ENIs before configuring HA on the instance with one ENI.
- Issue ID 0344678: If you remove HA configuration from the primary instance first, HA configuration is not removed and causes the primary instance to reboot.

  Workaround: Remove HA configuration from the secondary instance first before removing HA configuration from the primary instance.
- Issue ID 0346689: In INC mode, HA configuration between two NetScaler VPX instances in AWS does not work properly.

Networking

- Issue ID 0331220: In a stateless NAT46 configuration, the NetScaler appliance translates corrupted ICMPv4 error messages instead of dropping them.
- Issue ID 0334959: When configuring an INAT rule for stateless NAT46 translation, the NetScaler appliance accepts a VIP address for the Public IPv4 parameter even if the VIP is already set for a non-wildcard load balancing virtual server.
- Issue ID 0336393: In a stateless NAT46 configuration, the NetScaler appliance sets an incorrect value for the MTU field of the translated ICMPv4 messages when the appliance receives ICMPv6 'packet too big' error messages that have dummy fragment headers.

Build 73.5002.e

Release version: Citrix® NetScaler® release 10.e build 73.5002.e

Replaces build: None

Release date: March 2013

Release notes version: 2.0

Language supported: English (US)

Review the following sections:

- Bug Fixes
- Known Issues and Workarounds

Note:

- This release is based on Citrix NetScaler release 10 build 73.5. The release notes are available in the Build 73.5 section on Citrix eDocs.
- The bug fixes and known issues in this release apply to Citrix NetScaler 10.e nCore™.

Bug Fixes

AAA Application Traffic

- Issue ID 0349418: The NetScaler appliance now supports the exclusive normalization method with SAML. For that reason, assertions posted by any SAML 2.0 compliant IDP (such as the Pingone IDP server or Oracle ID server) are now handled correctly.

NetScaler SDX Appliance

- Issue ID 0367461: If a NetScaler VPX instance provisioned on a NetScaler SDX appliance is upgraded to release 10.0 build 71.6014.e or release 10.0 build 72.5005.e, all existing LA channels, and any new channels that you create, acquire the same, incorrect, MAC address. As a result, the services might go down and you might not be able to access the VPX instance by using the NetScaler IP (NSIP) address.

Known Issues and Workarounds

Application Firewall

- Issue ID 0363711: On a NetScaler appliance that has AAA, Kerberos authentication, KCD, and MSSQL monitor enabled, each monitor probe causes a memory leak that eventually results in the NetScaler appliance experiencing an out-of-memory condition that requires a restart to clear.

NetScaler VPX on AWS

- Issue ID 0337614: Custom scriptable monitors do not work on NetScaler VPX on AWS.
- Issue ID 0340395: While configuring HA between two VPX instances in AWS, if you first configure HA on the VPX instance with a single ENI, HA configuration does not work as expected.

  Workaround: Configure the instance with two or more ENIs before configuring HA on the instance with one ENI.
- Issue ID 0344678: If you remove HA configuration from the primary instance first, HA configuration is not removed and causes the primary instance to reboot.

  Workaround: Remove HA configuration from the secondary instance first before removing HA configuration from the primary instance.
- Issue ID 0346689: In INC mode, HA configuration between two NetScaler VPX instances in AWS does not work properly.

Networking

- Issue ID 0331220: In a stateless NAT46 configuration, the NetScaler appliance translates corrupted ICMPv4 error messages instead of dropping them.
- Issue ID 0334959: When configuring an INAT rule for stateless NAT46 translation, the NetScaler appliance accepts a VIP address for the Public IPv4 parameter even if the VIP is already set for a non-wildcard load balancing virtual server.
- Issue ID 0336393: In a stateless NAT46 configuration, the NetScaler appliance sets an incorrect value for the MTU field of the translated ICMPv4 messages when the appliance receives ICMPv6 'packet too big' error messages that have dummy fragment headers.

Build 72.5005.e

Release version: Citrix® NetScaler® release 10.e build 72.5005.e

Replaces build: None

Release date: January 2013

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Bug Fixes
- Known Issues and Workarounds

Note:

- This release is based on Citrix NetScaler release 10 build 72.5. The release notes are available in the Build 72.5 section on Citrix eDocs.
- The enhancements, bug fixes, and known issues in this release apply to Citrix NetScaler 10.e nCore™.

Enhancements

GUI Support for Kerberos Protocol Transition and Constrained Delegation

- Issue ID 0288056: Kerberos Protocol Transition (KPT) and Kerberos Constrained Delegation (KCD) can now be configured by using the configuration utility as well as the NetScaler command line.

KCD Support for Microsoft SQL Data Stream

- Issue IDs 0307491 and 0329542: Kerberos Constrained Delegation (KCD) is now supported for the Microsoft SQL server and the MSSQL data stream.

Bug Fixes

AAA Application Traffic

- Issue ID 0325382: To configure Kerberos-Constrained Delegation (KCD) on a NetScaler appliance with AAA-TM enabled, the appliance must be part of the authentication server's domain. You can add the appliance to that domain by creating a negotiate policy as if a client-side negotiation were intended, or by using the Likewise domainjoin command.

- Issue ID 0354718: On a NetScaler appliance that has AAA and Kerberos Constrained Delegation (KCD) enabled, if you configure a service without first configuring the associated server, the appliance might hang.

Known Issues and Workarounds

Application Firewall

- Issue ID 0363711: On a NetScaler appliance that has AAA, Kerberos authentication, KCD, and MSSQL monitor enabled, each monitor probe causes a memory leak that eventually results in the NetScaler appliance experiencing an out-of-memory condition that requires a restart to clear.

NetScaler VPX on AWS

- Issue ID 0337614: Custom scriptable monitors do not work on NetScaler VPX on AWS.
- Issue ID 0340395: While configuring HA between two VPX instances in AWS, if you first configure HA on the VPX instance with a single ENI, HA configuration does not work as expected.

  Workaround: Configure the instance with two or more ENIs before configuring HA on the instance with one ENI.
- Issue ID 0344678: If you remove HA configuration from the primary instance first, HA configuration is not removed and causes the primary instance to reboot.

  Workaround: Remove HA configuration from the secondary instance first before removing HA configuration from the primary instance.
- Issue ID 0346689: In INC mode, HA configuration between two NetScaler VPX instances in AWS does not work properly.

Networking

- Issue ID 0331220: In a stateless NAT46 configuration, the NetScaler appliance translates corrupted ICMPv4 error messages instead of dropping them.
- Issue ID 0334959: When configuring an INAT rule for stateless NAT46 translation, the NetScaler appliance accepts a VIP address for the Public IPv4 parameter even if the VIP is already set for a non-wildcard load balancing virtual server.
- Issue ID 0336393: In a stateless NAT46 configuration, the NetScaler appliance sets an incorrect value for the MTU field of the translated ICMPv4 messages when the appliance receives ICMPv6 'packet too big' error messages that have dummy fragment headers.

Build 71.6016.e

Release version: Citrix® NetScaler® release 10.e build 71.6016.e

Replaces build: None

Release date: December 2012

Release notes version: 2.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Known Issues and Workarounds

Note:

- This release is based on Citrix NetScaler release 10 build 71.6. The release notes are available in the Build 71.6 section on Citrix eDocs.
- The enhancements and known issues in this release apply to Citrix NetScaler 10.e nCore™.

Enhancements

AutoScale: Automatically Scaling Your Application Fleet in a CloudPlatform Environment

- Issue ID 0311703: In an environment deployed and managed by using Citrix® CloudPlatform, automatic scaling of an application fleet can be achieved by using the Citrix® NetScaler® appliance. CloudPlatform provides a feature called AutoScale, as part of its elastic load balancing feature. A CloudPlatform user can use the AutoScale feature to specify thresholds for various conditions for automatically scaling the application fleet upward and downward. The scale up and scale down conditions can vary from simple use cases, such as a server's CPU usage, to complex use cases, such as a combination of a server's CPU usage and responsiveness. CloudPlatform, in turn, configures the NetScaler appliance to load balance traffic to the application virtual machines (VMs), monitor application thresholds and performance, and trigger scale up and scale down actions to add or remove VMs from the application fleet.

  For more information about how AutoScale works on the NetScaler appliance, see http://support.citrix.com/proddocs/topic/ns-system-10-map/ns-autoscale-automatic-scaling-in-cloudplatform-env-wrapper-con.html.

  For answers to frequently asked questions, see http://support.citrix.com/proddocs/topic/ns-faq-map/ns-faq-autoscale-ref.html.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0325382: To configure Kerberos-Constrained Delegation (KCD) on a NetScaler appliance with AAA-TM enabled, the appliance must be part of the authentication server's domain. You can add the appliance to that domain by creating a negotiate policy as if a client-side negotiation were intended, or by using the Likewise 'domainjoin' command.

  1. To create a negotiate policy, at the NetScaler command prompt type the following commands:

     > add authentication negotiateAction <negActionName> -domain <domain> -domainUser <domainuse
     > add authentication negotiatePolicy <negPolName> ns_true <negActionName>

     For <negActionName>, substitute a name for the negotiation action. For <domain>, substitute the domain of the authentication server. For <domainuser>, substitute the user name for logging on. For <passwd>, substitute the password for that user name. For <negPolName>, substitute a name for the negotiation policy.
  2. To use the Likewise 'domainjoin' command, at the NetScaler command prompt type the following commands to open a shell and then run domainjoin:

     > shell
     # /opt/likewise/bin/domainjoin-cli join <domain> <domainuser>

     For <domain>, substitute the domain of the authentication server. For <domainuser>, substitute the user name that is used to log on to the domain.

NetScaler VPX on AWS

- Issue ID 0337614: Custom scriptable monitors do not work on NetScaler VPX on AWS.
- Issue ID 0340395: While configuring HA between two VPX instances in AWS, if you first configure HA on the VPX instance with a single ENI, HA configuration does not work as expected.

  Workaround: Configure the instance with two or more ENIs before configuring HA on the instance with one ENI.
- Issue ID 0344678: If you remove HA configuration from the primary instance first, HA configuration is not removed and causes the primary instance to reboot.

  Workaround: Remove HA configuration from the secondary instance first before removing HA configuration from the primary instance.
- Issue ID 0346689: In INC mode, HA configuration between two NetScaler VPX instances in AWS does not work properly.

Networking

- Issue ID 0331220: In a stateless NAT46 configuration, the NetScaler appliance translates corrupted ICMPv4 error messages instead of dropping them.
- Issue ID 0334959: When configuring an INAT rule for stateless NAT46 translation, the NetScaler appliance accepts a VIP address for the Public IPv4 parameter even if the VIP is already set for a non-wildcard load balancing virtual server.
- Issue ID 0336393: In a stateless NAT46 configuration, the NetScaler appliance sets an incorrect value for the MTU field of the translated ICMPv4 messages when the appliance receives ICMPv6 'packet too big' error messages that have dummy fragment headers.

Build 71.6008.e

Release version: Citrix® NetScaler® release 10.e build 71.6008.e

Replaces build: None

Release date: November 2012

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Known Issues and Workarounds

Note:

- This release is based on Citrix NetScaler release 10 build 71.6. The release notes are available in the Build 71.6 section on Citrix eDocs.
- The enhancements and known issues in this release apply to Citrix NetScaler 10.e nCore™.

Enhancements

NetScaler VPX on AWS

- Issue ID 0248904: You can now launch an instance of Citrix® NetScaler® VPX within Amazon Web Services (AWS). NetScaler VPX is available as an Amazon Machine Image (AMI) from AWS Marketplace. NetScaler VPX on AWS enables customers to leverage AWS Cloud computing capabilities and use NetScaler load balancing and traffic management features for their business needs. NetScaler VPX on AWS supports all the traffic management features of a physical NetScaler appliance. NetScaler VPX instances running in AWS can be deployed in standalone mode or in pairs for High Availability (HA) setup.

  Note: The NetScaler AMI launches on Windows EC2 instance types because it runs as a hardware virtual machine (HVM). HVM is currently available on Windows EC2 instances. The Windows OS is not running and is not used in any way.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0325382: To configure Kerberos-Constrained Delegation (KCD) on a NetScaler appliance with AAA-TM enabled, the appliance must be part of the authentication server's domain. You can add the appliance to that domain by creating a negotiate policy as if a client-side negotiation were intended, or by using the Likewise 'domainjoin' command.

  1. To create a negotiate policy, at the NetScaler command prompt type the following commands:

     > add authentication negotiateAction <negActionName> -domain <domain> -domainUser <domainuse
     > add authentication negotiatePolicy <negPolName> ns_true <negActionName>

     For <negActionName>, substitute a name for the negotiation action. For <domain>, substitute the domain of the authentication server. For <domainuser>, substitute the user name for logging on. For <passwd>, substitute the password for that user name. For <negPolName>, substitute a name for the negotiation policy.
  2. To use the Likewise 'domainjoin' command, at the NetScaler command prompt type the following commands to open a shell and then run domainjoin:

     > shell
     # /opt/likewise/bin/domainjoin-cli join <domain> <domainuser>

     For <domain>, substitute the domain of the authentication server. For <domainuser>, substitute the user name that is used to log on to the domain.

NetScaler VPX on AWS

- Issue ID 0337614: Custom scriptable monitors do not work on NetScaler VPX on AWS.
- Issue ID 0340395: While configuring HA between two VPX instances in AWS, if you first configure HA on the VPX instance with a single ENI, HA configuration does not work as expected.

  Workaround: Configure the instance with two or more ENIs before configuring HA on the instance with one ENI.
- Issue ID 0344678: If you remove HA configuration from the primary instance first, HA configuration is not removed and causes the primary instance to reboot.

  Workaround: Remove HA configuration from the secondary instance first before removing HA configuration from the primary instance.
- Issue ID 0346689: In INC mode, HA configuration between two NetScaler VPX instances in AWS does not work properly.

Networking

- Issue ID 0331220: In a stateless NAT46 configuration, the NetScaler appliance translates corrupted ICMPv4 error messages instead of dropping them.
- Issue ID 0334959: When configuring an INAT rule for stateless NAT46 translation, the NetScaler appliance accepts a VIP address for the Public IPv4 parameter even if the VIP is already set for a non-wildcard load balancing virtual server.
- Issue ID 0336393: In a stateless NAT46 configuration, the NetScaler appliance sets an incorrect value for the MTU field of the translated ICMPv4 messages when the appliance receives ICMPv6 'packet too big' error messages that have dummy fragment headers.

Build 70.7012.e

Release version: Citrix® NetScaler® release 10.e build 70.7012.e

Replaces build: None

Release date: November 2012

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Bug Fixes
- Known Issues and Workarounds

Note:

- This release is based on Citrix NetScaler release 10 build 70.7. The release notes are available in the Build 70.7 section on Citrix eDocs.
- The enhancements, bug fixes, and known issues in this release apply to Citrix NetScaler 10.e nCore™.

Enhancements

Kerberos Constrained Delegation (KCD) Support

- Issue ID 0288056: The AAA-TM feature now supports the constrained delegation feature of the Kerberos version 5 authentication protocol (KCD). KCD allows you to configure the list of services that a Kerberos user can access after authentication.

Bug Fixes

AAA Application Traffic

- Issue ID 0327102: On a NetScaler appliance with AAA-TM enabled and Kerberos-constrained delegation (KCD) configured, if the first request after authentication is not a 401-based request, KCD can fail. If KCD fails, the individual resource that the user requested prompts the user to re-enter their credentials. The user can either re-enter the credentials as prompted, or can simply cancel the request and then request the resource a second time. In either case, the user can access the resource.

- Issue ID 0328546: On a NetScaler appliance with AAA-TM enabled and Kerberos-constrained delegation (KCD) configured, under heavy load intermittent failures of KCD can cause individual resources to prompt users to re-enter their credentials.

- Issue ID 0329020: On a NetScaler appliance with AAA-TM enabled and Kerberos-constrained delegatino (KCD) configured, after upgrading the NetScaler operating system to version 10.0.9.45, KCD does not start properly.

- Issue ID 0329280: On a NetScaler appliance with AAA-TM enabled and Kerberos-constrained delegation (KCD) configured, if you change the authentication method on the traffic management virtual server from form-based to 401-based authentication, this might cause intermittent hangs or crashes.

Known Issues and Workarounds

AAA Application Traffic

- Issue ID 0325382: To configure Kerberos-Constrained Delegation (KCD) on a NetScaler appliance with AAA-TM enabled, the appliance must be part of the authentication server's domain. You can add the appliance to that domain by creating a negotiate policy as if a client-side negotiation were intended, or by using the Likewise "domainjoin" command.

  1. To create a negotiate policy, at the NetScaler command prompt type the following commands:

     > add authentication negotiateAction <negActionName> -domain <domain> -domainUser <domainuse
     > add authentication negotiatePolicy <negPolName> ns_true <negActionName>

     For <negActionName>, substitute a name for the negotiation action. For <domain>, substitute the domain of the authentication server. For <domainuser>, substitute the user name for logging on. For <passwd>, substitute the password for that user name. For <negPolName>, substitute a name for the negotiation policy.
  2. To use the Likewise "domainjoin" command, at the NetScaler command prompt type the following commands to open a shell and then run domainjoin:

     > shell
     # /opt/likewise/bin/domainjoin-cli join <domain> <domainuser>

     For <domain>, substitute the domain of the authentication server. For <domainuser>, substitute the user name that is used to log on to the domain.

Networking

- Issue ID 0331220: In a stateless NAT46 configuration, the NetScaler appliance translates corrupted ICMPv4 error messages instead of dropping them.

- Issue ID 0334959: When configuring an INAT rule for stateless NAT46 translation, the NetScaler appliance accepts a VIP address for the Public IPv4 parameter even if the VIP is already set for a non-wildcard load balancing virtual server.

- Issue ID 0336393: In a stateless NAT46 configuration, the NetScaler appliance sets an incorrect value for the MTU field of the translated ICMPv4 messages when the appliance receives ICMPv6 'packet too big' error messages that have dummy fragment headers.

Build 70.7002.e

Release version: Citrix® NetScaler® release 10.e build 70.7002.e

Replaces build: None

Release date: September 2012

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Known Issues and Workarounds

Note:

- This release is based on Citrix NetScaler release 10 build 70.7. The release notes are available in the Build 70.7 section on Citrix eDocs.
- The enhancements and known issues in this release apply to Citrix NetScaler 10.e nCore™.

Enhancements

Stateless NAT46 Translation

- Issue ID 0284926: The stateless NAT46 feature enables the communication between IPv4 and IPv6 networks by way of IPv4 to IPv6 packet translation and vice versa without maintaining any session information on the NetScaler appliance.

  A stateless NAT46 configuration on the NetScaler appliance has the following components:

  - **IPv4-IPv6 INAT entry**. An entry defining a 1:1 relationship between a public IPv4 address and an IPv6 address. In other words, a public IPv4 address on the appliance listens to connection requests on behalf of an IPv6 server

  - **NAT46 IPv6 prefix**. A global IPv6 prefix of length 96 bits (128-32=96) configured on the appliance. During IPv4 packet to IPv6 packet translation, the appliance sets the source IP address of the translated IPv6 packet to a concatenation of the NAT46 IPv6 prefix [96 bits] and the IPv4 source address [32 bits] that was received in the request packet.

  For more information, see Stateless NAT46 Translation.

Known Issues and Workarounds

Networking

- Issue ID 0331220: In a stateless NAT46 configuration, the NetScaler appliance translates corrupted ICMPv4 error messages instead of dropping them.
- Issue ID 0334959: When configuring an INAT rule for stateless NAT46 translation, the NetScaler appliance accepts a VIP address for the Public IPv4 parameter even if the VIP is already set for a non-wildcard load balancing virtual server.
- Issue ID 0336393: In a stateless NAT46 configuration, the NetScaler appliance sets an incorrect value for the MTU field of the translated ICMPv4 messages when the appliance receives ICMPv6 'packet too big' error messages that have dummy fragment headers.

FAQs

AppFlow

Which build of NetScaler supports AppFlow?

AppFlow is supported on NetScaler appliances running version 9.3 and above with nCore build.

What is the format used by AppFlow to transmit data?

AppFlow transmits information in the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information.

What do AppFlow records contain?

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response-status codes, server response time, and latency). IPFIX flow records are based on templates that must be sent before sending flow records.

After an upgrade to NetScaler Version 9.3 Build 48.6 Cl, why does an attempt to open a virtual server from the GUI result in the error message "The AppFlow feature is only available on Citrix Netscaler Ncore"

AppFlow is supported only on nCore appliances. When you open the virtual server configuration tab, clear the **AppFlow** checkbox.

What does the transaction ID in an AppFlow records contain?

A transaction ID is an unsigned 32-bit number identifying an application-level transaction. For HTTP, a transaction corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. A typical transaction has four uniflow records. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for the transaction.

What is an AppFlow action ?

An Appflow action is a set of collectors to which the flow records are sent if the associated AppFlow policy matches.

What commands can I run on the NetScaler appliance to verify that the AppFlow action is a hit?

The show appflow action. For example:

```
> show appflow action
1)      Name: aFL-act-collector-1
```

Collectors: collector-1
Hits: 0
Action Reference Count: 2

2) Name: apfl-act-collector-2-and-3
Collectors: collector-2, collecter-3
Hits: 0
Action Reference Count: 1

3) Name: apfl-act-collector-1-and-3
Collectors: collector-1, collecter-3
Hits: 0
Action Reference Count: 1

What is an AppFlow collector?

A collector receives flow records generated by the NetScaler appliance. To be able to send flow records, you must specify at least one collector. You can specify up to four. You can remove unused collectors.

What NetScaler verison is required for using AppFlow?

Use NetScaler version 9.3.49.5 or higher, and remember that AppFlow is available in only the nCore builds.

What transport protocol does AppFlow use?

AppFlow uses UDP as the transport protocol.

What ports needs to be opened if I have a firewall in the network?

Port 4739. It is the default UDP port the AppFlow collector uses for listening on IPFIX messages. If the user changes the default port, that port should be opened on the firewall.

How can I change the default port AppFlow uses?

When you add an AppFlow collector by using the add appflowCollector command, you can specify the port to be used.

```
> add appflowCollector coll1 -IPAddress
10.102.29.251 -port 8000
 Done
```

What does setting clientTrafficOnly do?

NetScaler generates AppFlow records only for client-side traffic.

How many collectors can be configured at a time?

You can configure up to four AppFlow collectors at a time on the NetScaler appliance. Please note that the maximum number of collectors that can be configured on a NetScaler appliance is four.

AppFlow

Which build of NetScaler supports AppFlow?

AppFlow is supported on NetScaler appliances running version 9.3 and above with nCore build.

What is the format used by AppFlow to transmit data?

AppFlow transmits information in the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information.

What do AppFlow records contain?

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response-status codes, server response time, and latency). IPFIX flow records are based on templates that must be sent before sending flow records.

After an upgrade to NetScaler Version 9.3 Build 48.6 Cl, why does an attempt to open a virtual server from the GUI result in the error message "The AppFlow feature is only available on Citrix Netscaler Ncore"

AppFlow is supported only on nCore appliances. When you open the virtual server configuration tab, clear the **AppFlow** checkbox.

What does the transaction ID in an AppFlow records contain?

A transaction ID is an unsigned 32-bit number identifying an application-level transaction. For HTTP, a transaction corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. A typical transaction has four uniflow records. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for the transaction.

What is an AppFlow action ?

An Appflow action is a set of collectors to which the flow records are sent if the associated AppFlow policy matches.

What commands can I run on the NetScaler appliance to verify that the AppFlow action is a hit?

The show appflow action. For example:

```
> show appflow action
1)      Name: aFL-act-collector-1
```

Collectors: collector-1
Hits: 0
Action Reference Count: 2

2) Name: apfl-act-collector-2-and-3
Collectors: collector-2, collecter-3
Hits: 0
Action Reference Count: 1

3) Name: apfl-act-collector-1-and-3
Collectors: collector-1, collecter-3
Hits: 0
Action Reference Count: 1

What is an AppFlow collector?

A collector receives flow records generated by the NetScaler appliance. To be able to send flow records, you must specify at least one collector. You can specify up to four. You can remove unused collectors.

What NetScaler verison is required for using AppFlow?

Use NetScaler version 9.3.49.5 or higher, and remember that AppFlow is available in only the nCore builds.

What transport protocol does AppFlow use?

AppFlow uses UDP as the transport protocol.

What ports needs to be opened if I have a firewall in the network?

Port 4739. It is the default UDP port the AppFlow collector uses for listening on IPFIX messages. If the user changes the default port, that port should be opened on the firewall.

How can I change the default port AppFlow uses?

When you add an AppFlow collector by using the add appflowCollector command, you can specify the port to be used.

```
> add appflowCollector coll1 -IPAddress
10.102.29.251 -port 8000
 Done
```

What does setting clientTrafficOnly do?

NetScaler generates AppFlow records only for client-side traffic.

How many collectors can be configured at a time?

You can configure up to four AppFlow collectors at a time on the NetScaler appliance. Please note that the maximum number of collectors that can be configured on a NetScaler appliance is four.

AutoScale

Note: The AutoScale feature is supported only on NetScaler 10.e.

What are the prerequisites for setting up AutoScale?

For prerequisites for setting up AutoScale, see "Prerequisites".

Can the CloudPlatform AutoScale feature be used without a NetScaler appliance?

No. The NetScaler appliance is currently required for the AutoScale feature to work. If the CloudPlatform administrator configures AutoScale in a network that does not include a NetScaler appliance, CloudPlatform throws an error.

What happens if the AutoScale feature is used with a NetScaler release that does not support AutoScale?

If the AutoScale feature is used with a NetScaler release that does not support AutoScale, the CloudPlatform user interface throws an error. CloudPlatform also writes a message to the log file, indicating that the configured NetScaler does not support AutoScale.

What versions of CloudPlatform and NetScaler should I use to implement AutoScale?

For information about NetScaler releases that support AutoScale, see Supported Environment.

In a load balancing rule, can manually provisioned virtual machine instances coexist with instances provisioned by the AutoScale feature?

No. The CloudPlatform virtual machine group in a load balancing rule can contain only manually provisioned instances or only instances provisioned by the AutoScale feature. They cannot coexist.

Is there a limit on the number of virtual machine instances to which we can scale up by using AutoScale?

Yes. The CloudPlatform administrator specifies the maximum number of members to which the configuration can scale up. When the limit is reached, virtual machines are not provisioned even if the scale-up condition is satisfied. The upper limit prevents uncontrolled spawning of VMs due to misconfiguration of the AutoScale feature or unexpected load conditions.

Are AutoScale events observable?

The events generated for deploying or destroying virtual machines are observable. These events are logged in the NetScaler logs (ns.log) and in the CloudPlatform logs (management-server.log). However, you cannot observe the metric values collected by NetScaler monitors.

What metrics can be used in AutoScale policies?

In an AutoScale policy, you can use any metric that is exposed through SNMP, or any NetScaler statistics associated with the load balancing virtual server used in the AutoScale configuration. For example, you can use metrics associated with CPU, memory, or disk usage, and NetScaler metrics such as throughput or response time.

What should a CloudPlatform administrator do before performing maintenance tasks on a CloudPlatform network in which AutoScale is configured?

The CloudPlatform administrator should disable the AutoScale configuration from the CloudPlatform user interface. Disabling the AutoScale configuration temporarily disables any scale-up or scale-down events. However, disabling AutoScale for an application, in CloudPlatform, does not affect the ability of the NetScaler appliance to serve traffic to existing virtual machines.

With AutoScale configured, are any configured VM limits enforced on the user account?

The NetScaler appliance works in the context of an AutoScale user account. Therefore, any limits that the CloudPlatform administrator has imposed on the number of VMs that can be created by the account are automatically enforced when the NetScaler appliance attempts to create more VMs than are permitted.

Is AutoScale supported in a high availability (HA) NetScaler pair?

No. Currently, HA mode is not supported for AutoScale.

Call Home

What is the Call Home feature on a NetScaler appliance?

The Call Home feature registers your NetScaler appliance with the Citrix Technical Support server (TaaS) and monitors the appliance for common error conditions. If your appliance is successfully registered with TaaS server, Call Home automatically uploads system debug data to that server in the event that one of the conditions occurs. The appliance keeps a full log of all upload events. If you are unable to correct the problem after reviewing the appliance's log, you can contact the Citrix Technical Support team and open a service request. The team can analyze the uploaded system data and recommend possible solutions.

Which release of NetScaler Software supports Call Home?

Release 10 and later.

Does Call Home support monitoring of any error conditions in a NetScaler virtual appliance?

No. Call Home does not currently support monitoring of virtual appliances.

Which NetScaler hardware models support Call Home?

Any NetScaler MPX appliance running release 10 or later of the NetScaler software supports Call Home.

Do you need a separate license for Call Home?

No. The Call Home feature does not require a separate license. It is available with all NetScaler platform licenses.

Does Call Home support monitoring of cluster events or error conditions?

No. Call Home does not currently support monitoring of NetScaler clusters.

What error conditions does Call Home monitor in a NetScaler appliance?

Call Home supports monitoring of the following events in a NetScaler appliance:

- Compact flash drive errors
- Hard disk drive errors
- Power supply unit failure
- SSL card failure
- Warm restart

What mechanism does Call Home use to upload the Call Home tar file to TaaS?

Call Home uses the HTTPS protocol to upload the Call Home tar file.

Does Call Home support automatic Technical Support service request creation?

No. You have to contact the Citrix Technical Support team to open a service request.

What is the frequency of Call Home tar file uploads to TaaS?

Call Home creates the Call Home tar file and uploads it to the Citrix Technical Support server (TaaS) upon first occurrence of a particular error condition since the appliance was last started. That is, a reoccurrence of same error condition does not trigger another upload unless the appliance was rebooted after the previous occurrence.

Must I configure SNMP for Call Home to monitor error conditions?

No. Call Home creates and uploads a Call Home tar file for the first occurrence of a monitored error condition since the appliance was last started. If you want to be alerted each time the error condition occurs, you can configure the corresponding SNMP alarm for the error condition.

Clustering FAQs

How many NetScaler appliances can I have in a cluster?

A NetScaler cluster can include as few as 2 or as many as 32 NetScaler nCore hardware or virtual appliances.

Can a cluster have NetScaler appliances from different networks?

No. The current cluster implementation requires that all cluster nodes be in the same network.

Can a NetScaler appliance be a part of multiple clusters?

No. An appliance can belong to only one cluster.

How can I set the hostname for a cluster node?

The hostname of a cluster node must be specified by executing the set ns hostname command through the cluster IP address. For example, to set the hostname of the cluster node with ID 2, the command is:

> set ns hostname hostName1 -ownerNode 2

What is a cluster IP address? What is its subnet mask?

The cluster IP address is the management address of a NetScaler cluster. All cluster configurations must be performed by accessing the cluster through this address. The subnet mask of the cluster IP address is fixed at 255.255.255.255.

Can I automatically detect NetScaler appliances so that I can add them to a cluster?

Yes. The configuration utility allows you to discover appliances that are present in the same subnet as the NSIP address of the configuration coordinator. For more information, see "Discovering NetScaler Appliances".

Why are the network interfaces of a cluster represented in 3-tuple (n/u/c) notation instead of the regular 2-tuple (u/c) notation?

When an appliance is part of a cluster, you must be able to identify the node to which the network interface belongs. Therefore, the network interface naming convention for cluster nodes is modified from u/c to n/u/c, where n denotes the node Id.

I have multiple standalone appliances, each of which has different configurations. Can I add them to a single cluster?

Yes. You can add appliances that have different configurations to a single cluster. However, when the appliance is added to the cluster, the existing configurations are cleared. To use the configurations that are available on each of the individual appliances, you must:

1. Create a single *.conf file for all the configurations.

2. Edit the configuration file to remove features that are not supported in a cluster environment.

3. Update the naming convention of interfaces from 2-tuple (u/c) format to 3-tuple (n/u/c) format.

4. Apply the configurations to the configuration coordinator node of the cluster by using the batch command.

Can I migrate the configurations of a standalone NetScaler appliance or an HA setup to the clustered setup?

No. When a node is added to a clustered setup, its configurations are implicitly cleared by using the clear ns config command (with the extended option). In addition, the SNIP addresses and all VLAN configurations (except default VLAN and NSVLAN) are cleared. Therefore, it is recommended that you back up the configurations before adding the appliance to a cluster. Before using the backed-up configuration file for the cluster, you must:

1. Edit the configuration file to remove features that are not supported in a cluster environment.

2. Update the naming convention of interfaces from two-tuple (x/y) format to three-tuple (x/y/z) format.

3. Apply the configurations to the configuration coordinator node of the cluster by using the batch command.

How can I configure/unconfigure the NSVLAN on a cluster?

- To make the NSVLAN available in a cluster, make sure that each appliance has the same NSVLAN configured before it is added to cluster.

- To remove the NSVLAN from a cluster node, first remove the node from the cluster and then delete the NSVLAN from the appliance.

Can a cluster node that is not connected to the client or server network still serve traffic?

Yes. The cluster supports a traffic distribution mechanism called linksets, which allows unconnected nodes to serve traffic by using the interfaces of connected nodes. The unconnected nodes communicate with the connected nodes through the cluster backplane. For more information, see "Using Linksets".

Can I execute commands from the NSIP address of a cluster node?

No. Access to individual cluster nodes through the NetScaler IP (NSIP) addresses is read-only. Therefore, when you log on to the NSIP address of a cluster node you can only view the configurations and the statistics. You cannot configure anything. However, there are some operations you can execute from the NSIP address of a cluster node. For more information, see "Operations Supported on Individual Nodes".

Can I disable configuration propagation among cluster nodes?

No, you cannot explicitly disable the propagation of cluster configurations among cluster nodes. However, during a software upgrade or downgrade, a version mismatch can

automatically disable configuration propagation.

Can I change the NSIP address or change the NSVLAN of a NetScaler appliance when it is a part of the cluster?

No. To make such changes you must first remove the appliance from the cluster, perform the changes, and then add the appliance to the cluster.

Does the NetScaler cluster support L2 and L3 Virtual Local Area Networks (VLANs)?

Yes. A cluster supports VLANs between cluster nodes. The VLANs must be configured on the cluster IP address.

- **L2 VLAN.** You can create a layer2 VLAN by binding interfaces that belong to different nodes of the cluster.
- **L3 VLAN.** You can create a layer3 VLAN by binding IP addresses that belong to different nodes of the cluster. The IP addresses must belong to the same subnet. Make sure that one of the following criteria is satisfied. Otherwise, the L3 VLAN bindings can fail.
  - All nodes have an IP address on the same subnet as the one bound to the VLAN.
  - The cluster has a striped IP address and the subnet of that IP address is bound to the VLAN.

  When you add a new node to a cluster that has only spotted IPs, the sync happens before spotted IP addresses are assigned to that node. In such cases, L3 VLAN bindings can be lost. To avoid this loss, either add a striped IP or add the L3 VLAN bindings on the NSIP of the newly added node.

How can I configure SNMP on a NetScaler cluster?

SNMP monitors the cluster, and all the nodes of the cluster, in the same way that it monitors a standalone appliance. The only difference is that SNMP on a cluster must be configured through the cluster IP address. When generating hardware specific traps, two additional varbinds are included to identify the node of the cluster: node ID and NSIP address of the node.

For detailed information about configuring SNMP, see "SNMP".

What details must I have available when I contact technical support for cluster-related issues?

The NetScaler provides a `show techsupport -scope cluster` command that extracts configuration data, statistical information, and logs of all the cluster nodes. You must run this command on the cluster IP address.

The output of this command is saved in a file named collector_cluster_<nsip_CCO>_P_<date-timestamp>.tar.gz which is available in the /var/tmp/support/cluster/ directory of the configuration coordinator.

Send this archive to the technical support team to debug the issue.

Can I use striped IP addresses as the default gateway of servers?

In case of cluster deployments, make sure the default gateway of the server points to a striped IP address (if you are using a NetScaler-owned IP address). For example, in case

of LB deployments with USIP enabled, the default gateway must be a striped SNIP address.

Can I view routing configurations of a specific cluster node from the cluster IP address?

Yes. You can view and clear the configurations specific to a node by specifying the owner node while entering the vtysh shell.

For example, to view the output of a command on nodes 0 and 1, the command is as follows:

```
> vtysh
ns# owner-node 0 1
ns(node-0 1)# show cluster state
ns(node-0 1)# exit-cluster-node
ns#
```

How can I specify the node for which I want to set the LACP system priority?

Applicable for NetScaler 10.1 and later releases.

In a cluster, you must set that node as the owner node by using the set lacp command.

For example: To set the LACP system priority for node with ID 2:

```
> set lacp -sysPriority 5 -ownerNode 2
```

How can I configure IP tunnels in a cluster?

Applicable for NetScaler 10.1 and later releases.

Configuring IP tunnels in a cluster is the same as on a standalone appliance. The only difference is that in a cluster setup, the local IP address must be a striped SNIP or MIP address. For more information, see "Configuring IP Tunnels".

How can I add a failover interface set (FIS) on the nodes of a NetScaler cluster?

Applicable for NetScaler 10.5 and later releases.

On the cluster IP address, specify the ID of the cluster node on which the FIS must be added.

add fis <name> -ownerNode <nodeId>

Note:

- The FIS name for each cluster node must be unique.
- A cluster LA channel can be added to a FIS. You must make sure that the cluster LA channel has a local interface as a member interface.

For more information on FIS, see "Configuring FIS".

Are Net Profiles supported on a cluster?

Applicable for NetScaler 10.5 and later releases.

Net profiles are now supported on a NetScaler cluster. You can bind spotted IP addresses to a net profile which can then be bound to spotted lbvserver or service (defined using a node group) with the following recommendations:

Note:

- If the "strict" parameter of the node group is "Yes", the net profile must contain a minimum of one IP address from each node of the node group member.
- If the "strict" parameter of the node group is "No", the net profile must include at least one IP address from each of the cluster nodes.
- If the above recommendations are not followed, the net profile configurations will not be honored and the USIP/USNIP settings will be used.

Configuration Utility - Frequently Asked Questions

Q: I am using a MAC Safari browser to upgrade a NetScaler ADC. On the upgrade wizard, when I click the Browse button to choose the build file from the appliance, the dialog box does not show any files or folders. Also, when I navigate back to the root folder, the dialog box displays the top level folder, but I cannot browse it. What should I do?

A: On the Safari browser, click the Settings icon and navigate to Preferences > Security > Manage Website Settings > Java, and then change value of the When visiting other websites setting to Run in unsafe mode.

Q: After I upgraded the JRE on my appliance to version 7.51, the graphical user interface (GUI) applet does not load when I access the NetScaler configuration utility. The applet download stops at 1%, and Java generates a security error. What should I do?

A: You can use the configuration utility with JRE 7.51 if, in the Java Control Panel, you lower the security level or add the NetScaler appliance's URL to the Exception Site List.

If using a Windows computer, navigate to Control Panel and click Java.

If using a MAC computer, navigate to System Preferences and click Java.

Then, in the Java Control Panel dialog box, do either of the following:

- Click the Security tab, and then set the Security Level to medium.
- Click the Security tab, click the Edit Site List button, and then add the URL of the NetScaler appliance in the Exception Site List box.

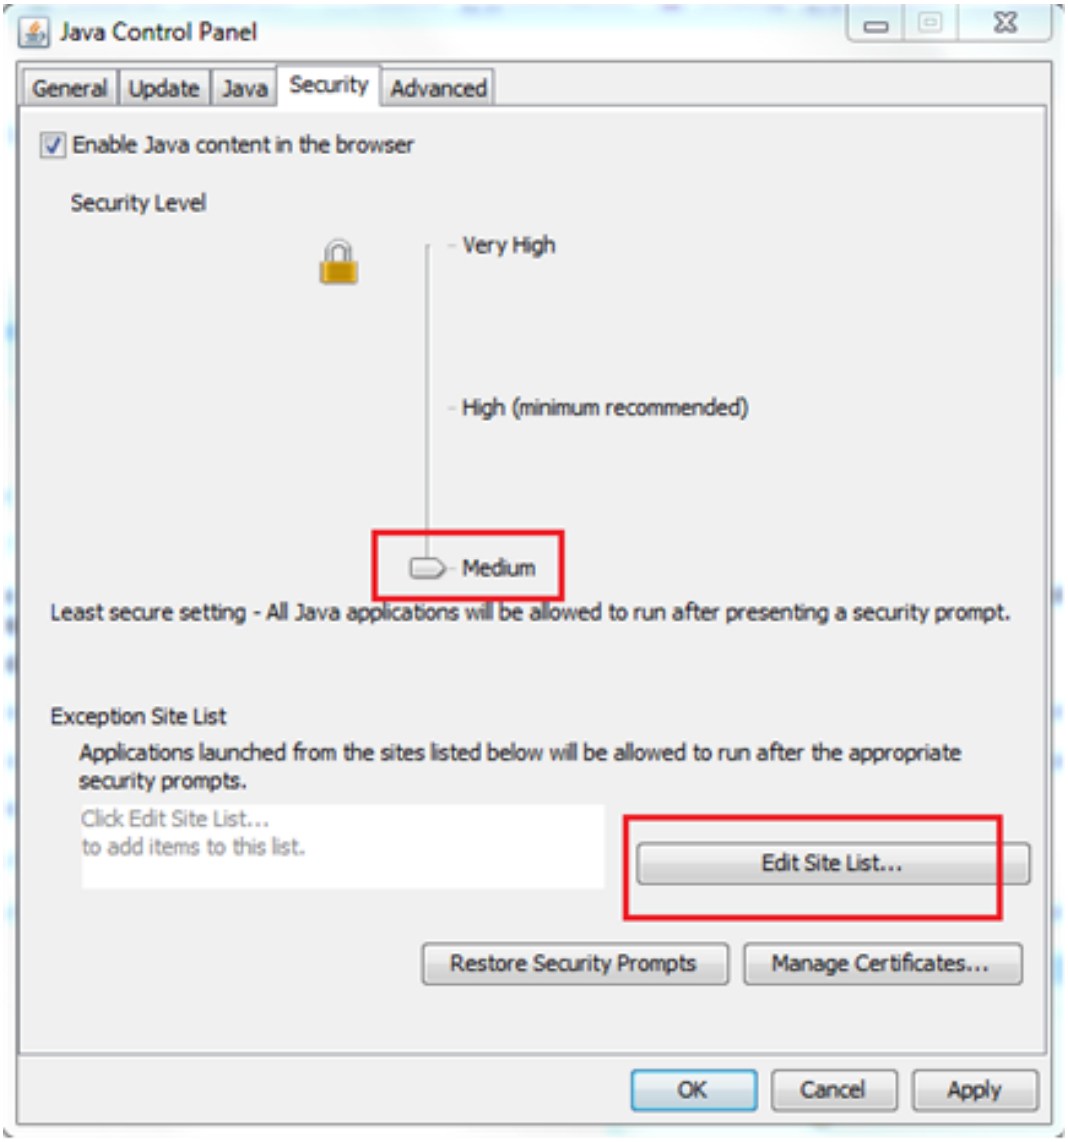

Figure 1. Java Control Panel

Q: After I upgraded the JRE on my appliance to version 7.45, the graphical user interface (GUI) applet does not load when I access the NetScaler configuration utility. The applet download stops at 1%, and Java throws a security error. What should I do?

A: The NetScaler GUI is not compatible with JRE version 7.45. Citrix recommends using a JRE version earlier than 7.45 to access the configuration utility. If you have already upgraded to version 7.45 and do not want to downgrade, you can configure Java to not keep temporary files. However, you will have to download the JAR files every time you access the configuration utility.

To downgrade JRE 7.45 to an earlier version:

1. Uninstall JRE 7.45 by following the instructions at http://www.java.com/en/download/help/uninstall_java.xml.

2. Download an earlier version of JRE from the following location: http://www.oracle.com/technetwork/java/javase/archive-139210.html.

To continue using JRE 7.45:

If you are using a Windows system, navigate to Control Panel and click Java. The Java Control Panel opens.

If you are using a MAC system, navigate to System Preferences and click Java. The Java Control Panel opens.

1. Click the General tab.
2. Under Temporary Internet Files, click Settings.
3. Clear the Keep temporary files on my computer option.
4. Close the browser and re-launch the GUI.
5. 
Open the configuration utility and click Run and Allow, respectively, when the following warnings appear:

Note:

- The Jar files will not be cached and you will have to download the files every time you access the configuration utility.
- This problem is fixed in the following releases:
  - Release 9.3, build 65.x and later
  - Release 10.0, build 78.x and later
  - Release 10.1, build 122.x and later
  - Release 10.1.e, build 120.13xx.e

Q: What should I do before accessing the NetScaler configuration utility?

A: Before accessing a new version of the NetScaler software:

- Clear your browser cache.
- Make Sure that JavaScript, Java, and plug-ins are enabled in your browser. For help with enabling Java for your browser, see http://java.com/en/download/help/enable_browser.xml.
- Clear the “Temporary internet files” in the Java console.
- On the Java tab of the Java console, in Java Runtime Environment Settings, make sure that the latest version of JRE is present and is enabled.

Q: I am using HTTP to access the configuration utility. Which port should I open?

A: Open TCP port 3010 when using HTTP to access the configuration utility.

Q: I am using HTTPS to access the configuration utility. Which port should I open?

A: Open TCP port 3008 when using HTTPS to access the configuration utility.

Q: After entering the IP address of the NetScaler appliance in the address bar, I get the following error: “Java Applet could not be loaded". What should I do?

A: Verify that Java is installed properly. You can download Java from www.java.com. If you are using a MAC Safari browser, Java is disabled if it is not used for 35 days.

To enable Java plug-in in Safari, follow these steps:

1. In the Safari browser, choose Safari > Preferences or press Command-comma (⌘-,) on your keyboard.

2. 

   Click Security, and then select Enable Java.

3. Close the Safari Preferences window.

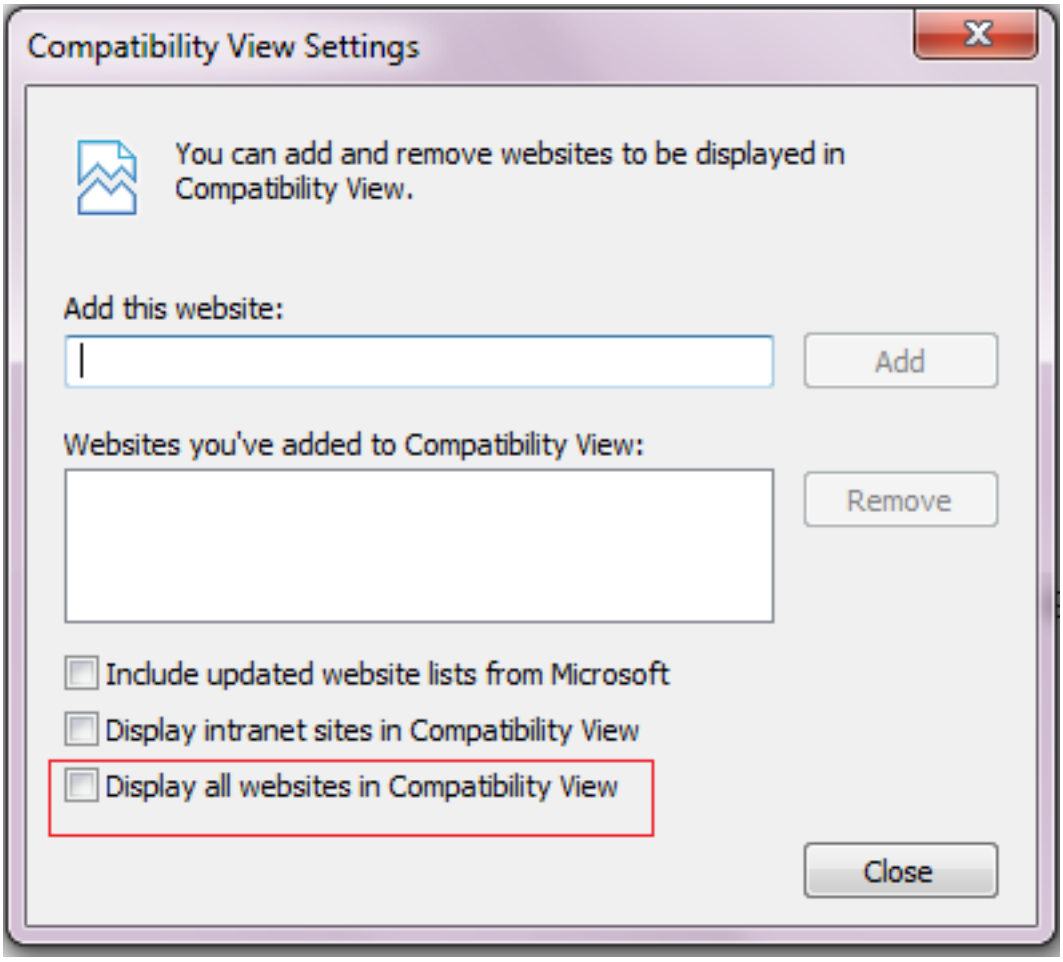
Q: With which browsers is the configuration utility compatible for different operating systems?

A: The following table lists the compatible browsers:

Operating System	Browser	Versions
Windows 7	Internet Explorer	8 and 9
	Mozilla Firefox	3.6.25 and above
	Chrome	15 and above
Windows 64 bit	Internet Explorer	8 and 9
	Chrome	15 and above
MAC OS	Mozilla Firefox	12 and above
	Safari	5.1.3

Q: When I access the NetScaler configuration utility by using Internet Explorer version 8 or 9, the browser displays only a grey bar at the top of the screen. What should I do?

A: The browser might be set in compatibility mode. To disable compatibility mode, go to **Tools** > **Compatibility View Settings** and clear the **Display all websites in Compatibility View** check box.



Q: Even after I disable compatibility mode in Internet Explorer version 8 or 9, the configuration utility does not appear. What should I do?

A: Make sure that the browser mode and document mode in the browser are set to the same version. To view the configuration, press F12. Set the values to either Internet Explorer 8 or Internet Explorer 9.

Q: When I access the NetScaler configuration utility by using Internet Explorer version 9, the utility displays the following error message: "You are not logged in. Please login." What should I do?

A: Make sure that the cookies are not blocked in your Interner Explorer settings. Go to **Tools** > **Internet Options**. Click the **Privacy** tab, and then under **Settings**, make sure that the slider is set to **Medium** or any lower value.

Q: I am using a MAC OS with JRE 1.7. After logging on to the configuration utility, I am not able to enter value in any of the text fields. What should I do?

A: Install Java 7, update 21 or higher.

Q: I am using a MAC OS. When I click outside a dialog window, the screen goes out of focus. Now, my browser looks disabled and hung. What should I do?

A: Click on the Java icon in the system dock, and in the JRE Security Warning window, click **Don't Block**. For details, see

http://www.oracle.com/technetwork/java/javase/7u21-relnotes-1932873.html

Q: Is there any compatibility issue in using JRE version 7_11 with the latest version of browsers?

A: Yes. Internet Explorer 9 and Firefox 18.0.1 block Java on computers running JRE version 7_11. You have to manually activate Java in the browser or upgrade to a later version of JRE (JRE 7_13).

High Availability

What are the various ports used to exchange the HA-related information between the nodes in an HA configuration?

In an HA configuration, both nodes use the following ports to exchange HArelated information:

- UDP Port 3003, to exchange heartbeat packets
- Port 3010, for synchronization and command propagation

What configurations are not synced or propagated in an HA configuration in either INC or non-INC mode?

Configurations implemented with the following commands are neither propagated nor synced to the secondary node:

- All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
- All Interface related configuration commands. For example, set interface and unset interface.
- All channel related configuration commands. For example, add channel, set channel, and bind channel.

Note: For more information about HA Configuration in INC mode, see Configuring High Availability Nodes in Different Subnets.

What configurations are not synced or propagated in an HA configuration in INC mode?

The following configurations are neither synced nor propagated. Each node has its own.

- MIPs
- SNIPs
- VLANs
- Routes (except LLB routes)
- Route monitors
- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations.

What are the conditions that trigger synchronization?

Synchronization is triggered by any of the following conditions:

- The incarnation number of the primary node, received by the secondary, does not match that of the secondary node.

Note: Both nodes in an HA configuration maintain a counter called *incarnation number*, which counts the number of configurations in the node's configuration file. Each node sends its incarnation number to each other node in the heartbeat messages. The incarnation number is not incremented for the following commands:

- All HA configuration related commands. For example, add ha node, set ha node, and bind ha node.
- All Interface related commands. For example, set interface and unset interface.
- All channel-related commands. For example, add channel, set channel, and bind channel.

- The secondary node comes up after a restart.
- The primary node becomes secondary after a failover.

Does a configuration added to the secondary node get synchronized on the primary?

No, a configuration added to the secondary node is not synchronized to the primary.

What could be the reason for both nodes claiming to be the primary in an HA configuration?

The most likely reason is that the primary and secondary nodes are both healthy but the secondary does not receive the heartbeat packets from the primary. The problem could be with the network between the nodes.

Does an HA configuration run into any issues if you deploy the two nodes with different system clock settings?

Different system-clock settings on the two nodes can cause the following issues:

- The time stamps in the log file entries do not match. This situation makes it difficult to analyze the log entries for any issues.
- After a failover, you might have problems with any type of cookie based persistence for load balancing. A significant difference between the times can cause a cookie to expire sooner than expected, resulting in termination of the persistence session.
- Similar considerations apply to any time related decisions on the nodes.

What are the conditions for failure of the *force HA sync* command?

Forced synchronization fails in any of the following circumstances:

- You force synchronization when synchronization is already in progress.
- The secondary node is disabled.
- HA synchronization is disabled on the current secondary node.
- HA propagation is disabled on the current primary node and you force synchronization from the primary.

What are the conditions for failure of the *sync HA files* command?

Synchronizing configuration files fail if the secondary node is disabled.

In an HA configuration, if the secondary node takes over as the primary, does it switch back to secondary status if the original primary comes back online?

No. After the secondary node takes over as the primary, it remains as primary even if the original primary node comes back online again. To interchange the primary and secondary status of the nodes, run the *force failover* command.

What are the conditions for failure of the *force failover* command?

A forced failover fails in any of the following circumstances:

- The secondary node is disabled.
- The secondary node is configured to remain secondary.
- The primary node is configured to remain primary.
- The state of the peer node is unknown.

Hardware FAQs

Transceivers

Are transceivers shipped with the MPX 8005/8015/8200/8400/8600/8800 appliance?

No. Transceivers are available for purchase separately. Contact your Citrix sales representative to order transceivers for your appliance.

Are transceivers hot-swappable?

The 1G SFP transceiver is hot-swappable with release 9.3 build 42.2 or later on the following NetScaler appliances, which use the Intel e1k interface:

- MPX 7500/9500
- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500
- MPX 11500/13500/14500/16500/18500/20500

The 10G SFP+ transceiver is hot-swappable with release 9.3 build 57.5 or later on the following NetScaler appliances, which use the ixgbe (ix) interface:

- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500
- MPX 11500/13500/14500/16500/18500/20500
- MPX 17500/19500/21500
- MPX 17550/19550/20550/21550

Why does the 10G SFP+ transceiver autonegotiate to 1G speed?

Autonegotiation is enabled by default on the 10G SFP+ ports into which you insert your 10G SFP+ transceiver. When a link is established between the port and the network, the speed is autonegotiated. For example, if you connect the port to a 1G network, the speed is autonegotiated to 1G.

Can I insert a 1G transceiver into a 10G slot?

The 10G slot supports copper 1G transceivers, which can operate at up to 1 Gbps in a 10 Gbps slot.

Note that you cannot insert a 10G transceiver into a 1G slot.

The following table shows the compatibility matrix of transceivers and ports available on the NetScaler appliance.

Ports	Transceivers		
	10G	1G Fiber	1G Copper
10G	Supported	Not Supported	Supported
1G Fiber	Not Supported	Supported	Not Supported
1G Copper	Not Supported	Not Supported	Supported

What is QSFP+?

QSFP+ stands for Quad Small Form-factor Pluggable, which is a small, hot-pluggable transceiver for connecting data devices. This transceiver is used for 40G interfaces.

QSFP+ to Four SFP+ Copper Breakout Cables—These cables connect to four SFP+ 10GE ports of a NetScaler appliance on one end and to a QSFP+ 40G port of a Cisco switch on the other end.

Support for 40G connectivity—NetScaler models that have at least four 10G SFP+ ports connect to Cisco 40G interfaces by aggregating four of the 10G SFP+ ports to form a 40G link aggregation channel. QSFP to Four port SFP+ Copper Breakout Cable **QSFP-4SFP10G-CU3M (reports as L45593-D178-C30)**is used.

Which NetScaler appliances support the QSFP-4SFP10G-CU3M (reports as L45593-D178-C30) Breakout Cable?

NetScaler appliances that have at least four 10G SFP+ ports support this cable. The following appliances have at least four 10G SFP+ ports:

- MPX 11500/13500/14500/16500/18500/20500
- MPX 17550/19550/20550/21550
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150

QSFP-4SFP10G-CU3M breakout cable is supported by NetScaler release 9.3 build 65.8 or later, and release 10.1 build 122.17 or later.

Power Supplies

Is the power supply on the NetScaler MPX 5500 and MPX 5550/5650 appliances field replaceable?

No. The power supply on the NetScaler MPX 5500 and MPX 5550/5650 appliances is fixed.

Does the MPX 8005/8015/8200/8400/8600/8800 appliance ship with two power supplies?

No. The MPX 8005/8015/8200/8400/8600/8800 appliance supports dual power supplies but ships with one power supply. Contact your Citrix sales representative to order a second power supply.

How many power supplies are shipped with each platform?

The following table lists the number of power supplies shipped with each platform:

Platform	Number of Power Supplies shipped
MPX 5500	1
MPX 7500/9500	1 (You can order a second power supply.)
MPX 9700/10500/12500/15500	2
MPX 15000/17000	1 (You can order a second power supply.)
MPX 11500/13500/14500/16500/18500/20500	2
MPX 17500/19500/21500	1 (You can order a second power supply.)
MPX 17550/19550/20550/21550	2

Are power supplies hot-swappable?

Yes. If the appliance has two power supplies, you can replace one power supply without shutting down the appliance, provided the other power supply is working.

Rack and Rail

Do you have different rail kits for 1U and 2U appliances?

No. All MPX and SDX appliances use the same rail kit. The kit contains two pairs of slide rails, of different lengths, for a 1U and a 2U appliance.

Which rail kit should I buy?

The appliance ships with the standard 4-post rail kit that fits racks from 28-38 inches.

The compact 4-post rail kit for racks from 23-33 inches, or the 2-post rail kit for 2-post racks, has to be purchased separately. Contact your Citrix sales representative to order the appropriate kit.

What are the maximum and the minimum lengths of the outer rack rails?

The length of a standard outer rack rail is from 28 to 38 inches. The length of a shorter outer rack rail is from 23 to 33 inches.

What is the space required between the front post and rear post of the rack?

Standard racks require 28–38 inches between the front and rear posts. Shorter racks require from 23 to 33 inches.

How far can an appliance extend from the front post of the rack?

The chassis can extend up to 1.25 inches from the front post for all NetScaler MPX and SDX appliances.

How much space is required for maintaining the front and rear area of an appliance?

Minimum clearance areas of 36 inches for the front area and 24 inches for the rear area are required for maintenance of all NetScaler MPX and SDX appliances.

Lights Out Management (LOM) Port

Which LOM features are supported on the NetScaler MPX Appliance?

The MPX 8005/8015/8200/8400/8600/8800, MPX 11500/13500/14500/16500/18500/20500, and MPX 17550/19550/20550/21550 have an Intelligent Platform Management Interface (IPMI), also known as the Lights out Management (LOM) port, on the front panel of the appliance. The following three LOM features are supported on those platforms:

- Configuring the LOM port
- Power cycling the appliance
- Performing a core dump

Can the LOM interface be configured to accept only encrypted Virtual Network Computer (VNC) sessions on TCP port 5900?

Yes, customers who enable Transport Layer Security (TLS) on their LOM interface will have their VNC connections delivered over TLS as well.

For more information on LOM security guidelines, see Secure Deployment Guide for NetScaler MPX, VPX, and SDX Appliances.

Can the version of SSH used on the LOM interface be upgraded? Is there a patch available?

Individual components of the LOM cannot be upgraded independently. You must upgrade the entire LOM firmware as a package. The latest available LOM package can be found on the Citrix downloads website under LOM Firmware Upgrade.

Is it possible to add a third-party or self-signed SSL certificate to the LOM interface?

Yes, you can enable SSL on the latest binaries for third-party and self-signed SSL certificates, except on the 88XX models. On those models, the current LOM release does not support third-party certificates.

General

What is the recommended terminal emulator?

PuTTY.

Which platforms support Pay-As-You-Grow licenses?

The following platforms support Pay-As-You-Grow licenses:

- MPX 5550 to MPX 5650

- MPX 7500 to MPX 9500
- MPX 8005 to MPX 8015 to MPX 8200 to MPX 8400 to MPX 8600 to MPX 8800
- MPX 11500 to MPX 13500 to MPX 14500 to MPX 16500 to MPX 18500 to MPX 20500
- MPX 17500 to MPX 19500 to MPX 21500
- MPX 17550 to MPX 19550 to MPX 20550 to MPX 21550
- MPX 22040 to MPX 22060 to MPX 22080 to MPX 22100 to MPX 22120

Do you support direct attach cable (DAC)?

Yes, Citrix NetScaler appliances support a passive DAC in the following releases and builds:

- Release 9.3, build 63.4 and later
- Release 9.3.e, build 60.3007.e and later
- Release 10, build 74.2 and later
- Release 10.1, build 112.15 and later

Which port should I insert the DAC into?

DAC is inserted into the 10G port on the appliance.

Does the 1G port support DAC?

No. The DAC might fit into a 1G port but is not supported.

How can I order a DAC?

Contact your Citrix sales representative to order a DAC.

Can I mix DAC and fiber transceivers on the same appliance?

Yes. You can mix DAC and fiber transceivers on the same appliance. Each 10G port supports both options.

Can I mix SFP+ fiber and DAC in ports that are part of the same link aggregation channel (LAC)?

No. There must be symmetry between all elements in the same LAC.

Integrated Caching

Content Groups

How is a DEFAULT content group different from other content groups?

The behavior of the DEFAULT content group is exactly the same as any other group. The only attribute that makes the DEFAULT content group special is that if an object is being cached and no content group has been created, the object is cached in the DEFAULT group.

What is the 'cache-Control' option of the content group level?

You can send any cache-control header the browser. There is a content group level option, -cacheControl, which enables you to specify the cache-control header that you want to be inserted in the response to the browser.

What is the 'Minhit' option in content group level?

Minhit is an integer value specifying the minimum number of hits to a cache policy before the object is cached. This value is configurable at the content group level. Following is the syntax to configure this value from the command line interface.

add/set cache contentGroup <Content_Group_Name> [-minHits <Integer>]

What is the use of the expireAtLastByte option?

The expireAtLastByte option enables the integrated cache to expire the object as soon as it has been downloaded. Only requests that are outstanding requests at that time are served from cache. any new requests are sent to the server. This setting is useful when the object is frequently modified, as in the case of stock quotes. This expiry mechanism works along with the Flash Cache feature. To configure expireAtLastByte option, run the following command from the command line interface:

add cache contentGroup <Group_Name> -expireAtLastByte YES

Cache policy

What is a caching policy?

Policies determine which transactions are cacheable and which are not. Additionally, policies add or override the standard HTTP caching behavior. Policies determine an action, such as CACHE or NOCACHE, depending on the specific characteristics of the request or response. If a response matches policy rules, the object in the response is added to the content group configured in the policy. If you have not configured a content group, the object is added to the DEFAULT content group.

What is a policy hit?

A hit occurs when a request or response matches a cache policy.

What is a miss?

A miss occurs when a request or response does not match any cache policy. A miss can also occur if the request or response matches a cache policy but some override of RFC behavior prevents the object from being stored in the cache.

I have configured Integrated Caching feature of the NetScaler appliance. When adding the following policy, an error message appears. Is there any error in the command?

```
add cache policy image_caching -rule exp1 | ns_ext_not_jpeg –action
cache

> ERROR: No such command
```

In the preceding command, the expression should be within the quotation marks. Without quotation marks, the operator is considered to be the pipe operator.

Memory Requirements

What are the commands that I can run on the NetScaler appliance to check the memory allocated to cache?

To display the memory allocated for cache in the NetScaler appliance, run any of the following commands from the command line interface:

- show cache parameter

  In the output, check the value of the Memory usage limit parameter. This is the maximum memory allocated for cache.
- show cache <Content_Group_Name>

  In the output, check the values of the Memory usage and Memory usage limit parameters indicating the memory used and allocated for the individual content group.

My NetScaler appliance has 2 GB of memory. Is there any recommended memory limit for cache?

For any model of the NetScaler appliance, you can allocate half of the memory to the cache. However, Citrix recommends allocating a little less than half of the memory, because of internal memory dependency. You can run the following command to allocate 1 GB of memory to cache:

```
set cache parameter -memLimit 1024
```

Is it possible to allocate memory for individual content groups?

Yes. Even though you allocate memory for the integrated cache globally by running the set cache parameter –memlimit<Integer>, you can allocate memory to individual content groups by running the set cache <Content_Group_Name> –memLimit <Integer> command. The maximum memory you can allocate to content groups (combined) cannot exceed the memory you have allocated to the integrated cache.

What is the dependency of memory between integrated cache and TCP buffer?

If the NetScaler appliance has 2 GB memory, then the appliance reserves approximately 800 to 900 MB of memory and remaining is allocated to FreeBSD operating system. Therefore, you can allocate up to 512 MB of memory to integrated cache and the rest is allocated to TCP buffer.

Does it affect the caching process if I do not allocate global memory to the integrated cache?

If you do not allocate memory to integrated cache, all requests are sent to the server. To make sure that you have allocated memory to the integrated cache, run the show cache parameter command. Actually no objects will be cached if global memory is 0, so this needs to be set first.

Verification commands

What are the options for displaying cache statistics?

You can use either of the following options to display the statistics for cache:

- stat cache

  To display the summary of the cache statistics.

- stat cache –detail

  To display the full details of the cache statistics.

What are the options for displaying the cached content?

To display the cached content, you can run the show cache object command.

What is the command that I can run to display the characteristics of an object stored in cache?

If the object stored in the cache is, for example, GET //10.102.12.16:80/index.html, you can display the details about the object by running the following command from the command line interface of the appliance:

```
show cache object -url '/index.html' -host 10.102.3.96 -port 80
```

Is it mandatory to specify the group name as a parameter to display the parameterized objects in cache?

Yes. It is mandatory to specify the group name as a parameter to display the parameterized objects in cache. For example, consider that you have added the following policies with the same rule:

add cache policy p2 -rule ns_url_path_cgibin -action CACHE –storeInGroup g1
add cache policy p1 -rule ns_url_path_cgibin -action CACHE -storeInGroup g2

In this case, for the multiple requests, if policy p1 is evaluated, its hit counter is incremented and the policy stores the object in the g1 group, which has hit parameters. Therefore, you have to run the following command to display the objects from the

cache:

show cache object -url "/cgi-bin/setCookie.pl" -host 10.102.18.152 groupName g1

Similarly, for another set of multiple requests, if policy p2 is evaluated, its hit counter is incremented and the policy stores the object in the g2 group, which does not have hit parameters. Therefore, you have to run the following command to display the objects from the cache:

show cache object -url "/cgi-bin/setCookie2.pl" -host 10.102.18.152

I notice that there are some blank entries in the output of the nscachemgr command. What are those entries?

Consider the following sample output of the nscachemgr command. The blank entries in this output are highlighted in bold face for your reference:

root@ns# /netscaler/nscachemgr -a
//10.102.3.89:80/image8.gif
//10.102.3.97:80/staticdynamic.html
//10.102.3.97:80/
//10.102.3.89:80/image1.gif
//10.102.3.89:80/file5.html
//10.102.3.96:80/
//10.102.3.97:80/bg_logo_segue.gif
//10.102.3.89:80/file500.html
//10.102.3.92:80/
//10.102.3.96:80/cgi-bin/rfc/ccProxyReval.pl
Total URLs in IC = 10

The blank entries in the output are due to the default caching properties for GET / HTTP/1.1.

Flushing Objects

How can I flush a selective object from the cache?

You can identify an object uniquely by its complete URL. To flush such object, you can perform any of the following tasks:

- Flush cache
- Flush content group
- Flush the specific object

To flush the specific object, you have to specify the query parameters. You specify the invalParam parameter to flush the object. This parameter applies only to a query.

Does any change in the cache configuration trigger flushing of cache?

Yes. When you make any changes to the cache configuration, all the SET cache commands inherently flush the appropriate content groups.

I have updated the objects on the server. Do I need to flush the cached objects?

Yes. When you update objects on the server, you must flush the cached objects, or at least the relevant objects and content groups. The integrated cache is not affected by an update to the server. It continues to serve the cached objects until they expire.

Flash Cache

What is Flash Cache feature of the NetScaler appliance?

The phenomenon of Flash crowds occurs when a large number of clients access the same content. The result is a sudden surge in traffic toward the server. The Flash Cache feature enables the NetScaler appliance to improve performance in such situation by sending only one request to the server. All other requests are queued on the appliance and the single response is served to all of the requests. You can use either of the following commands to enable the Fast Cache feature:

- add cache contentGroup <Group_Name> -flashCache YES
- set cache contentGroup <Group_Name> -flashCache YES

What is the limit for Flash Cache clients?

The number of Flash Cache clients depends on the availability of resources on the NetScaler appliance.

Default Behaviour

Does the NetScaler appliance proactively receive objects upon expiry?

The NetScaler appliance never proactively receives objects on expiry. This is true even for the negative objects. The first access after expiry triggers a request to the server.

Does the integrated cache add clients to the queue for serving even before it starts receiving the response?

Yes. The integrated cache adds clients to the queue for serving even before it starts receiving the response.

What is the default value for the Verify cached object using parameter of the cache configuration?

HOSTNAME_AND_IP is the default value.

Does the NetScaler appliance create log entries in the log files?

Yes. The NetScaler appliance creates log entries in the log files.

Are compressed objects stored in the cache?

Yes. Compressed objects are stored in the cache.

Interoperability with other features

What happens to objects that are currently stored in cache and are being accessed though SSL VPN?

Objects stored in the cache and accessed regularly are served as cache hits when accessed through SSL VPN.

What happens to objects stored in the cache when accessed through SSL VPN and later accessed through a regular connection?

The objects stored through the SSL VPN access are served as a hit when accessed through the regular connection.

When using weblogging, how do I differentiate entries that indicate response served from cache from those served by the server?

For responses served from the integrated cache, the server log field contains the value IC. For responses served from a server, the server log field contains the value sent by the server. Following is a sample log entry for an integrated caching transaction:

"10.102.1.52 - "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 4.0; .NET CLR 1.0.3705)" "GET /" 200 0 "IC" 10.102.1.45"

Along with a client request, the response logged is the one sent to the client and not necessarily the one sent by the server.

Miscellaneous

What do you mean by configuring relexpiry and absexpiry?

By configuring relexpiry and absexpiry, it means that you are overriding the header irrespective of what appears in the header. You can configure different expiry setting and the content group level. With relexpiry, expiration of the header is based on the time at which the object was received by the NetScaler. With absexpiry, expiration is based on the time configured on the NetScaler. Relexpiry is configured in terms of seconds. Absexpiry is a time of day.

What do you mean by configuring weakpos and heuristic?

The weakpos and heuristic are like fall back values. If there is an expiry header, it is considered only if the last-modified header is present. The NetScaler appliance sets expiry on the basis of the last-modified header and the heuristic parameter. The heuristic expiry calculation determines the time to expiry by checking the last-modified header. Some percentage of the duration since the object was last modified is used as time to expiry. The heuristic of an object that remains unmodified for longer periods of time and is likely to have longer expiry periods. The –heurExpiryParam specifies what percentage value to use in this calculation. Otherwise, the appliance uses the weakpos value.

What should I consider before configuring dynamic caching?

If there is some parameter that is in name-value form and does not have the full URL query, or the appliance receives the parameter in a cookie header or POST body, consider configuring dynamic caching. To configure dynamic caching, you have to configure hitParams parameter.

How is hexadecimal encoding supported in the parameter names?

On the NetScaler appliance, the %HEXHEX encoding is supported in the parameter names. In the names that you specify for hitParams or invalParams, you can specify a name that contains %HEXHEX encoding in the names. For example, name, nam%65, and n%61m%65 are equivalent.

What is the process for selecting a hitParam parameter?

Consider the following excerpt of an HTTP header for a POST request:

How do we select a hitparam?
POST /data2html.asp?param1=value1&param2=&param3&param4=value4
HTTP/1.1
Accept: image/gif, image/x-xbitmap, image/jpeg, image/pjpeg,
application/vnd.ms-powerpoint, application/vnd.ms-excel,
application/msword, application/x-shockwave-flash, */*
Referer: http://10.102.3.97/forms.html
Accept-Language: en-us
Content-Type: application/x-www-form-urlencoded
Accept-Encoding: gzip, deflate
User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)
Host: 10.102.3.97
Content-Length: 153
Connection: Keep-Alive
Cache-Control: no-cache
Cookie: ASPSESSIONIDQGQGGRNY=NNLLKDADEENOAFLCCDGFGDMO
S1=This+text+is+only+text%2C+not+more+and+not+less%2C+%0D%0Ajust+text+to+be+itself%2C+namely+%2

In the above request, you can use S1 and B1, highlighted in bold face for your reference, as hitParams depending on your requirements. Additionally, if you use -matchCookies YES in the ASPSESSIONIDQGQGGRNY content group, then you can also use these parameters as hitParams.

What happens to the queued clients if the response is not cacheable?

If the response is not cacheable, all of the clients in the queue receive the same response that the first client receives.

Can I enable the Poll every time (PET) and Flash Cache features on the same content group?

No. You cannot enable PET and Flash Cache on the same content group. The integrated cache does not perform AutoPET function on Flash Cache content groups. The PET feature ensures that the integrated cache does not serve a stored object without consulting the server. You can configure PET explicitly for a content group.

When are the log entries created for the queued clients?

The log entries are created for the queued clients soon after the appliance receives the response header. The log entries are created only if the response header does not make the object non-cacheable.

What is the meaning of the DNS, HOSTNAME, and HOSTNAME_AND_IP values of the Verify cached object using parameter of the cache configuration?

The meanings are as follows:

- set cache parameter -verifyUsing HOSTNAME

  This ignores the destination IP address.

- set cache parameter -verifyUsing HOSTNAME_AND_IP

  This matches the destination IP address.

- set cache parameter -verifyUsing DNS

  This uses the DNS server.

I have set weakNegRelExpiry to 600, which is 10 minutes. I noticed that 404 responses are not getting cached. What is the reason ?

This completely depends on your configuration. By default, 404 responses are cached for 10 minutes. If you want all 404 responses to be fetched form the server, specify–weakNegRelExpiry 0. You can fine tune the –weakNegRelExpiry to a desired value, such as higher or lower to get the 404 responses cached appropriately. If you have configured –absExpiry for positive responses, then it might not yield desired results.

When the user accesses the site by using the Mozilla Firefox browser, the updated content is served. However, when the user accesses the site by using the Microsoft Internet Explorer browser, stale content is served. What could be the reason?

The Microsoft Internet Explorer browser might be taking the content from its local cache instead of the NetScaler integrated cache. The reason could be that the Microsoft Internet Explorer browser is not respecting the expiry related header in the response.

To resolve this issue, you can disable the local cache of the Internet Explorer and clear the offline content. After clearing the offline content, the browser should display the updated content

What if Hits are zero?

Check to see if the server time and NS time are in sync. And the weakPosrelexpiry limit set should bear the time difference between NS and server as shown below

root@ns180# date

Tue May 15 18:53:52 IST 2012

Why are policies getting hits but nothing is being cached?

Verify that memory is allocated to the integrated cache and that the allocation is greater than zero.

Is it possible to zero the cache counters?

There is no command line or GUI option for setting the cache counters to zero, and flushing the cache does not do so either. Rebooting the box automatically sets these counters to zero.

SDX

Basic Questions

What is SDX?

SDX is a true service delivery networking platform for enterprises and cloud datacenters. SDX features an advanced virtualization architecture that supports multiple NetScaler instances on a single hardware appliance.

When do I need SDX?

If you have multiple enterprise applications that have independent life cycle needs for L4–L7 networking services, or if you have a need to consolidate multiple underutilized load balancing appliances, you benefit from SDX.

What's unique about SDX?

SDX uniquely delivers key benefits from advancements in server hardware virtualization, hardware-assisted SSL acceleration, and the market-proven, award-winning NetScaler product line. The Management Service features an advanced control plane to unify provisioning, monitoring, and management in the most demanding multitenant environments, while providing full resource isolation for data separation and to meet service level agreement guarantees, such as availability, reliability, and performance.

How will I benefit from SDX?

SDX delivers isolated multitenancy with up to 40:1 consolidation. As a key pillar in Citrix's TriScale technology framework, SDX addresses the growing need to "scale in" within virtual data centers and cloud network infrastructures. The TriScale scale-in factor enables IT to provide the foundation for consolidating L4–L7 network services today, thereby simplifying the build-out of cloud based services down the line, in accordance with business requirements.

Will I need to go outside my normal procurement procedure to purchase SDX?

SDX is a fully contained networking appliance, designed for network deployment. SDX is not designed to be managed through standard hypervisor management tools such as XenCenter.

How do I purchase an SDX?

An SDX order has three basic product components: SDX appliance SKU, SDX support contract SKU, and Add-On Instance Packs. SKUs are also available for platform conversion (MPX-to-SDX) and platform upgrade (SDX-to-SDX). SDX today is available in Platinum Edition only.

Is there SDX-specific documentation?

Yes, please visit
http://support.citrix.com/proddocs/topic/netscaler/sdx-ag-wrapper-con.html.

Do NetScaler editions apply to NetScaler SDX?

The editions do not apply from a packaging perspective. NetScaler SDX appliances and the instance 5-packs are priced the same regardless of the edition. However, when provisioning new instances, the administrator is free to deploy the Standard, Enterprise, or Platinum edition of the NetScaler software.

Configuration

How much memory can I assign to each instance?

There is no maximum limit to the memory that can be assigned to each instance. Minimum memory required per instance is 2GB.

Can we migrate the existing configuration (ns.conf) from the MPX platform to SDX VPX instance?

Yes, but some configuration, such as RBA policies and SNMP community configuration, is deleted.

Features and Functionality

What NetScaler features do I get with SDX?

All NetScaler features are available on SDX.

Does SDX accelerate SSL in hardware like MPX does?

Yes. You can assign SSL cores to an instance during provisioning.

What changes to my network are required for me to deploy SDX?

SDX fits into your network environment through standard Ethernet interfaces. You must disable link aggregation control protocol (LACP) on any external switch ports connected to the appliance.

Is SDX interoperable with my routing and switching infrastructure?

Yes, although link aggregation control protocol (LACP) is currently not supported. However, SDX supports manual link aggregation.

Is SDX interoperable with my existing NetScaler deployment?

Yes, although standard VPX-to-MPX limitations apply. For example, high availability is supported only across homogeneous devices (you cannot pair a virtual device with a physical device), some configuration, such as RBA policies and SNMP configuration, is deleted, and license transfer is not supported.

Can I manage SDX from Command Center?

Yes. You can identify SDX appliances and provision and de-provision VPX instances by using Command Center.

How does SDX deliver multitenancy?

Each instance runs as a separate virtual machine with its own dedicated NetScaler kernel, CPU resources, memory resources, address space, and bandwidth allocation. Network I/O is done in a way that not only maintains aggregate system performance but also enables complete segregation of each tenant's data-plane and management-plane traffic.

Do I need to manage an SDX through XenCenter?

No. XenCenter is not supported. Use the Management Service to manage XenServer.

We are a VMware shop. We have no infrastructure available to support XenServer, do you have a VMware variant of SDX?

No additional XenServer infrastructure is necessary. SDX is a fully contained networking appliance with its own control plane, and the virtualization layer is transparent to the deployment.

Why is the system health monitoring page not showing any data?

You have to install the supplemental pack before you can use this feature. For installation instructions for the supplemental pack, see http://support.citrix.com/article/CTX132877.

How do I verify that the supplemental pack installation was successful?

After installation, a pop up window shows whether installation was successful or if there was an error.

Why is the VPX instance not reachable after interfaces on the appliance are modified?

When you provision a NetScaler VPX instance with L2VLAN configuration, physical interfaces on the SDX appliance are mapped to virtual interfaces on the VPX instance. If you remove an interface, you might change the mapping between the physical interfaces and VPX instances, and therefore you might lose connectivity to the VPX instance.

For example,

1. You provision a VPX instance, by using the Management Service, with interfaces 10/1, 10/2, 10/7, and tag VLAN 512 to interface 10/2. When you log on to that VPX instance, you see that interfaces 10/1, 10/2, and 10/3 are configured.

2. If you later modify the instance and remove interface 10/1, you lose connectivity to the instance, because interface 10/2 is renamed to 10/1 in the VPX instance.

Are IPv6 addresses supported on the NetScaler SDX appliance?

Yes. All NetScaler-supported IPv6 functionality is available on the SDX appliance.

Where are link parameters, such as speed and duplex, configured?

Link parameters are configured from the Management Service.

Should the appliance be restarted if the platform license is upgraded?

No. You do not need to restart the appliance for the new license to apply.

Do I need to restart the appliance to upgrade the device-level firmware?

Yes, this upgrade is handled through the Management Service and requires that the appliance be restarted. This is the only time that the SDX appliance needs a complete restart.

Do I need to restart the appliance when I upgrade it by using a Pay-As-You-Grow license?

No. Upgrading the appliance upgrades the platform license. Restart the Management Service but not the instances running on the SDX appliance. Once upgraded, the Management Service detects the higher throughput available for the instances. If you decide to increase the bandwidth limit for an instance, restart that instance after modifying the bandwidth limit.

What happens to production instances if I remove my platform license?

There is no change to the production instances. However, you cannot add new instances.

How can we readd a gadget to the Home page?

Click the << button in the top-right corner of the Home page. Then, type the name of the gadget, or press Enter for all gadgets. Click "Add to Dashboard".

Should member interfaces in manual link aggregation be part of same VLAN?

Yes. Member interfaces in manual link aggregation should be part of the same VLAN.

How many VLANs are supported per interface with VLAN filtering enabled? What happens if I configure more?

With VLAN filtering enabled, 10G interfaces support up to 63 VLANs, and 1G interfaces suppport up to 31 VLANs. This is a hard limit based on the number of the queues supported by the NIC. An error message appears if the limit is exceeded.

How many instances can be shared on a single NIC?

For a 10G interface, SDX supports up to 63 virtual functions per physical port, which translates to 63 instances per 10G NIC. For 1G interfaces, the maximum number of shared instances per NIC is 7.

Why is the XenServer password the same as the Management Service password?

The XenServer password and the Management Service password are the same to maintain administrative consistency. Changing the XenServer password causes the internal communication between the Management Service and XenServer to fail.

If I have separate management networks, do I need to manually add these networks to the Management Service?

No. Communication is over an external device.

Why can't I modify the default administrator profile?

The default administrator profile enables multiple administrative roles to exist on the SDX. You cannot change the password of the nsroot administrator profile, but you can

create a new administrator profile and make it the default profile.

Why does Core usage show 50% when I'm not passing any traffic through my NetScaler instance?

CPU core usage shows, from the hypervisor perspective, the CPU utilization of one physical CPU, which has two hyperthreads: one for the packet engine and one for the management CPU. For example, assume a single instance with one dedicated core. Even if you are not passing any traffic through your appliance, PE CPU utilization will be 100%, and average core utilization will be 50%.

Will restarting the Management Service interrupt my production instances?

No. Your production instances will continue to pass traffic without interruption while the Management Service restarts. The same applies when you upgrade the Management Service.

Can I configure the Management Service to send syslog?

Syslog through the Management Service is currently not supported.

Am I required to upgrade all VPX instances if I upgrade the Management Service?

No, instance life cycles can be managed independently of one other and of the life cycle of the Management Service.

If my Management Service and VPX instances are on different networks, how can I manage the VPX instance through HTTPS?

The same way as if they are on the same network.

If my Management Service and VPX instances are on different networks, how can I manage the VPX instance through the Management Service?

If the Management Service and the VPX instance are in different networks but the instance can be reached from Management Service, the Management Service shows the instance as UP. If an instance is UP, you can manage it from the Management Service. However, if communication between the two fails, the Management Service shows the instance as "Out of Service".

I forgot the IP address of my Management Service. What can I do?

Log on to XenServer, and then use the default IP address (169.254.0.10) to log on to the Management Service. At the shell prompt, type networkconfig to view or modify the IP address of the Management Service.

Can I specify VLANs on management interfaces?

VLANs on management interfaces are currently not supported.

How do I restart XenServer?

The only supported method for restarting XenServer is from the Management Service. It is equivalent to restarting the appliance.

How many instances can I provision on the SDX appliance? How much aggregate throughput can I expect?

This number is dependent on the hardware and the license that you purchased, as shown below:

- 11500, 13500, 14500, 16500, 18500, 20500—5 to 20 instances. Throughput ranges from 8 to 42 Gbps.
- 17500, 19500, 21500—5 to 20 instances. Throughput ranges from 20 to 50 Gbps.
- 17550, 19550, 20550, 21550—5 to 40 instances. Throughput ranges from 20 to 50 Gbps.
- 8400, 8600—2 to 5 instances. Throughput ranges from 4 to 6 Gbps.

Note: For more information, see the NetScaler datasheet at http://www.citrix.com/content/dam/citrix/en_us/documents/products/netscaler-data-sheet.pdf

Can I restrict functionality on the VPX instances?

Some functionality can be restricted by specifying the license (Standard, Enterprise, or Platinum) when you provision the instance.

Platforms

How many SDX models are there, and how do they differ?

The NetScaler SDX appliance comes in the following variants:

- SDX 11500/13500/14500/16500/18500/20500—8 to 42 Gbps, maximum 20 instances, 8x1G ports, 4x10G ports.
- SDX 17500/19500/21500—20 to 50 Gbps, maximum 20 instances, 8x10G ports.

  Note: This platform is going EOS this year.

- SDX 17550/19550/20550/ 21550—20 to 50 Gbps, maximum 40 instances, 8x10G ports.

What is the minimum NetScaler software version required for SDX instances?

NetScaler VPX instances should run release 9.3 and later to be able to work on SDX.

How many physical interfaces will I need to use?

If you have a single management network, you'll need on an average 1 or 2 physical NICs per instance. For 2 or more management networks (multiple VLANs for NetScaler IP addresses), you'll need a dedicated separate physical NIC for each management VLAN trunk. You can share physical NICs among multiple instances with L2 separation. Therefore, depending on your topology, you can offset the management VLAN trunk count with multiple instances sharing a physical NIC.

Can I upgrade my MPX to an SDX? What about my MPX FIPS platform?

A non-FIPS MPX platform that supports the SDX architecture can be converted to a similar class of SDX platform. The MPX platform must have a platinum license to be eligible for

this upgrade. This is a one way upgrade, and it wipes out the entire configuration on that MPX platform. For more information about this upgrade, see http://support.citrix.com/article/CTX129423.

How many SSL cards (cores) are supported on a NetScaler SDX appliance?

The number of SSL cards supported varies by the platform as follows:

- SDX 17500/19500/21500—16 cards.
- SDX 11500/13500/14500/16500/18500/20500—16 cards.
- SDX 17550/19550/20550/21550—36 cards.

Note: Instances cannot share SSL cores. Any SSL cores that are allocated at the time of provisioning an instance are dedicated to that instance.

Can I apply my VPX license to SDX?

No. NetScaler SDX and NetScaler VPX have different licensing models. One license cannot be used for the other.

Why are the hardware sensors not displayed on the NetScaler SDX 17500/19500/21500 appliance?

The NetScaler SDX 17500/19500/21500 is built on the MPX 17500/19500/21500 hardware platform. These appliance configurations do not support monitoring of hardware components.

When I upgraded my MPX to an SDX, the LCD panel went dark. Is that expected?

Yes, that is normal behavior. SDX does not support the LCD panel.

What are RX and TX errors on the NetScaler SDX appliance?

RX and TX errors include cyclic redundancy check (CRC) errors and small or runt packet errors.

What happens if a hardware component is removed from the SDX appliance?

If a hardware component is physically removed from the appliance, it no longer appears in the Management Service user interface.

Do I need to restart my appliance after I reconfigure VLAN filtering?

No. However, you need to restart the VPX instances that are affected by this change. The Management Service restarts the affected instances if you select "Reboot associated Instances" in the Enable/Disable VLAN Filter dialog box.

What is the NMI button for on the SDX appliance?

The NMI button is not operational on the SDX appliance.

SSL

Basic Questions

HTTPS access to the NetScaler configuration utility fails on a VPX instance. How do I gain access?

A certificate-key pair is required for HTTPS access to the NetScaler configuration utility. On a NetScaler ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes and bind it to the internal service for HTTPS access to the configuration utility or update the ns-server-certificate to 1024 bytes. You can use HTTP access to the configuration utility or the NetScaler command line to install the certificate.

If I add a license to an MPX appliance, the certificate-key pair binding is lost. How do I resolve this problem?

If a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding. You must reinstall the certificate and bind it to the internal service

Citrix recommends that you install an appropriate license before starting the appliance.

What are the various steps involved in setting up a secure channel for an SSL transaction?

Setting up a secure channel for an SSL transaction involves the following steps:

1. The client sends an HTTPS request for a secure channel to the server.
2. After selecting the protocol and cipher, the server sends its certificate to the client.
3. The client checks the authenticity of the server certificate.
4. If any of the checks fail, the client displays the corresponding feedback.
5. If the checks pass or the client decides to continue even if a check fails, the client creates a temporary, disposable key called the *pre-master secret* and encrypts it by using the public key of the server certificate.
6. The server, upon receiving the pre-master secret, decrypts it by using the server's private key and generates the session keys. The client also generates the session keys from the pre-master secret. Thus both client and server now have a common session key, which is used for encryption and decryption of application data.

I understand that SSL is a CPU-intensive process. What is the CPU cost associated with the SSL process?

The following two stages are associated with the SSL process:

- The initial handshake and secure channel setup by using the public and private key technology.
- Bulk data encryption by using the asymmetric key technology.

Both of the preceding stages can affect server performance, and they require intensive CPU processing for of the following reasons:

1. The initial handshake involves public-private key cryptography, which is very CPU intensive because of large key sizes (1024bit, 2048bit, 4096bit).
2. Encryption/decryption of data is also computationally expensive, depending on the amount of data that needs to be encrypted or decrypted.

What are the various entities of an SSL configuration?

An SSL configuration has the following entities:

- Server certificate
- Certificate Authority (CA) certificate
- Cipher suite that specifies the protocols for the following tasks:
  - Initial key exchange
  - Server and client authentication
  - Bulk encryption algorithm
  - Message authentication
- Client authentication
- CRL
- SSL Certificate Key Generation Tool that enables you to create the following files:
  - Certificate request
  - Self signed certificate
  - RSA and DSA keys
  - DH parameters

I want to use the SSL offloading feature of the Citrix NetScaler appliance. What are the various options for receiving an SSL certificate?

You must receive an SSL certificate before you can configure the SSL setup on the Citrix NetScaler appliance. You can use any of the following methods to receive an SSL certificate:

- Request a certificate from an authorized CA.
- Use the existing server certificate.
- Create a certificate-key pair on the Citrix NetScaler appliance.

Note: This is a test certificate signed by the test Root-CA generated by the NetScaler. Test certificates signed by this Root-CA are not accepted by browsers. The browser throws a warning message stating that the server's certificate cannot be authenticated.

- For anything other than test purposes, you must provide a valid CA certificate and CA key to sign the server certificate.

What are the minimum requirements for an SSL setup?

The minimum requirements for configuring an SSL setup are as follows:

- Obtain the certificates and keys.
- Create a load balancing SSL virtual server.
- Bind HTTP or SSL services to the SSL virtual server.
- Bind certificate-key pair to the SSL virtual server.

What are the limits for the various components of SSL?

SSL components have the following limits:

- Bit size of SSL certificates: 4096.
- Number of SSL certificates: Depends on the available memory on the appliance.
- Maximum linked intermediate CA SSL certificates: 9 per chain.
- CRL revocations: Depends on the available memory on the appliance.

What are the various steps involved in the end-to-end data encryption on a Citrix NetScaler appliance?

The steps involved in the server-side encryption process on a Citrix NetScaler appliance are as follows:

1. The client connects to the SSL VIP configured on the Citrix NetScaler appliance at the secure site.
2. After receiving the secure request, the appliance decrypts the request, applies layer 4-7 content switching techniques and load balancing policies, and selects the best available backend Web server for the request.
3. The Citrix NetScaler appliance creates an SSL session with the selected server.
4. After establishing the SSL session, the appliance encrypts the client request and sends it to the Web server by using the secure SSL session.
5. When the appliance receives the encrypted response from the server, it decrypts and re-encrypts the data, and sends the data to the client by using the client side SSL session.

The multiplexing technique of the Citrix NetScaler appliance enables the appliance to reuse SSL sessions that have been established with the Web servers. Therefore, the appliance avoids the CPU intensive key exchange, known as *full handshake*. This process reduces the overall number of SSL sessions on the server and maintains end-to-end security.

Certificates and Keys

Can I place the certificate and key files at any location? Is there any recommended location to store these files?

You can store the certificate and key files on the Citrix NetScaler appliance or a local computer. However, Citrix recommends that you store the certificate and key files in the /nsconfig/ssl directory of the Citrix NetScaler appliance. The /etc directory exists in the flash memory of the Citrix NetScaler appliance. This provides portability and facilitates backup and restoration of the certificate files on the appliance.

Note: Make sure that the certificate and the key files are stored in the same directory.

What is the maximum size of the certificate key supported on the Citrix NetScaler appliance?

A Citrix NetScaler appliance running a software release earlier than release 9.0 supports a maximum certificate key size of 2048 bits. Release 9.0 and later support a maximum certificate key size of 4096 bits. This limit is applicable to both RSA and DSA certificates.

An MPX appliance supports certificates from 512-bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back end server
- 4096-bit client certificate (if client authentication is enabled on the virtual server)

A virtual appliance supports certificates from 512-bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 2048-bit certificate on the back end server
- 2048-bit client certificate (if client authentication is enabled on the virtual server)

What is the maximum size of the DH parameter supported on the Citrix NetScaler appliance?

The Citrix NetScaler appliance supports a DH parameter of maximum 2048 bits.

What is the maximum certificate-chain length, that is, the maximum number of certificates in a chain, supported on a Citrix NetScaler appliance?

A Citrix NetScaler appliance can send a maximum of 10 certificates in a chain when sending a server certificate message. A chain of the maximum length includes the server certificate and nine intermediate CA certificates.

What are the various certificate and key formats supported on the Citrix NetScaler appliance?

The Citrix NetScaler appliance supports the following certificate and key formats:

- Privacy Enhanced Mail (PEM)
- Distinguished Encoding Rule (DER)

Is there a limit for the number of certificates and keys that I can install on the Citrix NetScaler appliance?

No. The number of certificates and keys that can be installed is limited only by the available memory on the Citrix NetScaler appliance.

I have saved the certificate and key files on the local computer. I want to transfer these files to the Citrix NetScaler appliance by using the FTP protocol. Is there any preferred mode for transfering these files to the Citrix NetScaler appliance?

Yes. If using the FTP protocol, you should use binary mode to transfer the certificate and key files to the Citrix NetScaler appliance.

Note: By default, FTP is disabled. Citrix recommends using the SCP protocol for transferring certificate and key files. The configuration utility implicitly uses SCP to connect to the appliance.

What is the default directory path for the certificate and key?

The default directory path for the certificate and key is /nsconfig/ssl.

When adding a certificate and key pair, what happens if I do not specify an absolute path to the certificate and key files?

When adding a certificate and key pair, if you do not specify an absolute path to the certificate and key files, the Citrix NetScaler appliance searches the default directory, /nsconfig/ssl, for the specified files and attempts to load them to the kernel. For example, if the cert1024.pem and rsa1024.pem files are available in the /nsconfig/ssl directory of the appliance, both of the following commands are successful:

```
add ssl certKey cert1 -cert cert1204.pem -key rsa1024.pem

add ssl certKey cert1 -cert /nsconfig/ssl/cert1204.pem -key
/nsconfig/ssl/rsa1024.pem
```

I have configured a high availability setup. I want to implement the SSL feature on the setup. How should I handle the certificate and key files in a high availability setup?

In a high availability setup, you must store the certificate and key files on both the primary and the secondary Citrix NetScaler appliance. The directory path for the certificate and key files must be the same on both appliances before you add an SSL certificate-key pair on the primary appliance.

Ciphers

What is a NULL-Cipher?

Ciphers with no encryption are known as NULL-Ciphers. For example, NULL-MD5 is a NULL-Cipher.

Are the NULL-Ciphers enabled by default for an SSL VIP or an SSL service?

No. NULL-Ciphers are not enabled by default for an SSL VIP or an SSL service.

What is the procedure to remove NULL-Ciphers?

To remove the NULL-Ciphers from an SSL VIP, run the following command:

bind ssl cipher <SSL_VIP> REM NULL

To remove the NULL-Ciphers from an SSL Service, run the following command:

```
bind ssl cipher <SSL_Service> REM NULL -service
```

What are the various cipher aliases supported on the Citrix NetScaler appliance?

The Citrix NetScaler appliance supports the following cipher aliases:

1. Alias Name: ALL

   Description: All NetScaler-supported ciphers, excluding NULL ciphers

2. Alias Name: DEFAULT

   Description: Default cipher list with encryption strength >= 128bit

3. Alias Name: kRSA

   Description: Ciphers with RSA key exchange algorithm

4. Alias Name: kEDH

   Description: Ciphers with Ephemeral-DH key exchange algorithm

5. Alias Name: DH

   Description: Ciphers with DH key exchange algorithm

6. Alias Name: EDH

   Description: Ciphers with DH key exchange algorithm and authentication algorithm

7. Alias Name: aRSA

   Description: Ciphers with RSA authentication algorithm

8. Alias Name: aDSS

   Description: Ciphers with DSS authentication algorithm

9. Alias Name: aNULL

   Description: Ciphers with NULL authentication algorithm

10. Alias Name: DSS

    Description: Ciphers with DSS authentication algorithm

11. Alias Name: DES

    Description: Ciphers with DES encryption algorithm

12. Alias Name: 3DES

    Description: Ciphers with 3DES encryption algorithm

13. Alias Name: RC4

    Description: Ciphers with RC4 encryption algorithm

14. Alias Name: RC2

    Description: Ciphers with RC2 encryption algorithm

15. Alias Name: eNULL

    Description: Ciphers with NULL encryption algorithm

16. Alias Name: MD5

    Description: Ciphers with MD5 message authentication code (MAC) algorithm

17. Alias Name: SHA1

    Description: Ciphers with SHA-1 MAC algorithm

18. Alias Name: SHA

    Description: Ciphers with SHA MAC algorithm

19. Alias Name: NULL

    Description: Ciphers with NULL encryption algorithm

20. Alias Name: RSA

    Description: Ciphers with RSA key exchange algorithm and authentication algorithm

21. Alias Name: ADH

    Description: Ciphers with DH key exchange algorithm, and NULL authentication algorithm

22. Alias Name: SSLv2

    Description: SSLv2 protocol ciphers

23. Alias Name: SSLv3

    Description: SSLv3 protocol ciphers

24. Alias Name: TLSv1

    Description: SSLv3/TLSv1 protocol ciphers

25. Alias Name: TLSv1_ONLY

    Description: TLSv1 protocol ciphers

26. Alias Name: EXP

    Description: Export ciphers

27. Alias Name: EXPORT

    Description: Export ciphers

28. Alias Name: EXPORT40

    Description: Export ciphers with 40-bit encryption

29. Alias Name: EXPORT56

    Description: Export ciphers with 56-bit encryption

30. Alias Name: LOW

    Description: Low strength ciphers (56-bit encryption)

31. Alias Name: MEDIUM

    Description: Medium strength ciphers (128-bit encryption)

32. Alias Name: HIGH

    Description: High strength ciphers (168-bit encryption)

33. Alias Name: AES

    Description: AES ciphers

34. Alias Name: FIPS

    Description: FIPS-approved ciphers

What is the command to display all the predefined ciphers of the Citrix NetScaler appliance?

To display all the predefined ciphers of the Citrix NetScaler appliance, at the NetScaler command line, type:

show ssl cipher

What is the command to display the details of an individual cipher of the Citrix NetScaler appliance?

To display the details of an individual cipher of the Citrix NetScaler appliance, at the NetScaler command line, type:

show ssl cipher <Cipher_Name/Cipher_Alias_Name/Cipher_Group_Name>

Example:

```
 > show cipher SSL3-RC4-SHA
 1) Cipher Name: SSL3-RC4-SHA
 Description: SSLv3 Kx=RSA Au=RSA Enc=RC4(128)
Mac=SHA1
 Done
```

What is the significance of adding the predefined ciphers of the Citrix NetScaler appliance?

Adding the predefined ciphers of the Citrix NetScaler appliance causes the NULL-Ciphers to get added to an SSL VIP or an SSL service.

Certificates

Why do I need to bind the server certificate?

Binding the server certificates is the basic requirement for enabling the SSL configuration to process SSL transactions.

To bind the server certificate to an SSL VIP, at the NetScaler command line, type:

bind ssl vserver <vServerName> -certkeyName <cert_name>

To bind the server certificate to an SSL service, at the NetScaler command line, type:

bind ssl service <serviceName> -certkeyName <cert_name>

How many certificates can I bind to an SSL VIP or an SSL service?

On a NetScaler virtual appliance, you can bind a maximum of two certificates to an SSL VIP or an SSL service, one each of type RSA and type DSA. On a NetScaler MPX or MPX-FIPS appliance, if SNI is enabled, you can bind multiple server certificates of type RSA. If SNI is disabled, you can bind a maximum of one certificate of type RSA.

Note: DSA certificates are not supported on MPX or MPX-FIPS platforms.

Does SNI support Subject Alternative Name (SAN) certificates?

No. On a NetScaler appliance, SNI is not supported with a SAN extension certificate.

What happens if I unbind or overwrite a server certificate?

When you unbind or overwrite a server certificate, all the connections and SSL sessions created by using the existing certificate are terminated. When you overwrite an existing certificate, the following message appears:

```
ERROR:

Warning: Current certificate replaces the previous binding.
```

How do I install an intermediate certificate on Citrix NetScaler and link to a server certificate?

See the article at http://support.citrix.com/article/ctx114146 for information about installing an intermediate certificate.

Why am I am getting a "resource already exists" error when I try to install a certificate on the Citrix NetScaler?

See the article athttp://support.citrix.com/article/CTX117284 for instructions for resolving the "resource already exists" error.

I want to create a server certificate on a Citrix NetScaler appliance to test and evaluate the product. What is the procedure to create a server certificate?

Perform the following procedure to create a test certificate.

Note: A certificate created with this procedure cannot be used to authenticate all the users and browsers. After using the certificate for testing, you should obtain a server certificate signed by an authorized Root CA.

To create a self-signed server certificate:

1. To create a Root CA certificate, at the NetScaler command line, type:

   create ssl rsakey /nsconfig/ssl/test-ca.key 1024

   create ssl certreq /nsconfig/ssl/test-ca.csr -keyfile /nsconfig/ssl/test-ca.key

   Enter the required information when prompted, and then type the following command:

   create ssl cert /nsconfig/ssl/test-ca.cer /nsconfig/ssl/test-ca.csr ROOT_CERT -keyfile /nsconfig/ssl/test-ca.key

2. Perform the following procedure to create a server certificate and sign it with the root CA certificate that you just created

   a. To create the request and the key, at the NetScaler command line, type:

      create ssl rsakey /nsconfig/ssl/test-server.key 1024

      create ssl certreq /nsconfig/ssl/test-server.csr -keyfile /nsconfig/ssl/test-server.key

   b. Enter the required information when prompted.

   c. To create a serial-number file, at the NetScaler command line, type:

      shell
      # echo '01' > /nsconfig/ssl/serial.txt

```
# exit
```

3. To create a server certificate signed by the root CA certificate created in step 1, at the NetScaler command line, type:

   create ssl cert /nsconfig/ssl/test-server.cer /nsconfig/ssl/test-server.csr SRVR_CERT -CAcert /nsconfig/ssl/test-ca.cer -CAkey /nsconfig/ssl/test-ca.key -CAserial /nsconfig/ssl/serial.txt

4. To create a Citrix NetScaler certkey, which is the in-memory object that holds the server certificate information for SSL handshakes and bulk encryption, at the NetScaler command line, type:

   add ssl certkey test-certkey -cert /nsconfig/ssl/test-server.cer -key /nsconfig/ssl/test-server.key

5. To bind the certkey object to the SSL virtual server, at the NetScaler command line, type:

   bind ssl vserver <vServerName> -certkeyName <cert_name>

I have received a Citrix NetScaler appliance on which Citrix NetScaler software release 9.0 is installed. I have noticed an additional license file on the appliance. Is there any change in the licensing policy starting with Citrix NetScaler software release 9.0?

Yes. Starting with Citrix NetScaler software release 9.0, the appliance might not have a single license file. The number of license files depends on the Citrix NetScaler software release edition. For example, if you have installed the Enterprise edition, you might need additional license files for the full functionality of the various features. However, if you have installed the Platinum edition, the appliance has only one license file.

How do I export the certificate from Internet Information Service (IIS)?

There are many ways to do this, but by using the following method the appropriate certificate and private key for the Web site are exported. This procedure **must** be performed on the actual IIS server.

1. Open the Internet Information Services (IIS) Manager administration tool.
2. Expand the Web Sites node and locate the SSL-enabled Web site that you want to serve through the Citrix NetScaler.
3. Right-click this Web site and click Properties.
4. Click the Directory Security tab and, in the Secure Communications section of the window, select the View Certificate box.
5. Click the Details tab, and then click Copy to File.
6. On the Welcome to the Certificate Export Wizard page, click Next.
7. Select Yes, export the private key and click Next.

   Note: The private key MUST be exported for SSL Offload to work on the Citrix NetScaler

8. Make sure that the Personal Information Exchange -PKCS #12 radio button is selected, and select *only* the Include all certificates in the certification path if possible check box. Click Next.

9. Enter a password and click Next.

10. Enter a file name and location, and then click Next. Give the file an extension of .PFX.

11. Click Finish.

How do I convert the PKCS#12 certificate and install it on the Citrix NetScaler?

1. Move the exported .PFX certificate file to a location from where it may be copied to the Citrix NetScaler (that is, to a machine that permits SSH access to the management interface of a Citrix NetScaler appliance). Copy the certificate to the appliance by using a secure copy utility such as SCP.

2. Access the BSD shell and convert the certificate (for example, cert.PFX) to .PEM format:

   ```
   root@ns# openssl pkcs12 -in cert.PFX -out cert.PEM
   ```

3. To make sure that the converted certificate is in correct x509 format, verify that the following command produces no error:

   ```
   root@ns# openssl x509 -in cert.PEM -text
   ```

4. Verify that the certificate file contains a private key. Begin by issuing the following command:

   ```
   root@ns# cat cert.PEM
   ```

   Verify that the output file includes an RSA PRIVATE KEY section.

   ```
   -----BEGIN RSA PRIVATE KEY-----
    Mkm^s9KMs9023pz/s...
    -----END RSA PRIVATE KEY-----
   ```

   The following is another example of an RSA PRIVATE KEY section:

   ```
    Bag Attributes
   1.3.6.1.4.1.311.17.2: <No Values>
   localKeyID: 01 00 00 00
   Microsoft CSP Name: Microsoft RSA SChannel Cryptographic
   Provider
   friendlyName:
   4b9cef4cc8c9b849ff5c662fd3e0ef7e_76267e3e-6183-4d45-886e-6e067297b38f

   Key Attributes
   X509v3 Key Usage: 10
   -----BEGIN RSA PRIVATE KEY-----
   Proc-Type: 4,ENCRYPTED
   DEK-Info: DES-EDE3-CBC,43E7ACA5F4423968
   ```

pZJ2SfsSVqMbRRf6ug37Clua5gY0Wld4frPIxFXyJquUHr31dilW5ta3hbIaQ+Rg

... (more random characters)
v8dMugeRplkaH2Uwt/mWBk4t71Yv7GeHmcmjafK8H8iW80ooPO3D/ENV8X4U/tlh

5eU6ky3WYZ1BTy6thxxLlwAullynVXZEflNLxq1oX+ZYl6djgjE3qg==
-----END RSA PRIVATE KEY-----

The following is a SERVER CERTIFICATE section:

Bag Attributes
localKeyID: 01 00 00 00
friendlyName: AG Certificate
subject=/C=AU/ST=NSW/L=Wanniassa/O=Dave Mother Asiapacific/OU=Support/CN=davemother.food.lan
issuer=/DC=lan/DC=food/CN=hotdog
-----BEGIN CERTIFICATE-----
MIIFiTCCBHGgAwIBAgIKCGryDgAAAAAHzANBgkqhkiG9w0BAQUFADA8MRMwEQYK

... (more random characters) 5pLDWYVHhLkA1pSxvFjNJHRSIydWHc5ltGyKqIUcBezVaXyel94pNSUYx07N

MY2ovQyQZM8gGe3+lGFum0VHbv/y/gB9HhFesog=
-----END CERTIFICATE-----

The following is an INTERMEDIATE CA CERTIFICATE section:

Bag Attributes: <Empty Attributes>
subject=/DC=lan/DC=food/CN=hotdog
issuer=/DC=lan/DC=food/CN=hotdog
-----BEGIN CERTIFICATE-----
MIIESDCCAzCgAwIBAgIQah20fCRYTY9LRXYMIRaKGjANBgkqhkiG9w0BAQUFADA8

... (more random characters) Nt0nksawDnbKo86rQcNnY5xUs7c7pj2zxj/IOsgNHUp5W6dDI9pQoqFFaDk=

-----END CERTIFICATE-----

Further Intermediate CA certificates may follow, depending on the certification path of the exported certificate.

5. Open the .PEM file in a text editor
6. Locate the first line of the .PEM file and the first instance of the following line, and copy those two lines and all the lines between them:

   ```
   -----END CERTIFICATE-----
   ```

   Note: Make sure that last copied line is the first `-----END CERTIFICATE-----` line in the .PEM file.

7. Paste the copied lines into a new file. Call the new file something intuitive, such as `cert-key.pem`. This is the certificate-key pair for the server hosting the HTTPS service. This file should contain both the section labeled `RSA PRIVATE KEY` and the section labeled `SERVER CERTIFICATE` in the example above.

Note: The certificate-key pair file contains the private key and must therefore be kept secure.

8. Locate any subsequent sections beginning with `-----BEGIN CERTIFICATE-----` and ending with `---END CERTIFICATE-----`, and copy each such section to a separate new file.

   These sections correspond to certificates of trusted CAs that have been included in the certification path. These sections should be copied and pasted into new individual files for these certificates. For example, the INTERMEDIATE CA CERTIFICATE section of the example above should be copied and pasted into a new file).

   For multiple intermediate CA certificates in the original file, create new files for each intermediate CA certificate in the order in which they appear in the file. Keep track (using appropriate filenames) of the order in which the certificates appear, as they need to be linked together in the correct order in a later step.

9. Copy the certificate-key file (`cert-key.pem`) and any additional CA certificate files into the /nsconfig/ssl directory on the Citrix NetScaler.

10. Exit the BSD shell and access the Citrix NetScaler prompt.

11. Follow the steps in "Install the certificate-key files on the appliance" to install the key/certificate once uploaded on the device.

How do I convert the PKCS#7 certificate and install it on the NetScaler appliance?

You can use OpenSSL to convert a PKCS #7 Certificate to a format recognizable by the NetScaler appliance. The procedure is identical to the procedure for PKCS #12 certificates, except that you invoke OpenSSL with different parameters. The steps for converting PKCS #7 certificates are as follows:

1. Copy the certificate to the appliance by using a secure copy utility, such as SCP.

2. Convert the certificate (for example, cert.P7B) to PEM format:

   ```
   > openssl pkcs7 -inform DER -in cert.p7b -print_certs -text -out
   cert.pem
   ```

3. Follow steps 3 through 7 as described in the answer to Q32 for PKCS #12 certificates.

Note: Before loading the converted PKCS #7 certificate to the appliance, be sure to verify that it contains a private key, exactly as described in step 3 for the PKCS #12 procedure. PKCS #7 certificates, particularly those exported from IIS, do not typically contain a private key.

When I bind a cipher to a virtual server or service by using the bind cipher command, I see the error message "Command deprecated."

The command for binding a cipher to a virtual server or service has changed.

Use the bind ssl vserver <vsername> -ciphername <ciphername> command to bind an SSL cipher to an SSL virtual server.

Use the bind ssl service <serviceName> -ciphername <ciphername> command to bind an SSL cipher to an SSL service.

Note: New ciphers and cipher groups are added to the existing list and not replaced.

Why can't I create a new cipher group and bind ciphers to it by using the add cipher command?

The add cipher command functionality has changed in release 10. The command only creates a cipher group. To add ciphers to the group, use the bind cipher command.

OpenSSL

How do I install the OpenSSL toolkit?

See the article at http://support.citrix.com/article/ctx106627.

How do I use OpenSSL to convert certificates between PEM and DER?

To use OpenSSL, you must have a working installation of the OpenSSL software and be able to execute Openssl from the command line.

x509 certificates and RSA keys can be stored in a number of different formats.

Two common formats are DER (a binary format used primarily by Java and Macintosh platforms) and PEM (a base64 representation of DER with header and footer information, which is used primarily by UNIX and Linux platforms). There is also an obsolete NET (Netscape server) format that was used by earlier versions of IIS (up to and including 4.0) and various other less common formats that are not covered in this article.

A key and the corresponding certificate, as well as the root and any intermediate certificates, can also be stored in a single PKCS#12 (.P12, .PFX) file.

Procedure

Use the Openssl command to convert between formats as follows:

1. To convert a certificate from PEM to DER:

   ```
   x509 -in input.crt -inform PEM -out output.crt -outform DER
   ```

2. To convert a certificate from DER to PEM:

   ```
   x509 -in input.crt -inform DER -out output.crt -outform PEM
   ```

3. To convert a key from PEM to DER:

   ```
   rsa -in input.key -inform PEM -out output.key -outform DER
   ```

4. To convert a key from DER to PEM:

   ```
   rsa -in input.key -inform DER -out output.key -outform PEM
   ```

Note: If the key you are importing is encrypted with a supported symmetric cipher, you are prompted to enter the pass-phrase.

Note: To convert a key to or from the obsolete NET (Netscape server) format, substitute NET for PEM or DER as appropriate. The stored key is encrypted in a weak unsalted RC4 symmetric cipher, so a pass-phrase will be requested. A blank pass-phrase is acceptable.

System Limits

What are the important numbers to remember?

1. Create Certificate Request:
    - Request File Name: Maximum 63 characters
    - Key File Name: Maximum 63 characters
    - PEM Passphrase (For Encrypted Key): Maximum 31 characters
    - Common Name: Maximum 63 characters
    - City: Maximum 127 characters
    - Organization Name: Maximum 63 characters
    - State/Province Name: Maximum 63 characters
    - Email Address: Maximum 39 Characters
    - Organization Unit: Maximum 63 characters
    - Challenge Password: Maximum 20 characters
    - Company Name: Maximum 127 characters
2. Create Certificate:
    - Certificate File Name: Maximum 63 characters
    - Certificate Request File Name: Maximum 63 characters
    - Key File Name: Maximum 63 characters
    - PEM Passphrase: Maximum 31 characters
    - Validity Period: Maximum 3650 days
    - CA Certificate File Name: Maximum 63 characters
    - CA Key File Name: Maximum 63 characters
    - PEM Passphrase: Maximum 31 characters
    - CA Serial Number File: Maximum 63 characters

3. Create and Install a Server Test Certificate:
    - Certificate File Name: Maximum 31 characters
    - Fully Qualified Domain Name: Maximum 63 characters
4. Create Diffie-Hellman (DH) key:
    - DH Filename (with path): Maximum 63 characters
    - DH Parameter Size: Maximum 2048 bits
5. Import PKCS12 key:
    - Output File Name: Maximum 63 characters
    - PKCS12 File Name: Maximum 63 characters
    - Import Password: Maximum 31 characters
    - PEM Passphrase: Maximum 31 characters
    - Verify PEM Passphrase: Maximum 31 characters
6. Export PKCS12
    - PKCS12 File Name: Maximum 63 characters
    - Certificate File Name: Maximum 63 characters
    - Key File Name: Maximum 63 characters
    - Export Password: Maximum 31 characters
    - PEM Passphrase: Maximum 31 characters
7. CRL Management:
    - CA Certificate File Name: Maximum 63 characters
    - CA Key File Name: Maximum 63 characters
    - CA Key File Password: Maximum 31 characters
    - Index File Name: Maximum 63 characters
    - Certificate File Name: Maximum 63 characters
8. Create RSA Key:
    - Key Filename: Maximum 63 characters
    - Key Size: Maximum 4096 bits
    - PEM Passphrase: Maximum 31 characters
    - Verify Passphrase: Maximum 31 characters
9. Create DSA Key:
    - Key Filename: Maximum 63 characters

- Key Size: Maximum 4096 bits
- PEM Passphrase: Maximum 31 characters
- Verify Passphrase: Maximum 31 characters

10. Change advanced SSL settings:
    - Maximum CRL memory size: Maximum 1024 Mbytes
    - Encryption trigger timeout (10 mS ticks): Maximum 200
    - Encryption trigger packet count: Maximum 50
    - OCSP cache size: Maximum 512 Mbytes
11. Install Certificate:
    - Certificate-Key pair Name: Maximum 31 characters
    - Certificate File Name: Maximum 63 characters
    - Private Key File Name: Maximum 63 characters
    - Password: Maximum 31 characters
    - Notification Period: Maximum 100
12. Create Cipher Group:
    - Cipher Group Name: Maximum 39 characters
13. Create CRL:
    - CRL Name: Maximum 31 characters
    - CRL File: Maximum 63 characters
    - URL: Maximum 127 characters
    - Base DN: Maximum 127 characters
    - Bind DN: Maximum 127 characters
    - Password: Maximum 31 characters
    - Day(s): Maximum 31
14. Create SSL Policy:
    - Name: Maximum 127 characters
15. Create SSL Action:
    - Name: Maximum 127 characters
16. Create OCSP Responder:
    - Name: Maximum 32 characters
    - URL: Maximum 128 characters

- Batching Depth: Maximum 8
- Batching Delay: Maximum 10000
- Produced At Time Skew: Maximum 86400
- Request Time-out: Maximum120000

17. Create Virtual Server:
    - Name: Maximum 127 characters
    - Redirect URL: Maximum 127 characters
    - Client Time-out: Maximum 31536000 secs
18. Create Service:
    - Name: Maximum 127 characters
    - Idle Time-out (secs):

      Client: Maximum 31536000

      Server: Maximum 31536000
19. Create Service Group:
    - Service Group Name: Maximum 127 characters
    - Server ID: Maximum 4294967295
    - Idle Time-out (secs):

      Client: Maximum value 31536000

      Server: Maximum 31536000
20. Create Monitor:
    - Name: Maximum 31 characters
21. Create Server:
    - Server Name: Maximum 127 characters
    - Domain Name: Maximum 255 characters
    - Resolve Retry: Maximum 20939 secs

CITRIX®

Getting Started 10

Understanding the NetScaler

The Citrix NetScaler product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4–L7) network traffic for web applications. For example, a NetScaler bases load balancing decisions on individual HTTP requests instead of on long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The NetScaler feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.

Switching Features

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by the way in which it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and on the basis of L4–L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Security and Protection Features

NetScaler security and protection features protect web applications from Application Layer attacks. A NetScaler allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization Features

Optimization features offload resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. A NetScaler supports several transparent TCP optimizations, which mitigate problems caused by high latency and congested network links, accelerating the delivery of applications while requiring no configuration changes to clients or servers.

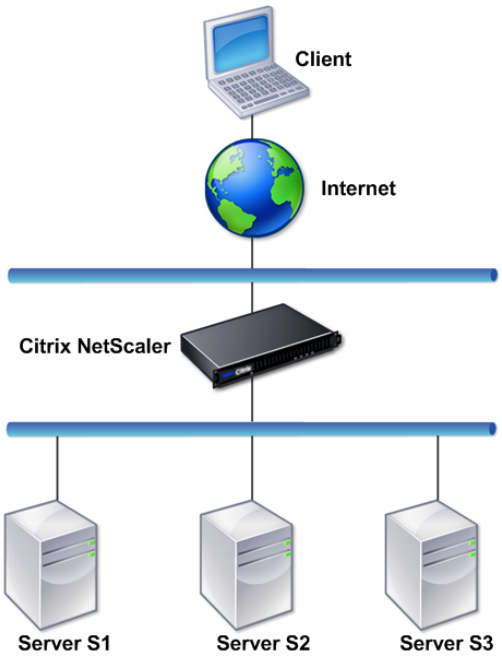
Where Does a NetScaler Appliance Fit in the Network?

A NetScaler appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. In this case, the appliance owns public IP addresses that are associated with its virtual servers, while the real servers are isolated in a private network. It is also possible to operate the appliance in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

Physical Deployment Modes

A NetScaler appliance logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the appliance is placed between the clients and the servers. The appliance has a separate network interface to each client network and a separate network interface to each server network. The appliance and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment



In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see "Understanding Common Network Topologies."

Citrix NetScaler as an L2 Device

A NetScaler functioning as an L2 device is said to operate in L2 mode. In L2 mode, the NetScaler forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device's media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network

interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler.

For information about how the L2 and L3 modes interact, see "Configuring Modes of Packet Forwarding."

For information about configuring L2 mode, see "Enabling and Disabling Layer 2 Mode."

Citrix NetScaler as a Packet Forwarding Device

A NetScaler appliance can function as a packet forwarding device, and this mode of operation is called *L3 mode*. With L3 mode enabled, the appliance forwards any received unicast packets that are destined for an IP address that does not belong to the appliance, if there is a route to the destination. The appliance can also route packets between VLANs.

In both modes of operation, L2 and L3, the appliance generally drops packets that are in:

- Multicast frames
- Unknown protocol frames destined for an appliance's MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see "Configuring Modes of Packet Forwarding."

For information about configuring the L3 mode, see "Enabling and Disabling Layer 3 Mode."

How a NetScaler Communicates with Clients and Servers

A NetScaler appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as *NetScaler-owned IP addresses*. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that

become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-Owned IP Addresses

To function as a proxy, a NetScaler appliance uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

NetScaler IP (NSIP) address
The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

Mapped IP (MIP) address
A MIP address is used for server-side connections. It is not the IP address of the appliance. In most cases, when the appliance receives a packet, it replaces the source IP address with a MIP address before sending the packet to the server. With the servers abstracted from the clients, the appliance manages connections more efficiently.

Virtual server IP (VIP) address
A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.

Subnet IP (SNIP) address
A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

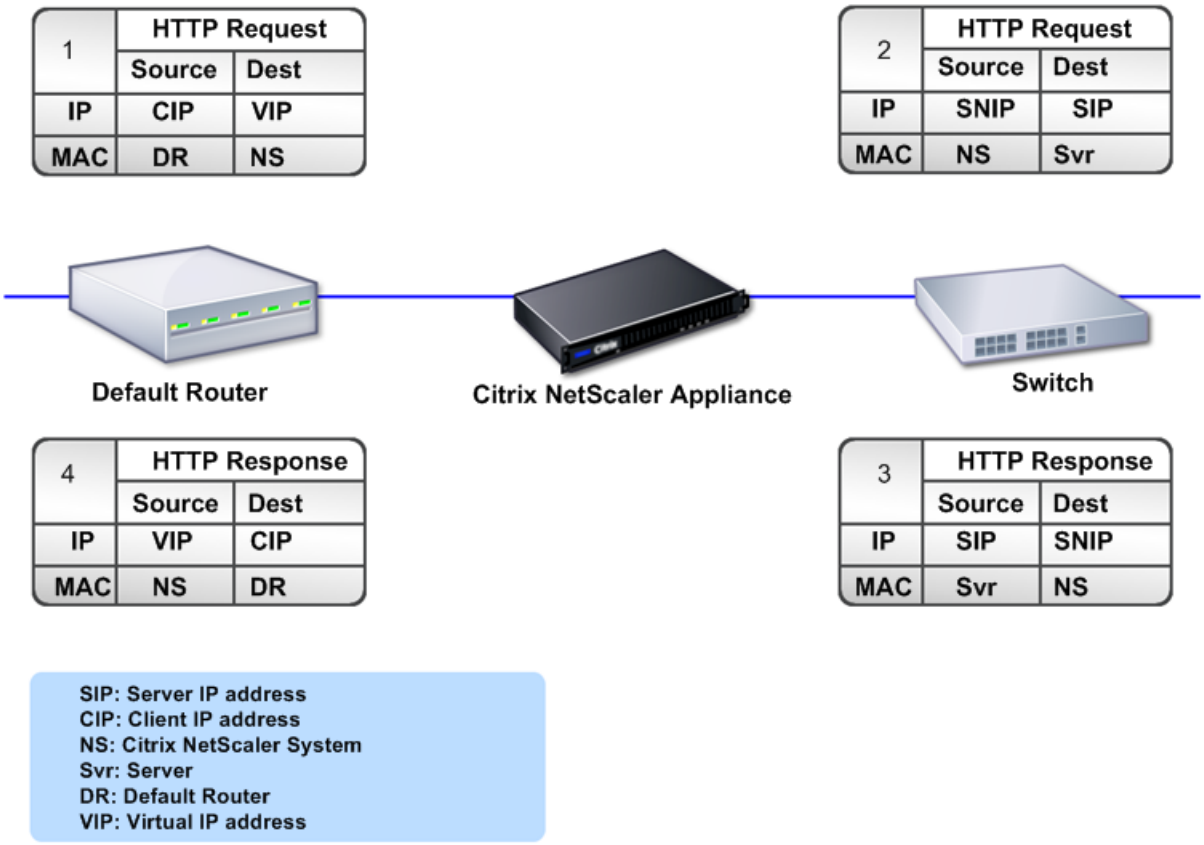
IP Set
An IP set is a set of IP addresses, which are configured on the appliance as SNIP . An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

Net Profile
A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

How Traffic Flows Are Managed

Because a NetScaler appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the NetScaler instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client's request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

Figure 2. Virtual Server Based Connections



In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

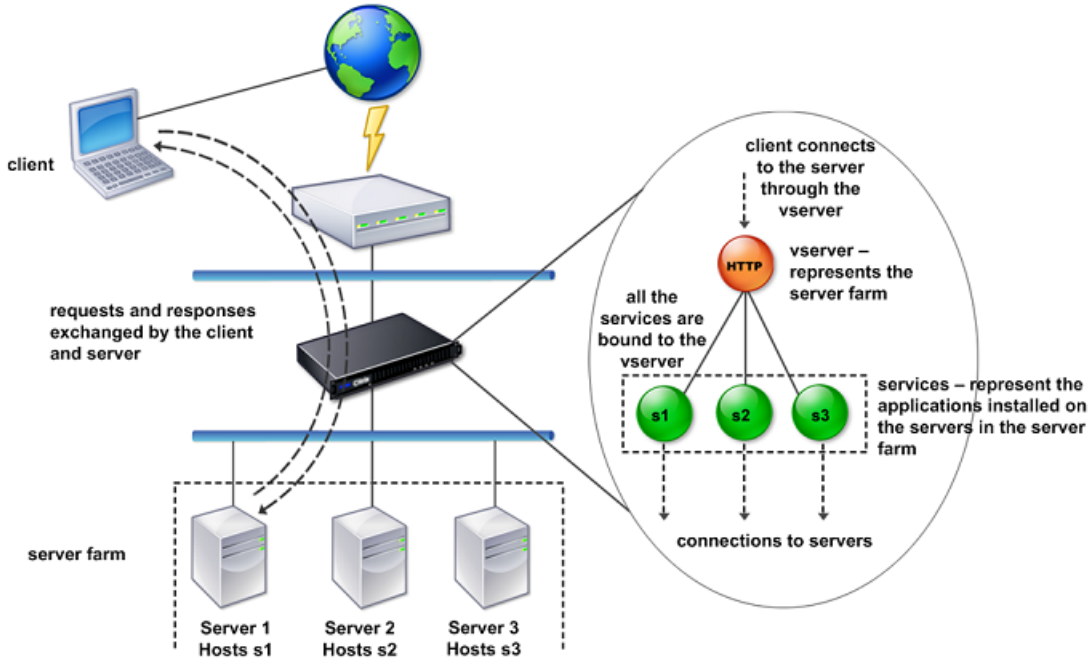
For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

Traffic Management Building Blocks

The configuration of a NetScaler appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 3. How Traffic Management Building Blocks Work



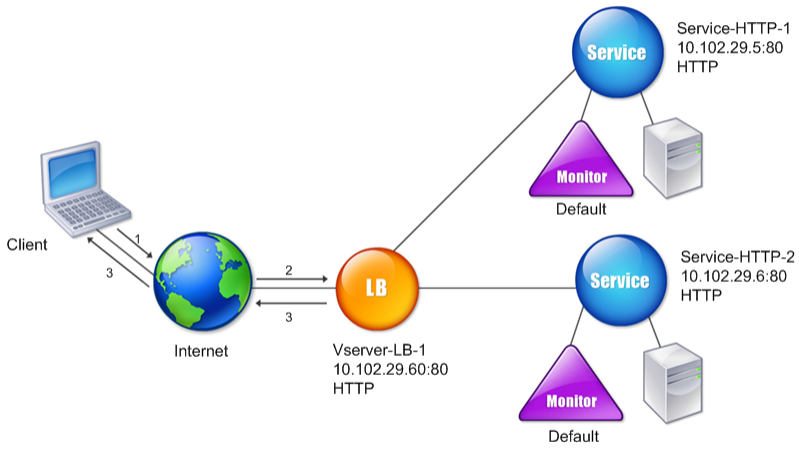
A Simple Load Balancing Configuration

In the example shown in the following figure, the NetScaler appliance is configured to function as a load balancer. For this configuration, you need to configure virtual

entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to connect to a NetScaler appliance. When the appliance receives client requests sent to the VIP address, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a *monitor* to track whether a specific configured service (server plus application) is available to receive requests.

Figure 4. Load Balancing Virtual Server, Services, and Monitors



In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

Understanding Virtual Servers

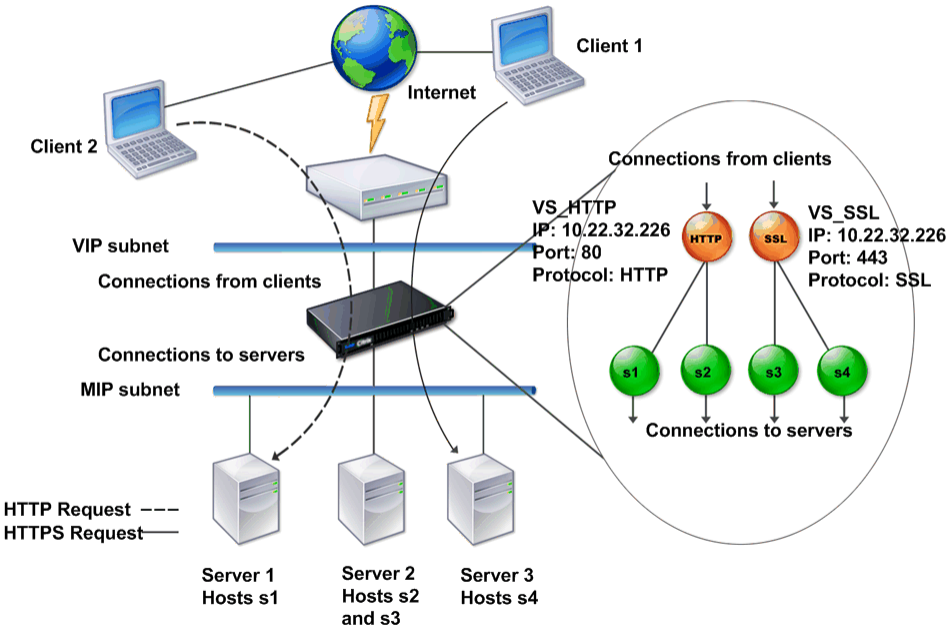
A virtual server is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual

IP (VIP) address, port, and protocol. The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 5. Multiple Virtual Servers with a Single VIP Address



The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP request at the VIP address, it processes the request as specified by the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as *wildcard* virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

Load balancing virtual server
Receives and redirects requests to an appropriate server. Choice of the appropriate server is based on which of the various load balancing methods the user configures.

Cache redirection virtual server
Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.

Content switching virtual server
Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.

Virtual private network (VPN) virtual server
Decrypts tunneled traffic and sends it to intranet applications.

SSL virtual server
Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding Services

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the destination IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state. If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

Understanding Policies and Expressions

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the NetScaler what to do when a request matches the expression. As an example, the expression might be to match a specific URL pattern to a type of security attack, with the action being to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.

When a NetScaler receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

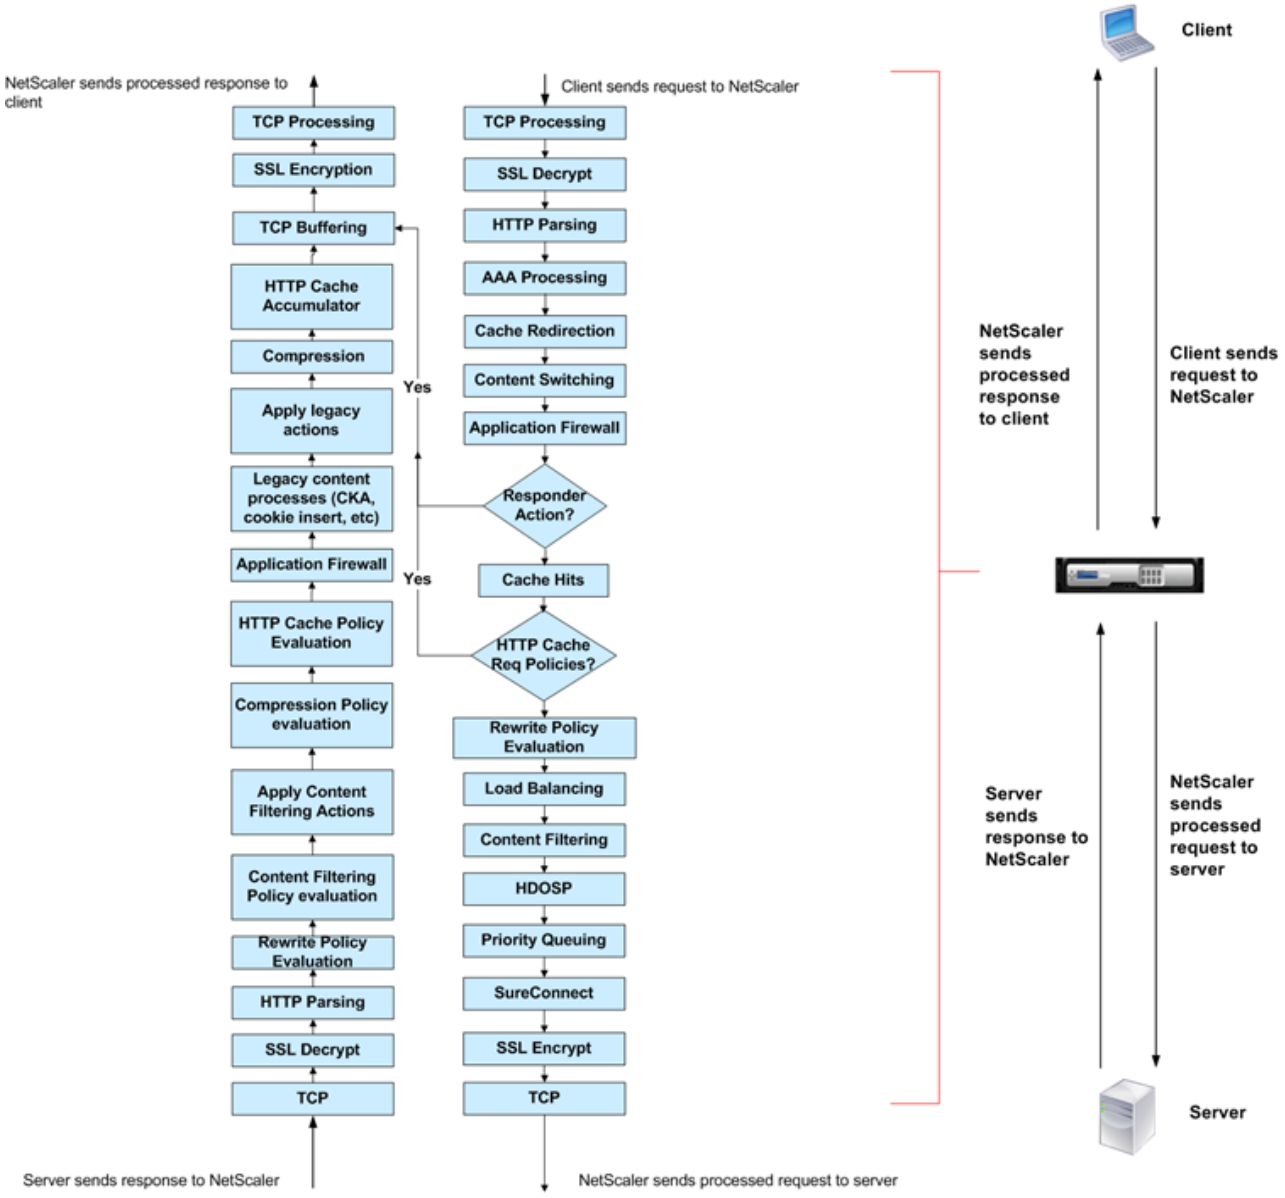
For all policy types except Rewrite policies, a NetScaler implements only the first policy that a request matches, not any additional policies that it might also match. For Rewrite policies, the NetScaler evaluates the policies in order and, in the case of multiple matches, performs the associated actions in that order. Policy priority is important for getting the results you want.

Processing Order of Features

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

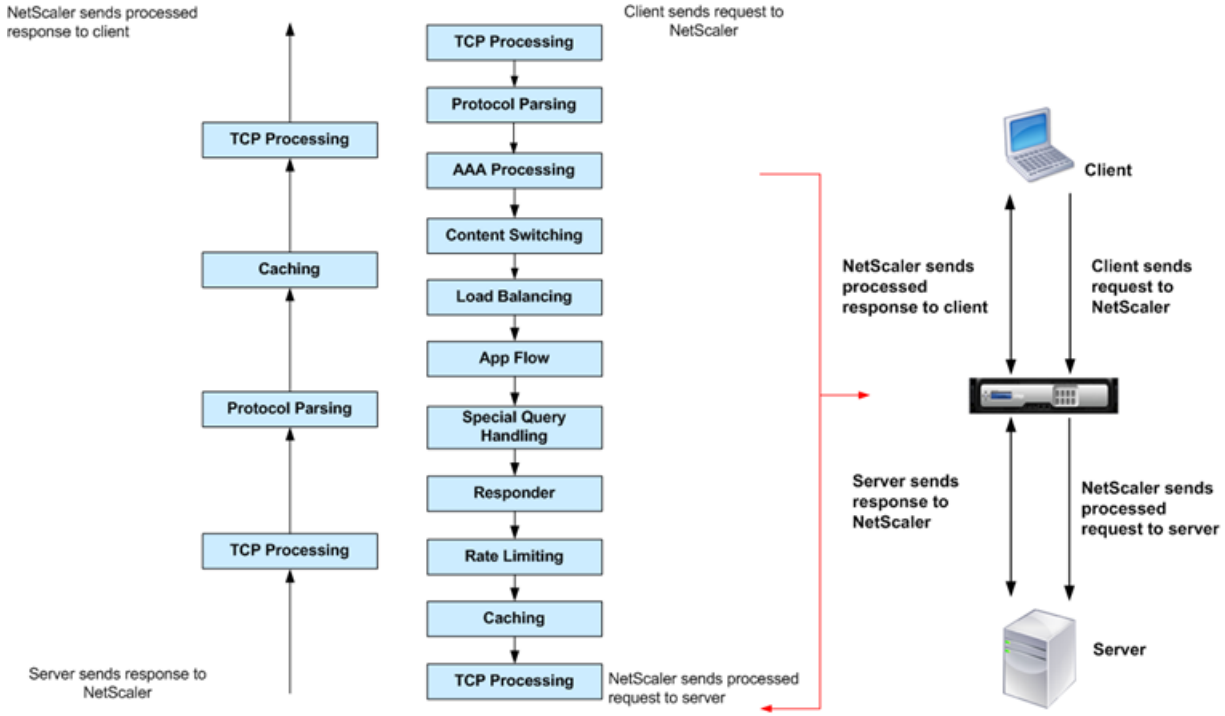
The following figure shows the L7 packet flow in the NetScaler.

Figure 6. L7 Packet Flow Diagram



The following figure shows the DataStream packet flow in the NetScaler. DataStream is supported for MySQL and MS SQL databases. For information about the DataStream feature, see "DataStream."

Figure 7. DataStream Packet Flow Diagram



Introduction to the Citrix NetScaler Product Line

The Citrix NetScaler product line optimizes delivery of applications over the Internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A NetScaler can be integrated into any network as a complement to existing load balancers, servers, caches, and firewalls. It requires no additional client or server side software, and can be configured using the NetScaler web-based GUI and CLI configuration utilities.

NetScaler appliances are available in a variety of hardware platforms that have a range of specifications, including multicore processors.

The NetScaler operating system is the base operating system for all NetScaler hardware platforms. The NetScaler operating system is available in three editions: Standard, Enterprise, and Platinum.

Citrix NetScaler Hardware Platforms

NetScaler hardware is available in a variety of platforms that have a range of hardware specifications, including multicore processors. All hardware platforms support some combination of Fast Ethernet, Gigabit Ethernet, and 10 Gigabit Ethernet interfaces.

The following platforms are available for NetScaler 10.

- Citrix NetScaler MPX 5500
- Citrix NetScaler MPX 5550/5650
- Citrix NetScaler MPX 7500/9500
- Citrix NetScaler MPX 8200/8400/8600
- Citrix NetScaler MPX 9700/10500/12500/15500
- Citrix NetScaler MPX 11500/13500/14500/16500/18500/20500
- Citrix NetScaler MPX 15000
- Citrix NetScaler MPX 17000
- Citrix NetScaler MPX 17500/19500/21500

- Citrix NetScaler MPX 17550/19550/20550/21550

For more information about the hardware platform specifications, see "Introduction to the Hardware Platforms."

The following tables list different editions of the NetScaler and the hardware platforms on which they are available.

Table 1. Product Editions and MPX Hardware Platforms

Hardware	MPX 5500	MPX 5550/5650	MPX 7500/9500	MPX 8200/8400/8600	MPX 15000	MPX 17000
Platinum Edition	Yes	Yes	Yes	Yes	Yes	Yes
Enterprise Edition	Yes	Yes	Yes	Yes	Yes	Yes
Standard Edition	Yes	Yes	Yes	Yes	Yes	Yes

Table 2. Product Editions and MPX Hardware Platforms (contd.)

Hardware	MPX 9700/10500/12500/15500	MPX 11500/13500/14500/16500/18500/20500	MPX 17500/19500/21500	MPX 17550/19550/20550/21550
Platinum Edition	Yes	Yes	Yes	Yes
Enterprise Edition	Yes	Yes	Yes	Yes
Standard Edition	Yes	Yes	Yes	Yes

Citrix NetScaler Editions

The NetScaler operating system is available in Standard, Enterprise, and Platinum editions. The Enterprise and Standard editions have limited features available. Feature licenses are required for all editions.

For instructions on how to obtain and install licenses, see "http://support.citrix.com/article/ctx121062."

The Citrix NetScaler editions are described as follows:

- *Citrix NetScaler, Standard Edition*. Provides small and medium enterprises with comprehensive Layer 4- Layer 7 (L4-L7) traffic management, enabling increased web application availability.
- *Citrix NetScaler, Enterprise Edition*. Provides web application acceleration and advanced L4-L7 traffic management, enabling enterprises to increase web application performance and availability and reduce datacenter costs.
- *Citrix NetScaler, Platinum Edition*. Provides a web application delivery solution that reduces data center costs and accelerates application performance, with end-to-end visibility of application performance, and provides advanced application security.

The following table summarizes the features supported by each edition in the Citrix NetScaler product line:

Table 3. Citrix NetScaler Application Delivery Product Line Features

Key Features	Platinum Edition	Enterprise Edition	Standard Edition
Application availability			
Layer 4 load balancing	Yes	Yes	Yes
Layer 7 content switching	Yes	Yes	Yes
AppExpert rate controls	Yes	Yes	Yes
IPv6 support	Yes	Yes	Yes
Global server load balancing (GSLB)	Yes	Yes	Optional
Dynamic routing protocols	Yes	Yes	No
Surge protection	Yes	Yes	No
Priority queuing	Yes	Yes	No
Application acceleration			
Client and server TCP optimizations	Yes	Yes	Yes
Citrix AppCompress for HTTP	Yes	Yes	Optional
Citrix AppCache	Yes	Optional	No
Citrix Branch Repeater client	Yes	No	No
Application security			
Layer 4 DoS defenses	Yes	Yes	Yes
Layer 7 content filtering	Yes	Yes	Yes

Key Features	Platinum Edition	Enterprise Edition	Standard Edition
HTTP/URL Rewrite	Yes	Yes	Yes
Access Gateway, EE SSL VPN	Yes	Yes	Yes
Layer 7 DoS Defenses	Yes	Yes	No
AAA security	Yes	Yes	No
Application firewall with XML security	Yes	Optional	No
Simple manageability			
AppExpert visual policy builder	Yes	Yes	Yes
AppExpert service callouts	Yes	Yes	Yes
AppExpert templates	Yes	Yes	Yes
Role-based administration	Yes	Yes	Yes
Configuration wizards	Yes	Yes	Yes
Citrix Command Center	Yes	Yes	No
Citrix EdgeSight for NetScaler	Yes	Optional	No
Web 2.0 optimization			
Rich Internet application support	Yes	Yes	Yes
Advanced server offload	Yes	Yes	No
Lower total cost of ownership (TCO)			
TCP buffering	Yes	Yes	Yes
TCP multiplexing	Yes	Yes	Yes
SSL offload and acceleration	Yes	Yes	Yes
Cache redirection	Yes	Yes	No
Citrix EasyCall	Yes	No	No

Note: While we have taken care to ensure absolute accuracy when compiling this information, it might change. For the latest information, see Citrix Support at "http://www.citrix.com."

Supported Releases on NetScaler Hardware

The following table lists the earliest NetScaler builds for releases that are supported on the NetScaler MPX platforms.

Hardware	Software Release	Software Build #
MPX 5500	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 5550/5650	10.5	All
	10.1	All
	10.0	71.6.nc and later
	9.3	59.5.nc and later
MPX 7500/9500	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 8005/8015	10.5	All
	10.1	122.17.nc and later
	9.3	65.8.nc and later
MPX 8200/8400/8600	10.5	All
	10.1	All
	10.0	70.7.nc and later
	9.3	58.5.nc and later
MPX 9700/10500/12500	10.5	All

Hardware	Software Release	Software Build #
	10.1	All
	10.0	All
	9.3	All
MPX 9700/10500/12500 10G	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 15500	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 15500 10G	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 11500/13500/14500/16500/18500/20500	10.5	All
	10.1	All
	10.0	All
	9.3	52.3.nc and later
MPX 11515/11520/11530/11540/11542	10.5	All
	10.1	123.11.nc and later
	9.3	65.8.nc and later
MPX 15000	10.5	All
	10.1	All
	10.0	All
	9.3	All

Hardware	Software Release	Software Build #
MPX 17000	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 17500/19500/21500	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 17550/19550/20550/21550	10.5	All
	10.1	All
	10.0	All
	9.3	53.5.nc and later
MPX 22040/22060/22080/22100/22120	10.5	51.10.nc and later
	10.1	123.11.nc and later
	9.3	65.8.nc and later
MPX 24100/24150	10.5	51.10.nc and later
	10.1	129.11.nc and later

Installing the NetScaler Hardware

Before installing a NetScaler appliance, review the pre-installation checklist. A NetScaler is typically mounted in a rack, and all models ship with rack-rail hardware. All models except the 7000 support small form factor pluggable SFP, XFP, or SFP+ transceivers. After mounting the appliance and installing the transceivers, connect the NetScaler to your network. Use a console cable to connect the NetScaler to a personal computer so that you can perform an initial configuration. After connecting everything else, connect the NetScaler to a power source.

Unpacking the Appliance

The hardware accessories for your particular appliance, such as cables, adapters, and rail kit, vary depending on the hardware platform you ordered. Unpack the box that contains your new appliance on a sturdy table with plenty of space and inspect the contents.

Use the following list to verify that you received everything that should have been included in the box.

- The appliance you ordered
- One RJ-45 to DB-9 adapter
- One 6 ft RJ-45/DB-9 cable
- Two power cables
- One fiber patch cable
- The following list specifies the number of power cables included for each appliance model:
  - One power cable for the MPX 5500, MPX 5550/5650, MPX 7500/9500, and MPX 8200/8400/8600/8800 appliances
  - Two power cables for the MPX 15000, MPX 17000, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 25100T/25160T, and MPX 17550/19550/20550/21550 appliances

  Note: For Brazilian customers, Citrix does not ship a power cable. Use a cable that conforms to the **ABNT NBR 14136:2002** standard.
- One standard 4-post rail kit

  Note: If the kit that you received does not fit your rack, contact your Citrix sales representative to order the appropriate kit.

In addition to the items included in the box with your new appliance, you will need the following items to complete the installation and initial configuration process.

- Ethernet cables for each additional Ethernet port that you will connect to your network
- One available Ethernet port on your network switch or hub for each NetScaler Ethernet port you want to connect to your network

> **Note:** Transceiver modules are sold separately. Contact your Citrix sales representative to order transceiver modules for your appliance. Only transceivers supplied by Citrix are supported on the appliance.

- A computer to serve as a management workstation

Rack Mounting the Appliance

Most appliances can be installed in standard server racks that conform to EIA-310-D specification. The appliances ship with a set of rails, which you must install before you mount the appliance. The only tools that you need for installing an appliance are a Phillips screwdriver and a flathead screwdriver.

> ⚠ **Caution:** If you are installing the appliance as the only unit in the rack, mount it at the bottom. If the rack contains other units, make sure that the heaviest unit is at the bottom. If the rack has stabilizing devices available, install them before mounting the appliance.

The following table lists the different hardware platforms and the rack units required for each platform.

Table 1. ***Height Requirements For Each Platform***

Platform	Number of rack units
MPX 5500	One rack unit
MPX 5550/5650	One rack unit
MPX 7500/9500	One rack unit
MPX 8200/8400/8600/8800	One rack unit
MPX 9700/10500/12500/15500	Two rack units
MPX 15000, MPX 17000	Two rack units

MPX 11500/13500/14500/16500/18500/20500	Two rack units
MPX 17500/19500/21500	Two rack units
MPX 17550/19550/20550/21550	Two rack units

Each appliance ships with a mounting rail kit that contains two rail assemblies, one for the left side and the other for the right side of the appliance, and screws to attach the rails. An assembly consists of an inner rail and a rack rail. The supplied rail kit is 28 inches long (38 inches extended). Contact your Citrix sales representative to order a 23-inch (33 inches extended) rail kit.

Note: The same rail kit is used for both square-hole and round-hole racks. See "Installing the Rail Assembly to the Rack" for specific instructions for threaded, round-hole racks.

To mount the appliance, you must first install the rails and then install the appliance in the rack.

Perform the following tasks to mount the appliance:

- Remove the inner rails from the rail assembly.
- Attach the inner rails to the appliance.
- Install the rack rails on the rack.
- Install the appliance in the rack.

The appliance is shipped with rack-rail hardware. This hardware consists of including two inner rails that you attach to the appliance, one on each side, and a rack-rail assembly that you attach to the rack. The following figure illustrates The following figure shows the steps involved in mounting the Citrix NetScaler how to mount the appliance to a rack.

To remove the inner rails from the rail assembly

1. Place the rail assembly on a flat surface.
2. Slide out the inner rail toward the front of the assembly.
3. Depress the latch until the inner rail comes all the way out of the rail assembly.
4. Repeat steps 1 through 3 to remove the second inner rail.

To attach the inner rails to the appliance

1. Position the right inner rail behind the handle on the right side of the appliance.

2. Align the holes on the rail with the corresponding holes on the side of the appliance.
3. Attach the rail to the appliance with the provided screws: 4 per side for a 1U appliance and 5 per side for a 2U appliance, as shown in the following figure.

Figure 1. Attaching inner rails

4. Repeat steps 1 through 3 to install the left inner rail on the other side of the appliance.

To install the rack rails on the rack

1. If you have a round-hole, threaded rack, skip to step 3.
2. Install square nut retainers into the front post and back post of the rack as shown in the following figures. Before inserting a screw, be sure to align the square nut with the correct hole for your 1U or 2U appliance. The three holes are not evenly spaced.

Figure 2. Installing Retainers into the Front Rack Posts

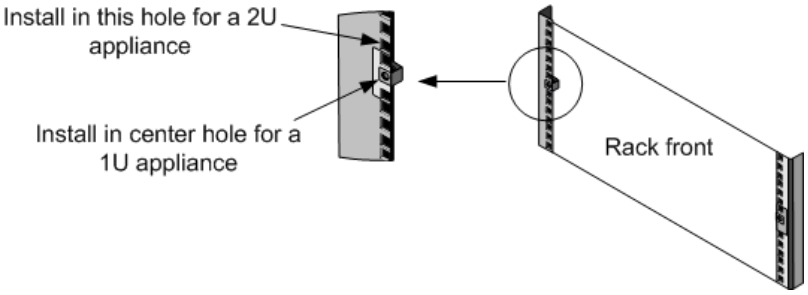


Figure 3. Installing Retainers into the Rear Rack Posts

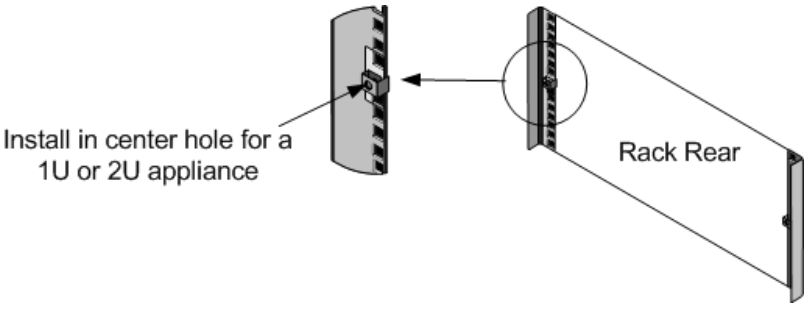
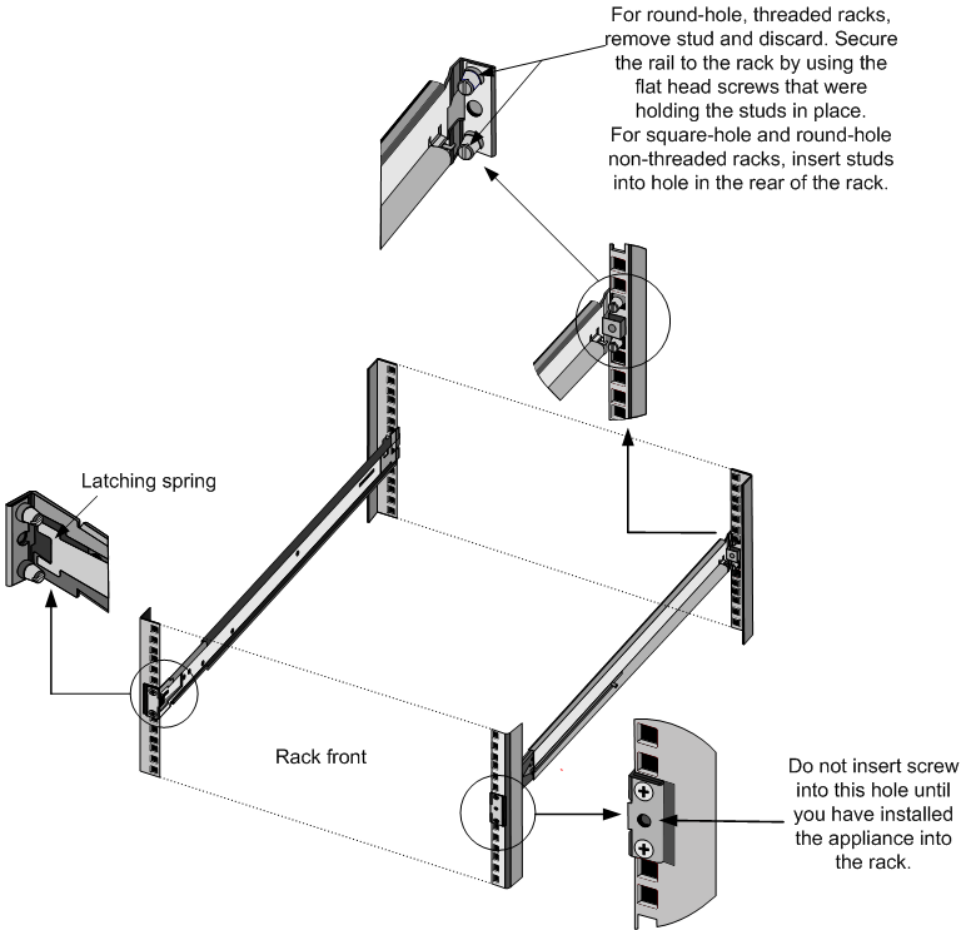


3. Install the adjustable rail assembly into the rack as shown in the following figures. Use a screw to lock the rear rail flange into the rack. With the screw securing the rail in place, you can optionally remove the latching spring.

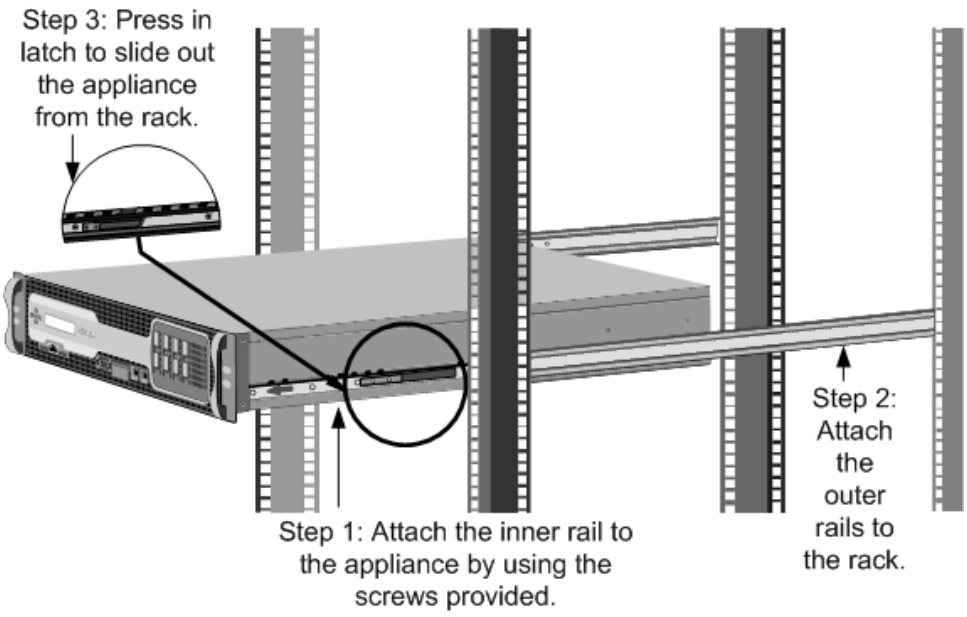
Figure 4. Installing the Rail Assembly to the Rack



To install the appliance in the rack

1. Align the inner rails, attached to the appliance, with the rack rails.
2. Slide the appliance into the rack rails, keeping the pressure even on both sides.
3. Verify that the appliance is locked in place by pulling it all the way out from the rack.

Figure 5. Rack Mounting the Appliance



Installing and Removing 1G SFP Transceivers

Note: This section applies to the MPX 8200/8400/8600/8800, MPX 9700/10500/12500/15500, and MPX 11500/13500/14500/16500/18500/20500 appliances.

Note: Some CloudBridge 4000/5000Repeater on SDX appliances do not require SFP transceivers.

A Small Form-Factor Pluggable (SFP) is a compact transceiver that can operate at speeds of up to 1 gigabit per second and is available in both copper and fiber types. Inserting a 1G SFP copper transceiver converts the 1G SFP port to a 1000BASE-T port. Inserting a 1G SFP fiber transceiver converts the 1G SFP port to a 1000BASE-X port. Auto-negotiation is enabled by default on the 1G SFP port into which you insert your 1G SFP transceiver. As soon as a link between the port and the network is established, the speed and mode are matched on both ends of the cable.

Note: The 1G SFP transceiver is hot-swappable from release 9.3 build 47.5 and later on the NetScaler appliances that use the e1k interface. The following platforms support 1G SPF transceivers:

- MPX 7500/9500
- MPX 8200/8400/8600/8800
- MPX 9700/10500/12500/15500

- MPX 11500/13500/14500/16500/18500/20500

⚠ **Caution:** NetScalerCloudBridge 4000/5000Repeater on SDX appliances do not support 1G SFP transceivers from vendors other than Citrix Systems. Attempting to install third-party 1G SFP transceivers on your NetScalerCloudBridge 4000/5000Repeater on SDX appliance voids the warranty.

Insert 1G SFP transceivers into the 1G SFP ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the 1G SFP transceiver or the appliance.

⚠ **Caution:** Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install a 1G SFP transceiver

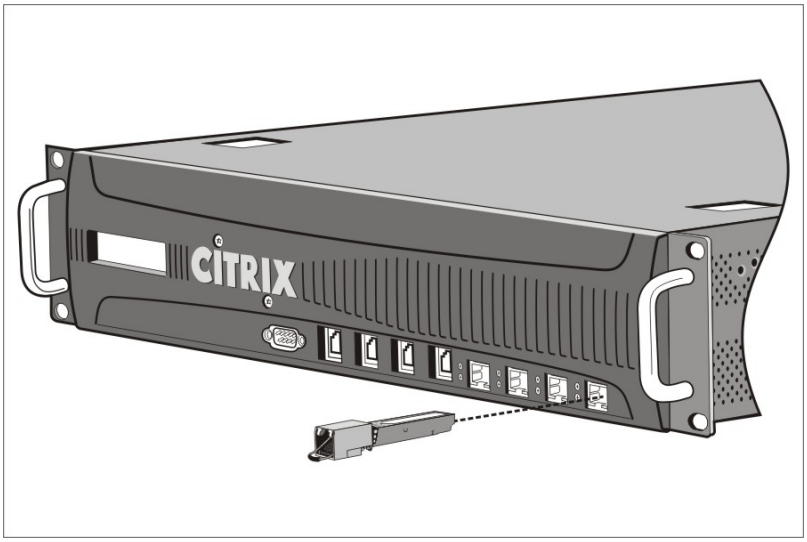
1. Remove the 1G SFP transceiver carefully from its box.

   👉 **Danger:** Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.

2. Align the 1G SFP transceiver to the front of the 1G SFP transceiver port on the front panel of the appliance, as shown in the following figure.

   Note: The illustration in the following figures might not represent your actual appliance.

   Figure 6. Installing a 1G SFP transceiver



3. Hold the 1G SFP transceiver between your thumb and index finger and insert it into the 1G SFP transceiver port, pressing it in until you hear the transceiver snap into place.
4. Lock the transceiver.
5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.
6. If you are using a fiber 1G SFP transceiver, do not remove the dust caps attached to the transceiver and the cable until you are ready to insert the cable.

To remove a 1G SFP transceiver

1. Disconnect the cable from the 1G SFP transceiver. If you are using a fiber optic cable, replace the dust cap on the cable before putting it away.

   👉 **Danger:** Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.

2. Unlock the 1G SFP transceiver.
3. Hold the 1G SFP transceiver between your thumb and index finger and slowly pull it out of the port.
4. If you are removing a fiber 1G SFP transceiver, replace the dust cap before putting it away.
5. Put the 1G SFP transceiver into its original box or another appropriate container.

Installing and Removing XFP and 10G SFP+ Transceivers

Note: This section applies to the MPX 8200/8400/8600/8800, MPX 9700/10500/12500/15500, MPX 15000, MPX 17000, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances.

Note: Some CloudBridge 4000/5000Repeater on SDX appliances do not require SFP+ transceivers.

A 10-Gigabit Small Form-Factor Pluggable (XFP or SFP+) is a compact optical transceiver that can operate at speeds of up to 10 gigabits per second. The MPX 15000 and MPX 17000 appliances use XFP transceivers and the MPX 8200/8400/8600/8800, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances use 10G SFP+ transceivers. Autonegotiation is enabled by default on the XFP/10G SFP+ ports into which you insert your XFP/10G SFP+ transceiver. As soon as a link between the port and

the network is established, the mode is matched on both ends of the cable and for 10G SFP+ transceivers, the speed is also autonegotiated.

Note: An XFP transceiver is **not hot-swappable** on the NetScaler appliances. You must restart a NetScaler appliance after you insert an XFP transceiver.

However, the 10G SFP+ transceiver is hot-swappable from release 9.3 build 57.5 and later on the NetScaler appliances that use the ixgbe (ix) interface. The following platforms support 10G SPF+ transceivers:

- MPX 8200/8400/8600/8800
- MPX 9700/10500/12500/15500 10G and 10G FIPS
- MPX 11500/13500/14500/16500/18500/20500
- MPX 17500/19500/21500
- MPX 17550/19550/20550/21550

The following platforms support XFP transceivers:

- MPX 15000
- MPX 17000

⚠ **Caution:** NetScalerCloudBridge 4000/5000Repeater on SDX appliances do not support XFP/10G SFP+ transceivers provided by vendors other than Citrix Systems. Attempting to install third-party XFP/10G SFP+ transceivers on your NetScalerCloudBridge 4000/5000Repeater on SDX appliance voids the warranty.

Insert the XFP/10G SFP+ transceivers into the XFP/10G SFP+ ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the transceiver or the appliance.

⚠ **Caution:** Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install an XFP/a 10G SFP+ transceiver

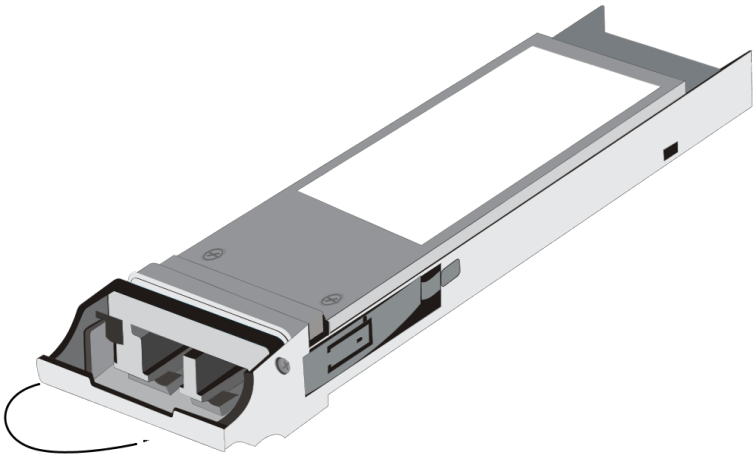
1. Remove the XFP/10G SFP+ transceiver carefully from its box.

   👉 **Danger:** Do not look directly into fiber optic transceivers and cables. They emit laser beams that can damage your eyes.

2. Align the XFP/10G SFP+ transceiver to the front of the XFP/10G SFP+ transceiver port on the front panel of the appliance.

3. Hold the XFP/10G SFP+ transceiver between your thumb and index finger and insert it into the XFP/10G SFP+ transceiver port, pressing it in until you hear the transceiver snap into place.
4. Move the locking hinge to the DOWN position as shown in the following figure.

Figure 7. Locking an XFP transceiver



5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.
6. Do not remove the dust caps attached to the transceiver and cable until you are ready to insert the cable.

To remove an XFP/a 10G SFP+ transceiver

1. Disconnect the cable from the XFP/10G SFP+ transceiver. Replace the dust cap on the cable before putting it away.

> 👉 **Danger:** Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.

2. Unlock the XFP/10G SFP+ transceiver by moving the locking hinge to the UP position.
3. Hold the XFP/10G SFP+ transceiver between your thumb and index finger and slowly pull it out of the port.
4. Replace the dust cap on the transceiver before putting it away.
5. Put the XFP/10G SFP+ transceiver into its original box or another appropriate container.

Connecting the Cables

When the appliance is securely mounted on the rack, you are ready to connect the cables. Ethernet cables and the optional console cable are connected first. Connect the power cable last.

> **Danger:** Before installing or repairing the appliance, remove all jewelry and other metal objects that might come in contact with power sources or wires. When you touch both a live power source or wire and ground, any metal objects can heat up rapidly and cause burns, set clothing on fire, or fuse the metal object to an exposed terminal.

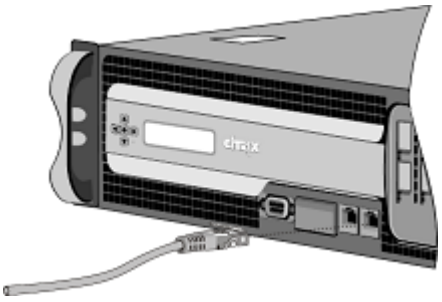
Connecting the Ethernet CablesConnecting the Appliance to the Network

Ethernet cables connect your appliance to the network. The type of cable you need depends on the type of port used to connect to the network. Use a category 5e or category 6 Ethernet cable with a standard RJ-45 connector on a 10/100/1000BASE-T port or 1G SFP copper transceiver. Use a fiber optic cable with an LC duplex connector with a 1G SFP fiber transceiver, or 10G SFP+, or XFP transceiver. The type of connector at the other end of the fiber optic cable depends on the port of the device that you are connecting to.

To connect an Ethernet cable to a 10/100/1000BASE-T port or 1G SFP copper transceiver

1. Insert the RJ-45 connector on one end of your Ethernet cable into an appropriate port on the front panel of the appliance, as shown in the following figure.

   Figure 8. Inserting an Ethernet cable

2. Insert the RJ-45 connector on the other end into the target device, such as a router or switch.
3. Verify that the LED glows amber when the connection is established.

To connect the Ethernet cable to a 1G SFP fiber, or 10G SFP +, or XFP transceiver

1. Remove the dust caps from the transceiver and cable.
2. Insert the LC connector on one end of the fiber optic cable into the appropriate port on the front panel of the appliance.
3. Insert the connector on the other end into the target device, such as a router or switch.
4. Verify that the LED glows amber when the connection is established.

Connecting the Console Cable

You can use the console cable to connect your appliance to a computer or terminal, from which you can configure the appliance. Alternatively, you can use a computer connected to the network. Before connecting the console cable, configure the computer or terminal to support VT100 terminal emulation, 9600 baud, 8 data bits, 1 stop bit, parity, and flow control set to NONE. Then connect one end of the console cable to the RS232 serial port on the appliance and the other end to the computer or terminal.

To connect the console cable to a computer or terminal

1. Insert the DB-9 connector at the end of the cable into the console port that is located on the front panel of the appliance, as shown in the following figure.

   Figure 9. Inserting a console cable

   
   Note: To use a cable with an RJ-45 converter, insert the optional converter provided into the console port and attach the cable to it.

2. Insert the RJ-45 connector at the other end of the cable into the serial port of the computer or terminal.

Connecting the Power CableConnecting the Appliance to a Power Source

An MPX 5500, MPX 5550/5650, MPX 7500/9500, and MPX 8200/8400/8600/8800 appliance has one power cable. All the other appliances come with two power cables,

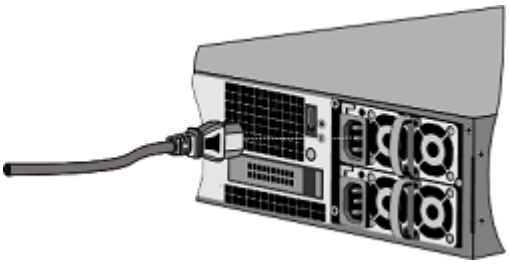
but they can also operate if only one power cable is connected. A separate ground cable is not required, because the three-prong plug provides grounding.

The CloudBridge 4000/5000Repeater on SDX appliance has two power supplies, with one serving as a backup. A separate ground cable is not required, because the three-prong plug provides grounding. Power up the appliance by installing one or both power cords.

To connect the appliance to the power source

1. Connect one end of the power cable to the power outlet on the back panel of the appliance, next to the power supply, as shown in the following figure.

   Figure 10. Inserting a power cable

2. Connect the other end of the power cable to a standard 110V/220V power outlet.
3. If a second power supply is provided, rRepeat steps 1 and 2 to connect the second power supply.

Note: The MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliance emit a high-pitched alert if one power supply fails or if you connect only one power cable to the appliance. To silence the alarm, you can press the small red button located on the back panel of the appliance. The appliance emits a high-pitched alert if one power supply fails or if you connect only one power cable to the appliance. To silence the alarm, you can press the small red button located on the back panel of the appliance.

Accessing a Citrix NetScaler

A NetScaler appliance has both a command line interface (CLI) and a graphical user interface (GUI). The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all appliances ship with the default NetScaler IP address (NSIP) of 192.168.100.1 and default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.

If you encounter an IP address conflict when deploying multiple NetScaler units, check for the following possible causes:

- Did you select an NSIP that is an IP address already assigned to another device on your network?
- Did you assign the same NSIP to multiple NetScaler appliances?
- The NSIP is reachable on all physical ports. The ports on a NetScaler are host ports, not switch ports.

The following table summarizes the available access methods.

Table 1. Methods for Accessing a NetScaler appliance

Access Method	Port	Default IP Address Required? (Y/N)
CLI	Console	N
CLI and GUI	Ethernet	Y

Using the Command Line Interface

You can access the CLI either locally, by connecting a workstation to the console port, or remotely, by connecting through secure shell (SSH) from any workstation on the same network.

Logging on to the Command Line Interface through the Console Port

The appliance has a console port for connecting to a computer workstation. To log on to the appliance, you need a serial crossover cable and a workstation with a terminal emulation program.

To log on to the CLI through the console port

1. Connect the console port to a serial port on the workstation, as described in "Connecting the Console Cable".
2. On the workstation, start HyperTerminal or any other terminal emulation program. If the logon prompt does not appear, you may need to press ENTER one or more times to display it.
3. Log on by using the administrator credentials.
   The command prompt (>) appears on the workstation monitor.

Logging on to the Command Line Interface by using SSH

The SSH protocol is the preferred remote access method for accessing an appliance remotely from any workstation on the same network. You can use either SSH version 1 (SSH1) or SSH version 2 (SSH2.)

If you do not have a working SSH client, you can download and install any of the following SSH client programs:

- PuTTY

  Open Source software supported on multiple platforms. Available at:

  "http://www.chiark.greenend.org.uk/~sgtatham/putty/"

- Vandyke Software SecureCRT

  Commercial software supported on the Windows platform. Available at:

  "http://www.vandyke.com/products/securecrt/"

These programs have been tested by the Citrix NetScaler team, which has verified that they work correctly with a NetScaler appliance. Other programs may also work correctly, but have not been tested.

To verify that the SSH client is installed properly, use it to connect to any device on your network that accepts SSH connections.

To log on to a NetScaler by using an SSH client

1. On your workstation, start the SSH client.
2. For initial configuration, use the default NetScaler IP address (NSIP), which is 192.168.100.1. For subsequent access, use the NSIP that was assigned during initial configuration. Select either SSH1 or SSH2 as the protocol.
3. Log on by using the administrator credentials. For example:

```
login as: nsroot
Using keyboard-interactive authentication.
Password:
```

```
Last login: Tue Jun 16 10:37:28 2009 from 10.102.29.9

 Done
>
```

Using the Graphical User Interface

Important: A certificate-key pair is required for HTTPS access to the NetScaler configuration utility. On a NetScaler ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Additionally, if a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes on a NetScaler ADC for HTTPS access to the configuration utility, and that you install an appropriate license before starting the ADC.

The graphical user interface includes a configuration utility and a statistical utility, called Dashboard, either of which you access through a workstation connected to an Ethernet port on the appliance. If your computer does not have a supported Java plug-in installed, the utility prompts you to download and install the plug-in the first time you log on. If automatic installation fails, you can install the plug-in separately before you attempt to log on to the configuration utility or Dashboard.

The system requirements for the workstation running the GUI are as follows:

- For Windows-based workstations, a Pentium 166 MHz or faster processor with at least 48 MB of RAM is recommended for applets running in a browser using a Java plug-in product. You should have 40 MB free disk space before installing the plug-in.
- For Linux-based workstations, a Pentium platform running Linux kernel v2.2.12 or above, and glibc version 2.12-11 or later. A minimum of 32 MB RAM is required, and 48 MB RAM is recommended. The workstation should support 16-bit color mode, KDE and KWM window managers used in conjunction, with displays set to local hosts.
- For Solaris-based workstations, a Sun running either Solaris 2.6, Solaris 7, or Solaris 8, and the Java 2 Runtime Environment, Standard Edition, version 1.6 or later.

Your workstation must have a supported web browser and version 1.6 or above of the Java applet plug-in installed to access the configuration utility and Dashboard.

The following browsers are supported.

Using the Configuration Utility

Once you log on to the configuration utility, you can configure the appliance through a graphical interface that includes context-sensitive help.

If your computer does not have a supported Java plug-in installed, the first time you log on to the appliance, the configuration utility will prompt you to download and install the plug-in.

Note: Prior to installing the Java 2 Runtime Environment, ensure that you have installed the full set of required operating system patches needed for the current Java release.

To log on to the configuration utility

1. Open your web browser and enter the NetScaler IP (NSIP) as an HTTP address. If you have not yet set up the initial configuration, enter the default NSIP (`http://192.168.100.1`).
   The **Citrix Logon** page appears.

   Note: If you have two NetScaler appliances in a high availability setup, make sure that you do not access the GUI by entering the IP address of the secondary NetScaler. If you do so and use the GUI to configure the secondary NetScaler, your configuration changes will not be applied to the primary NetScaler.

2. In the **User Name** text box, type `nsroot`.
3. In the **Password** text box, type the administrative password you assigned to the nsroot account during initial configuration and click **Login**.
   The **Configuration Utility** page appears.

   Note: If your workstation does not already have a supported version of the Java runtime plug-in installed, the NetScaler prompts you to download the Java Plug-in. After the download is complete, the configuration utility page appears.

   If you need to access the online help, select Help from the Help menu at the top right corner.

4. In the **Start in** list, click **Configuration**, and then click **Login**.
   The **Configuration Utility** page appears.

   Note: If your workstation does not already have a supported version of the Java runtime plug-in installed, the NetScaler prompts you to download the Java Plug-in. After the download is complete, the configuration utility page appears.

   If you need to access the online help, select Help from the Help menu at the top right corner.

Using the Statistical Utility

Dashboard, the statistical utility, is a browser-based application that displays charts and tables on which you can monitor the performance of a NetScaler.

To log on to Dashboard

1. Open your web browser and enter the NSIP as an HTTP address (http://<NSIP>). The **Citrix Logon** page appears.
2. In the **User Name** text box, type `nsroot`.
3. In the **Password** text box, type the administrative password you assigned to the nsroot account during initial configuration.
4. In the **Start in** list, click **Dashboard**, and then click **Login**.

Installing the Java Runtime Plug-in

If automatic installation of the Java plug-in fails, you can install the plug-in separately before you attempt to log on to the configuration utility.

Note: Before installing the Java 2 Runtime Environment, make sure that you have installed the full set of required operating system patches needed for the current Java release.

To install the Java runtime plug-in on your workstation

1. In your web browser, enter the NSIP and port number of your appliance: `http://<NSIP>:80`
   The Java plug-in icon appears.
2. Click the Java plug-in icon and follow the screen prompts to copy the plug-in installer to your workstation hard disk. The Java plug-in setup icon (for example, **j2re-1.6.0**) appears on your computer at the location you specified.
3. Double-click the plug-in setup icon, and follow the screen prompts to install the plug-in.
4. Return to your web browser and click the Java plug-in icon a second time to display the GUI logon screen.

Configuring a NetScaler for the First Time

Your new NetScaler is preconfigured with a default IP address (the NSIP) and associated subnet mask for management access. The default NSIP is 192.168.100.1 and the subnet mask (netmask) is 255.255.0.0. You can change these values to fit the addressing scheme for your network. For your initial configuration, you must also specify at least one SNIP or MIP. Before saving your new configuration, you should change the administrator password.

You can perform the initial configuration of your appliance by using any of the following interfaces:

- LCD Keypad
- Command Line Interface
- Configuration Utility
- XML API

If you are setting up two NetScaler appliances as a high availability pair, you configure one as primary and the other as secondary.

The configuration procedure for a FIPS appliance is slightly different from the procedure for a NetScaler MPX appliance or a NetScaler virtual appliance.

Using the LCD Keypad

When you first install the appliance, you can configure the initial settings by using the LCD keypad on the front panel of the appliance. The keypad interacts with the LCD display module, which is also on the front panel of these appliances.

Note: You can use the LCD keypad for initial configuration on a new appliance with the default configuration. The configuration file (ns.conf) should contain the following command and default values.

set ns config -IPAddress 192.168.100.1 -netmask 255.255.0.0

The functions of the different keys are explained in the following table.

Table 1. LCD Key Functions

Key	Function
<	Moves the cursor one digit to the left.
>	Moves the cursor one digit to the right.

Key	Function
^	Increments the digit under the cursor.
v	Decrements the digit under the cursor.
.	Processes the information, or terminates the configuration, if none of the values are changed. This key is also known as the ENTER key.

To perform the initial configuration by using the LCD keypad press the "<" key.

You are prompted to enter the subnet mask, NetScaler IP address (NSIP), and gateway in that order respectively. The subnet mask is associated with both the NSIP and default gateway IP address. The NSIP is the IPv4 address of the NetScaler appliance. The default gateway is the IPv4 address for the router, which will handle external IP traffic that the NetScaler cannot otherwise route. The NSIP and the default gateway should be on the same subnet.

If you enter a valid value for the subnet mask, such as 255.255.255.224, you are prompted to enter the IP address. Similarly, if you enter a valid value for the IP address, you are prompted to enter the gateway address. If the value you entered is invalid, the following error message appears for three seconds, where xxx.xxx.xxx.xxx is the IP address you entered, followed by a request to re-enter the value.

```
Invalid addr!
xxx.xxx.xxx.xxx
```

If you press the ENTER (.) key without changing any of the digits, the software interprets this as a user exit request. The following message will be displayed for three seconds.

```
Exiting menu...
xxx.xxx.xxx.xxx
```

If all the values entered are valid, when you press the ENTER key, the following message appears.

```
Values accepted,
Rebooting...
```

The subnet mask, NSIP, and gateway values are saved in the configuration file.

Note: For information about deploying a high availability (HA) pair, see "http://support.citrix.com/proddocs/topic/ns-system-10-map/ns-nw-ha-cnfgrng-ha-con.html."

Configuring a NetScaler by Using the Command Line Interface

When you first install the appliance, you can configure the initial settings by using the serial console. Connect a serial cable to the port on the appliance and the other end to a computer. For remote access to the command-line interface (CLI), see Logging on to the Command Line Interface by using SSH. At the CLI, you can setup or change the NSIP, subnet or mapped IP address, advanced network settings, and time zone.

To configure a NetScaler by using the command line interface

1. Connect a workstation to the NetScaler.
2. Run the vt100 terminal emulation program of your choice on your workstation or notebook computer to connect to the appliance.
   - For Microsoft Windows, you can use Hyperterminal, which is installed with all current versions of Windows.
   - For Apple Macintosh OSX, you can use the GUI-based Terminal program or the shell-based telnet client.

     Note: OSX is based on the FreeBSD UNIX platform. Most standard UNIX shell programs are available from the OSX command line.
   - For UNIX-based workstations, you can use the shell-based telnet client or any supported terminal emulation program.
3. Press ENTER.
   The terminal screen displays the Logon prompt.

   Note: You might have to press ENTER two or three times, depending on which terminal program you are using.
4. Log on to the appliance by using the administrator credentials.

   Note: Your sales representative or Citrix Customer Service can provide the administrator credentials.
5. At the NetScaler command prompt, you can type **config ns** and follow the prompts to complete the initial configuration. Alternatively, type the commands shown in the following steps.

   Note: To prevent an attacker from breaching your ability to send packets to the appliance, choose a non-routable IP address on your organization's LAN as your appliance IP address.
6. **set ns config** `-ipaddress <IPAddress> -netmask <Netmask>`
7. **add ns ip** `<IPAddress> <Netmask> -type <Type>`

8. **add route** `<Network> <Netmask> <Gateway>`
9. **set system user nsroot** `<Password>`
10. **save ns config**
11. **reboot**

    Example

```
set ns config - ipaddress 10.102.29.60 - netmask
255.255.255.0
add ns ip 10.102.29.61 255.255.255.0 -type snip
add route 0.0.0.0 0.0.0.0 10.102.29.1
set system user nsroot administrator
save ns config
reboot
```

Configuring a NetScaler by Using the Configuration Utility

The configuration utility is accessed from a web browser. To configure the NetScaler using the Setup Wizard in the configuration utility, you need an administrative workstation or laptop configured on the same network as the appliance. You also need Java RunTime Environment (JRE) version 1.6 or later. You can use the Setup Wizard to configure the following initial settings:

- System IP address and subnet mask
- Subnet or Mapped IP address and subnet mask
- Host name
- Default gateway
- Time zone
- Licenses
- Administrator password

Important: Before running the Setup Wizard, you should download your licenses from the Citrix web site and put them in a location on your workstation or laptop hard drive or another device where you can access them from your web browser during configuration.

To configure initial settings by using the Setup Wizard

1. In a web browser, type `http:// 192.168.100.1`.

Note: The operating system is preconfigured with a default IP address and associated netmask. The default IP address is 192.168.100.1 and the default netmask is 255.255.0.0.

2. In **User Name** and **Password**, type the administrator credentials. You can obtain the initial user name and password from your sales representative or from Citrix Customer Service.
3. In **Start in**, select **Configuration**, and then click **Login**.
4. In the **Setup Wizard**, click **Next**, and then follow the instructions in the wizard.

Note: To prevent an attacker from breaching your ability to send packets to the appliance, choose a non-routable IP address on your organization's LAN as your appliance IP address.

Configuring a NetScaler by Using the XML API

You can use an external Application Programming Interface (API) to configure the NetScaler. The API allows you to create custom client applications to configure and monitor the state of the NetScaler. It is based on Simple Object Access Protocol (SOAP) over HTTP. You can download the API documentation from the Downloads page of the configuration utility.

Configuring a High Availability Pair for the First Time

You can deploy two NetScaler appliances in a high availability configuration, where one unit actively accepts connections and manages servers while the secondary unit monitors the first. The NetScaler that is actively accepting connections and managing the servers is called a primary unit and the other one is called a secondary unit in a high availability configuration. If there is a failure in the primary unit, the secondary unit becomes the primary and begins actively accepting connections.

Each NetScaler in a high availability pair monitors the other by sending periodic messages, called heartbeat messages or health checks, to determine the health or state of the peer node. If a health check for a primary unit fails, the secondary unit retries the connection for a specific time period. For more information about high availability, see "High Availability." If a retry does not succeed by the end of the specified time period, the secondary unit takes over for the primary unit in a process called failover. The following figure shows two high availability configurations, one in one-arm mode and the other in two-arm mode.

Figure 1. High availability in one-arm mode

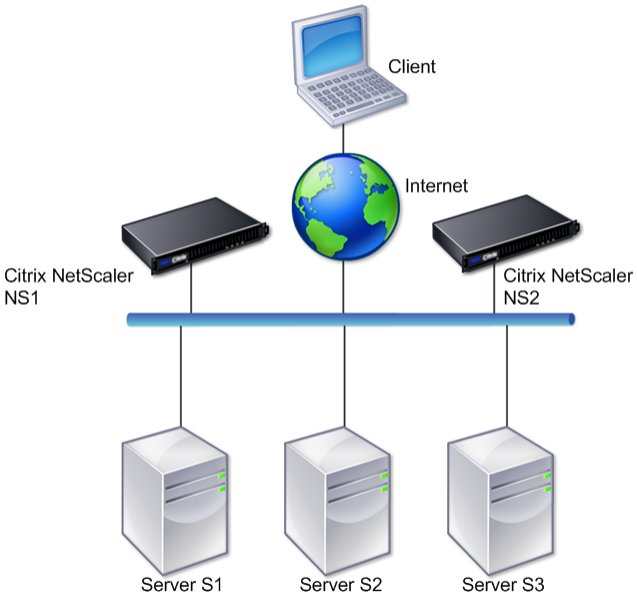


Figure 2. High availability in two-arm mode

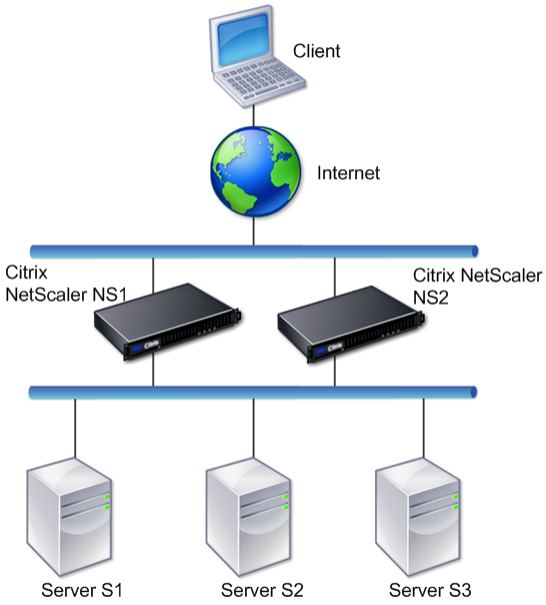


In one-arm configuration, both NS1 and NS2 and servers S1, S2, and S3 are connected to the switch.

In two-arm configuration, both NS1 and NS2 are connected to two switches. The servers S1, S2, and S3 are connected to the second switch. The traffic between client and the servers passes through either NS1 or NS2.

To set up a high availability environment, configure one NetScaler as primary and another as secondary. Perform the following tasks on each of the NetScalers:

- Add a node.
- Disable high availability monitoring for unused interfaces.

Adding a Node

A node is a logical representation of a peer NetScaler appliance. It identifies the peer unit by ID and NSIP. An appliance uses these parameters to communicate with the peer and track its state. When you add a node, the primary and secondary units exchange heartbeat messages asynchronously. The node ID is an integer that must not be greater than 64.

To add a node by using the command line interface

At the command prompt, type the following commands to add a node and verify that the node has been added:

- **add HA node** `<id> <IPAddress>`
- **show HA node** `<id>`

  Example

```
add HA node 0 10.102.29.170
 Done
> show HA node 0
1)      Node ID:      0
        IP:   10.102.29.200 (NS200)
        Node State: UP
        Master State: Primary
        SSL Card Status: UP
        Hello Interval: 200 msecs
        Dead Interval: 3 secs
        Node in this Master State for: 1:0:41:50
(days:hrs:min:sec)
```

To add a node by using the configuration utility

1. In the navigation pane, expand **System** and click **High Availability**.
   The **High Availability** page appears.
2. On the **High Availability** page, select the **Nodes** tab.
3. Click **Add**.
   The **High Availability Setup** dialog box appears.
4. In the **High Availability Setup** dialog box, in the **Remote Node IP Address** text box, type an IP Address (for example, `10.102.29.170`).
5. Ensure that the **Configure remote system to participate in High Availability setup** check box is selected.

   By default, this check box is selected.
6. Select the **Turn off HA monitor on interfaces/channels that are down** check box to disable the HA monitor on interfaces that are down.

   By default, this check box is selected.
7. Verify that the node you added appears in the list of nodes under the **Nodes** tab.

Disabling High Availability Monitoring for Unused Interfaces

The high availability monitor is a virtual entity that monitors an interface. You must disable the monitor for interfaces that are not connected or being used for traffic. When the monitor is enabled on an interface whose status is DOWN, the state of the node becomes NOT UP. In a high availability configuration, a primary node entering a NOT UP state might cause a high availability failover. An interface is marked DOWN under the following conditions:

- The interface is not connected

- The interface is not working properly
- The cable connecting the interface is not working properly

To disable the high availability monitor for an unused interface by using the command line interface

At the command prompt, type the following commands to disable the high availability monitor for an unused interface and verify that it is disabled:

- **set interface** `<id> -haMonitor OFF`
- **show interface** `<id>`

  Example

```
> set interface 1/8 -haMonitor OFF
 Done
> show interface 1/8
        Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
        flags=0x4000 <ENABLED, DOWN, down, autoneg, 802.1q>
        MTU=1514, native vlan=1, MAC=00:d0:68:15:fd:3d,
downtime 238h55m44s
        Requested: media AUTO, speed AUTO, duplex AUTO, fctl
OFF,
                  throughput 0

        RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0)
Hangs(0) Muted(0)
        Bandwidth thresholds are not set.
```

  When the high availability monitor is disabled for an unused interface, the output of the **show interface** command for that interface does not include "HAMON."

To disable the high availability monitor for unused interfaces by using the configuration utility

1. In the navigation pane, expand **Network** and click **Interfaces**.
   The **Interfaces** page appears.
2. Select the interface for which the monitor must be disabled.
3. Click **Open**.
   The **Modify Interface** dialog box appears.
4. In **HA Monitoring**, select the **OFF** option.
5. Click **OK**.
6. Verify that, when the interface is selected, "HA Monitoring: OFF" appears in the details at the bottom of the page.

Configuring a FIPS Appliance for the First Time

A certificate-key pair is required for HTTPS access to the configuration utility and for secure remote procedure calls. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each appliance. This node stores the password, which is checked against the one provided by the contacting appliance. To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on the other appliance. RPC nodes maintain this information, which includes the IP addresses of the other NetScaler appliances and the passwords used to authenticate on each.

On a NetScaler MPX appliance virtual appliance, a certificate-key pair is automatically bound to the internal services. On a FIPS appliance, a certificate-key pair must be imported into the hardware security module (HSM) of a FIPS card. To do so, you must configure the FIPS card, create a certificate-key pair, and bind it to the internal services.

To configure secure HTTPS by using the command line interface

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see "Configuring the HSM."
2. If the appliance is part of a high availability setup, enable the SIM. For information about enabling the SIM on the primary and secondary appliances, see " Configuring FIPS Appliances in a High Availability Setup."
3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

   import ssl fipskey *serverkey* -key *ns-server.key* -inform `PEM`
4. Add a certificate-key pair. At the command prompt, type:

   add certkey server -cert *ns-server.cert* -fipskey *serverkey*
5. Bind the certificate-key created in the previous step to the following internal services. At the command prompt, type:

   bind ssl service `nshttps-127.0.0.1-443` -certkeyname server

   bind ssl service `nshttps-::11-443` -certkeyname server

To configure secure HTTPS by using the configuration utility

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see "Configuring the HSM."

2. If the appliance is part of a high availability setup, enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see " Configuring FIPS Appliances in a High Availability Setup."
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see "Importing an Existing FIPS Key."
4. In the navigation pane, expand **SSL**, and then click **Certificates**.
5. In the details pane, click **Install**.
6. In the **Install Certificate** dialog box, type the certificate details.
7. Click **Create**, and then click **Close**.
8. In the navigation pane, expand **Load Balancing**, and then click **Services**.
9. In the details pane, click **Internal Services**.
10. Select **nshttps-127.0.0.1-443** from the list, and then click **Open**.
11. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
12. Select **nshttps-::11-443** from the list, and then click **Open**.
13. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
14. Click **OK**.

To configure secure RPC by using the command line interface

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see "Configuring the HSM."
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see " Configuring FIPS Appliances in a High Availability Setup."
3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

   import ssl fipskey *serverkey* -key *ns-server.key* -inform `PEM`
4. Add a certificate-key pair. At the command prompt, type:

   add certkey server -cert *ns-server.cert* -fipskey *serverkey*
5. Bind the certificate-key pair to the following internal services. At the command prompt, type:

   bind ssl service `nsrpcs-127.0.0.1-3008` -certkeyname server

   bind ssl service `nskrpcs-127.0.0.1-3009` -certkeyname server

   bind ssl service `nsrpcs-::11-3008` -certkeyname server

6. Enable secure RPC mode. At the command prompt, type:

   set ns rpcnode <IP address> -secure `YES`

To configure secure RPC by using the configuration utility

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see "Configuring the HSM."
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see " Configuring FIPS Appliances in a High Availability Setup."
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see "Importing an Existing FIPS Key."
4. In the navigation pane, expand **SSL**, and then click **Certificates**.
5. In the details pane, click **Install**.
6. In the **Install Certificate** dialog box, type the certificate details.
7. Click **Create**, and then click **Close**.
8. In the navigation pane, expand **Load Balancing**, and then click **Services**.
9. In the details pane, click **Internal Services**.
10. Select **nsrpcs-127.0.0.1-3008** from the list, and then click **Open**.
11. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
12. Select **nskrpcs-127.0.0.1-3009** from the list, and then click **Open**.
13. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
14. Select **nsrpcs-::11-3008** from the list, and then click **Open**.
15. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
16. Click **OK**.
17. In the navigation pane, expand **Network**, and then click **RPC**.
18. In the details pane, select the IP address, and click **Open**.
19. In the **Configure RPC Node** dialog box, select **Secure**.
20. Click **OK**.

Understanding Common Network Topologies

As described in "Physical Deployment Modes," you can deploy the Citrix NetScaler appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

Setting Up Common Two-Arm Topologies

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the appliance. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the appliance on a public subnet and the servers on a private subnet, and transparent mode, with both the appliance and the servers on the public network.

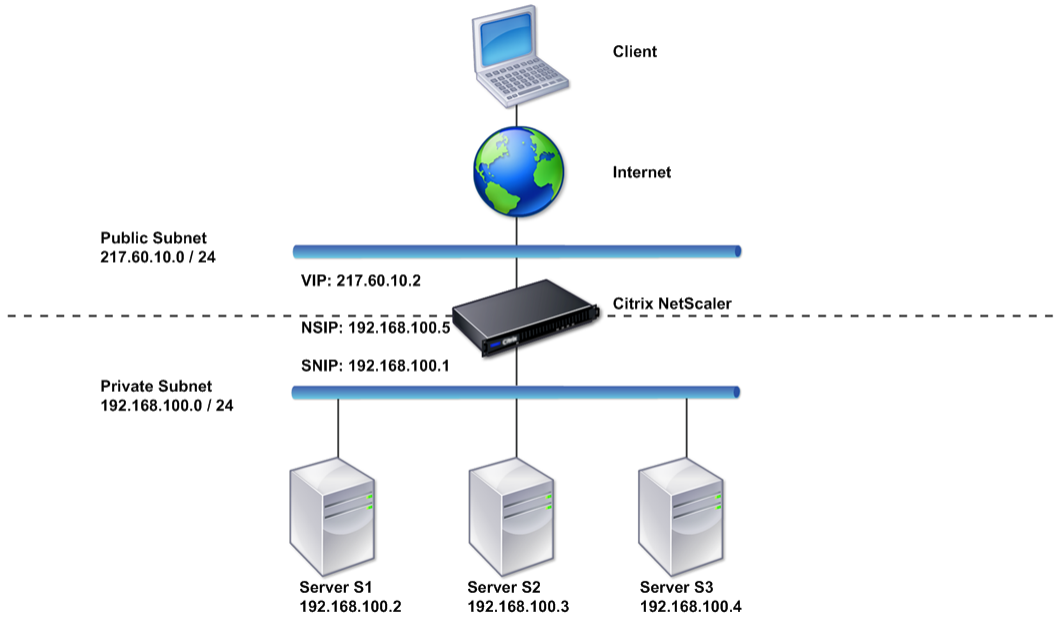
Setting Up a Simple Two-Arm Multiple Subnet Topology

One of the most commonly used topologies has the NetScaler appliance inline between the clients and the servers, with a virtual server configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider an appliance deployed in two-arm mode for managing servers S1, S2, and S3, with a virtual server of type HTTP configured on the appliance, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the appliance to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the appliance so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP is on public subnet 217.60.10.0, and the NSIP, the servers, and the SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets



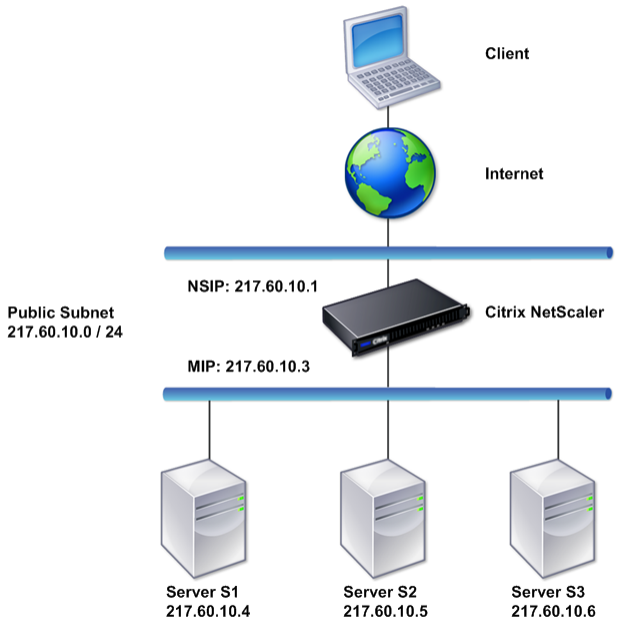
Task overview: To deploy a NetScaler appliance in two-arm mode with multiple subnets

1. Configure the NSIP and default gateway, as described in "Configuring the NetScaler IP Address (NSIP)."
2. Configure the SNIP, as described in "Configuring Subnet IP Addresses."
3. Enable the USNIP option, as described in "To enable or disable USNIP mode."
4. Configure the virtual server and the services, as described in "Creating a Virtual Server" and "Configuring Services."
5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

Setting Up a Simple Two-Arm Transparent Topology

Use transparent mode if the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 2. Topology Diagram for Two-Arm, Transparent Mode



Task overview: To deploy a NetScaler in two-arm, transparent mode

1. Configure the NSIP, MIP, and default gateway, as described in "Configuring a NetScaler by Using the Command Line Interface."
2. Enable L2 mode, as described in "Enabling and Disabling Layer 2 Mode."
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

Setting Up Common One-Arm Topologies

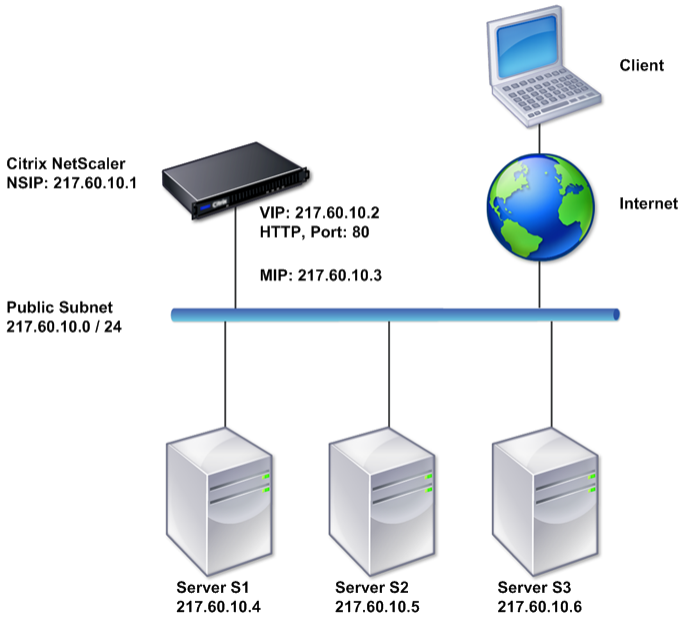
The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

Setting Up a Simple One-Arm Single Subnet Topology

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler deployed in one-arm mode for managing servers S1, S2, and S3. A virtual server of type HTTP is configured on a NetScaler, and HTTP services are running on the servers. As shown in the following

figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 3. Topology Diagram for One-Arm Mode, Single Subnet



Task overview: To deploy a NetScaler in one-arm mode with a single subnet

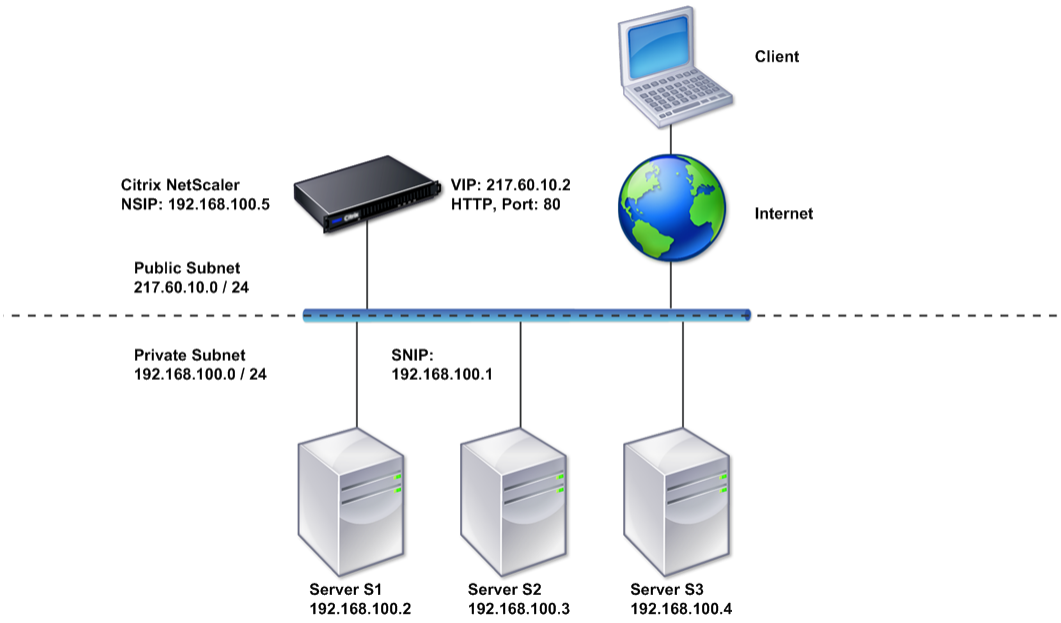
1. Configure the NSIP, MIP, and the default gateway, as described in "Configuring the NetScaler IP Address (NSIP)".
2. Configure the virtual server and the services, as described in "Creating a Virtual Server" and "Configuring Services".
3. Connect one of the network interfaces to the switch.

Setting Up a Simple One-Arm Multiple Subnet Topology

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A virtual server of type HTTP is configured on the appliance, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the appliance uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address

(VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 4. Topology Diagram for One-Arm Mode, Multiple Subnets



Task overview: To deploy a NetScaler appliance in one-arm mode with multiple subnets

1. Configure the NSIP and the default gateway, as described in "Configuring the NetScaler IP Address (NSIP)".
2. Configure the SNIP and enable the USNIP option, as described in "Configuring Subnet IP Addresses".
3. Configure the virtual server and the services, as described in "Creating a Virtual Server" and "Configuring Services".
4. Connect one of the network interfaces to the switch.

Configuring System Management Settings

Once your initial configuration is in place, you can configure settings to define the behavior of the Citrix NetScaler appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the NetScaler clock with a Network Time Protocol (NTP) server. The NetScaler can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

Configuring System Settings

Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a NetScaler appliance to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the NetScaler configuration utility.

You can modify the types of HTTP parameters described in the following table.

Table 1. HTTP Parameters

Parameter Type	Specifies
HTTP Port Information	The web server HTTP ports used by your managed servers. If you specify the ports, the appliance performs request switching for any client request that has a destination port matching a specified port.

Parameter Type	Specifies
	Note: If an incoming client request is not destined for a service or a virtual server that is specifically configured on the appliance, the destination port in the request must match one of the globally configured HTTP ports. This allows the appliance to perform connection keep-alive and server off-load.
Limits	The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if you set **Max Connections** to 500, and the appliance is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the appliance can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set **Max Requests** to 0. **Note:** If you are using the Apache HTTP server, you must set **Max Connections** equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this

Parameter Type	Specifies
	parameter is optional for other web servers.
Client IP Insertion	Enable/disable insertion of the client's IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a web server managed by an appliance receives a mapped IP address or a subnet IP address, the server identifies it as the client’s IP address. Some applications need the client’s IP address for logging purposes or to dynamically determine the content to be served by the web server. You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the appliance. You can then access the inserted address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).
Cookie Version	The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.

Parameter Type	Specifies
Requests/Responses	Options for handling certain types of requests, and enable/disable logging of HTTP error responses.
Server Header Insertion	Insert a server header in NetScaler-generated HTTP responses.

To configure HTTP parameters by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change HTTP parameters**.
3. In the **Configure HTTP parameters** dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click **OK**.

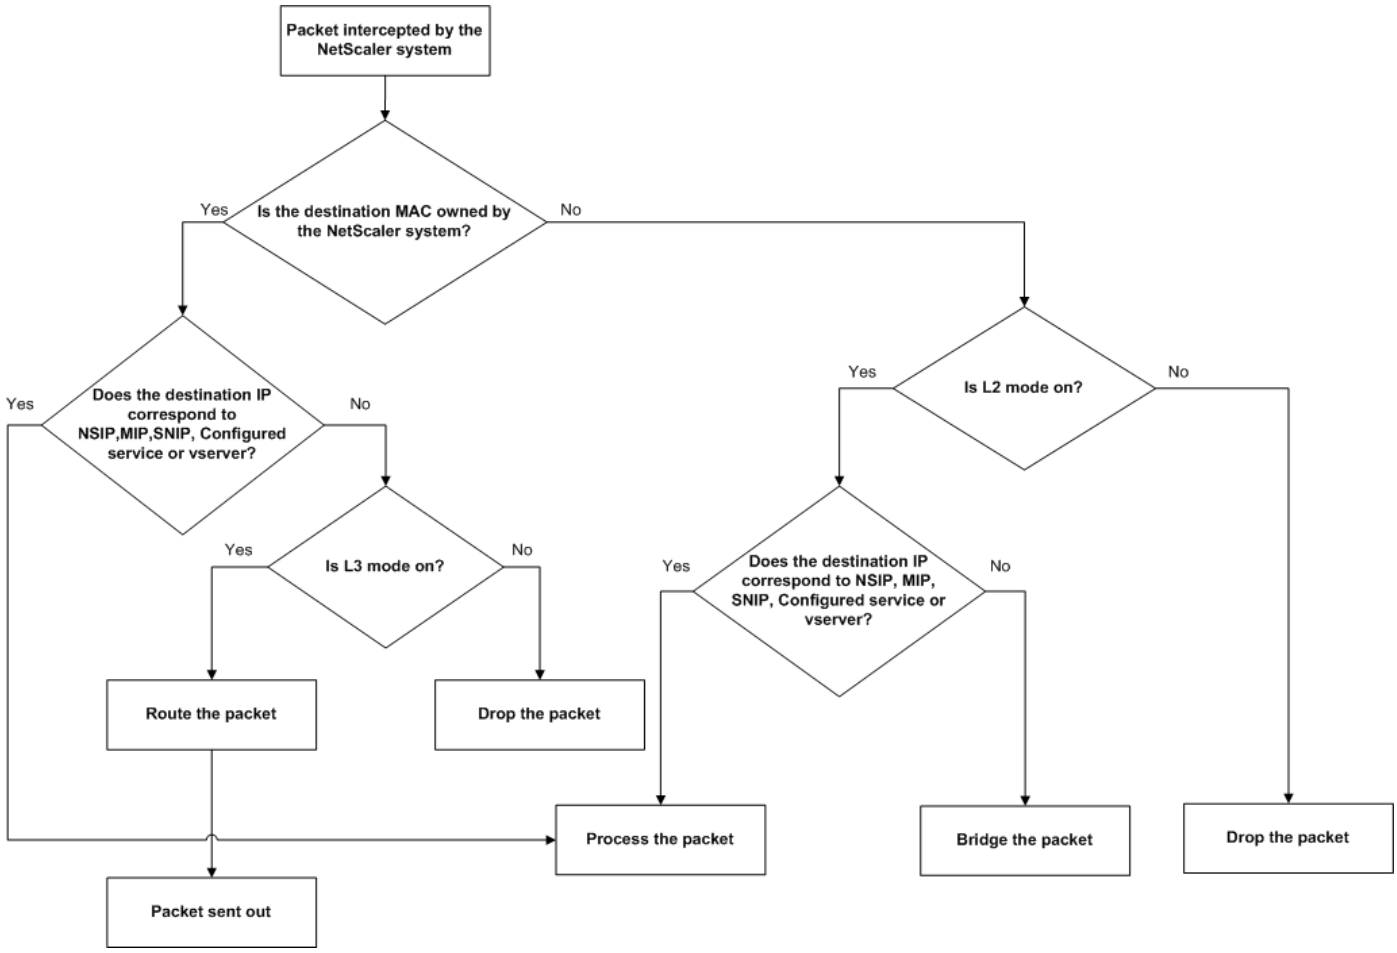
To set the FTP port range by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change global system settings**.
3. Under **FTP Port Range**, in the **Start Port** and **End Port** text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click **OK**.

Configuring Modes of Packet Forwarding

The NetScaler appliance can either route or bridge packets that are not destined for an IP address owned by the appliance (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured virtual server). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the appliance evaluates packets and either processes, routes, bridges, or drops them.

Figure 1. Interaction between Layer 2 and Layer 3 Modes



An appliance can use the following modes to forward the packets it receives:

- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

Enabling and Disabling Layer 2 Mode

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler appliance to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the appliance and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), the appliance drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with the appliance, Layer 2 mode must be disabled to prevent bridging (Layer

2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The appliance does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the appliance to the same broadcast domain.

To enable or disable Layer 2 mode by using the command line interface

At the command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- **enable ns mode** <Mode>
- **disable ns mode** <Mode>
- **show ns mode**

  Examples

```
> enable ns mode l2
 Done
> show ns mode

      Mode                    Acronym          Status
      -------                 -------          ------
 1)   Fast Ramp               FR               ON
 2)   Layer 2 mode            L2               ON
 .
 .
 .
 Done
>

> disable ns mode l2
 Done
> show ns mode

      Mode                      Acronym          Status
      -------                   -------          ------
 1)   Fast Ramp                 FR               ON
 2)   Layer 2 mode              L2               OFF
 .
 .
 .
 Done
>
```

To enable or disable Layer 2 mode by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Configure modes**.

3. In the **Configure Modes** dialog box, to enable Layer 2 mode, select the **Layer 2 Mode** check box. To disable Layer 2 mode, clear the check box.
4. Click **OK**.
   The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Enabling and Disabling Layer 3 Mode

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler appliance to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), the appliance performs route table lookups and forwards all packets that are not destined for any appliance-owned IP address. If you disable Layer 3 mode, the appliance drops these packets.

To enable or disable Layer 3 mode by using the command line interface

At the command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- **enable ns mode** <Mode>
- **disable ns mode** <Mode>
- **show ns mode**

  Examples

```
> enable ns mode l3
 Done
> show ns mode

     Mode                          Acronym          Status
     -------                       -------          ------
 1)  Fast Ramp                     FR               ON
 2)  Layer 2 mode                  L2               OFF
 .
 .
 .
 9)  Layer 3 mode (ip forwarding)  L3               ON
 .
 .
 .
 Done
>

> disable ns mode l3
 Done
> show ns mode

     Mode                          Acronym          Status
     -------                       -------          ------
 1)  Fast Ramp                     FR               ON
```

```
 2)  Layer 2 mode                  L2               OFF
 .
 .
 .
 9)  Layer 3 mode (ip forwarding)  L3               OFF
 .
 .
 .
 Done
>
```

To enable or disable Layer 3 mode by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable Layer 3 mode, select the **Layer 3 Mode (IP Forwarding)** check box. To disable Layer 3 mode, clear the check box.
4. Click **OK**.
   The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

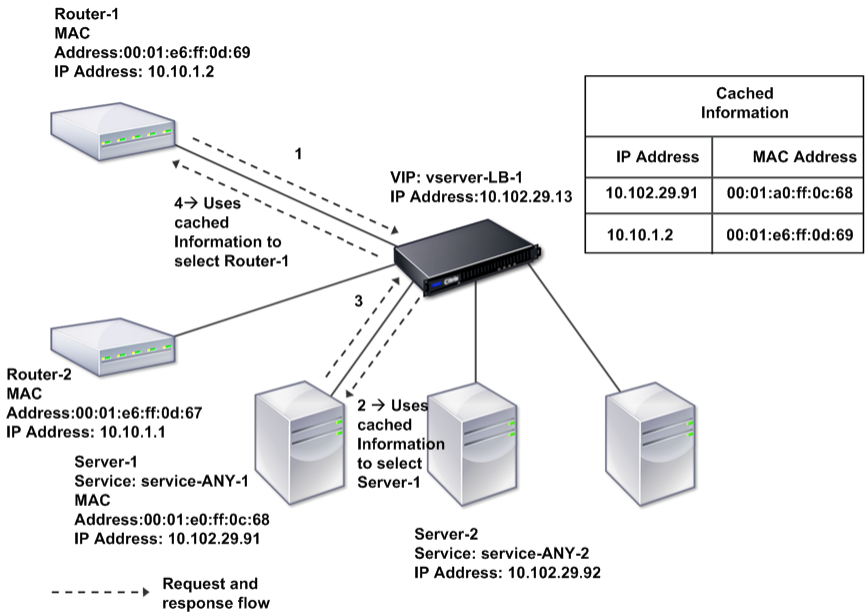
Enabling and Disabling MAC-Based Forwarding Mode

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler appliance remembers the MAC address of the source. To avoid multiple lookups, the appliance caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the appliance ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

Figure 2. MAC-Based Forwarding Process



When MAC-based forwarding is enabled, the appliance caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server responds through an appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when an appliance initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the appliance's default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

To enable or disable MAC-based forwarding by using the command line interface

At the command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:

- **enable ns mode** <Mode>
- **disable ns mode** <Mode>
- **show ns mode**

  Example

```
> enable ns mode mbf
 Done
> show ns mode

 Done
>
```

To enable or disable MAC-based forwarding by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.

2. In the details pane, under **Modes and Features** group, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable MAC-based forwarding mode, select the **MAC Based Forwarding** check box. To disable MAC-based forwarding mode, clear the check box.
4. Click **OK**.
   The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Configuring Network Interfaces

NetScaler interfaces are numbered in slot/port notation. In addition to modifying the characteristics of individual interfaces, you can configure virtual LANs to restrict traffic to specific groups of hosts. You can also aggregate links into high-speed channels.

Virtual LANs

The NetScaler supports (Layer 2) port and IEEE802.1Q tagged virtual LANs (VLANs). VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface to belong to multiple VLANs by using IEEE 802.1q tagging.

You can bind your configured VLANs to IP subnets. The NetScaler (if it is configured as the default router for the hosts on the subnets) then performs IP forwarding between these VLANs. A NetScaler supports the following types of VLANs.

Default VLAN
By default, the network interfaces on a NetScaler are included in a single, port-based VLAN as untagged network interfaces. This default VLAN has a VID of 1 and exists permanently. It cannot be deleted, and its VID cannot be changed.

Port-Based VLANs
A set of network interfaces that share a common, exclusive, Layer 2 broadcast domain define the membership of a port-based VLAN. You can configure multiple port-based VLANs. When you add an interface to a new VLAN as an untagged member, it is automatically removed from the default VLAN.

Tagged VLAN
A network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of only one VLAN (its native VLAN). The untagged network interface forwards the frames for the native VLAN as untagged frames. A tagged network interface can be a part of more than one VLAN. When you configure tagging, be sure that both ends of the link have matching VLAN settings. You can use the configuration utility to define a tagged VLAN (nsvlan) that can have any ports bound as tagged members of the VLAN. Configuring this VLAN requires a reboot of the NetScaler and therefore must be done during initial network configuration.

Link Aggregate Channels

Link aggregation combines incoming data from multiple ports into a single high speed link. Configuring the link aggregate channel increases the capacity and availability of the communication channel between a NetScaler and other connected devices. An aggregated link is also referred to as a channel.

When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to only one channel. Binding a network interface to a link aggregate channel changes the VLAN configuration. That is, binding network interfaces to a channel removes them from the VLANs that they originally belonged to and adds them to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you have bound network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then you bind them to link aggregate channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them to VLAN 2.

Note: You can also use Link Aggregation Control Protocol (LACP) to configure link aggregation. For more information, see "Configuring Link Aggregation by Using the Link Aggregation Control Protocol."

Configuring Clock Synchronization

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the appliance periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at http://www.ntp.org.

To configure clock synchronization on your appliance

1. Log on to the command line and enter the `shell` command.
2. At the shell prompt, copy the `ntp.conf` file from the `/etc` directory to the `/nsconfig` directory. If the file already exists in the `/nsconfig` directory, make sure that you remove the following entries from the `ntp.conf` file:

   ```
   restrict localhost

   restrict 127.0.0.2
   ```

   These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler.

3. Edit `/nsconfig/ntp.conf` by typing the IP address for the desired NTP server under the file's server and restrict entries.
4. Create a file named `rc.netscaler` in the `/nsconfig` directory, if the file does not already exist in the directory.
5. Edit `/nsconfig/rc.netscaler` by adding the following entry:

   ```
   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
   ```

   This entry starts the ntpd service, checks the `ntp.conf` file, and logs messages in the `/var/log` directory.

   Note: If the time difference between the NetScaler and the time server is more than 1000 sec, the ntpd service terminates with a message to the NetScaler log. To avoid this, you need to start ntpd with the -g option, which forcibly syncs the time. Add the following entry in `/nsconfig/rc.netscaler`:

   ```
   /usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log
   &
   ```

   If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start ntpd again. You can check the time difference between the appliance and the time server by running the following command in the shell:

   ```
   ntpdate -q <IP address or domain name of the NTP server>
   ```

6. Reboot the appliance to enable clock synchronization.

   Note: If you want to start time synchronization before you restart the appliance, enter the following command (which you added to the rc.netscaler file in step 5) at the shell prompt:

   ```
   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/
   ntpd.log &
   ```

Configuring DNS

You can configure a NetScaler appliance to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records, AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the appliance can balance the load on external DNS servers.

A common practice is to configure an appliance as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing virtual server as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the appliance load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method. For information about using a VIP, see "Load Balancing DNS Servers."

To add a name server by using the command line interface

At the command prompt, type the following commands to add a name server and verify the configuration:

- **add dns nameServer** `<IP>`
- **show dns nameServer** `<IP>`

Example

```
> add dns nameServer 10.102.29.10
 Done
> show dns nameServer 10.102.29.10
1)       10.102.29.10  -  State: DOWN
 Done
>
```

To add a name server by using the configuration utility

1. In the navigation pane, expand **DNS**, and then click **Name Servers**.
2. In the details pane, click **Add**.
3. In the **Create Name Server** dialog box, select **IP Address**.
4. In the **IP Address** text box, type the IP address of the name server (for example, `10.102.29.10`). If you are adding an external name server, clear the **Local** check box.
5. Click **Create**, and then click **Close**.
6. Verify that the name server you added appears in the **Name Servers** pane.

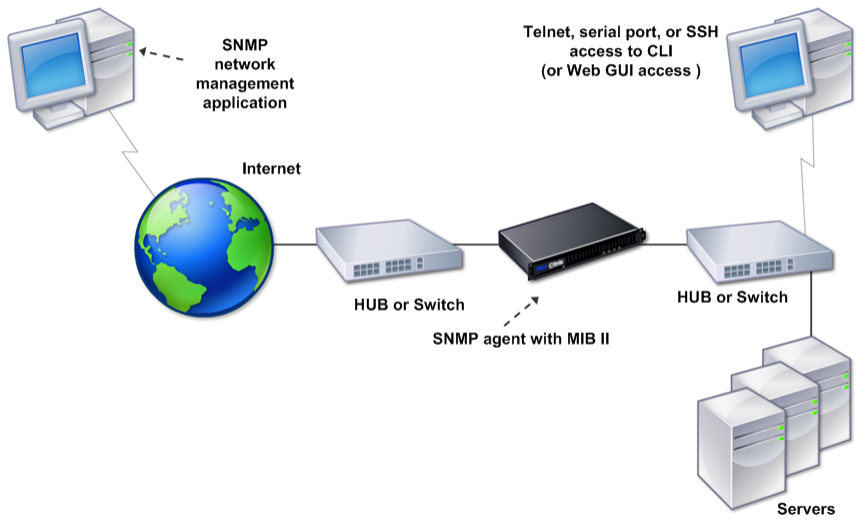
Configuring SNMP

The Simple Network Management Protocol (SNMP) network management application, running on an external computer, queries the SNMP agent on the NetScaler. The agent

searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that condition. The following figure shows a network with a NetScaler that has SNMP enabled and configured.

Figure 3. SNMP on the NetScaler



The SNMP agent on a NetScaler supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the NetScaler) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler supports the following enterprise-specific MIBs:

A subset of standard MIB-2 groups
Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.

A system enterprise MIB
Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

Adding SNMP Managers

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access an appliance. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the appliance, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks.

To add an SNMP manager by using the command line interface

At the command prompt, type the following commands to add an SNMP manager and verify the configuration:

- **add snmp manager** `<IPAddress> ... [-netmask <netmask>]`
- **show snmp manager** `<IPAddress>`

  Example

```
> add snmp manager 10.102.29.5 -netmask 255.255.255.255
 Done
> show snmp manager 10.102.29.5
1)      10.102.29.5         255.255.255.255
 Done
>
```

To add an SNMP manager by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Managers**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Manager** dialog box, in the **IP Address** text box, type the IP address of the workstation running the management application (for example, `10.102.29.5`).
4. Click **Create**, and then click **Close**.
5. Verify that the SNMP manager you added appears in the **Details** section at the bottom of the pane.

Adding SNMP Traps Listeners

After configuring the alarms, you need to specify the trap listener to which the appliance will send the trap messages. Apart from specifying parameters like IP address

and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

To add an SNMP trap listener by using the command line interface

At the command prompt, type the following command to add an SNMP trap and verify that it has been added:

- **add snmp trap** `specific <IP>`
- **show snmp trap**

  Example

```
> add snmp trap specific 10.102.29.3
 Done
> show snmp trap
Type     DestinationIP   DestinationPort  Version
SourceIP      Min-Severity  Community
----     -------------   ---------------  -------
--------      ------------  ---------
generic  10.102.29.9     162              V2       NetScaler
IP  N/A           public
generic  10.102.29.5     162              V2       NetScaler
IP  N/A           public
generic  10.102.120.101  162              V2       NetScaler
IP  N/A           public
.
.
.
specific 10.102.29.3     162              V2       NetScaler
IP   -            public
 Done
>
```

To add an SNMP trap listener by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Traps**.
2. In the details pane, click **Add**.
3. In the **Create SNMP Trap Destination** dialog box, in the **Destination IP Address** text box, type the IP address (for example, `10.102.29.3`).
4. Click **Create** and then click **Close**.
5. Verify that the SNMP trap you added appears in the **Details** section at the bottom of the pane.

Configuring SNMP Alarms

You configure alarms so that the appliance generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the appliance will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the appliance will not generate a trap message when a login failure occurs.

To enable or disable an alarm by using the command line interface

At the command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

- **set snmp alarm** `<trapName> [-state ENABLED | DISABLED ]`
- **show snmp alarm** `<trapName>`

  Example

```
> set snmp alarm LOGIN-FAILURE -state ENABLED
 Done
> show snmp alarm LOGIN-FAILURE
   Alarm           Alarm Threshold  Normal Threshold  Time
State     Severity   Logging
   -----           ---------------  ----------------  ----
--------  ---------  --------
 1) LOGIN-FAILURE  N/A              N/A               N/A
ENABLED   -          ENABLED
 Done
>
```

To set the severity of the alarm by using the command line interface

At the command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- **set snmp alarm** `<trapName> [-severity <severity>]`
- **show snmp alarm** `<trapName>`

  Example

```
> set snmp alarm LOGIN-FAILURE -severity Major
 Done
> show snmp alarm LOGIN-FAILURE
   Alarm           Alarm Threshold  Normal Threshold  Time
State     Severity   Logging
   -----           ---------------  ----------------  ----
--------  ---------  --------
```

```
 1) LOGIN-FAILURE  N/A              N/A               N/A
ENABLED   Major      ENABLED
 Done
>
```

To configure alarms by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Alarms**.
2. In the details pane, select an alarm (for example, **LOGIN-FAILURE**), and then click **Open**.
3. In the **Configure SNMP Alarm** dialog box, to enable the alarm, select the **Enable** check box. To disable the alarm, clear the **Enable** check box.
4. In the **Severity** drop-down list, select a severity option (for example, **Major**).
5. Click **OK**, and then click **Close**.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the **Details** section at the bottom of the pane.

Configuring Syslog

You can customize logging of NetScaler and Access Gateway Enterprise Edition access events for the needs of your site. You can direct these logs either to files on the NetScaler or to external log servers. The NetScaler uses the Audit Server Logging feature for logging the states and status information collected by different modules in the kernel and by user-level daemons.

Syslog is used to monitor a NetScaler and to log connections, statistics, and so on. You can customize the two logging functions for system events messaging and syslog. The NetScaler internal event message generator passes log entries to the syslog server. The syslog server accepts these log entries and logs them. For more information about the Audit Server Logging feature, see "Audit Logging."

Verifying the Configuration

After you finish configuring your system, complete the following checklists to verify your configuration.

Configuration Checklist

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build's release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch's port.
- Enough mapped IP addresses have been configured to support all server-side connections during peak times.

- The number of configured mapped IP addresses is: ____
- The expected number of simultaneous server connections is:

  [ ] 62,000 [ ] 124,000 [ ] Other____

Topology Configuration Checklist

- The routes have been used to resolve servers on other subnets.

  The routes entered are:

  _____

- If the NetScaler is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the NetScaler resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

  _____

- If the NetScaler is placed behind an external load balancer, then the load balancing policy on the external load balancer is not “least connection.”

  The load balancing policy configured on the external load balancer is:

  _____

- If the NetScaler is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

  Note: The TCP idle connection timeout on a NetScaler appliance is 360 seconds. If the timeout on the firewall is also set to 300 seconds or more, then the appliance can perform TCP connection multiplexing effectively because connections will not be closed earlier.

  The value configured for the session time-out is: _____

Server Configuration Checklist

- “Keep-alive” has been enabled on all the servers.

  The value configured for the keep-alive time-out is: _____

- The default gateway has been set to the correct value. (The default gateway should either be a NetScaler or upstream router.) The default gateway is:

  _____

- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.

  _____

- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.
- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler.

The MaxConn (maximum number of connections) value that has been set is:

_____

- If a Netscape® Enterprise Server™ is used, the maximum requests per connection parameter is set on the NetScaler. The maximum requests per connection value that has been set is:

  _____

Software Features Configuration Checklist

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in parallel with a NetScaler.)

  Reason for enabling or disabling:

  _____

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is different, it should be disabled.)

  Reason for enabling or disabling:

  _____

- Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)

  Reason for enabling or disabling:

  _____

- Do the default settings of the surge protection feature need to be changed?

  Reason for changing or not changing:

  _____

Access Checklist

- The system IPs can be pinged from the client-side network.
- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.

Firewall Checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

Load Balancing Traffic on a NetScaler Appliance

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A Citrix NetScaler appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

To configure load balancing, you define a virtual server to proxy multiple servers in a server farm and balance the load among them.

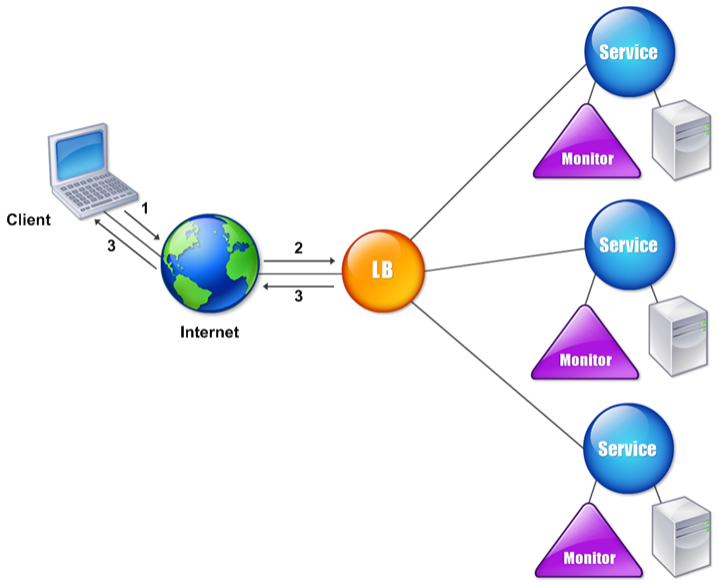
How Load Balancing Works

When a client initiates a connection to the server, a virtual server terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler appliance uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture



The entities function as follows:

- **Virtual server**. An entity that is represented by an IP address, a port, and a protocol. The virtual server IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The virtual server represents a bank of servers.
- **Service**. A logical representation of a server or an application running on a server. Identifies the server's IP address, a port, and a protocol. The services are bound to the virtual servers.
- **Server object**. An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create services by using the server object.
- **Monitor**. An entity that tracks the health of the services. The appliance periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The appliance then performs load balancing among the remaining services.

Configuring Load Balancing

To configure load balancing, you must first create services. Then, you create virtual servers and bind the services to the virtual servers. By default, the NetScaler appliance

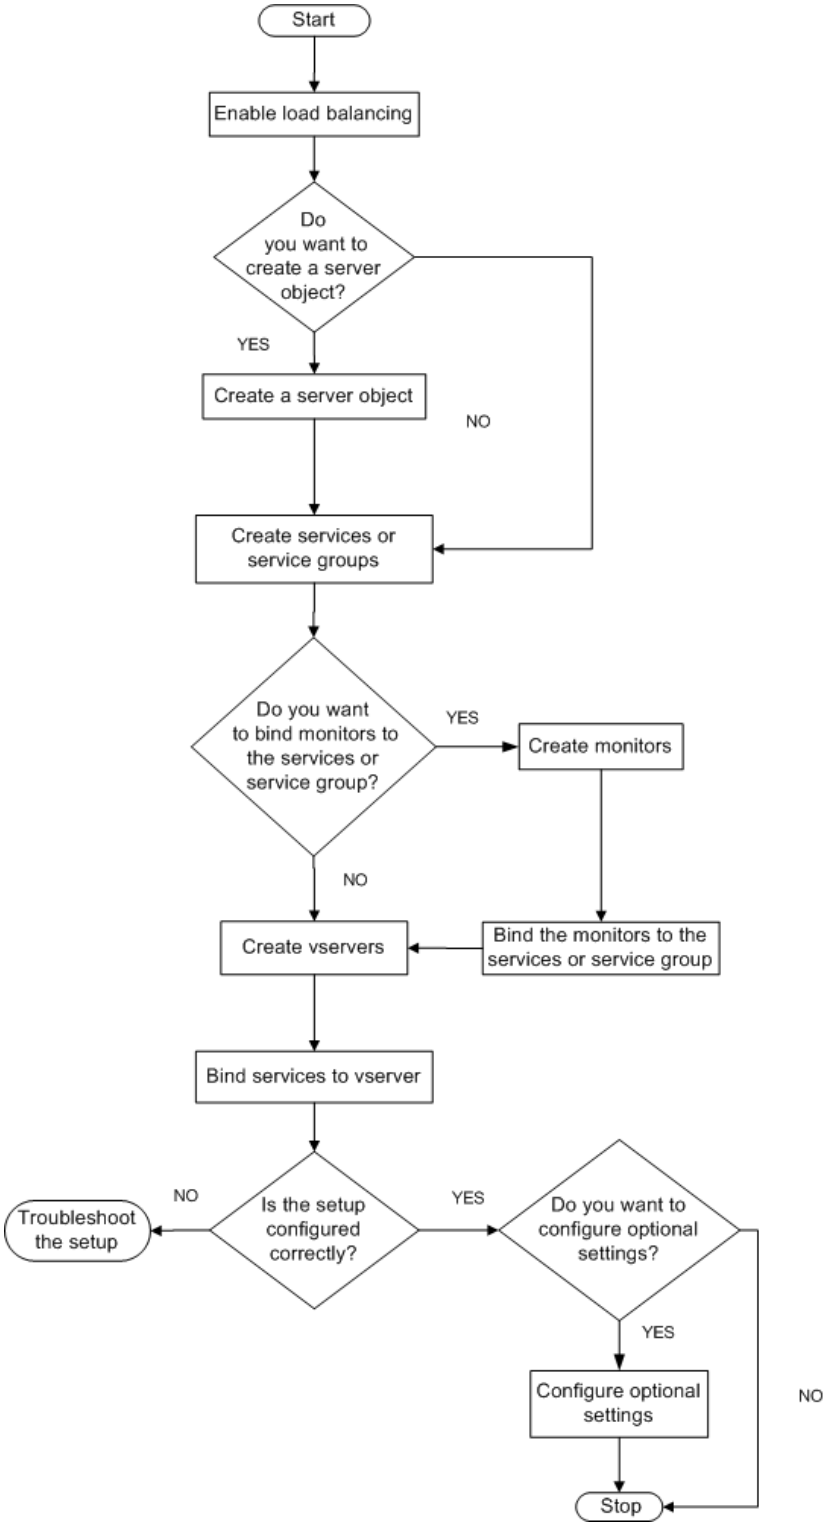
binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the **stat lb vserver** `<vserverName>` command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.

The following flow chart illustrates the sequence of the configuration tasks.

Figure 2. Sequence of Tasks to Configure Load Balancing



Enabling Load Balancing

Before configuring load balancing, make sure that the load balancing feature is enabled.

To enable load balancing by using the command line interface

At the command prompt, type the following commands to enable load balancing and verify that it is enabled:

- **enable feature** `lb`
- **show feature**

  Example

```
> enable feature lb
 Done
> show feature

     Feature                  Acronym          Status
     -------                  -------          ------
 1)  Web Logging              WL               OFF
 2)  Surge Protection         SP               OFF
 3)  Load Balancing           LB               ON
 .
 .
 .
 9)  SSL Offloading           SSL              ON
 .
 .
 .
Done
```

To enable load balancing by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. In the **Configure Basic Features** dialog box, select the **Load Balancing** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** message, click **Yes**.

Configuring Services and a Virtual Server

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing virtual server, and binding the service objects to the virtual server.

To implement the initial load balancing configuration by using the command line interface

At the command prompt, type the following commands to implement and verify the initial configuration:

- **add service** <name> <IPaddress> <serviceType> <port>
- **add lb vserver** <vServerName> <serviceType> [<IPaddress> <port>]
- **bind lb vserver** <name> <serviceName>
- **show service bindings** <serviceName>

  Example

```
> add service service-HTTP-1 10.102.29.5 HTTP 80
 Done
> add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
 Done
> bind lb vserver vserver-LB-1 service-HTTP-1
 Done
> show service bindings service-HTTP-1
   service-HTTP-1 (10.102.29.5:80) - State : DOWN

     1)      vserver-LB-1 (10.102.29.60:80) - State : DOWN
 Done
```

To implement the initial load balancing configuration by using the configuration utility

1. In the navigation pane, click **Load Balancing**.
2. In the details pane, under **Getting Started**, click **Load Balancing wizard**, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
4. Select the virtual server that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click **Open**.
6. Verify that each service is bound to the virtual server by confirming that the **Active** check box is selected for each service on the **Services** tab.

Choosing and Configuring Persistence Settings

You must configure persistence on a virtual server if you want to maintain the states of connections on the servers represented by that virtual server (for example, connections used in e-commerce). The appliance then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the appliance uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

Table 1. Limitations on Number of Simultaneous Persistent Connections

Persistence Type	Persistent Connections
Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP	250K
CookieInsert, URL passive, Custom Server ID	Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.

If the configured persistence cannot be maintained because of a lack of resources on an appliance, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain virtual servers. The following table shows the relationship.

Table 2. Persistence Types Available for Each Type of Virtual Server

Persistence TypeHeader 1	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
Source IP	YES	YES	YES	YES	YES
CookieInsert	YES	YES	NO	NO	NO
SSL Session ID	NO	YES	NO	NO	YES
URL Passive	YES	YES	NO	NO	NO
Custom Server ID	YES	YES	NO	NO	NO
Rule	YES	YES	NO	NO	NO
SRCIPDESTIP	N/A	N/A	YES	YES	N/A
DESTIP	N/A	N/A	YES	YES	N/A

You can also specify persistence for a group of virtual servers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which virtual server in the group receives the client request. When the configured time for persistence elapses, any virtual server in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs. For more information about all persistence types, see "Persistence and Persistent Connections."

Configuring Persistence Based on Cookies

When you enable persistence based on cookies, the NetScaler adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the NetScaler uses it to select the service for those requests. You can use this type of persistence on virtual servers of type HTTP or HTTPS.

The NetScaler inserts the cookie <NSC_XXXX>= <ServiceIP> <ServicePort>

where:

- <NSC_XXXX> is the virtual server ID that is derived from the virtual server name.
- <ServiceIP> is the hexadecimal value of the IP address of the service.
- <ServicePort> is the hexadecimal value of the port of the service.

The NetScaler encrypts ServiceIP and ServicePort when it inserts a cookie, and decrypts them when it receives a cookie.

Note: If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the NetScaler sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler inserts the absolute Coordinated Universal Time (GMT) of the cookie's expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on a NetScaler, and the timeout value.
- If an HTTP cookie version 1 is used, the NetScaler inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the NetScaler does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the

client software, and such cookies are not valid if that software is shut down. This persistence type does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can use the procedure in the following table to change the HTTP cookie version.

To change the HTTP cookie version by using the configuration utility

1. Navigate to **System** > **Settings**.
2. In the details pane, click **Change HTTP Parameters**.
3. In the **Configure HTTP Parameters** dialog box, under **Cookie**, select **Version 0** or **Version 1**.

Note: For information about the parameters, see "Configuring Persistence Based on Cookies."

To configure persistence based on cookies by using the command line interface

At the command prompt, type the following commands to configure persistence based on cookies and verify the configuration:

- **set lb vserver** <name> -persistenceType `COOKIEINSERT`
- **show lb vserver** <name>

  Example

```
> set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
 Done
> show lb vserver vserver-LB-1
    vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    .
    .
    .
    Persistence: COOKIEINSERT (version 0)   Persistence
Timeout: 2 min
    .
    .
    .
 Done
>
```

To configure persistence based on cookies by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, **vserver-LB-1**), and then click **Open**.

3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Method and Persistence** tab, in the **Persistence** list, select **COOKIEINSERT**.
4. In the **Time-out (min)** text box, type the time-out value (for example, `2`).
5. Click **OK**.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the **Details** section at the bottom of the pane.

Configuring Persistence Based on Server IDs in URLs

The NetScaler can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the NetScaler extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and port specified as a hexadecimal number. The NetScaler extracts the server ID from subsequent client requests and uses it to select the server.

URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see "Policy Configuration and Reference."

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

Example: Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching token sid=. Thus, a request with the URL http://www.citrix.com/index.asp?&sid;=c0a864100050 is directed to the server with the IP address10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

Note: For information about the parameters, see "Load Balancing."

To configure persistence based on server IDs in URLs by using the command line interface

At the command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

- **set lb vserver** `<name> -persistenceType URLPASSIVE`
- **show lb vserver** `<name>`

  Example

```
> set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
 Done
> show lb vserver vserver-LB-1
```

```
    vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    .
    .
    .
    Persistence: URLPASSIVE Persistence Timeout: 2 min
    .
    .
    .
 Done
>
```

To configure persistence based on server IDs in URLs by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Method and Persistence** tab, in the **Persistence** list, select **URLPASSIVE**.
4. In the **Time-out (min)** text box, type the time-out value (for example, `2`).
5. In the **Rule** text box, enter a valid expression. Alternatively, click **Configure** next to the **Rule** text box and use the **Create Expression** dialog box to create an expression.
6. Click **OK**.
7. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the **Details** section at the bottom of the pane.

Configuring Features to Protect the Load Balancing Configuration

You can configure URL redirection to provide notifications of virtual server malfunctions, and you can configure backup virtual servers to take over if a primary virtual server becomes unavailable.

Configuring URL Redirection

You can configure a redirect URL to communicate the status of the appliance in the event that a virtual server of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The appliance uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup virtual servers are down.

To configure a virtual server to redirect client requests to a URL by using the command line interface

At the command prompt, type the following commands to configure a virtual server to redirect client requests to a URL and verify the configuration:

- **set lb vserver** <name> -redirectURL <URL>
- **show lb vserver** <name>

  Example

```
> set lb vserver vserver-LB-1 -redirectURL http://
www.newdomain.com/mysite/maintenance
 Done
> show lb vserver vserver-LB-1
    vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    State: DOWN
    Last state change was at Wed Jun 17 08:56:34 2009 (+666
ms)
    .
    .
    .
    Redirect URL: http://www.newdomain.com/mysite/maintenance
    .
    .
    .
 Done
>
```

To configure a virtual server to redirect client requests to a URL by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server for which you want to configure URL redirection (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Advanced** tab, in the **Redirect URL** text box, type the URL (for example, `http://www.newdomain.com/mysite/maintenance`), and then click **OK**.
4. Verify that the redirect URL you configured for the server appears in the **Details** section at the bottom of the pane.

Configuring Backup Virtual Servers

If the primary virtual server is down or disabled, the appliance can direct the connections or client requests to a backup virtual server that forwards the client traffic

to the services. The appliance can also send a notification message to the client regarding the site outage or maintenance. The backup virtual server is a proxy and is transparent to the client.

You can configure a backup virtual server when you create a virtual server or when you change the optional parameters of an existing virtual server. You can also configure a backup virtual server for an existing backup virtual server, thus creating a cascaded backup virtual server. The maximum depth of cascading backup virtual servers is 10. The appliance searches for a backup virtual server that is up and accesses that virtual server to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup virtual servers are down or have reached their thresholds for handling requests.

Note: If no backup virtual server exists, an error message appears, unless the virtual server is configured with a redirect URL. If both a backup virtual server and a redirect URL are configured, the backup virtual server takes precedence.

To configure a backup virtual server by using the command line interface

At the command prompt, type the following commands to configure a backup server and verify the configuration:

- **set lb vserver** <name> [-backupVserver <string>]
- **show lb vserver** <name>

  Example

```
> set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
 Done
> show lb vserver vserver-LB-1
    vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    State: DOWN
    Last state change was at Wed Jun 17 08:56:34 2009 (+661
ms)
    .
    .
    .
    Backup: vserver-LB-2
    .
    .
    .
 Done
>
```

To set up a backup virtual server by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server for which you want to configure the backup virtual server (for example, **vserver-LB-1**), and then click **Open**.

3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Advanced** tab, in the **Backup Virtual Server** list, select the backup virtual server (for example, **vserver-LB-2**, and then click **OK**.
4. Verify that the backup virtual server you configured appears in the **Details** section at the bottom of the pane.

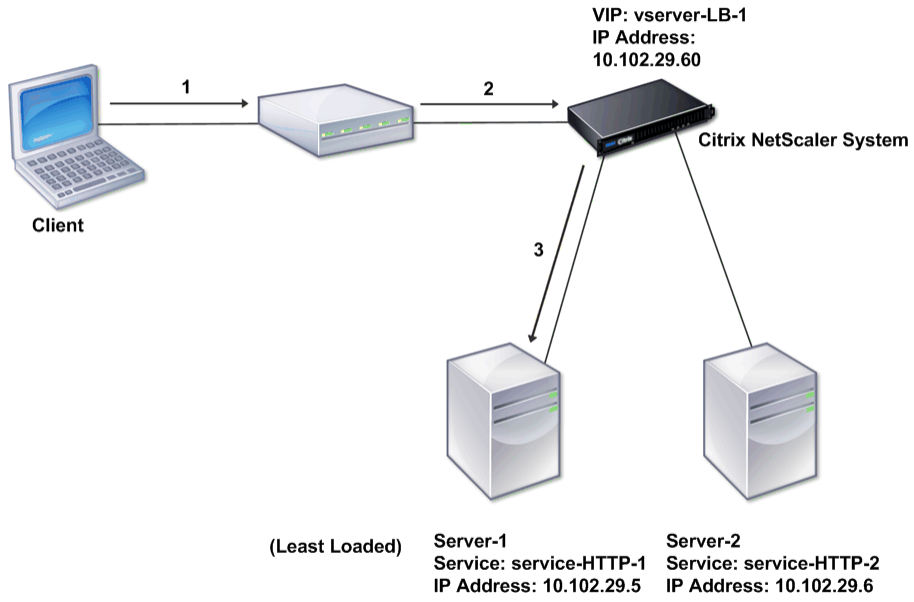
Note: If the primary server goes down and then comes back up, and you want the backup virtual server to function as the primary server until you explicitly reestablish the primary virtual server, select the **Disable Primary When Down** check box.

A Typical Load Balancing Scenario

In a load balancing setup, the NetScaler appliances are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 3. Basic Load Balancing Topology



The virtual server selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the virtual server named virtual server-LB-1. Virtual server-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load

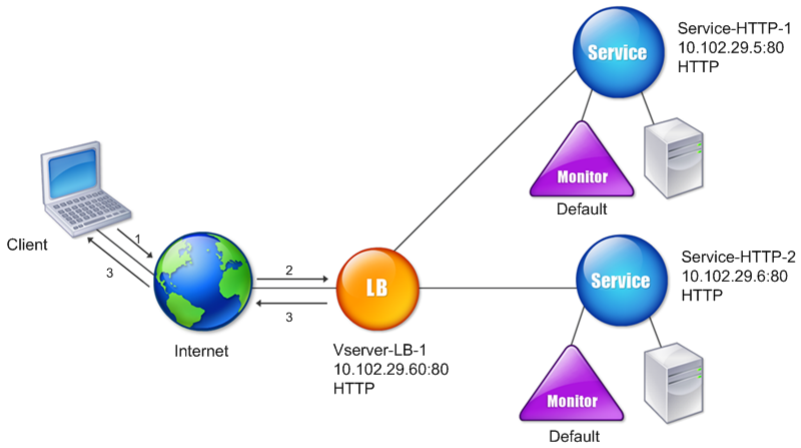
balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

Table 3. LB Configuration Parameter Values

Entity Type	Required parameters and sample values			
	Name	IP Address	Port	Protocol
Virtual Server	vserver-LB-1	10.102.29.60	80	HTTP
Services	service-HTTP-1	10.102.29.5	8083	HTTP
	service-HTTP-2	10.102.29.6	80	HTTP
Monitors	Default	None	None	None

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 4. Load Balancing Entity Model



The following tables list the commands used to configure this load balancing setup by using the command line interface.

Table 4. Initial Configuration Tasks

Task	Command
To enable load balancing	enable feature lb
To create a service named service-HTTP-1	add service service-HTTP-1 10.102.29.5 HTTP 80
To create a service named service-HTTP-2	add service service-HTTP-2 10.102.29.6 HTTP 80
To create a virtual server named vserver-LB-1	add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
To bind a service named service-HTTP-1 to a virtual server named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-1
To bind a service named service-HTTP-2 to a virtual server named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-2

For more information about the initial configuration tasks, see "Enabling Load Balancing" and "Configuring Services and a Vserver."

Table 5. Verification Tasks

Task	Command
To view the properties of a virtual server named vserver-LB-1	show lb vserver vserver-LB-1
To view the statistics of a virtual server named vserver-LB-1	stat lb vserver vserver-LB-1
To view the properties of a service named service-HTTP-1	show service service-HTTP-1
To view the statistics of a service named service-HTTP-1	stat service service-HTTP-1
To view the bindings of a service named service-HTTP-1	show service bindings service-HTTP-1

Table 6. Customization Tasks

Task	Command
To configure persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2
To configure COOKIEINSERT persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
To configure URLPassive persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
To configure a virtual server to redirect the client request to a URL on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
To set a backup virtual server on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -backupVserver vserver-LB-2

For more information about configuring persistence, see "Choosing and Configuring Persistence Settings." For information about configuring a virtual server to redirect a client request to a URL and setting up a backup virtual server, see "Configuring Features to Protect the Load Balancing Configuration."

Accelerating Load Balanced Traffic by Using Compression

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the NetScaler appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

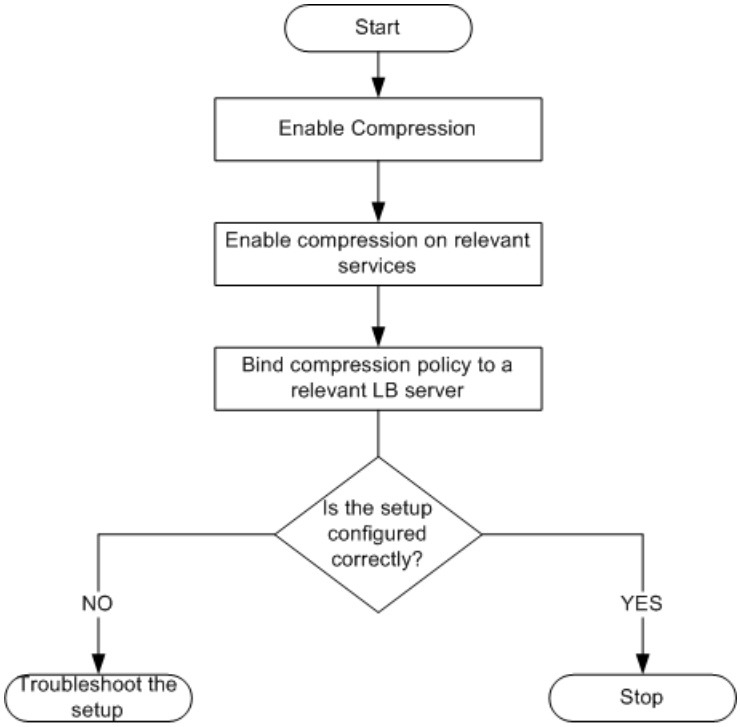
To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switching, you should bind the polices to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

Note: For more information about compression, see "Compression."

Compression Configuration Task Sequence

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression



Note: The steps in the above figure assume that load balancing has already been configured. For information about configuring load balancing, or for more information about services, see "Load Balancing."

If you want to configure something other than a basic compression setup, (for example, if you need to configure optional parameters in addition to the required parameters) see "Compression."

Enabling Compression

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

To enable compression by using the command line interface

At the command prompt, type the following commands to enable compression and verify the configuration:

- **enable ns feature** `CMP`
- **show ns feature**

Example

```
> enable ns feature CMP
Done
> show ns feature

        Feature                         Acronym
Status
        -------                         -------
------
1)      Web Logging                     WL                      ON
2)      Surge Protection                SP
OFF
.
7)      Compression Control             CMP                     ON
8)      Priority Queuing                PQ
OFF
.
Done
```

To enable compression by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. In the **Configure Basic Features** dialog box, select the **Compression** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

Configuring Services to Compress Data

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed. To create a service, see "Configuring Services."

To enable compression on a service by using the command line

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- **set service** <name> -CMP YES
- **show service** <name>

  Example

```
> show service SVC_HTTP1
```

```
SVC_HTTP1 (10.102.29.18:80) - HTTP
State: UP
Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)
Time since last state change: 0 days, 03:03:37.200
Server Name: 10.102.29.18
Server ID : 0   Monitor Threshold : 0
Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
Use Source IP: NO
Client Keepalive(CKA): NO
Access Down Service: NO
TCP Buffering(TCPB): NO
HTTP Compression(CMP): YES
Idle timeout: Client: 180 sec   Server: 360 sec
Client IP: DISABLED
Cacheable: NO
SC: OFF
SP: OFF
Down state flush: ENABLED

1)      Monitor Name: tcp-default
State: DOWN     Weight: 1
Probes: 1095    Failed [Total: 1095 Current: 1095]
Last response: Failure - TCP syn sent, reset received.
Response Time: N/A
Done
```

To enable compression on a service by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Services**.
2. In the details pane, select the service for which you want to configure compression (for example, **service-HTTP-1**), and then click **Open**.
3. On the **Advanced** tab, under **Settings**, select the **Compression** check box, and then click **OK.**
4. Verify that, when the service is selected, `HTTP Compression(CMP): ON` appears in the **Details** section at the bottom of the pane.

Binding a Compression Policy to a Virtual Server

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the **Configure Virtual Server (Load Balancing)** dialog box or from the **Compression Policy Manager** dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the **Configure Virtual Server (Load Balancing)** dialog box. For information about how you can bind a

compression policy to a load balancing virtual server by using the **Compression Policy Manager** dialog box, see "Configuring and Binding Policies with the Policy Manager."

To bind or unbind a compression policy to a virtual server by using the command line

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

- **(bind|unbind) lb vserver** `<name> -policyName <string>`
- **show lb vserver** `<name>`

  Example

```
> bind lb vserver lbvip -policyName ns_cmp_msapp
Done
> show lb vserver lbvip
lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
State: UP
Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
Time since last state change: 19 days, 04:26:50.470

Push Label Rule:

Bound Service Groups:
1)      Group Name: Service-Group-1

1) Service-Group-1 (10.102.29.252: 80) - HTTP State: UP
Weight:                                                  1

1)      Policy : ns_cmp_msapp Priority:0
Done
```

To bind or unbind a compression policy to a load balancing virtual server by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, **Vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Policies** tab, click **Compression**.
4. Do one of the following:
   - To bind a compression policy, click **Insert Policy**, and then select the policy you want to bind to the virtual server.
   - To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click **Unbind Policy**.
5. Click **OK.**

Securing Load Balanced Traffic by Using SSL

The Citrix NetScaler SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

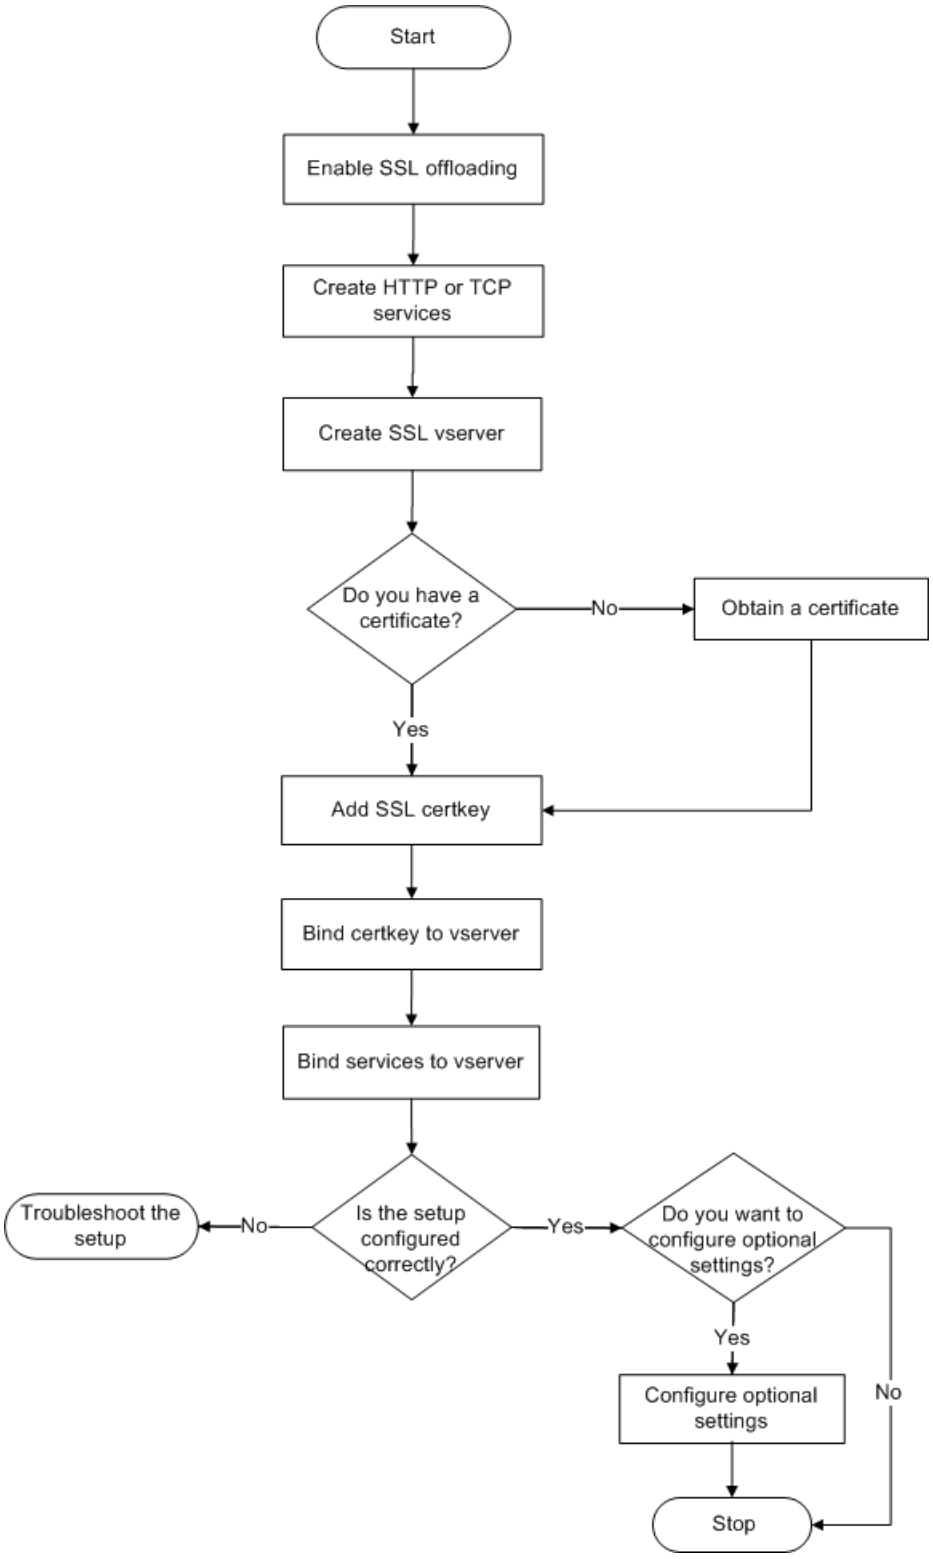
SSL Configuration Task Sequence

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading



Enabling SSL Offload

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

To enable SSL by using the command line interface

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

- **enable ns feature** `SSL`
- **show ns feature**

  Example

```
> enable ns feature ssl
Done
> show ns feature
Feature Acronym Status
------- ------- ------
1) Web Logging WL ON
2) SurgeProtection SP OFF
3) Load Balancing LB ON . . .
 9) SSL Offloading SSL ON
10) Global Server Load Balancing GSLB ON . .
Done >
```

To enable SSL by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. Select the **SSL Offloading** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** message box, click **Yes**.

Creating HTTP Services

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.

To add an HTTP service by using the command line interface

At the command prompt, type the following commands to add a HTTP service and verify the configuration:

- **add service** `<name> (<IP> | <serverName>) <serviceType> <port>`
- **show service** `<name>`

```
> add service SVC_HTTP1 10.102.29.18 HTTP 80
 Done
> show service SVC_HTTP1
        SVC_HTTP1 (10.102.29.18:80) - HTTP
        State: UP
        Last state change was at Wed Jul 15 06:13:05 2009
        Time since last state change: 0 days, 00:00:15.350
        Server Name: 10.102.29.18
        Server ID : 0   Monitor Threshold : 0
        Max Conn: 0     Max Req: 0      Max Bandwidth: 0
kbits
        Use Source IP: NO
        Client Keepalive(CKA): NO
        Access Down Service: NO
        TCP Buffering(TCPB): NO
        HTTP Compression(CMP): YES
        Idle timeout: Client: 180 sec   Server: 360 sec
        Client IP: DISABLED
        Cacheable: NO
        SC: OFF
        SP: OFF
        Down state flush: ENABLED

1)      Monitor Name: tcp-default
                State: UP       Weight: 1
                Probes: 4       Failed [Total: 0 Current: 0]
                Last response: Success - TCP syn+ack
received.
                Response Time: N/A
 Done
```

To add an HTTP service by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Services**.
2. In details pane, click **Add**.

3. In the **Create Service** dialog box, in the **Service Name**, **Server**, and **Port** text boxes, type the name of the service, IP address, and port (for example, `SVC_HTTP1`, `10.102.29.18`, and `80`).
4. In the **Protocol** list, select the type of the service (for example, `HTTP`).
5. Click **Create**, and then click **Close**.
   The HTTP service you configured appears in the **Services** page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the **Details** section at the bottom of the pane.

For more information about services, see "Configuring Services."

Adding an SSL-Based Virtual Server

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

To add an SSL-based virtual server by using the command line interface

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

- **add lb vserver** `<name> <serviceType> [<IPAddress> <port>]`
- **show lb vserver** `<name>`

  Example

```
  > add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
  Done
  > show lb vserver vserver-SSL-1
  vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS
  State: DOWN[Certkey not bound] Last state change was at
Tue Jun 16 06:33:08 2009 (+176 ms)
  Time since last state change: 0 days, 00:03:44.120
  Effective State: DOWN Client Idle Timeout: 180 sec
  Down state flush: ENABLED
  Disable Primary Vserver On Down : DISABLED
  No. of Bound Services : 0 (Total) 0 (Active)
  Configured Method: LEASTCONNECTION Mode: IP
  Persistence: NONE
  Vserver IP and Port insertion: OFF
  Push: DISABLED Push VServer: Push Multi Clients: NO Push
Label Rule: Done
```

⚠ **Caution:** To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

To add an SSL-based virtual server by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, click **Add**.
3. In the **Create Virtual Server (SSL Offload)** dialog box, in the **Name**, **IP Address**, and **Port** text boxes, type the name of the virtual server, IP address, and port (for example, `Vserver-SSL-1`, `10.102.29.50`, and `443`).
4. In the **Protocol** list, select the type of the virtual server, for example, **SSL.**
5. Click **Create**, and then click **Close**.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the **Details** section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

⚠ **Caution:** To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Binding Services to the SSL Virtual Server

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.

Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see "SSL Offload and Acceleration."

To bind a service to a virtual server by using the command line interface

At the command prompt, type the following commands to bind service to the SSL virtual server and verify the configuration:

- **bind lb vserver** `<name> <serviceName>`
- **show lb vserver** `<name>`

Example

```
  > bind lb vserver vserver-SSL-1 SVC_HTTP1
  Done
  > show lb vserver vserver-SSL-1 vserver-SSL-1
(10.102.29.50:443) - SSL Type:
  ADDRESS State: DOWN[Certkey not bound]
  Last state change was at Tue Jun 16 06:33:08 2009 (+174
ms)
  Time since last state change: 0 days, 00:31:53.70
  Effective State: DOWN Client Idle
  Timeout: 180 sec
  Down state flush: ENABLED Disable Primary Vserver On Down :
  DISABLED No. of Bound Services : 1 (Total) 0 (Active)
  Configured Method: LEASTCONNECTION Mode: IP Persistence:
NONE Vserver IP and
  Port insertion: OFF Push: DISABLED Push VServer: Push
Multi Clients: NO Push Label Rule:

  1) SVC_HTTP1 (10.102.29.18: 80) - HTTP
  State: DOWN Weight: 1
  Done
```

To bind a service to a virtual server by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, select a virtual server, and then click **Open**.
3. On the **Services** tab, in the **Active** column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click **OK.**
5. Verify that the **Number of Bound Services** counter in the **Details** section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

Adding a Certificate Key Pair

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler appliance, or you can create your own SSL certificate. The appliance supports RSA/DSA certificates of up to 4096 bits.

Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

To add a certificate key pair by using the command line interface

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

- **add ssl certKey** <certkeyName> -cert <string> [-key <string>]
- **show sslcertkey** <name>

  Example

```
> add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-
root.key
 Done
> show sslcertkey CertKey-SSL-1
   Name: CertKey-SSL-1 Status: Valid,
   Days to expiration:4811 Version: 3
   Serial Number: 00 Signature Algorithm:
md5WithRSAEncryption Issuer: C=US,ST=California,L=San
   Jose,O=Citrix ANG,OU=NS Internal,CN=de fault
   Validity Not Before: Oct 6 06:52:07 2006 GMT Not After :
Aug 17 21:26:47 2022 GMT
   Subject: C=US,ST=California,L=San Jose,O=Citrix ANG,OU=NS
Internal,CN=d efault Public Key
   Algorithm: rsaEncryption Public Key
   size: 1024
 Done
```

To add a certificate key pair by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Certificates**.
2. In the details pane, click **Add**.
3. In the **Install Certificate** dialog box, in the **Certificate-Key Pair Name** text box, type a name for the certificate key pair you want to add, for example, `Certkey-SSL-1`.

4. Under **Details**, in **Certificate File Name**, click **Browse (Appliance)** to locate the certificate.

   Both the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select **Local**.

5. Select the certificate you want to use, and then click **Select**.
6. In **Private Key File Name**, click **Browse (Appliance)** to locate the private key file.

   To use a private key present on the local system, select **Local**.

7. Select the key you want to use and click **Select.**

   To encrypt the key used in the certificate key pair, type the password to be used for encryption in the **Password** text box.

8. Click **Install**.
9. Double-click the certificate key pair and, in the **Certificate Details** window, verify that the parameters have been configured correctly and saved.

Binding an SSL Certificate Key Pair to the Virtual Server

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.

To bind an SSL certificate key pair to a virtual server by using the command line interface

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

- **bind ssl vserver** <vServerName> -certkeyName <string>
- **show ssl vserver** <name>

  Example

```
 > bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1
Done
> show ssl vserver Vserver-SSL-1

     Advanced SSL configuration for VServer Vserver-SSL-1:
     DH: DISABLED
     Ephemeral RSA: ENABLED Refresh Count: 0
     Session Reuse: ENABLED Timeout: 120 seconds
     Cipher Redirect: ENABLED
     SSLv2 Redirect: ENABLED
```

```
     ClearText Port: 0
     Client Auth: DISABLED
     SSL Redirect: DISABLED
     Non FIPS Ciphers: DISABLED
     SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate
1) Cipher Name: DEFAULT
   Description: Predefined Cipher Alias
Done
```

To bind an SSL certificate key pair to a virtual server by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. Select the virtual server to which you want to bind the certificate key pair, for example, **Vserver-SSL-1**, and click **Open**.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, on the **SSL Settings** tab, under **Available**, select the certificate key pair that you want to bind to the virtual server (for example, **Certkey-SSL-1**), and then click **Add**.
4. Click **OK.**
5. Verify that the certificate key pair that you selected appears in the **Configured** area.

Configuring Support for Outlook Web Access

If you use Outlook Web Access (OWA) servers on your NetScaler appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.

To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL virtual server.

Creating an SSL Action to Enable OWA Support

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

To create an SSL action to enable OWA support by using the command line interface

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

- **add ssl action** <name> -OWASupport ENABLED
- **show SSL action** <name>

```
 > add ssl action Action-SSL-OWA -OWASupport enabled
Done
> show SSL action Action-SSL-OWA
   Name: Action-SSL-OWA
   Data Insertion Action: OWA
   Support: ENABLED
Done
```

To create an SSL action to enable OWA support by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Policies**.
2. In the details pane, on the **Actions** tab, click **Add**.
3. In the **Create SSL Action** dialog box, in the **Name** text box, type `Action-SSL-OWA`.
4. Under **Outlook Web Access**, select **Enabled**.
5. Click **Create**, and then click **Close**.
6. Verify that **Action-SSL-OWA** appears in the **SSL Actions** page.

Creating SSL Policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

To create an SSL policy by using the command line interface

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

- **add ssl policy** <name> -rule <expression> -reqAction <string>

- **show ssl policy** <name>

  Example

```
   > add ssl policy Policy-SSL-1 -rule ns_true -reqaction
Action-SSL-OWA
   Done
   > show ssl policy Policy-SSL-1
   Name: Policy-SSL-1      Rule: ns_true
   Action: Action-SSL-OWA  Hits: 0
   Policy is bound to following entities
   1)      PRIORITY : 0
   Done
```

To create an SSL policy by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Policies**.
2. In the details pane, click **Add**.
3. In the **Create SSL Policy** dialog box, in the **Name** text box, type the name of the SSL Policy (for example, `Policy-SSL-1`).
4. In **Request Action**, select the configured SSL action that you want to associate with this policy (for example, **Action-SSL-OWA**).

   The `ns_true` general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see "Understanding Policies and Expressions."
5. In **Named Expressions**, choose the built-in general expression `ns_true` and click **Add Expression**. The expression `ns_true` now appears in the Expression text box.
6. Click **Create**, and then click **Close**.
7. Verify that the policy is correctly configured by selecting the policy and viewing the **Details** section at the bottom of the pane.

Binding the SSL Policy to an SSL Virtual Server

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

To bind an SSL policy to an SSL virtual server by using the command line interface

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

- **bind ssl vserver** <vServerName> -policyName <string>

- **show ssl vserver** <name>

  Example

```
> bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
 Done
> show ssl vserver Vserver-SSL-1
        Advanced SSL configuration for VServer Vserver-
SSL-1:
        DH: DISABLED
        Ephemeral RSA: ENABLED          Refresh Count: 0
        Session Reuse: ENABLED          Timeout: 120 seconds
        Cipher Redirect: ENABLED
        SSLv2 Redirect: ENABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1)      CertKey Name: CertKey-SSL-1 Server Certificate

1)      Policy Name: Policy-SSL-1
                        Priority: 0
1)      Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
 Done
>
```

To bind an SSL policy to an SSL virtual server by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server (for example, **Vserver-SSL-1**), and then click **Open**.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, click **Insert Policy**, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the **Priority** field and type a new priority level.
4. Click **OK.**

Features at a Glance

Citrix NetScaler features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see "Processing Order of Features."

Application Switching and Traffic Management Features

SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see "SSL Offload and Acceleration."

Access Control Lists

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. A NetScaler does not compare incoming packets to disabled ACLs.

For more information, see "Access Control Lists."

Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the NetScaler can maintain

session persistence based on source IP, cookie, server, group, or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts. To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

For more information, see "Load Balancing."

Content Switching

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see "Content Switching."

Global Server Load Balancing (GSLB)

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see "Global Server Load Balancing."

Dynamic Routing

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see "Configuring Dynamic Routes."

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.

For more information, see " Link Load Balancing."

TCP Optimization

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.

Web Interface on NetScaler

Provides access to XenApp and XenDesktop resources, which include applications, content, and desktops. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in. The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.26 on the NetScaler appliance.

Note: Web Interface is supported only on NetScaler nCore releases.

For more information, see "Web Interface."

CloudBridge

The Citrix NetScaler CloudBridge feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or NetScaler virtual appliances on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or NetScaler virtual appliance on a cloud instance to a NetScaler appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see "CloudBridge."

DataStream

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content

switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors.

Note: DataStream is supported for MySQL and MS SQL databases.

For more information, see "DataStream."

Application Acceleration Features

AppCompress

Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user's browser.

For more information, see "Compression."

Cache Redirection

Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

For more information, see "Cache Redirection."

AppCache

Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

For more information, see "Integrated Caching."

TCP Buffering

Buffers the server's response and delivers it to the client at the client's speed, thus offloading the server faster and thereby improving the performance of web sites.

For more information, see "TCP Buffering."

Application Security and Firewall Features

Denial of Service Attack (DoS) Defense

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardrop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see "HTTP Denial-of-Service Protection."

Content Filtering

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the appliance to screen unwanted requests and reduces your servers' exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see "Content Filtering."

Responder

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.

For more information, see "Responder."

Rewrite

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.

When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see "Rewrite."

Priority Queuing

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The appliance places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.

For more information, see "Priority Queuing."

Surge Protection

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see "Surge Protection."

Access Gateway

Access Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's mobile workforce.

For more information, see "Access Gateway."

Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see "Application Firewall."

Application Visibility Feature

NetScaler Insight Center

NetScaler Insight Center is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler ADC appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Insight Center provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.

HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird's eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

EdgeSight for NetScaler

Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.

For more information, see "EdgeSight Monitoring for NetScaler."

Enhanced Application Visibility Using AppFlow

The Citrix NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

For more information, see "AppFlow."

Stream Analytics

The performance of your web site or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see "Stream Analytics."

Licensing, Upgrading, and Downgrading

2015-05-18 16:52:06 UTC

Contents

Licensing, Upgrading, and Downgrading

The following topics describe the migration instructions for setting up a new version of a NetScaler with a list of all new and deprecated commands, parameters, and SNMP OIDs.

New and Deprecated Commands, Parameters, and SNMP OIDs	Lists the foundational changes that affect the base system and its configuration, including new and deprecated commands, parameters, and SNMP OIDs.
Upgrading or Downgrading the System Software	Describes the licensing framework and the procedure for upgrading or downgrading the system software across releases and within a release.

New and Deprecated Commands, Parameters, and SNMP OIDs

Welcome to the NetScaler 10 system software release. There are new commands, parameters, and SNMP OIDs in this release. Some commands, parameters, and SNMP OIDs will be deprecated in this release. For complete descriptions of the new commands and parameters, see "Command Reference". For complete descriptions of the SNMP OIDs, see the *Citrix NetScaler SNMP OID Reference Guide* at "http://support.citrix.com/article/CTX132381".

New and Deprecated Commands, Parameters, and SNMP OIDs

Welcome to the NetScaler 10 system software release. There are new commands, parameters, and SNMP OIDs in this release. Some commands, parameters, and SNMP OIDs will be deprecated in this release. For complete descriptions of the new commands and parameters, see "Command Reference". For complete descriptions of the SNMP OIDs, see the *Citrix NetScaler SNMP OID Reference Guide* at "http://support.citrix.com/article/CTX132381".

ns-migration-new-cmds-10-ref

Due to technical difficulties, we are unable to display this topic. Citrix is currently fixing this problem. In the meantime, you can view this topic online:

http://support.citrix.com/proddocs/index.jsp?lang=en&topic=/netscaler-migration-10/ns-migration-new-cmds-10-ref.html

Deprecated Commands

The following commands are deprecated in release 10.

- rm vserver
- set vserver
- unset vserver
- enable vserver
- disable vserver
- add lb wlm
- rm lb wlm
- set lb wlm
- show lb wlm
- bind lb wlm
- unbind lb wlm
- add ns limitSelector
- rm ns limitSelector
- set ns limitSelector
- show ns limitSelector
- add ns appflowCollector
- rm ns appflowCollector
- show ns appflowCollector
- set ns appflowParam
- show ns appflowParam

ns-migration-new-params-10-ref

Due to technical difficulties, we are unable to display this topic. Citrix is currently fixing this problem. In the meantime, you can view this topic online:

http://support.citrix.com/proddocs/index.jsp?lang=en&topic=/netscaler-migration-10/ns-migration-new-params-10-ref.html

Deprecated Parameters

The following parameters are deprecated in release 10.

- add service -serverID
- set service -serverID
- unset service -serverID
- bind serviceGroup -serverID
- add dns policy -viewName -preferredLocation -drop -cacheBypass
- set dns policy -viewName -preferredLocation -drop -cacheBypass
- show dns aaaaRec [<IPv6Address>]
- show dns addRec [<IPAddress>]
- show dns mxRec [-mx <string>]
- show dns nsRec [<nameServer>]
- show dns ptrRec [<domain>]
- add lb monitor -destIP *
- set lb monitor -destIP *
- add gslb vserver -backupSessionTimeout
- set gslb vserver -backupSessionTimeout
- set ns config -httpPort -maxConn -maxReq -cip -cookieversion -secureCookie -pmtuMin -pmtuTimeout -ftpPortRange -crPortRange -timezone -grantQuotaMaxClient -exclusiveQuotaMaxClient -grantQuotaSpillOver -exclusiveQuotaSpillOver
- unset ns config -ftpPortRange -crPortRange -timezone
- set ns -tcpParam -KAprobeUpdateLastactivity
- add ssl policy -reqAction

New SNMP OIDs

The following table lists the new SNMP OIDs in release 10.

OID	Description
Application firewall	
1.3.6.1.4.1.5951.4.1.1.64.1.34	AppFirewall SNMP traps dropped due to time limit.
Cluster	
1.3.6.1.4.1.5951.4.1.1.72	The cluster table. This is indexed on the clID.
1.3.6.1.4.1.5951.4.1.1.72.1	
1.3.6.1.4.1.5951.4.1.1.72.1.1	This represents the unique id of the cluster node
1.3.6.1.4.1.5951.4.1.1.72.1.2	This represents the IP address of the cluster node
Load Balancing	
1.3.6.1.4.1.5951.4.1.2.7.1.36	The name of the server of the servicegroup member
1.3.6.1.4.1.5951.4.1.3.1.1.67	Number invalid requests/responses on this vserver
1.3.6.1.4.1.5951.4.1.3.1.1.68	Number invalid requests/responses dropped on this vserver
Networking	
1.3.6.1.4.1.5951.4.1.1.20.62	This represents whether ISIS feature is enabled or disabled on NetScaler
1.3.6.1.4.1.5951.4.1.1.22.7	This provides statistical information about the configured PBR6s, in the rs9000 product family of NetScaler products.
1.3.6.1.4.1.5951.4.1.1.22.7.20	This table contains all the PBRs configured. This is indexed on the acPbrName.
1.3.6.1.4.1.5951.4.1.1.22.7.20.1	
1.3.6.1.4.1.5951.4.1.1.22.7.20.1.1	The name of the PBR6
1.3.6.1.4.1.5951.4.1.1.22.7.20.1.2	The full name of the PBR6
1.3.6.1.4.1.5951.4.1.1.22.7.20.1.3	The priority of the PBR6
1.3.6.1.4.1.5951.4.1.1.22.7.20.1.4	Number of times the pbr6 was hit
1.3.6.1.4.1.5951.4.1.1.22.7.21	Total packets that matched the PBR6 with action ALLOW
1.3.6.1.4.1.5951.4.1.1.22.7.22	Total packets that matched PBR6 with action DENY
1.3.6.1.4.1.5951.4.1.1.22.7.23	Total packets that matched one of the configured PBR6

1.3.6.1.4.1.5951.4.1.1.22.7.24	Total packets that did not match any PBR6
1.3.6.1.4.1.5951.4.1.1.71	This provides statistical information about the total number of megabits received/transmitted on the Network Interfaces configured in the Netscaler product.
1.3.6.1.4.1.5951.4.1.1.71.1	Number of megabits received by the NetScaler appliance.
1.3.6.1.4.1.5951.4.1.1.71.2	Number of megabits transmitted by the NetScaler appliance.
1.3.6.1.4.1.5951.4.1.10.2.32	the state of HA License check
SSL	
1.3.6.1.4.1.5951.4.1.10.2.33	This represents the interpretation details of sslCardStatus.
System	
1.3.6.1.4.1.5951.4.1.1.16	The model ID is populated if the system is such that it is license controlled. If the system does not support license based models, then the model id will be zero.
1.3.6.1.4.1.5951.4.1.1.46.90	Current threshold for TCP rate control. By default, there is no rate control for TCP.
1.3.6.1.4.1.5951.4.1.10.2.34	This represents the status of CallHome Upload Event.

Upgrading or Downgrading the System Software

NetScaler 10 offers new and updated features with increased functionality. A comprehensive list of enhancements is listed in the release notes accompanying the release announcement. Take a moment to read this document before you upgrade your software.

It is important to understand the licensing framework and types of licenses before you upgrade your software. A software edition upgrade may require new licenses, such as upgrading from the standard edition to the enterprise edition, the standard edition to the platinum edition, or the enterprise edition to the platinum edition.

Note: For upgrading or downgrading the nodes in a cluster setup, see "Upgrading or Downgrading the Cluster Software".

Changes to the Licensing Framework

The licensing framework has changed since release 8.1, build 65.5. For more information, see "http://support.citrix.com/article/ctx121062".

Citrix NetScaler Application Accelerator users have been upgraded to the Access Gateway Enterprise Edition without any change in functionality.

NetScaler Licenses

A NetScaler must be properly licensed before it can be deployed to distribute, optimize, or secure network traffic for Web applications. After you have obtained the licenses, you must install the licenses on your appliance, and then verify that the features corresponding to these licenses are enabled.

Obtaining NetScaler Licenses

The procedure to obtain NetScaler licenses has changed. For more information, see "http://support.citrix.com/article/ctx121062".

Installing NetScaler Licenses

Install each license to use the feature controlled by that license.

To install the licenses by using the command line interface

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy the new license file(s) to this directory.

   Example

   ```
   login: nsroot
   Password: nsroot
   Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
   Done
   > shell
   Last login: Mon Aug  4 03:51:42 from 10.103.25.64
   root@ns# mkdir /nsconfig/license
   root@ns# cd /nsconfig/license
   ```

   Copy the new license file(s) to this directory.

   Note: The NetScaler appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the `reboot -w` command to warm reboot the system, or run the `reboot` command to reboot the system normally.

To install the licenses by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://192.168.100.1`.
2. In User Name and Password, type the administrator credentials.
3. In Start in, select Configuration, and then click Login, as shown in the following figure.

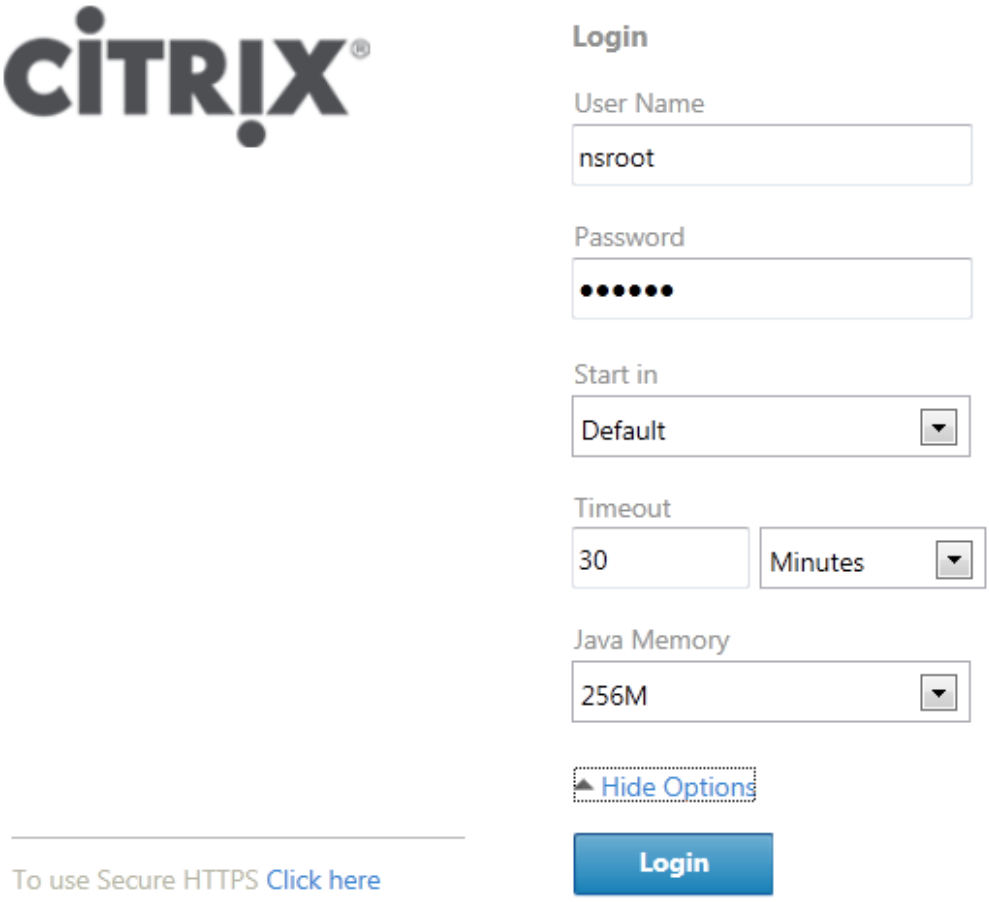


Figure 1. Login Screen

4. In the navigation pane, expand System, and then click Licenses.
5. In the Licenses pane, click Manage Licenses. If the /nsconfig/license directory does not exist, you are prompted to create it.
6. In the Manage Licenses dialog box, click Add.
7. In the Select License Files dialog box, navigate to the location of the license files and select the file you want to upload (for example, Citrix NetScaler IPv6 - Option.lic).
8. Click Select.

9. After your file is uploaded to the license directory, click OK.
10. When prompted to restart the NetScaler, do one of the following:
    - If you plan to upgrade your software, click No.
    - If you don’t plan to upgrade your software, click Yes to restart the NetScaler.

Verifying the Licensed Features

Before using a feature, make sure that your license supports the feature.

To verify the licensed features by using the command line interface

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. At the command prompt, enter the sh ns license command to display the features supported by the license.

   Example

```
sh ns license
        License status:
                        Web Logging: YES
                    Surge Protection: YES
                      .......

                      HTML Injection: YES
 Done
```

To verify the licensed features by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://192.168.100.1`.
2. In User Name and Password, type the administrator credentials.
3. In Start in, select Configuration, and then click Login, as shown in the following figure.

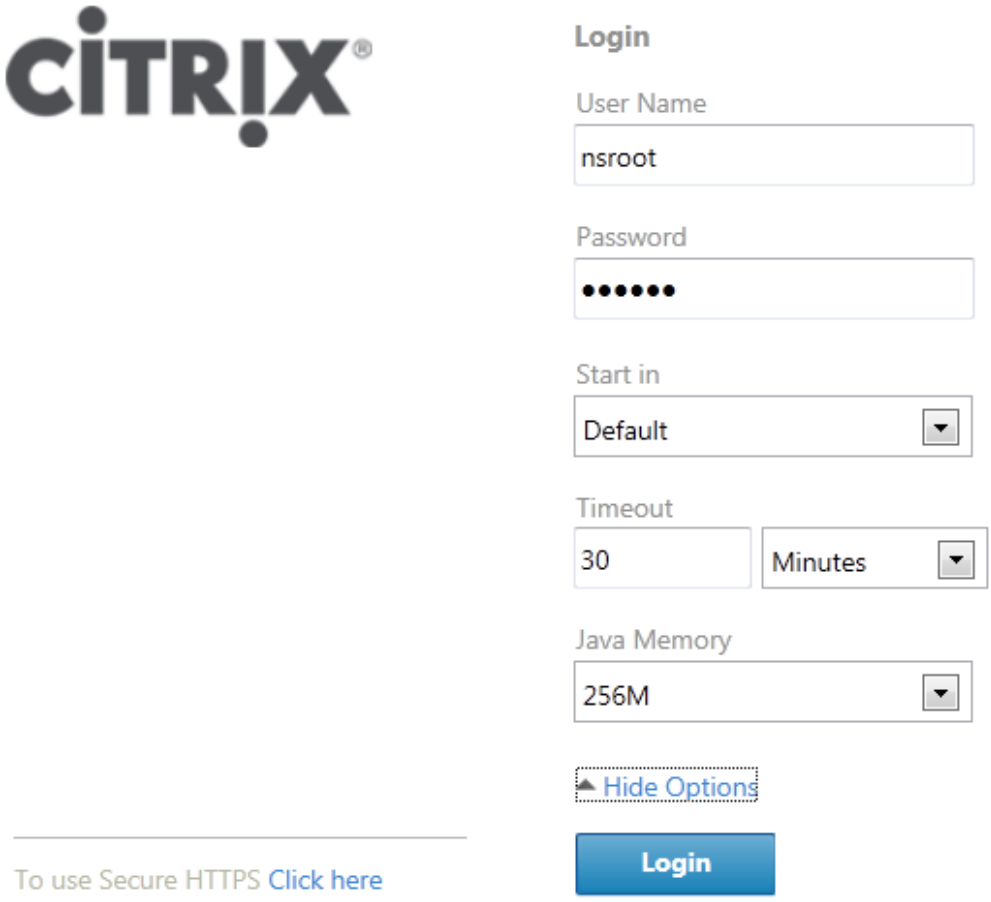

Figure 1. Login Screen

4. In the navigation pane, expand System, and then click Licenses. You will see a green check mark next to the licensed features.

Enabling or Disabling a Feature

When you use the NetScaler for the first time, you need to enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it will apply only after the feature is enabled.

To enable a feature by using the command line interface

At the NetScaler command prompt, type the following commands to enable a feature and verify the configuration:

- `enable feature <FeatureName>`
- `show feature`

Example

```
enable feature lb cs
done
 >show feature

      Feature                Acronym          Status
      -------                -------          ------
1)    Web Logging              WL               OFF
2)    Surge Protection         SP               ON
3)    Load Balancing           LB               ON
4)    Content Switching        CS               ON
5)    Cache Redirection        CR               ON
.
.
.
24)   NetScaler Push           push             OFF
Done
```

The example shows how to enable load balancing (lb) and content switching (cs).
If the license key is not available for a particular feature, the following error message appears for that feature:

```
ERROR: feature(s) not licensed
```

Note: To enable an optional feature, you need a feature-specific license. For example, if you have purchased and installed the Citrix NetScaler Enterprise Edition license and need to enable the Integrated Caching feature, you first need to purchase and install the AppCache license.

To disable a feature by using the command line interface

At the NetScaler command prompt, type the following commands to disable a feature and verify the configuration:

- `disable feature <FeatureName>`
- `show feature`

Example

```
> disable feature lb
 Done
> show feature

      Feature                 Acronym          Status
      -------                 -------          ------
 1)   Web Logging               WL               OFF
 2)   Surge Protection          SP               ON
 3)   Load Balancing            LB               OFF
 4)   Content Switching          CS               ON
 .
 .
 .
 24)  NetScaler Push            push             OFF
Done
>
```

The example shows how to disable load balancing (lb).

Access Gateway Universal License

The Access Gateway universal license limits the number of concurrent user sessions to the number of licenses purchased. If you purchase 100 licenses, you can have 100 concurrent sessions at any time. When a user ends a session, that license is released for the next user. A user who logs on to the Access Gateway from more than one computer occupies a license for each session.

If all licenses are occupied, no additional connections can be opened until a user ends a session or the administrator terminates the session using the configuration utility. When a connection is closed, the license is released and can be used for a new user.

Obtaining the Universal License

You need the following information before going to the Citrix Web site for the universal license.

The license code

You can find the code on the Access Gateway CD, in an email you receive from Citrix, or from the Subscription Advantage Management-Renewal-Information (SAMRI) system.

Your user ID and password for My Citrix

Register at My Citrix (www.mycitrix.com) to receive your user ID and password.

Note: If you cannot locate either the license code or your user ID and password, contact Citrix Customer Service.

The host name of the Access Gateway

The entry field for this name on My Citrix is case-sensitive, so make sure that you copy the host name exactly as it is configured on the NetScaler.

The number of licenses you want to include in the license file

You do not have to download all of the licenses you are entitled to at once. For example, if your company purchased 100 licenses, you can choose to download 50. You can allocate the rest in another license file at a later time. Multiple license files can be installed on the Access Gateway.

Note: Before obtaining your licenses, make sure you configure the host name of the NetScaler using the Setup Wizard and then restart the NetScaler.

To obtain your universal license

1. In a Web browser, go to http://www.citrix.com/ and click My Citrix.
2. Enter your user name and password. If this is the first time you are logging on to the site, you are asked for additional background information.
3. Under My Tools, point to Choose a toolbox, and click Activation System/Manage Assets.
4. In the Current Tool drop-down menu, select Activate/Allocate and follow the directions to obtain your license file.

Installing the Universal License

To install the license, see "Installing NetScaler Licenses". After installation, verify that the license was installed correctly.

Verifying Installation of the Universal License

Before proceeding, verify that your universal license is installed correctly.

To verify installation of the universal license by using the command line interface

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. Use the show license command to verify that “SSL VPN = YES” and that Maximum Users has increased from 5 to the expected number of concurrent users.

To verify installation of the universal license by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://192.168.100.1`.
2. In User Name and Password, type the administrator credentials.
3. In the navigation pane, expand System, and then click Licenses.
4. In the Licenses pane, you will see a green check mark next to Access Gateway. The field Maximum Access Gateway Users Allowed displays the number of concurrent user sessions licensed on the NetScaler.

Upgrading to Release 10

You can upgrade to release 10 on a standalone NetScaler or a high availability (HA) pair by using the configuration utility or the command line interface.

Important:

If an IPv6 address is configured as the NetScaler IP (NSIP) address, upgrading from release 8.1 to release 10 changes the NSIP address to the subnet IP (SNIP) address. To add the NSIP address after the upgrade, at the command line interface, type:

```
rm ns ip6
```

```
add ns ip6 <ipv6 address> -type NSIP.
```

There is no change if the NSIP address is an IPv4 address.

Upgrading a Standalone NetScaler

Before upgrading the system software, make sure that you have the required licenses. For more information, see "NetScaler Licenses". Software upgrades from 8.x to 9.x, 8.x and 9.x to 10, and 8.x, 9.x, and 10.x to 10.1 do not require a new license.

Note: When upgrading from release 8.0, 8.1, 9.0, 9.1, 9.2, or 9.3 you have the option to use the configuration utility. All upgrades can be performed by using the command line interface, which is the recommended option. When using the upgrade wizard in the configuration utility to upgrade from release 8.0, do not use the Device option to upload your software.

To upgrade a standalone NetScaler running release 8.1, 9.0, 9.1, 9.2, 9.3 by using the command line interface

In the following procedure, <release> and <releasenumber> represent the release version you are upgrading to, and <targetbuildnumber> represents the build number that you are upgrading to. Refer to the table below for specific values.

Table 1. Release Version Values

Release Version	<release>	<releasenumber>
9.3	9.3	9.3
9.2	9.2	9.2
9.1	9.1	9.1
9.0	9.0	9.0
8.1	rhodes	8.1
8.0	andes	8.0

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.

2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:`save config`

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd /nsconfig

   b. cp ns.conf ns.conf.NS<releasenumber><currentbuildnumber>
   You should backup a copy of the configuration file on another computer.

4. Create a <releasenumber>nsinstall subdirectory in the /var/nsinstall directory.

5. Change directory to /var/nsinstall/<releasenumber>nsinstall, create a directory named build_<targetbuildnumber>, and change to this directory.

6. Download or copy the installation package (build-<release>-<build number>_nc.tgz) and the documentation bundle (ns-<releasenumber>-<build number>-doc.tgz) to this directory and extract the contents of the installation package. To download the installation package from the Citrix Web site, follow the steps below:

   a. Go to MyCitrix.com, log on using your credentials, and click Downloads.

   b. In the Select a Product, select NetScaler ADC.

   c. Under Firmware, click the release and build number to download.

   d. Click Get Firmware.

   e. Click Show Documentation and then click Get Documentation.
7. Run the installns script to install the new version of the system software.

   Note:

   To install a FIPS appliance, run the installns script with the -F option. To automatically clean up the flash, run the installns script with the -c option.

   If the configuration file for the build that you are upgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

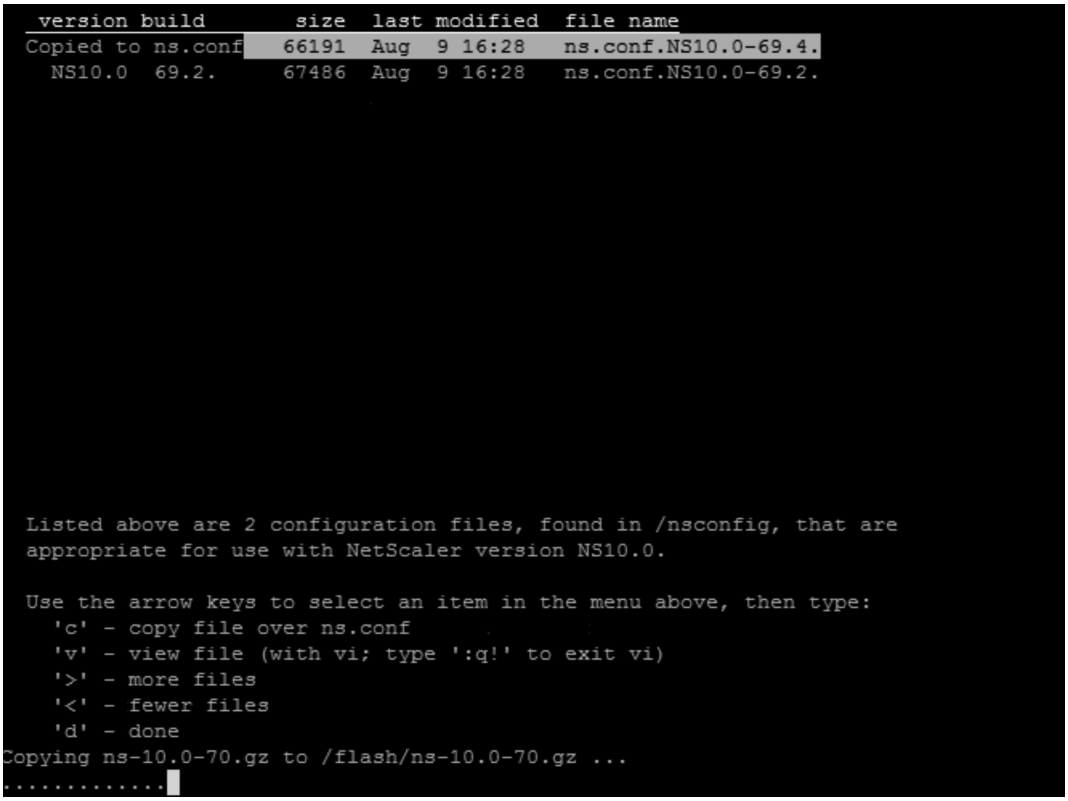

Figure 1. Upgrade menu if configuration file exists

Warning: When upgrading to the NetScaler 10 nCore build, the installation script prompts you to delete the /var directory if the swap partition is smaller than 32 gigabytes (GB). If you receive this prompt, type N, save any important files located in /var to a backup location, and then re-run the installation script.

If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see "Auto Cleanup".

8. When prompted, restart the NetScaler.

Example

```
login: nsroot
Password: nsroot
Last login: Mon Mar  26 03:37:27 2008 from 10.102.29.9
Done
> save config
> shell
Last login: Mon Mar  26 03:51:42 from 10.103.25.64
root@NSnnn# cd /var/nsinstall
root@NSnnn# cd 10nsinstall
root@NSnnn# mkdir build_53
root@NSnnn# cd build_53
root@NSnnn# ftp ... get build-10.0-53.5_nc.tgz
root@NSnnn# get ns-10.0-53.5-doc.tgz
root@NSnnn# tar xzvf build-10.0-53.5_nc.tgz
root@NSnnn# ./installns
installns version (10.0-53.5) kernel (ns-10.0-53.5_nc.gz)
...
...
...
Copying ns-10.0-53.5_nc.gz to /flash/ns-10.0-53.5_nc.gz ...

Installing documentation...
...
...
...
Installation has completed.

Reboot NOW? [Y/N] Y
```

To upgrade a standalone NetScaler running release 8.1, 9.0, 9.1, 9.2, 9.3 by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://10.102.29.50`.
2. In User Name and Password, type the administrator credentials.
3. 
   In Start in, select Configuration, and then click Login, as shown in the following figure.
4. In the configuration utility, in the navigation pane, click System.
5. In the System Overview page, click Upgrade Wizard.
6. Follow the instructions to upgrade the software.
7. When prompted, select Reboot.

   Note: After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Upgrading a High Availability Pair

To upgrade the system software on NetScaler units in a high availability pair, you need to upgrade the software first on the secondary node and then on the primary node.

To upgrade NetScaler units in a high availability pair running release 8.1, 9.0, 9.1, 9.2, 9.3 by using the command line interface

Machine A is the primary node and machine B is the secondary node before the upgrade.

On machine B (original secondary node)

1. Follow the procedure for upgrading a standalone node as described in "Upgrading a Standalone NetScaler".

2. After the NetScaler restarts, log on using the administrator credentials and enter the show ha node command to verify that the NetScaler is a secondary node and synchronization and propagation are disabled.

   Example

```
login: nsroot
Password: nsroot
Last login: Mon Mar  26 08:37:26 2008 from 10.102.29.9
Done
show ha node
      2 nodes:
1)     Node ID:      0
      IP:       10.0.4.2
      Node State: UP
      Master State: Secondary
      ...
      Sync State: AUTO DISABLED
      Propagation: AUTO DISABLED
      ...
Done
```

   Note: Before upgrading the primary node (machine A), you have the option to test the new release by entering the force failover command on the secondary node (machine B). When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. If machine B properly assumes the role of primary node, proceed with upgrading the former primary node (machine A).

On machine A (original primary node)

3. Follow the procedure for upgrading a standalone node as described in "Upgrading a Standalone NetScaler".

4. After the NetScaler restarts, log on using the administrator credentials and enter the show ha node command to verify that the NetScaler is a secondary node and synchronization is disabled.

On machine B (new primary node)

5. Enter the show ha node command to verify whether machine B is the primary node.

On machine A (new secondary node)

6. Enter the show ns runningconfig command to verify whether the configuration of machine A has been synchronized with that of machine B

On machine B (new primary node)

7. Enter the save ns config command to save the configuration.

Machine B (original secondary node) is now the primary node and machine A (original primary node) is now the secondary node.

To upgrade NetScaler units in a high availability pair running release 8.1, 9.0, 9.1, 9.2, 9.3 by using the configuration utility

1. Log on to the secondary node and perform the upgrade as described in "To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, 9.2, or 9.3 by using the configuration utility:.

   Note: Before upgrading the primary node (machine A), you have the option to test the new release by entering the force failover command at the command line interface on the secondary node (machine B). When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command at the command line interface on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. If machine B properly assumes the role of primary node, proceed with upgrading the former primary node (machine A).

2. Log on to the primary node and perform the upgrade as described in "To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, 9.2, or 9.3 by using the configuration utility".

Upgrading to a Later Build within Release 10

You can upgrade from an earlier 10 build to a later 10 build on a standalone NetScaler or a high availability pair. This procedure can be performed by using the configuration utility or the command line interface.

Upgrading a Standalone NetScaler to a Later Build

In the following procedure, <targetbuildnumber> is the build number that you are upgrading to within the 10 release.

To upgrade a standalone NetScaler running release 10 to a later build by using the command line interface

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.

2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save ns config

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd /nsconfig

   b. cp ns.conf ns.conf.NS<releasenumber><currentbuildnumber>

   You should backup a copy of the configuration file on another computer.

4. Download or copy the installation package (build-10-<targetbuildnumber>_nc.tgz) and the documentation bundle (ns-10-<targetbuildnumber>-doc.tgz) to this directory and extract the contents of the installation package.

5. Run the installns script to install the new version of the system software.

   Note:

   To install a FIPS appliance, run the installns script with the -F option. To automatically clean up the flash, run the installns script with the -c option.

   If the configuration file for the build that you are upgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

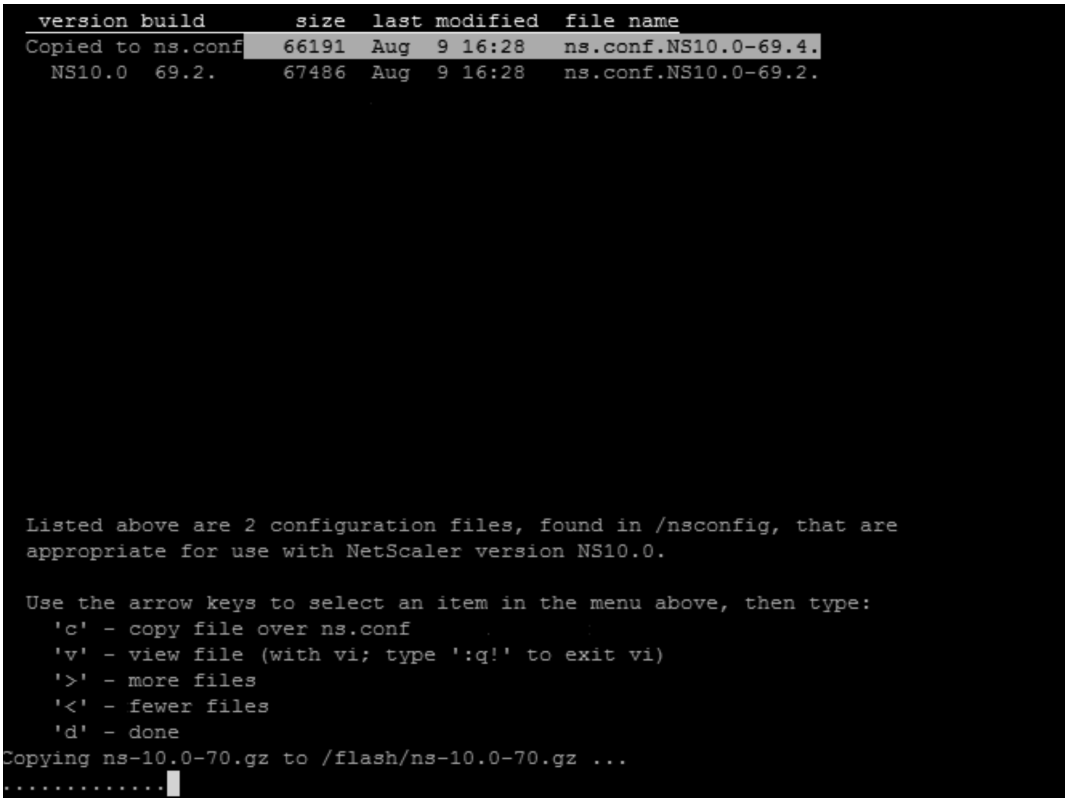

Figure 1. Upgrade menu if configuration file exists

If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see "Auto Cleanup".

6. When prompted, restart the NetScaler.

Example

```
login: nsroot
Password:
Last login: Thu Aug  9 12:12:54 2012 from 10.144.7.22
Done
> save config
> shell
Last login: Mon Aug  9 03:51:42 from 10.103.25.64
root@NSnnn# cd /var/nsinstall
root@NSnnn# cd 10.0nsinstall
root@NSnnn# mkdir build_70
root@NSnnn# cd build_70
root@NSnnn# ftp ... get build-10.0-70_nc.tgz
root@NSnnn# get ns-10.0-70-doc.tgz
root@NSnnn# tar  build-10.0-70_nc.tgz
root@NSnnn# ./installns
installns version (10.0-70) kernel (ns-10.0-70_nc.gz)
The Netscaler version 10.0-70 checksum file is located on
http://www.mycitrix.com under Support > Downloads > Citrix NetScaler.
Select the Release 10.0-70 link and expand the "Show Documentation" link
to view the MD5 checksum file for build 10.0-70.
```

```
There may be a pause of up to 3 minutes while data is written to the flash.
Do not interrupt the installation process once it has begun....
...
...
Copying ns-10.0-70_nc.gz to /flash/ns-10.0-70_nc.gz ...
...
Installing documentation...
...
Installation has completed.

Reboot NOW? [Y/N] Y
```

To upgrade a standalone NetScaler running release 10 to a later build by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://10.102.29.50`.
2. In User Name and Password, type the administrator credentials.
3. 
   In Start in, select Configuration, and then click Login, as shown in the following figure.
4. In the configuration utility, in the navigation pane, click System.
5. In the System Overview page, click Upgrade Wizard.
6. Follow the instructions to upgrade the software.
7. When prompted, select Reboot.

   Note: After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Upgrading a NetScaler High Availability Pair to a Later Build

To upgrade the system software on NetScaler units in a high availability pair, you need to upgrade the software first on the secondary node and then on the primary node.

Warning: In certain rare cases, synchronization and propagation are disabled if you upgrade only one of the nodes in an HA pair to a later build.

To determine whether synchronization and propagation are disabled, at the command line interface, type:

show ha node

Note: In an HA setup, both nodes must run NetScaler nCore or NetScaler classic. If the nodes are running NetScaler classic and you want to migrate to NetScaler nCore of the same NetScaler release, propagation and synchronization are not supported during the migration process. Once migration is complete, you have to manually enable propagation and synchronization. The same applies if you migrate from NetScaler nCore to NetScaler classic.

If synchronization and propagation are disabled, a new command added on the new primary node will not be propagated to the new secondary node. Also, if you restart the new secondary node, it will not synchronize and fetch the running configuration from the new primary node, but it will use the configuration that was last saved before the node was restarted.

To resolve this situation, upgrade both of the nodes to the same build as soon as possible and make sure that no new command is added on the new primary node when a different build is running on the new secondary node.

In the following procedure, machine A is the original primary and machine B is the original secondary node, and <targetbuildnumber> is the build number that you are upgrading to within the 10 release.

To upgrade a NetScaler high availability pair to a later build by using the command line interface

On machine B (original secondary node)

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save config

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd **/nsconfig**

   b. cp **ns.conf ns.conf.NS10.0-**<currentbuildnumber>
4. Disable synchronization and propagation manually by entering the following commands in the order shown at the command line interface:

   a. set HA node -haSync DISABLED

   b. set HA node -haProp DISABLED

   c. save config

   On machine A (original primary node)

5. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.

6. Log on to the NetScaler by using the administrator credentials.

7. Disable synchronization and propagation manually by entering the following commands in the order shown at the command line interafce:

   a. set HA node -haSync DISABLED

   b. set HA node -haProp DISABLED

   c. save config

   On machine B (original secondary node)

8. Change directory to /var/nsinstall/10nsinstall, create a directory named build_<targetbuildnumber>, and change to this directory.

9. Download or copy the installation package (build-10-<targetbuildnumber>_nc.tgz) and the documentation bundle (ns-10-<targetbuildnumber>_nc.tgz) to this directory, by using a Secure File Transfer Protocol (SFTP), and extract the contents of the installation package.

10. Run the `installns` script to install the new version of the system software.

    Note: To install a FIPS appliance, run the installns script with the -F option. To automatically clean up the flash, run the installns script with the -c option.

    If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see Auto Cleanup.

11. When prompted, restart the NetScaler.

12. After the NetScaler restarts, log on using the administrator credentials and enter the show ha node command to verify that the NetScaler is a secondary node.

Note: Before upgrading the primary node (machine A), you have the option to test the new build by entering the force failover command on the secondary node (machine B). When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. If machine B properly assumes the role of primary node, proceed with upgrading the former primary node (machine A) by following steps 13 through 19.

On machine A (original primary node)

13. Follow the procedure for upgrading a standalone node.
14. After the NetScaler restarts, log on using the administrator credentials and enter the show ha node command to verify that the NetScaler is a secondary node.
15. Enable synchronization and propagation manually by entering the following commands in the order shown at the command line interface:
    a. set HA node -haSync ENABLED
    b. set HA node -haProp ENABLED
    c. save config

On machine B (new primary node)

16. Enter the show ha node command to verify that machine B is the primary node.
17. Enable synchronization and propagation by entering the following command in the order shown at the command line interface:
    a. set HA node -haSync ENABLED
    b. set HA node -haProp ENABLED
    c. save config

On machine A (new secondary node)

18. Enter the show ns runningconfig command to verify that the configuration of machine A has been synchronized with that of machine B.

On machine B (new primary node)

19. Enter the save ns config command to save the current configuration.

Machine B (original secondary node) is now the primary node and machine A (original primary node) is now the secondary node.

Downgrading from Release 10

You can downgrade to any release on a standalone NetScaler or a high availability pair by using the command line interface.

Caution: Loss in configuration may occur when downgrading. You should compare the configurations before and after the downgrade, and then manually read any missing entries.

This procedure provides steps to downgrade from release 10 to an earlier release. For downgrading to an earlier build within release 10, see "Downgrading to an Earlier Build within Release 10".

Note: Downgrading using the configuration utility is not supported.

Downgrading a Standalone NetScaler

In the following procedure, <release> and <releasenumber> represent the release version you are downgrading to, and <targetbuildnumber> represents the build number that you are downgrading to. Refer to the table below for specific values.

Table 1. Release Version Values

Release Version	<release>	<releasenumber>
9.3	9.3	9.3
9.2	9.2	9.2
9.1	9.1	9.1
8.1	rhodes	8.1
8.0	andes	8.0
7.0	sierra	7.0

To downgrade a standalone NetScaler

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.

2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save config

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd /nsconfig

   b. cp ns.conf ns.conf.NS10<currentbuildnumber>

   You should backup a copy of the configuration file on another computer.

4. Copy the <releasenumber> configuration file (ns.conf.NS<releasenumber>) to ns.conf. At the shell prompt, type:

   cp **ns.conf.NS**<releasenumber> **ns.conf**

   Note: ns.conf.NS<releasenumber> is the backup configuration file that is automatically created when the system software is upgraded from release version <releasenumber> to the current release version. There may be some loss in configuration when downgrading. After the appliance restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.

   Important: If routing is enabled, perform step 5. Otherwise, skip to step 6.

5. If routing is enabled, the ZebOS.conf file will contain the configuration. At the shell prompt, type:

   a. cd **/nsconfig**

   b. cp **ZebOS.conf ZebOS.conf.NS**10

   c. cp ZebOS.conf.NS<targetreleasenumber> ZebOS.conf

6. Change directory to /var/nsinstall/<releasenumber>nsinstall, or create one if it does not exist.

7. Change directory to build_<targetbuildnumber>, or create one if it does not exist.

8. Download or copy the installation package (build-<release>-<targetbuildnumber>.tgz) and the documentation bundle (ns-<releasenumber>-<targetbuildnumber>-doc.tgz) to this directory and extract the contents of the installation package.

9. Run the `installns` script to install the new version of the system software.

   If the configuration file for the build that you are downgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

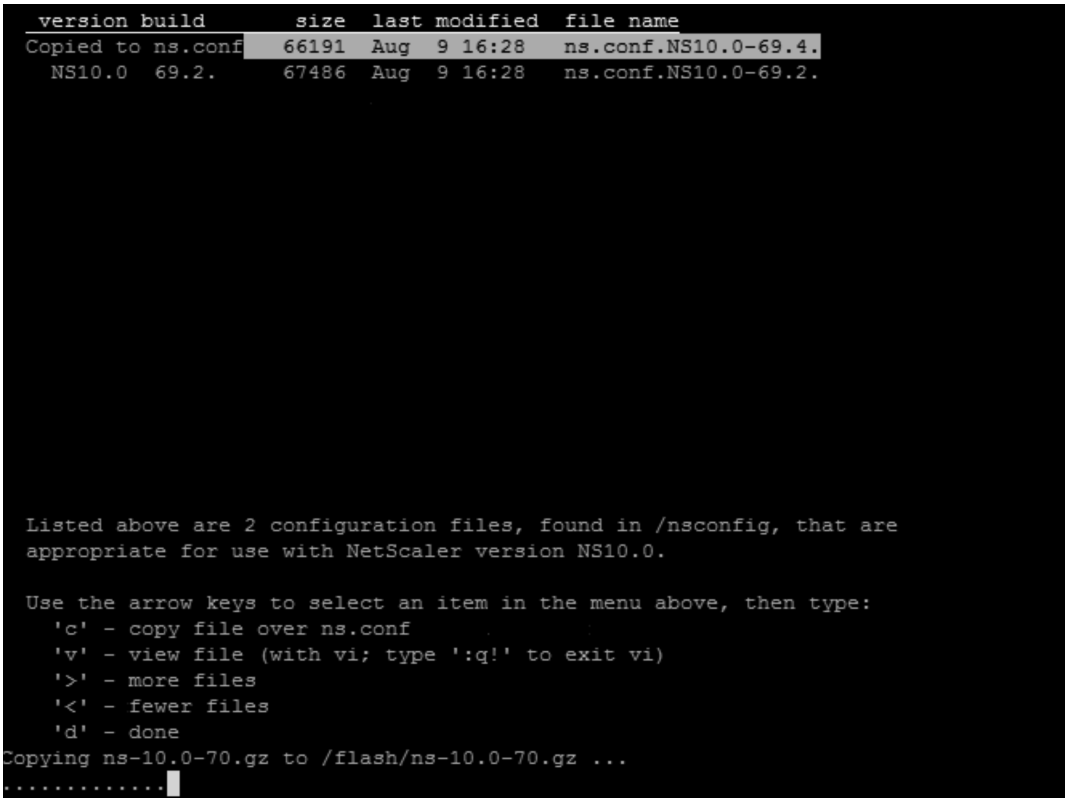

Figure 1. Downgrade menu if configuration file exists

If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see "Auto Cleanup".

10. When prompted, restart the NetScaler.

Example

login: nsroot
Password: nsroot
Last login: Tue Mar 27 01:38:25 2008 from 10.102.29.9
Done
> save config
> shell
Last login: Tue Mar 27 02:07:06 from 10.103.25.64
root@NSnnn# cp ns.conf.NS9.3 ns.conf
root@NSnnn# cd /var/nsinstall
root@NSnnn# mkdir 9.3nsinstall
root@NSnnn# cd 9.3nsinstall
root@NSnnn# mkdir build_55
root@NSnnn# cd build_55
root@NSnnn# ftp ... get build_93_55_nc.tgz
root@NSnnn# get ns-9.3-55-doc.tgz
root@NSnnn# tar xzvf build_93_55_nc.tgz
root@NSnnn# ./installns
installns version (9.3-55) kernel (ns-9.3-55.gz)
...
...

Installation has completed.

Reboot NOW? [Y/N] Y
```

Downgrading a High Availability Pair

To downgrade the system software on NetScaler units in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see "Downgrading a Standalone NetScaler".

Downgrading to an Earlier Build within Release 10

You can downgrade from a later 10 build to an earlier 10 build on a standalone NetScaler or a high availability pair. This procedure must be performed by using the command line interface.

Note: Loss in configuration may occur when downgrading. You should compare the configurations before and after the downgrade, and then manually read any missing entries.

Downgrading a Standalone NetScaler to an Earlier Build

In the procedure below, <targetbuildnumber> is the build number that you are downgrading to within the same release.

To downgrade a standalone NetScaler to an earlier build

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save ns config

   Caution: If ns.conf.NS10-<targetbuildnumber> does not exist, loss in configuration may occur when downgrading to an earlier build. The errors and warnings appear only on the console. Please watch the console closely for these errors and warnings. After the appliance restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.
3. Change directory to /var/nsinstall/10nsinstall.
4. Change directory to build_<targetbuildnumber>, or create one if it does not exist.
5. Run the installns script to install the old version of the system software.

   If the configuration file for the build that you are downgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

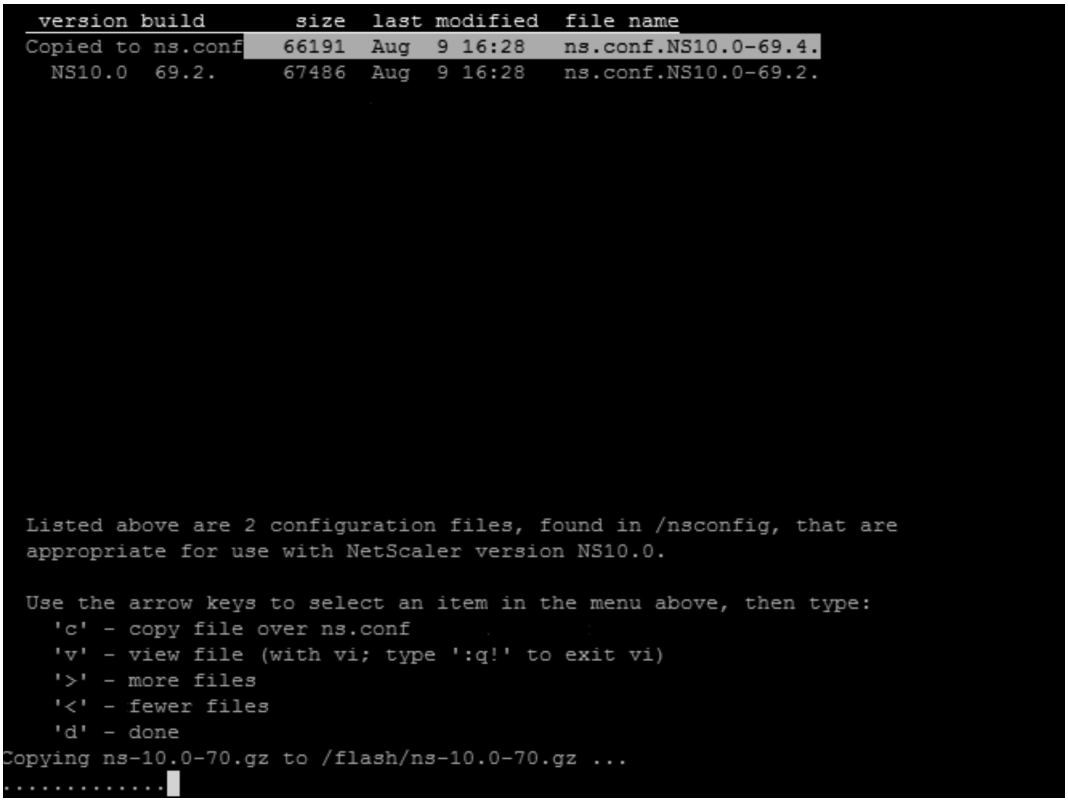

Figure 1. Downgrade menu if configuration file exists

If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see "Auto Cleanup".

6. When prompted, restart the NetScaler.

Example

```
login: nsroot
Password: nsroot
Last login: Sun Aug  5 08:38:25 2008 from 10.102.29.4
Done
> save ns config
> shell
Last login: Sun Aug  5 09:07:06 from 10.103.25.64
root@NSnnn# cp ns.conf.NS10.0-69.4 ns.conf
root@NSnnn# cd /var/nsinstall
root@NSnnn# cd 10nsinstall
root@NSnnn# cd build_69_4
root@NSnnn# ftp ... get build-10-69.4_nc.tgz
root@NSnnn# get ns-10.0-69.4-doc.tgz
root@NSnnn# tar xzvf build-10.0-69.4_nc.tgz
root@NSnnn# ./installns
installns version (10.0-69.4) kernel (ns-10.0-69.4.gz)
...
...
...
Copying ns-10.0-69.4_nc.gz to /flash/ns-10.0-69.4_nc.gz ...
Changing /flash/boot/loader.conf for ns-10.0-69.4 ...
Installing documentation...

Installation has completed.

Reboot NOW? [Y/N] Y
```

Downgrading a NetScaler High Availability Pair to an Earlier Build

To downgrade the system software on NetScaler units in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see "Downgrading a Standalone NetScaler to an Earlier Build".

Note: Note: In an HA setup, both nodes must run NetScaler nCore or NetScaler classic. If the nodes are running NetScaler classic and you want to migrate to NetScaler nCore of the same NetScaler release, propagation and synchronization are not supported during the migration process. Once migration is complete, you have to manually enable propagation and synchronization. The same applies if you migrate from NetScaler nCore to NetScaler classic.

Auto Cleanup

The cleanup procedure has been simplified in the later versions of release 7.0 (build 48 and later) and in releases 8.0, 8.1, 9.0, 9.1, 9.2, 9.3, and 10. You no longer have to manually delete build files from the flash drive. During the installation process, if the free space on the flash drive is found to be insufficient, the NetScaler prompts you to initiate the cleanup process.

Note: To automatically clean up the flash, run the installns script with the -c option.

When downgrading to release 7.0, the prompt looks like this:

```
Installation path for kernel will be /flash
Size of kernel ns-7.0-21.7.gz is 58003.323 kilobytes
Available space on /flash/ filesystem is 25075 kilobytes
Available space on /flash/ filesystem is insufficient to install ns-7.0-21.7.gz
Do you want Auto Cleanup [Y/N] ?
```

When upgrading to release 8.1, the prompt looks like this:

```
Installation path for kernel is /flash
Size of kernel ns-8.1-32.2.gz is 61062.235 kilobytes
Available space on /flash/ filesystem is 59108 kilobytes
Available space on /flash/ filesystem is insufficient to install ns-8.1-32.2.gz
Do you want installns to free space by archiving older releases? [Y/ N]
```

To initiate the cleanup process, press Y. Messages similar to the following appear:

```
Archiving older releases ...
  Creating the archive directory /var/nsbackup/ns_2007_2_16_1_6_26 ...
  Move //flash//ns-6.1-97.4.m.gz /var/nsbackup/ ns_2007_2_16_1_6_26ns-6.1-97.4.m.gz ...
  Move //flash//ns-8.1-32.2.gz /var/nsbackup/ns_2007_2_16_1_6_26ns-8.1-32.2.gz ...
Archive operation completed, free space is 156452, required space is 61062.235
```

The installation process automatically continues after successful completion of the cleanup.

API

Contents

API

The following topics provides information on the API support provided for the NetScaler appliance. Intended for application developers who want to configure and monitor a NetScaler appliance programmatically.

NITRO API	Describes the use of the NITRO APIs for the REST, Java, and .NET platforms.
XML API	Describes the properties and use of the XML API.

NITRO API

The NetScaler NITRO protocol allows you to configure and monitor the NetScaler appliance programmatically.

NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java or .NET, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs).

Note: You must have a basic understanding of the NetScaler appliance before using NITRO.

To use the NITRO protocol, the client application needs only the following:

- Access to a NetScaler appliance, version 9.2 or later.
- To use REST interfaces, you must have a system to generate HTTP or HTTPS requests (payload in JSON format) to the NetScaler appliance. You can use any programming language or tool.
- For Java clients, you must have a system where Java Development Kit (JDK) 1.5 or later is available. The JDK can be downloaded from http://www.oracle.com/technetwork/java/javase/downloads/index.html.
- For .NET clients, you must have a system with .NET framework 3.5 or later installed. The .NET framework can be downloaded from http://www.microsoft.com/downloads/en/default.aspx.

Note: You can also use XML APIs to configure the NetScaler appliance programmatically. For more information, see "XML API".

NITRO API

The NetScaler NITRO protocol allows you to configure and monitor the NetScaler appliance programmatically.

NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java or .NET, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs).

Note: You must have a basic understanding of the NetScaler appliance before using NITRO.

To use the NITRO protocol, the client application needs only the following:

- Access to a NetScaler appliance, version 9.2 or later.
- To use REST interfaces, you must have a system to generate HTTP or HTTPS requests (payload in JSON format) to the NetScaler appliance. You can use any programming language or tool.
- For Java clients, you must have a system where Java Development Kit (JDK) 1.5 or later is available. The JDK can be downloaded from http://www.oracle.com/technetwork/java/javase/downloads/index.html.
- For .NET clients, you must have a system with .NET framework 3.5 or later installed. The .NET framework can be downloaded from http://www.microsoft.com/downloads/en/default.aspx.

Note: You can also use XML APIs to configure the NetScaler appliance programmatically. For more information, see "XML API".

Obtaining the NITRO Package

The NITRO package is available as a tar file on the Downloads page of the NetScaler appliance's configuration utility. You must download and un-tar the file to a folder on your local system. This folder is referred to as <NITRO_SDK_HOME> in this documentation.

The folder contains the NITRO libraries in the lib subfolder. The libraries must be added to the client application classpath to access NITRO functionality. The <NITRO_SDK_HOME> folder also provides samples and documentation that can help you understand the NITRO SDK.

Note:

- The REST package contains only documentation for using the REST interfaces.

How NITRO Works

The NITRO infrastructure consists of a client application and the NITRO Web service running on a NetScaler appliance. The communication between the client application and the NITRO web service is based on REST architecture using HTTP or HTTPS.

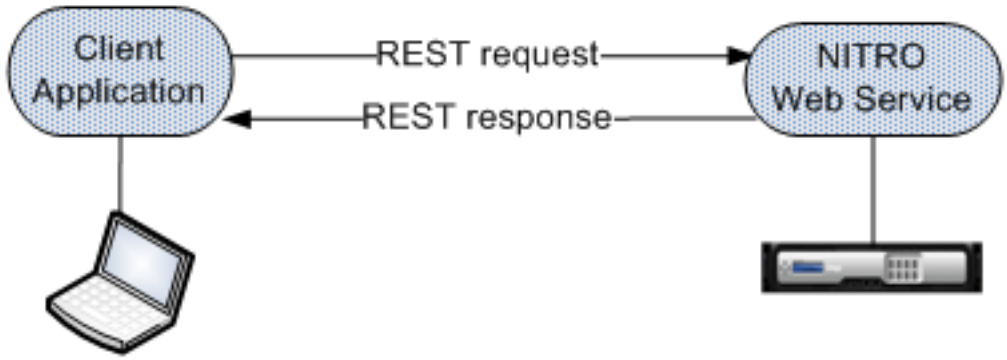

Figure 1. NITRO execution flow

As shown in the above figure, a NITRO request is executed as follows:

1. The client application sends REST request message to the NITRO web service. When using the SDKs, an API call is translated into the appropriate REST request message.

2. The web service processes the REST request message.

3. The NITRO web service returns the corresponding REST response message to the client application. When using the SDKs, the REST response message is translated into the appropriate response for the API call.

To minimize traffic on the NetScaler network, you retrieve the whole state of a resource from the server, make modifications to the state of the resource locally, and then upload it back to the server in one network transaction. For example, to update a load balancing virtual server, you must retrieve the object, update the properties, and then upload the changed object in a single transaction.

Note: Local operations on a resource (changing its properties) do not affect its state on the server until the state of the object is explicitly uploaded.

NITRO APIs are synchronous in nature. This means that the client application waits for a response from the NITRO web service before executing another NITRO API.

Java API

NetScaler NITRO APIs are categorized depending on the scope and purpose of the APIs into system APIs, feature configuration APIs, and feature statistics APIs. Additionally, you can import and export AppExpert applications. You can also troubleshoot NITRO operations.

Tutorials

These tutorials demonstrate the end-to-end usage of NITRO to achieve the following:

- Create Your First NITRO Application
- Create a NetScaler Cluster

Create Your First NITRO Application

After completing this tutorial, you will understand and be able to perform the following tasks:

- Integrate NITRO with the IDE
- Log in to the appliance
- Create a load balancing virtual server (lbvserver)
- Retrieve details of an lbvserver
- Delete an lbvserver
- Save the configurations on the appliance
- Log out of the appliance
- Debug the NITRO application

Before you begin, make sure that you have the latest NITRO SDK and that the client application satisfies the prerequisites for using the NITRO SDK.

Sample Code

For the executable code, see the <NITRO_SDK_HOME>/sample/MyFirstNitroApplication.java sample file.

To create your first NITRO application:

1. Copy the libraries from <NITRO_SDK_HOME>/lib folder to the project classpath.

2. Create a new class and name it **MyFirstNitroApplication**.

3. Create an instance of `com.citrix.netscaler.nitro.service.nitro_service` class. This instance is used to perform all operations on the appliance:

   ```
   nitro_service ns_session = new nitro_service("10.102.29.170","HTTP");
   ```

   This code establishes a connection with an appliance that has IP address 10.102.29.170 and uses the HTTP protocol. Replace 10.102.29.170 with the IP address of the NetScaler appliance that you have access to.
4. Use the `nitro_service` instance to log in to the appliance using your credentials:

   ```
   ns_session.login("admin","verysecret");
   ```

   This code logs into the appliance, with user name as `admin` and password as `verysecret`. Replace the credentials with your login credentials.
5. Enable the load balancing feature:

   ```
   String[] features_to_be_enabled = {"lb"};
   ns_session.enable_features(features_to_be_enabled);
   ```

   This code first sets the features to be enabled in an array and then enables the LB feature.
6. Create an instance of the `com.citrix.netscaler.nitro.resource.config.lb.lbvserver` class. You will use this instance to perform operations on the lbvserver.

   ```
   lbvserver new_lbvserver_obj = new lbvserver();
   ```

7. Use the `lbvserver` instance to create a new lbvserver:

   ```
   new_lbvserver_obj.set_name("MyFirstLbVServer");
   new_lbvserver_obj.set_ipv46("10.102.29.88");
   new_lbvserver_obj.set_servicetype("HTTP");
   new_lbvserver_obj.set_port(88);
   new_lbvserver_obj.set_lbmethod("ROUNDROBIN");
   lbvserver.add(ns_session,new_lbvserver_obj);
   ```

   This code first sets the attributes (name, IP address, service type, port, and load balancing method) of the lbvserver locally and then adds it to the appliance by using the corresponding `add()` method.
8. Retrieve the details of the lbvserver you have created:

   ```
   new_lbvserver_obj = lbvserver.get(ns_session,new_lbvserver_obj.get_name());
   System.out.println("Name : " +new_lbvserver_obj.get_name() +"\n" +"Protocol : " +new_lbvserver_obj.ge
   ```

   This code first retrieves the details of the lbvserver as an object from the NetScaler, extracts the required attributes (name and service type) from the object, and displays the results.
9. Delete the lbvserver you created in the above steps:

```
lbvserver.delete(ns_session, new_lbvserver_obj.get_name());
```

10. Save the configurations:

```
ns_session.save_config();
```

11. Log out of the appliance:

```
ns_session.logout();
```

Debug the NITRO application

All NITRO exceptions are captured by the `com.citrix.netscaler.nitro.exception.nitro_exception` class. For a more detailed description, see Exception Handling.

Create a NetScaler Cluster

After completing this tutorial you will be able to create a two-node NetScaler cluster. To add more appliances to the cluster you must repeat the procedure that adds and joins the node to the cluster.

Sample Code

For the executable code, see the <NITRO_SDK_HOME>/sample/CreateCluster.java sample file.

To create a cluster

1. Copy the libraries from <NITRO_SDK_HOME>/lib folder to the project classpath.

2. Create a new class and name it CreateCluster.

3. Log on to one of the appliances that you want to add to the cluster and create a cluster:

   ```
   //Connect to the first appliance that you want to add to the cluster
   nitro_service nonClipSession0 = new nitro_service(nsipAddress0,protocol);
   nonClipSession0.login(uName,password);

   //Create a cluster instance
   clusterinstance newClusterInstance = new clusterinstance();
   newClusterInstance.set_clid(1);
   clusterinstance.add(nonClipSession0,newClusterInstance);

   //Add the appliance to the cluster
   clusternode ClusterNode0 = new clusternode();
   ClusterNode0.set_nodeid(0);
   ClusterNode0.set_ipaddress(nsipAddress0);
   ClusterNode0.set_state("ACTIVE");
   ClusterNode0.set_backplane("0/1/1");
   clusternode.add(nonClipSession0,ClusterNode0);

   //Add the cluster IP address
   nsip newNSIPAddress = new nsip();
   newNSIPAddress.set_ipaddress(clipAddress);
   newNSIPAddress.set_netmask("255.255.255.255");
   newNSIPAddress.set_type("CLIP");
   nsip.add(nonClipSession0,newNSIPAddress);

   //Enable the cluster instance
   clusterinstance.enable(nonClipSession0, newClusterInstance);

   //Save the configurations
   nonClipSession0.save_config();

   //Warm reboot the appliance
   nonClipSession0.reboot(true);
   ```

   The cluster is created and the first node is added to the cluster. This node becomes the initial configuration coordinator of the cluster.

4. Log on to the cluster IP address to add other appliances to the cluster:

   ```
   //Connect to the cluster IP address
   nitro_service clipSession = new nitro_service(clipAddress,protocol);
   clipSession.login(uName,password);

   //Add the node to the cluster
   clusternode ClusterNode1 = new clusternode();
   ClusterNode1.set_nodeid(1);
   ClusterNode1.set_ipaddress(nsipAddress1);
   ```

```
ClusterNode1.set_state("ACTIVE");
ClusterNode1.set_backplane("1/1/1");
clusternode.add(clipSession,ClusterNode1);

//Save the configurations
clipSession.save_config();
```

5. Log on to the appliance that you added in the previous step and join it to the cluster:

```
//Connect to the node that you have just added to the cluster
nitro_service nonClipSession1 = new nitro_service(nsipAddress1,protocol);
nonClipSession1.login(uName,password);

//Join the node to the cluster
cluster newCluster = new cluster();
newCluster.set_clip(clipAddress);
newCluster.set_password(password);
cluster.join(nonClipSession1,newCluster);

//Save the configurations
nonClipSession1.save_config();

//Warm reboot the appliance
nonClipSession1.reboot(true);
```

   The second node is now a part of the cluster.

6. Verify the details of the cluster by logging on to the cluster IP address

```
//Retrieving the cluster node details
Long id = new Long(1);
clusternode node= clusternode.get(clipSession, id);
System.out.println("Node ID: "+ node.get_nodeid() + " | Admin state: " + node.get_state() + " | Backplane

//Retrieving the cluster instance details
Long id1 = new Long(1);
clusterinstance instance= clusterinstance.get(clipSession, id1);
System.out.println("Cluster instance ID: "+ instance.get_clid() + " | Operational state: " +instance.get_op
```

System APIs

The first step towards using NITRO is to establish a session with the NetScaler appliance and then authenticate the session by using the NetScaler administrator's credentials.

You must create an object of the `com.citrix.netscaler.nitro.service.nitro_service` class by specifying the NetScaler IP (NSIP) address and the protocol to connect to the appliance (HTTP or HTTPS). You then use this object and log on to the appliance by specifying the user name and the password of the NetScaler administrator.

Note: You must have a user account on that appliance. The configuration operations that you perform are limited by the administrative roles assigned to your account.

The following sample code establishes a session with a NetScaler appliance with IP address 10.102.29.60 by using the HTTPS protocol:

```
//Specify the NetScaler appliance IP address and protocol
nitro_service ns_session = new nitro_service("10.102.29.60","https");

//Specify the login credentials
ns_session.login("admin","verysecret");
```

Note: When using HTTPS, you must make sure that the root CA is added to the truststore. By default, NITRO validates the SSL certificate and verifies the hostname. To disable this validation, use the following:

```
ns_session.set_certvalidation(false);
ns_session.set_hostnameverification(false);
```

Note: By default, the connection to the appliance expires after 30 minutes of inactivity. You can modify the timeout period by specifying a new timeout period (in seconds) in the `login` method. For example, to modify the timeout period to 60 minutes:

```
ns_session.login("admin","verysecret",3600);
```

You must use the `nitro_service` object in all further NITRO operations on the appliance. For example to save the configurations on the appliance, you must use the `nitro_service` object as follows:

```
ns_session.save_config();
```

The `nitro_service` class also provides APIs to perform other system-level operations such as enabling and disabling NetScaler features and modes, saving and clearing NetScaler configurations, setting the session timeout, setting the severity of the exceptions to be handled, setting the behavior of bulk operations, and disconnecting from the appliance.

Feature Configuration APIs

NetScaler resources are organized into a set of packages or namespaces. Each package or namespace corresponds to a NetScaler feature. For example, all load-balancing related resources, such as load balancing virtual server, load balancing group, and load balancing monitor are available in `com.citrix.netscaler.nitro.resource.config.lb`.

Similarly, all application firewall related resources, such as application firewall policy and application firewall archive are available in `com.citrix.netscaler.nitro.resource.config.appfw`.

Each NetScaler resource is represented by a class. For example, the class that represents a load balancing virtual server is called `lbvserver` (in `com.citrix.netscaler.nitro.resource.config.lb`). The state of a resource is represented by properties of a class. You can set the value for these properties by using the `set_<propertyname>()` methods provided by the resource class. For example to set the IP address of a load balancing virtual server, the lbvserver class provides the `set_ipv46()` method. Similarly, you can get the value of these properties by using the `get_<propertyname>()` methods of the resource class.

Note: The setter and getter properties are always executed locally on the client. They do not involve any network interaction with the NITRO web service. All properties have basic simple types: integer, long, boolean, and string.

A resource class provides APIs to perform the following operations:

Create | Retrieve | Update | Delete | Enable/Disable | Unset | Bind/Unbind | Global bind | Bulk operations

Create

To create a new resource, instantiate the resource class, configure the resource by setting its properties locally, and then upload the new resource instance to the NetScaler appliance.

The following sample code creates a load balancing virtual server:

```
//Create an instance of the lbvserver class
lbvserver new_lbvserver_obj = new lbvserver();

//Set the properties of the resource locally
new_lbvserver_obj.set_name("MyFirstLbVServer");
new_lbvserver_obj.set_ipv46("10.102.29.88");
new_lbvserver_obj.set_port(88);
new_lbvserver_obj.set_servicetype("HTTP");
new_lbvserver_obj.set_lbmethod("ROUNDROBIN");

//Upload the resource to NetScaler
lbvserver.add(ns_session,new_lbvserver_obj);
```

Retrieve

To retrieve the properties of a resource, you retrieve the resource object from the NetScaler appliance. Once the object is retrieved, you can extract the required properties of the resource locally, without further network traffic.

The following sample code retrieves the details of a load balancing virtual server:

```
//Retrieve the resource object from the NetScaler
new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer");

//Extract the properties of the resource from the object locally
System.out.println(new_lbvserver_obj.get_name());
System.out.println(new_lbvserver_obj.get_servicetype());
```

You can also retrieve resources by specifying a filter on the value of their properties by using the `com.citrix.netscaler.nitro.util.filtervalue` class.

For example, you can retrieve all the load balancing virtual servers that have their port set to 80 and servicetype to HTTP:

```
filtervalue[] filter = new filtervalue[2];
filter[0] = new filtervalue("port","80");
filter[1] = new filtervalue("servicetype","HTTP");
lbvserver[] result = lbvserver.get_filtered(ns_session,filter);
```

You can also retrieve all NetScaler resources of a certain type, such as all services in the NetScaler appliance, by calling the static `get()` method on the service class, without providing a second parameter, as follows:

```
service[] resources = service.get(ns_session);
```

Update

To update the properties of a resource, instantiate the resource class, specify the name of the resource to be updated, configure the resource by updating its properties locally, and then upload the updated resource instance to the NetScaler appliance.

The following sample code updates the service type and load balancing method of a load balancing virtual server:

```
//Create an instance of the lbvserver class
lbvserver update_lb = new lbvserver();

//Specify the name of the lbvserver to be updated
update_lb.set_name("MyFirstLbVServer");

//Specify the updated service type and lb method
update_lb.set_servicetype("https");
update_lb.set_lbmethod("LEASTRESPONSETIME");

//Upload the resource to NetScaler
lbvserver.update(ns_session,update_lb);
```

Note: Some properties in some NetScaler resources are not allowed to be modified after creation. The port number or the service type (protocol) of a load balancing virtual server or a service, are examples of such properties. Even though the update method appears to succeed, these properties retain their original values on the appliance.

Delete

To delete an existing resource, invoke the `delete()` method on the resource class, by passing the name of the resource.

The following sample code deletes a load balancing virtual server with name "MyFirstLbVServer":

```
lbvserver remove_lb = new lbvserver();
remove_lb.set_name("MyFirstLbVServer");
lbvserver.delete(ns_session, remove_lb);
```

Enable/Disable

To enable a resource, invoke the `enable()` method.

The following sample code enables a load balancing virtual server named "lb_vip":

```
lbvserver obj = new lbvserver();
obj.set_name = "lb_vip";
lbvserver.enable(ns_session, obj);
```

Note: To disable a resource, invoke the `disable()` method.

```
lbvserver.disable(ns_session,obj);
```

Unset

To unset the value that is set to a parameter, invoke the `unset()` method on the resource class, by passing the name of the resource and the parameters to be unset. If the parameter has a default value, the value is reset to that value.

The following sample code unsets the load balancing method and the comments of a load balancing virtual server named "lb_123":

```
lbvserver lb1 = new lbvserver();
lb1.set_name("lb_123");
String args[] = {"comment", "lbmethod"};
lbvserver.unset(ns_session, lb1, args);
```

Bind/Unbind

NetScaler resources form relationships with each other through the process of binding. This is how services are associated with a load balancing virtual server (by binding them to it), or how various policies are bound to a load balancing virtual server. Each binding relationship is represented in NITRO by its own class.

To bind one NetScaler resource to another, you must instantiate the appropriate binding class (for example, to bind a service to a load balancing virtual server, you must instantiate the `lbvserver_service_binding` class) and add it to the NetScaler configuration (by using the static `add()` method on this class).

Binding classes have a property representing the name of each resource in the binding relationship. They can also have other properties related to that relationship (for example, the weight of the binding between a load balancing virtual server and a service).

The following sample code binds a service to a load balancing virtual server, by specifying a certain weight for the binding:

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();
bindObj.set_name("MyFirstLbVServer");
bindObj.set_servicename("svc_prod");
bindObj.set_weight(20);
lbvserver_service_binding.add(ns_session,bindObj);
```

Note: To unbind a resource from another, invoke the `delete()` method from the resource binding class, by passing the name of the two resources.

The following code sample unbinds a service from a server:

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();
bindObj.set_name("MyFirstLbVServer");
bindObj.set_servicename("svc_prod");
lbvserver_service_binding.delete(ns_session,bindObj);
```

Global bind

Some NetScaler resources can be bound globally to affect the whole system. For example, a compression policy can be bound to an load balancing virtual server, in which case the policy affects only the traffic on that load balancing virtual server. However, if bound globally, it can affect any traffic on the appliance, regardless of which virtual servers handle the traffic.

Some NITRO classes can be used to bind resources globally. These classes have names that follow the following pattern: `<featurename>global_<resourcetype>_binding`.

For example, the class `aaaglobal_preauthenticationpolicy_binding` is used to bind preauthentication policies globally.

The following sample code creates a preauthentication action and a preauthentication policy that uses that action, and then binds the policy globally at priority 200:

```
aaapreauthenticationaction preauth_act1;
aaapreauthenticationpolicy preauth_pol1;
aaaglobal_aaapreauthenticationpolicy_binding glob_binding;
preauth_act1 = new aaapreauthenticationaction();
preauth_act1.set_name("preauth_act1");
preauth_act1.set_preauthenticationaction("ALLOW");
aaapreauthenticationaction.add(ns_session,preauth_act1);
```

```
preauth_pol1 = new aaapreauthenticationpolicy();
preauth_pol1.set_name("preauth_pol1");
preauth_pol1.set_rule("CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS");
preauth_pol1.set_reqaction("preauth_act1");
aaapreauthenticationpolicy.add(ns_session,preauth_pol1);

glob_binding = new aaaglobal_aaapreauthenticationpolicy_binding();
glob_binding.set_policy("preauth_pol1");
glob_binding.set_priority(200);
aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session,glob_binding);
```

Bulk operations

You can create, retrieve, update, and delete multiple resources simultaneously and thus minimize network traffic. For example, you can add multiple load balancing virtual servers in the same operation. To perform a bulk operation, you instantiate an array of the resource class, configure the properties of all the instances locally, and then upload all the instances to the NetScaler with one command.

To account for the failure of some operations within the bulk operation, NITRO allows you to configure one of the following behaviors:

- **Exit.** When the first error is encountered, the execution stops. The commands that were executed before the error are committed.
- **Rollback.** When the first error is encountered, the execution stops. The commands that were executed before the error are rolled back. Rollback is only supported for add and bind commands.
- **Continue.** All the commands in the list are executed even if some commands fail.

Note: You must configure the required behavior while establishing a connection with the appliance.

```
nitro_service ns_session = new nitro_service("10.102.29.60","http");
ns_session.set_onerror(OnerrorEnum.CONTINUE);
ns_session.login("admin","verysecret");
```

The following sample code creates two load balancing virtual servers:

```
//Create an array of lbvserver instances
lbvserver[] lbs = new lbvserver[2];

//Specify properties of the first lbvserver
lbs[0] = new lbvserver();
lbs[0].set_name("lbvserv1");
lbs[0].set_servicetype("http");
lbs[0].set_ipv46("10.70.136.5");
lbs[0].set_port(80);

//Specify properties of the second lbvserver
lbs[1] = new lbvserver();
lbs[1].set_name("lbvserv2");
```

```
lbs[1].set_servicetype("https");
lbs[1].set_ipv46("10.70.136.5");
lbs[1].set_port(443);

//Upload the properties of the two lbvservers to the NetScaler
lbvserver.add(ns_session,lbs);
```

Cluster APIs

For managing clusters, you can add or remove a cluster instance or an individual node and perform a few other instance or node operations such as viewing instance or node properties. You can also configure the cluster IP address. Other cluster-management tasks include joining a NetScaler appliance to the cluster and configuring a linkset.

Cluster Instance Operations

The `com.citrix.netscaler.nitro.resource.config.cluster.clusterinstance` class provides APIs to manage a cluster instance.

The following sample code creates a cluster instance with ID 1:

```
clusterinstance new_cl_inst_obj = new clusterinstance();
//Set the properties of the cluster instance locally
new_cl_inst_obj.set_clid(1);
new_cl_inst_obj.set_preemption("ENABLED");

//Upload the cluster instance
clusterinstance.add(ns_session,new_cl_inst_obj);
```

Cluster Node Operations

The `com.citrix.netscaler.nitro.resource.config.cluster.clusternode` class provides APIs to manage cluster nodes.

The following sample code adds a cluster node with NSIP address 10.102.29.60:

```
clusternode new_cl_node_obj = new clusternode();
//Set the properties of the cluster node locally
new_cl_node_obj.set_nodeid(0);
new_cl_node_obj.set_ipaddress("10.102.29.60");
new_cl_node_obj.set_state("ACTIVE");
new_cl_node_obj.set_backplane("0/1/1");

//Upload the cluster node
clusternode.add(ns_session,new_cl_node_obj);
```

Add a Cluster IP Address

The `com.citrix.netscaler.nitro.resource.config.ns.nsip` class provides the `add()` API to configure an IP address. To configure the IP address as a cluster IP address, you must specify the type as CLIP.

The following sample code configures a cluster IP address on NetScaler appliance with IP address 10.102.29.60:

```
nsip new_nsip_obj = new nsip();
//Set the properties locally
new_nsip_obj.set_ipaddress("10.102.29.61");
new_nsip_obj.set_netmask("255.255.255.255");
new_nsip_obj.set_type("CLIP");

//Upload the cluster node
nsip.add(ns_session,new_nsip_obj);
```

Add a Spotted IP Address

The `com.citrix.netscaler.nitro.resource.config.ns.nsip` class provides the `add()` API to configure an IP address. To configure the IP address as spotted, you must specify the ID of the node that must own the IP address. This configuration must be done on the cluster IP address.

The following sample code configures a spotted SNIP address on a node with ID 1:

```
nsip new_nsip_obj = new nsip();
//Set the properties locally
new_nsip_obj.set_ipaddress("10.102.29.77");
new_nsip_obj.set_netmask("255.255.255.0");
new_nsip_obj.set_type("SNIP");
new_nsip_obj.set_ownernode(1);

//Upload the cluster node
nsip.add(ns_session,new_nsip_obj);
```

Join NetScaler Appliance to Cluster

The `com.citrix.netscaler.nitro.resource.config.cluster.cluster` class provides the `join()` API to join a NetScaler appliance to the cluster. You must specify the cluster IP address and the nsroot password of the configuration coordinator.

The following sample joins a NetScaler appliance to a cluster:

```
cluster new_cl_obj = new cluster();
//Set the properties of the cluster  locally
new_cl_obj.set_clip("10.102.29.61");
new_cl_obj.set_password("verysecret");

//Upload the cluster
cluster.add(ns_session,new_cl_obj);
```

Linkset Operations

The `com.citrix.netscaler.nitro.resource.config.network.linkset` class provides the APIs to manage linksets.

To configure a linkset, do the following:

1. Add a linkset by invoking the `add()` method of the `linkset` class.

2. Bind the interfaces to the linkset using the `add()` method of the `linkset_interface_binding` class.

The following sample code creates a linkset LS/1 and bind interfaces 1/1/2 and 2/1/2 to it:

```
//Create the linkset
linkset new_linkset_obj = new linkset();
new_linkset_obj.set_id("LS/1");
linkset.add(ns_session,new_linkset_obj);

//Bind the interfaces to the linkset
linkset_interface_binding new_linkif_obj = new linkset_interface_binding();
new_linkif_obj.set_id("LS/1");
new_linkif_obj.set_ifnum("1/1/2 2/1/2");
linkset_interface_binding.add(ns_session,new_linkif_obj);
```

Feature Statistics APIs

The NetScaler appliance collects statistics about the usage of its features and the corresponding resources. You can retrieve these statistics by using NITRO API. The statistics APIs are available in different packages from the configuration APIs.

The APIs to retrieve statistics of NetScaler features are available in packages that have the following pattern: `com.citrix.netscaler.nitro.resource.stat.<feature>`.

For example, APIs to retrieve statistics of the load balancing virtual server are available in the `com.citrix.netscaler.nitro.resource.stat.lb` package.

The following sample code retrieves the statistics of a load balancing virtual server and displays some of the statistics returned:

```
lbvserver_stats stats = lbvserver_stats.get(ns_session,"MyFirstLbVServer");
System.out.println(stats.get_curclntconnections());
System.out.println(stats.get_deferredreqrate());
```

Note: Not all NetScaler features and resources have statistic objects associated with them.

AppExpert Application APIs

To export an AppExpert application, you must instantiate the `com.citrix.netscaler.nitro.resource.config.app.application` class, configure the properties of the AppExpert locally, and then export the AppExpert application.

The following sample code exports an AppExpert application named "MyApp1":

```
application myapp = new application();
myapp.set_appname("MyApp1");
myapp.set_apptemplatefilename("myapp_template");
application.export(ns_session,myapp);
```

You can also import an AppExpert application. You must instantiate the `com.citrix.netscaler.nitro.resource.config.app.application` class, configure the properties of the AppExpert locally, and then import the AppExpert application.

The following sample code imports an AppExpert application named "MyApp1":

```
application myapp = new application();
myapp.set_appname("MyApp1");
myapp.set_apptemplatefilename("myapp_template");
application.Import(ns_session,myapp);
```

Exception Handling

The status of a NITRO request is captured in the `com.citrix.netscaler.nitro.exception.nitro_exception` class. This class provides the following details of the exception:

- **Session ID.** The session in which the exception occurred.
- **Severity.** The severity of the exception: error or warning. By default, only errors are captured. To capture warnings, you must set the warning flag to true, while connecting to the appliance.
- **Error code.** The status of the NITRO request. An error code of 0 indicates that the NITRO request is successful. A non-zero error code indicates an error in processing the NITRO request.
- **Error message.** Provides a brief description of the exception.

For a list of error codes, see the errorlisting.html file available in the <NITRO_SDK_HOME>/doc/api_reference folder.

.NET API

NetScaler NITRO APIs are categorized depending on the scope and purpose of the APIs into system APIs, feature configuration APIs, and feature statistics APIs. Additionally, you can import and export AppExpert applications. You can also troubleshoot NITRO operations.

Tutorials

These tutorials demonstrate the end-to-end usage of NITRO to achieve the following:

- Create Your First NITRO Application
- Create a NetScaler Cluster

Create Your First NITRO Application

After completing this tutorial, you will understand and be able to perform the following tasks:

- Integrate NITRO with the IDE
- Log in to the appliance
- Create a load balancing virtual server (lbvserver)
- Retrieve details of an lbvserver
- Delete an lbvserver
- Save the configurations on the appliance
- Log out of the appliance
- Debug the NITRO application

Before you begin, make sure that you have the latest NITRO SDK and that the client application satisfies the prerequisites for using the NITRO SDK.

Sample Code

For the executable code, see the <NITRO_SDK_HOME>/sample/MyFirstNitroApplication.cs sample file.

To create your first NITRO application:

1. Copy the libraries from <NITRO_SDK_HOME>/lib folder to the project classpath.

2. Create a new class and name it **MyFirstNitroApplication**.

3. Create an instance of `com.citrix.netscaler.nitro.service.nitro_service` class. This instance is used to perform all operations on the appliance:

   ```
   nitro_service ns_session = new nitro_service("10.102.29.170", "http");
   ```

   This code establishes a connection with an appliance that has IP address 10.102.29.170 and uses the HTTP protocol. Replace 10.102.29.170 with the IP address of the NetScaler appliance that you have access to.
4. Use the `nitro_service` instance to log in to the appliance using your credentials:

   ```
   ns_session.login("admin","verysecret");
   ```

   This code logs into the appliance, with user name as `admin` and password as `verysecret`. Replace the credentials with your login credentials.
5. Enable the load balancing feature:

   ```
   String[] features_to_be_enabled = {"lb"};
   ns_session.enable_features(features_to_be_enabled);
   ```

   This code enables load balancing on the appliance.
6. Create an instance of the `com.citrix.netscaler.nitro.resource.config.lb.lbvserver` class. You will use this instance to perform operations on the lbvserver.

   ```
   lbvserver new_lbvserver_obj = new lbvserver();
   ```

7. Use the `lbvserver` instance to create a new lbvserver:

   ```
   new_lbvserver_obj.name = "MyFirstLbVServer";
   new_lbvserver_obj.ipv46 = "10.102.29.88";
   new_lbvserver_obj.servicetype = "HTTP";
   new_lbvserver_obj.port = 80;
   new_lbvserver_obj.lbmethod = "ROUNDROBIN";
   lbvserver.add(ns_session,new_lbvserver_obj);
   ```

   This code first sets the attributes (name, IP address, service type, port, and load balancing method) of the lbvserver locally and then adds it to the appliance by using the corresponding `add()` method.
8. Retrieve the details of the lbvserver you have created:

   ```
   lbvserver new_lbvserver_obj1 = lbvserver.get(ns_session,new_lbvserver_obj.name);
   System.Console.Out.WriteLine("Name : " +new_lbvserver_obj1.name +"\n" +"Protocol : " +new_lbvserver_
   ```

   This code first retrieves the details of the lbvserver as an object from the NetScaler, extracts the required attributes (name and service type) from the object, and displays the results.
9. Delete the lbvserver you created in the above steps:

   ```
   lbvserver.delete(ns_session, new_lbvserver_obj.name);
   ```

10. Save the configurations:

    ns_session.save_config();

11. Log out of the appliance:

    ns_session.logout();

Debug the NITRO application

All NITRO exceptions are captured by the `com.citrix.netscaler.nitro.exception.nitro_exception` class. For a more detailed description, see Exception Handling.

Create a NetScaler Cluster

After completing this tutorial you will be able to create a two-node NetScaler cluster. To add more appliances to the cluster you must repeat the procedure that adds and joins the node to the cluster.

Sample Code

For the executable code, see the <NITRO_SDK_HOME>/sample/CreateCluster.cs sample file.

To create a cluster

1. Copy the libraries from <NITRO_SDK_HOME>/lib folder to the project classpath.

2. Create a new class and name it CreateCluster.

3. Log on to one of the appliances that you want to add to the cluster and create a cluster:

   ```
   //Connect to the first appliance that you want to add to the cluster
   nitro_service nonClipSession0 = new nitro_service(nsipAddress0,protocol);
   nonClipSession0.login(uName,password);

   //Create a cluster instance
   clusterinstance newClusterInstance = new clusterinstance();
   newClusterInstance.clid = 1;
   clusterinstance.add(nonClipSession0,newClusterInstance);

   //Add the appliance to the cluster
   clusternode ClusterNode0 = new clusternode();
   ClusterNode0.nodeid = 0;
   ClusterNode0.ipaddress = nsipAddress0;
   ClusterNode0.state = "ACTIVE";
   ClusterNode0.backplane = "0/1/1";
   clusternode.add(nonClipSession0,ClusterNode0);

   //Add the cluster IP address
   nsip newNSIPAddress = new nsip();
   newNSIPAddress.ipaddress = clipAddress;
   newNSIPAddress.netmask = "255.255.255.255";
   newNSIPAddress.type = "CLIP";
   nsip.add(nonClipSession0,newNSIPAddress);

   //Enable the cluster instance
   clusterinstance.enable(nonClipSession0, newClusterInstance);

   //Save the configurations
   nonClipSession0.save_config();

   //Warm reboot the appliance
   nonClipSession0.reboot(true);
   ```

   The cluster is created and the first node is added to the cluster. This node becomes the initial configuration coordinator of the cluster.

4. Log on to the cluster IP address to add other appliances to the cluster:

   ```
   //Connect to the cluster IP address
   nitro_service clipSession = new nitro_service(clipAddress,protocol);
   clipSession.login(uName,password);

   //Add the node to the cluster
   clusternode ClusterNode1 = new clusternode();
   ClusterNode1.nodeid = 1;
   ClusterNode1.ipaddress = nsipAddress1;
   ```

```
ClusterNode1.state = "ACTIVE";
ClusterNode1.backplane = "1/1/1";
clusternode.add(clipSession,ClusterNode1);

//Save the configurations
clipSession.save_config();
```

5. Log on to the appliance that you added in the previous step and join it to the cluster:

```
//Connect to the node that you have just added to the cluster
nitro_service nonClipSession1 = new nitro_service(nsipAddress1,protocol);
nonClipSession1.login(uName,password);

//Join the node to the cluster
cluster newCluster = new cluster();
newCluster.clip = clipAddress;
newCluster.password = password;
cluster.join(nonClipSession1,newCluster);

//Save the configurations
nonClipSession1.save_config();

//Warm reboot the appliance
nonClipSession1.reboot(true);
```

   The second node is now a part of the cluster.

6. Verify the details of the cluster by logging on to the cluster IP address

```
//Retrieving the cluster node details
uint id = 1;
clusternode node= clusternode.get(clipSession, id);
System.Console.Out.WriteLine("Node ID: " + node.nodeid + " | Admin state: " + node.state + " | Backplan

//Retrieving the cluster instance details
uint id1 = 1;
clusterinstance instance= clusterinstance.get(clipSession, id1);
System.Console.Out.WriteLine("Cluster instance ID: "+ instance.clid + " | Operational state: " +instance.c
```

System APIs

The first step towards using NITRO is to establish a session with the NetScaler appliance and then authenticate the session by using the NetScaler administrator's credentials.

You must create an object of the `com.citrix.netscaler.nitro.service.nitro_service` class by specifying the NetScaler IP (NSIP) address and the protocol to connect to the appliance (HTTP or HTTPS). You then use this object and log on to the appliance by specifying the user name and the password of the NetScaler administrator.

Note: You must have a user account on that appliance. The configuration operations that you perform are limited by the administrative roles assigned to your account.

The following sample code establishes a session with a NetScaler appliance with IP address 10.102.29.60 by using the HTTPS protocol:

```
//Specify the NetScaler appliance IP address and protocol
nitro_service ns_session = new nitro_service("10.102.29.60","https");

//Specify the login credentials
ns_session.login("admin","verysecret");
```

Note: By default, the connection to the appliance expires after 30 minutes of inactivity. You can modify the timeout period by specifying a new timeout period (in seconds) in the `login` method. For example, to modify the timeout period to 60 minutes:

```
ns_session.login("admin","verysecret",3600);
```

You must use the `nitro_service` object in all further NITRO operations on the appliance. For example to save the configurations on the appliance, you must use the `nitro_service` object as follows:

```
ns_session.save_config();
```

The `nitro_service` class also provides APIs to perform other system-level operations such as enabling and disabling NetScaler features and modes, saving and clearing NetScaler configurations, setting the session timeout, setting the severity of the exceptions to be handled, setting the behavior of bulk operations, and disconnecting from the appliance.

Feature Configuration APIs

NetScaler resources are organized into a set of packages or namespaces. Each package or namespace corresponds to a NetScaler feature. For example, all load-balancing related resources, such as load balancing virtual server, load balancing group, and load balancing monitor are available in `com.citrix.netscaler.nitro.resource.config.lb`.

Similarly, all application firewall related resources, such as application firewall policy and application firewall archive are available in `com.citrix.netscaler.nitro.resource.config.appfw`.

Each NetScaler resource is represented by a class. For example, the class that represents a load balancing virtual server is called `lbvserver` (in `com.citrix.netscaler.nitro.resource.config.lb`). The state of a resource is represented by properties of a class. You can get and set the properties of the class.

Note: The setter and getter properties are always executed locally on the client. They do not involve any network interaction with the NITRO web service. All properties have basic simple types: integer, long, boolean, and string.

A resource class provides APIs to perform the following operations:

Create | Retrieve | Update | Delete | Enable/Disable | Unset | Bind/Unbind | Global bind | Bulk operations

Create

To create a new resource, instantiate the resource class, configure the resource by setting its properties locally, and then upload the new resource instance to the NetScaler appliance.

The following sample code creates a load balancing virtual server:

```
//Create an instance of the lbvserver class
lbvserver new_lbvserver_obj = new lbvserver();

//Set the properties of the resource locally
new_lbvserver_obj.name = "MyFirstLbVServer";
new_lbvserver_obj.ipv46 = "10.102.29.88";
new_lbvserver_obj.port = 88;
new_lbvserver_obj.servicetype = "HTTP";
new_lbvserver_obj.lbmethod = "ROUNDROBIN";

//Upload the resource to NetScaler
lbvserver.add(ns_session,new_lbvserver_obj);
```

Retrieve

To retrieve the properties of a resource, retrieve the resource object from the NetScaler appliance. Once the object is retrieved, you can extract the required properties of the resource locally, without incurring further network traffic.

The following sample code retrieves the details of a load balancing virtual server:

```
//Retrieve the resource object from the NetScaler
new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer");

//Extract the properties of the resource from the object locally
Console.WriteLine(new_lbvserver_obj.name);
Console.WriteLine(new_lbvserver_obj.servicetype);
```

You can also retrieve resources by specifying a filter on the value of their properties by using the `com.citrix.netscaler.nitro.util.filtervalue` class.

For example, you can retrieve all the load balancing virtual servers that have their port set to 80 and servicetype to HTTP:

```
filtervalue[] filter = new filtervalue[2];
filter[0] = new filtervalue("port","80");
filter[1] = new filtervalue("servicetype","HTTP");
lbvserver[] result = lbvserver.get_filtered(ns_session,filter);
```

You can also retrieve all NetScaler resources of a certain type, such as all services in the NetScaler appliance, by calling the static `get()` method on the service class, without providing a second parameter, as follows:

```
service[] resources = service.get(ns_session);
```

Update

To update the properties of a resource, instantiate the resource class, specify the name of the resource to be updated, configure the resource by updating its properties locally, and then upload the updated resource instance to the NetScaler appliance.

The following sample code updates the service type and load balancing method of a load balancing virtual server:

```
//Create an instance of the lbvserver class
lbvserver update_lb = new lbvserver();

//Specify the name of the lbvserver to be updated
update_lb.name = "MyFirstLbVServer";

//Specify the updated service type and lb method
update_lb.servicetype = "https";
update_lb.lbmethod = "LEASTRESPONSETIME";

//Upload the resource to NetScaler
lbvserver.update(ns_session, update_lb);
```

Note: Some properties in some NetScaler resources are not allowed to be modified after creation. The port number or the service type (protocol) of a load balancing virtual server or a service, are examples of such properties. Even though the update method

appears to succeed, these properties retain their original values on the appliance.

Delete

To delete an existing resource, invoke the static method delete() on the resource class, by passing the name of the resource.

The following sample code deletes a load balancing virtual server with name "MyFirstLbVServer":

```
lbvserver remove_lb = new lbvserver();
remove_lb.name("MyFirstLbVServer");
lbvserver.delete(ns_session, remove_lb);
```

Enable/Disable

To enable a resource, invoke the `enable()` method.

The following sample code enables a load balancing virtual server named "lb_vip":

```
lbvserver obj = new lbvserver();
obj.name = "lb_vip";
lbvserver.enable(ns_session, obj);
```

Note: To disable a resource, invoke the `disable()` method.

```
lbvserver.disable(ns_session, obj);
```

Unset

To unset the value that is set to a parameter, invoke the `unset()` method on the resource class, by passing the name of the resource and the parameters to be unset. If the parameter has a default value, the value is reset to that value.

The following sample code unsets the load balancing method and the comments of a load balancing virtual server named "lb_123":

```
lbvserver obj = new lbvserver();
obj.name = "lb_123";
String[] args = { "lbmethod","comment" };
lbvserver.unset(ns_session, lb1, args);
```

Bind/Unbind

NetScaler resources form relationships with each other through the process of binding. This is how services are associated with a load balancing virtual server (by binding them to it), or how various policies are bound to a load balancing virtual server. Each binding relationship is represented in NITRO by its own class.

To bind one NetScaler resource to another, you must instantiate the appropriate binding class (for example, to bind a service to a load balancing virtual server, you must instantiate the `lbvserver_service_binding` class) and add it to the NetScaler configuration (by

using the static `add()` method on this class).

Binding classes have a property representing the name of each resource in the binding relationship. They can also have other properties related to that relationship (for example, the weight of the binding between a load balancing virtual server and a service).

The following sample code binds a service to a load balancing virtual server, by specifying a certain weight for the binding:

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();
bindObj.name = "MyFirstLbVServer";
bindObj.servicename = "svc_prod";
bindObj.weight = 20;
lbvserver_service_binding.add(ns_session,bindObj);
```

Note: To unbind a resource from another, invoke the `delete()` method from the resource binding class, by passing the name of the two resources.

The following code sample unbinds a service from a server:

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();
bindObj.name("MyFirstLbVServer");
bindObj.servicename("svc_prod");
lbvserver_service_binding.delete(ns_session,bindObj);
```

Global bind

Some NetScaler resources can be bound globally to affect the whole system. For example, a compression policy can be bound to an load balancing virtual server, in which case the policy affects only the traffic on that load balancing virtual server. However, if bound globally, it can affect any traffic on the appliance, regardless of which virtual servers handle the traffic.

Some NITRO classes can be used to bind resources globally. These classes have names that follow the following pattern: `<featurename>global_<resourcetype>_binding`.

For example, the class `aaaglobal_preauthenticationpolicy_binding` is used to bind preauthentication policies globally.

The following sample code creates a preauthentication action and a preauthentication policy that uses that action, and then binds the policy globally at priority 200:

```
aaapreauthenticationaction preauth_act1;
aaapreauthenticationpolicy preauth_pol1;
aaaglobal_aaapreauthenticationpolicy_binding glob_binding;
preauth_act1 = new aaapreauthenticationaction();
preauth_act1.name = "preauth_act1";
preauth_act1.preauthenticationaction = "ALLOW";
aaapreauthenticationaction.add(ns_session, preauth_act1);

preauth_pol1 = new aaapreauthenticationpolicy();
preauth_pol1.name = "preauth_pol1";
```

```
preauth_pol1.rule = "CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS";
preauth_pol1.reqaction = "preauth_act1";
aaapreauthenticationpolicy.add(ns_session, preauth_pol1);

glob_binding = new aaaglobal_aaapreauthenticationpolicy_binding();
glob_binding.policy = "preauth_pol1";
glob_binding.priority = 200;
aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session,glob_binding);
```

Bulk operations

You can create, retrieve, update, and delete multiple resources simultaneously and thus minimize network traffic. For example, you can add multiple load balancing virtual servers in the same operation. To perform a bulk operation, you instantiate an array of the resource class, configure the properties of all the instances locally, and then upload all the instances to the NetScaler with one command.

To account for the failure of some operations within the bulk operation, NITRO allows you to configure one of the following behaviors:

- **Exit.** When the first error is encountered, the execution stops. The commands that were executed before the error are committed.
- **Rollback.** When the first error is encountered, the execution stops. The commands that were executed before the error are rolled back. Rollback is only supported for add and bind commands.
- **Continue.** All the commands in the list are executed even if some commands fail.

Note: You must configure the required behavior while establishing a connection with the appliance.

```
nitro_service ns_session = new nitro_service("10.102.29.60","http");
ns_session.onerror = OnerrorEnum.CONTINUE;
ns_session.login("admin","verysecret");
```

The following sample code creates two load balancing virtual servers:

```
//Create an array of lbvserver instances
lbvserver[] lbs = new lbvserver[2];

//Specify details of first lbvserver
lbs[0] = new lbvserver();
lbs[0].name = "lbvserv1";
lbs[0].servicetype = "http";
lbs[0].ipv46 = "10.70.136.5";
lbs[0].port = 80;

//Specify details of second lbvserver
lbs[1] = new lbvserver();
lbs[1].name = "lbvserv2";
lbs[1].servicetype = "https";
lbs[1].ipv46 = "10.70.136.5";
lbs[1].port = 443;
```

```
//upload the details of the lbvservers to the NITRO server
lbvserver.add(ns_session,lbs);
```

Cluster APIs

For managing clusters, you can add or remove a cluster instance or an individual node and perform a few other instance or node operations such as viewing instance or node properties. You can also configure the cluster IP address. Other cluster-management tasks include joining a NetScaler appliance to the cluster and configuring a linkset.

Cluster Instance Operations

The `com.citrix.netscaler.nitro.resource.config.cluster.clusterinstance` class provides APIs to manage a cluster instance.

The following sample code creates a cluster instance with ID 1:

```
clusterinstance new_cl_inst_obj = new clusterinstance();
//Set the properties of the cluster instance locally
new_cl_inst_obj.clid = 1;
new_cl_inst_obj.preemption = "ENABLED";

//Upload the cluster instance
clusterinstance.add(ns_session,new_cl_inst_obj);
```

Cluster Node Operations

The `com.citrix.netscaler.nitro.resource.config.cluster.clusternode` class provides APIs to manage cluster nodes.

The following sample code adds a cluster node with NSIP address 10.102.29.60:

```
clusternode new_cl_node_obj = new clusternode();
//Set the properties of the cluster node locally
new_cl_node_obj.nodeid = 0;
new_cl_node_obj.ipaddress = "10.102.29.60";
new_cl_node_obj.state = "ACTIVE";
new_cl_node_obj.backplane = "0/1/1";

//Upload the cluster node
clusternode.add(ns_session,new_cl_node_obj);
```

Add a Cluster IP Address

The `com.citrix.netscaler.nitro.resource.config.ns.nsip` class provides the `add()` API to configure an IP address. To configure the IP address as a cluster IP address, you must specify the type as CLIP.

The following sample code configures a cluster IP address on NetScaler appliance with IP address 10.102.29.60:

```
nsip new_nsip_obj = new nsip();
//Set the properties locally
new_nsip_obj.ipaddress = "10.102.29.61";
new_nsip_obj.netmask = "255.255.255.255";
new_nsip_obj.type = "CLIP";

//Upload the cluster node
nsip.add(ns_session,new_nsip_obj);
```

Add a Spotted IP Address

The `com.citrix.netscaler.nitro.resource.config.ns.nsip` class provides the `add()` API to configure an IP address. To configure the IP address as spotted, you must specify the ID of the node that must own the IP address. This configuration must be done on the cluster IP address.

The following sample code configures a spotted SNIP address on a node with ID 1:

```
nsip new_nsip_obj = new nsip();
//Set the properties locally
new_nsip_obj.ipaddress = "10.102.29.77";
new_nsip_obj.netmask = "255.255.255.0";
new_nsip_obj.type = "SNIP";
new_nsip_obj.ownernode = 1;

//Upload the cluster node
nsip.add(ns_session,new_nsip_obj);
```

Join NetScaler Appliance to Cluster

The `com.citrix.netscaler.nitro.resource.config.cluster.cluster` class provides the `join()` API to join a NetScaler appliance to the cluster. You must specify the cluster IP address and the nsroot password of the configuration coordinator.

The following sample code joins a NetScaler appliance to a cluster:

```
cluster new_cl_obj = new cluster();
//Set the properties of the cluster locally
new_cl_obj.clip = "10.102.29.61";
new_cl_obj.password = "verysecret";

//Upload the cluster node
cluster.add(ns_session,new_cl_node_obj);
```

Linkset Operations

The `com.citrix.netscaler.nitro.resource.config.network.linkset` class provides the APIs to manage linksets.

To configure a linkset, do the following:

1. Add a linkset by invoking the `add()` method of the `linkset` class.

2. Bind the interfaces to the linkset using the `add()` method of the `linkset_interface_binding` class.

The following sample code creates a linkset LS/1 and bind interfaces 1/1/2 and 2/1/2 to it:

```
//Create the linkset
linkset new_linkset_obj = new linkset();
new_linkset_obj.id = "LS/1";
linkset.add(ns_session,new_linkset_obj);

//Bind the interfaces to the linkset
linkset_interface_binding new_linkif_obj = new linkset_interface_binding();
new_linkif_obj.id = "LS/1";
new_linkif_obj.ifnum = "1/1/2 2/1/2";
linkset_interface_binding.add(ns_session,new_linkif_obj);
```

Feature Statistics APIs

The NetScaler appliance collects statistics about the usage of its features and the corresponding resources. You can retrieve these statistics by using NITRO API. The statistics APIs are available in different namespaces from the configuration APIs.

The APIs to retrieve statistics of NetScaler features are available in namespaces that have the following pattern: `com.citrix.netscaler.nitro.resource.stat.<feature>`.

For example, APIs to retrieve statistics of the load balancing virtual server are available in the `com.citrix.netscaler.nitro.resource.stat.lb` namespace.

The following sample code retrieves the statistics of a load balancing virtual server and displays some of the statistics returned:

```
lbvserver_stats stats = lbvserver_stats.get(ns_session,"MyFirstLbVServer");
Console.WriteLine(stats.curclntconnections);
Console.WriteLine(stats.deferredreqrate);
```

Note: Not all NetScaler features and resources have statistic objects associated with them.

AppExpert Application APIs

To export an AppExpert application, you must instantiate the `com.citrix.netscaler.nitro.resource.config.app.application` class, configure the properties of the AppExpert locally, and then export the AppExpert application.

The following sample code exports an AppExpert application named "MyApp1":

```
application myapp = new application();
myapp.appname = "MyApp1";
myapp.apptemplatefilename = "myapp_template";
application.export(ns_session,myapp);
```

You can also import an AppExpert application. You must instantiate the `com.citrix.netscaler.nitro.resource.config.app.application` class, configure the properties of the AppExpert locally, and then import the AppExpert application.

The following sample code imports an AppExpert application named "MyApp1":

```
application myapp = new application();
myapp.appname = "MyApp1";
myapp.apptemplatefilename = "myapp_template";
application.Import(ns_session,myapp);
```

Exception Handling

The status of a NITRO request is captured in the `com.citrix.netscaler.nitro.exception.nitro_exception` class. This class provides the following details of the exception:

- **Session ID.** The session in which the exception occurred.
- **Severity.** The severity of the exception: error or warning. By default, only errors are captured. To capture warnings, you must set the warning flag to true, while connecting to the appliance.
- **Error code.** The status of the NITRO request. An error code of 0 indicates that the NITRO request is successful. A non-zero error code indicates an error in processing the NITRO request.
- **Error message.** Provides a brief description of the exception.

For a list of error codes, see the errorlisting.html file available in the <NITRO_SDK_HOME>/doc/api_reference folder.

REST Web Services

REST (REpresentational State Transfer) is an architectural style based on simple HTTP requests and responses between the client and the server. REST is used to query or change the state of objects on the server side. In REST, the server side is modeled as a set of entities where each entity is identified by a unique URL. For example, the load balancing virtual server entity is identified by the URL http://<NSIP>/nitro/v1/config/<lbvserver>/<lbvserver_name>.

Each resource also has a state on which the following operations can be performed:

- **Create.** Clients can create new server-side resources on a "container" resource. You can think of container resources as folders, and child resources as files or subfolders. The calling client provides the state for the resource to be created. The state can be specified in the request by using XML or JSON format. The client can also specify the unique URL that will identify the new object. Alternatively, the server can choose and return a unique URL identifying the created object. The HTTP method used for Create requests is POST.

- **Read.** Clients can retrieve the state of a resource by specifying its URL with the HTTP GET method. The response message contains the resource state, expressed in JSON format.

- **Update.** You can update the state of an existing resource by specifying the URL that identifies that object and its new state in JSON or XML, using the PUT HTTP method.

- **Delete.** You can destroy a resource that exists on the server-side by using the DELETE HTTP method and the URL identifying the resource to be removed.

In addition to these four CRUD operations (Create, Read, Update, and Delete), resources can support other operations or actions. These operations use the HTTP POST method, with the URL specifying the operation to be performed and the request body specifying the parameters for that operation.

NetScaler NITRO APIs are categorized depending on the scope and purpose of the APIs into system APIs, feature configuration APIs, and feature statistics APIs.

Performing System Level Operations

The first step towards using NITRO is to establish a session with the NetScaler appliance and then authenticate the session by using the NetScaler administrator's credentials. You must specify the username and password in the `login` object. The session ID that is created must be specified in the request header of all further operations in the session.

Note: You must have a user account on the appliance to log on to it. The configuration operations that you can perform are limited by the administrative roles assigned to your account.

To connect to a NetScaler appliance with NSIP address 10.102.29.60 by using the HTTP protocol:

- **URL.** https://10.102.29.60/nitro/v1/config/login/
- **Method.** POST
- **Request.**
  - **Header.**

    Content-Type:application/vnd.com.citrix.netscaler.login+json

    Note: Content types such as 'application/x-www-form-urlencoded' that were supported in earlier versions of NITRO can also be used. You must make sure that the payload is the same as used in earlier versions. The payloads provided in this documentation are only applicable if the content type is of the form 'application/vnd.com.citrix.netscaler.login+json'.
  - **Payload.**

```
{
   "login":
   {
      "username":"admin",
      "password":"verysecret"
   }
}
```

- **Response.**
  - **Header.**

```
HTTP/1.0 201 Created
Set-Cookie:
NITRO_AUTH_TOKEN=##87305E9C51B06C848F0942; path=/nitro/v1
```

Note: By default, the connection to the appliance expires after 30 minutes of inactivity. You can modify the timeout period by specifying a new timeout period (in seconds) in the `login` object. For example, to modify the timeout period to 60 minutes, the request payload is:

```
{
   "login":
   {
      "username":"admin",
      "password":"verysecret",
      "timeout":3600
   }
}
```

You can also connect to the appliance to perform a single operation, by specifying the username and password in the request header of the operation. For example, to connect to an appliance while adding a load balancing virtual server:

- **URL.** https://10.102.29.60/nitro/v1/config/lbvserver/
- **Method.** POST
- **Request.**
  - **Header.**

    X-NITRO-USER:admin
    X-NITRO-PASS:verysecret
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver
    +json

  - **Payload.**

    ```
    {
      "lbvserver":
      {
        ...
        ...
        ...
      }
    ```

- **Response.**
  - **Header.**

    HTTP/1.0 201 Created

You can also perform other system-level operations such as enabling NetScaler features and modes, saving and clearing NetScaler configurations, setting the session timeout, setting the severity of the exceptions to be handled, setting the behavior of bulk operations, and disconnecting from the appliance.

For more information on the REST messages, see the Configuration node of the <NITRO_SDK_HOME>/index.html file.

Example 1: Enable the load balancing feature

- **URL.** http://10.102.29.60/nitro/v1/config/nsfeature?action=enable
- **HTTP Method.** POST
- **Request.**

- **Header**

  Cookie:NITRO_AUTH_TOKEN=tokenvalue
  Content-Type:application/vnd.com.citrix.netscaler.nsfeature+json

- **Payload**

```
{
   "nsfeature":
   {
      "feature":
      [
         "LB",
      ]
   }
}
```

Example 2: Save NetScaler configurations

- **URL.** http://10.102.29.60/nitro/v1/config/nsconfig?action=save
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.nsconfig+json

  - **Payload**

```
{
   "nsconfig":{}
}
```

Example 3: Disconnecting from the appliance

- **URL.** https://10.102.29.60/nitro/v1/config/logout/
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.logout+json

  - **Payload**

```
{
   "logout":{}
}
```

Note: Make sure that you have saved the configurations before performing this operation.

Configuring NetScaler Features

A NetScaler appliance has multiple features, and each feature has multiple resources. Each NetScaler resource, depending on the operation to be performed on it, has a unique URL associated with it. URLs for configuration operations have the format `http://<NSIP>/nitro/v1/config/<resource_type>/<resource_name>`. For example, to access the lbvserver named MyFirstLbVServer on a NetScaler with IP 10.102.29.60, the URL is `http://10.102.29.60/nitro/v1/config/lbvserver/MyFirstLbVServer`.

Using NITRO you can perform the following operations:

Create | Retrieve | Update | Delete | Enable/Disable | Unset | Bind/Unbind | Bulk operations

For more information on the REST messages, see the Configuration node of the <NITRO_SDK_HOME>/index.html file.

Create

To create a new resource (for example, an lbvserver) on the appliance, specify the resource name and other related arguments in the specific resource object. For a lbvserver resource, the object would be an `lbvserver` object.

To create an lbvserver named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json

  - **Payload**

```
{
   "lbvserver":
   {
      "name":"MyFirstLbVServer",
      "servicetype":"http"
   }
}
```

Retrieve

NetScaler resource properties can be retrieved as follows:

- To retrieve details of all resources of a specific type, specify the resource type in the URL.

  URL format: `http://<NSIP>/nitro/v1/config/<resource_type>`

- To retrieve details of a specific resource on the NetScaler appliance, specify the resource name in the URL.

  URL format:
  `http://<NSIP>/nitro/v1/config/<resource_type>/<resource_name>`

- To retrieve specific details of a resource, specify the resource details that you want to view in the URL.

  URL format: `http://<NSIP>/nitro/v1/config/<resource_type>/<resource_name>?attrs=<attrib1>,<attrib2>`

- To retrieve details of resources on the basis of some filter, specify the filter conditions in the URL.

  URL format: `http://<NSIP>/nitro/v1/config/<resource_type>?filter=<attrib1>:<value>,<attrib2>:<value>`

- If the request is likely to result in a large number of resources, you can divide the results into pages and retrieve them page by page.

  For example, assume that you have a NetScaler that has 53 lbvservers and you want to retrieve all the lbvservers. So, instead of retrieving all 53 in one response, you can configure the results to be divided into pages of 10 lbvservers each (6 pages total), and retrieve them from the NetScaler page by page.

  URL format: `http://<NSIP>/nitro/v1/config/<resource_type>?pageno=<value>&pagesize=<value>`

  You specify the page count with the `pagesize` parameter and the page number that you want to retrieve with the `pageno` parameter.

- To get the number of resources that are likely to be returned by a request, you can use the `count` query string parameter to ask for a count of the resources to be returned, rather than the resources themselves.

  URL format: `http://<NSIP>/nitro/v1/config/<resource_type>?count=yes`

To retrieve the details of an lbvserver named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/MyFirstLbVServer/
- **HTTP Method.** GET
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
- **Response.**

- **Header**

  HTTP/1.0 200 OK
  Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json

- **Payload**

```
{
   "lbvserver":
   [
      {
         "name":"MyFirstLbVServer",
         "servicetype":"http",
         "insertvserveripport":"OFF",
         "ip":"0.0.0.0",
         "port":80,
         ...
      }
   ]
}
```

Update

To update the details of an existing resource on the NetScaler appliance, specify the resource name, and the arguments to be updated, in the specific resource object.

To change the load balancing method to ROUNDROBIN and update the comment property for a load balancing virtual server named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/MyFirstLbVServer/

- **HTTP Method.** PUT

- **Request.**

  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json

  - **Payload**

```
{
   "lbvserver":
   {
      "name":"MyFirstLbVServer",
      "lbmethod":"ROUNDROBIN",
      "comment":"Updated comments"
   }
}
```

Delete

To delete a NetScaler resource, specify the resource name in the URL.

To delete a load balancing virtual server named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/MyFirstLbVServer
- **HTTP Method.** DELETE

Enable/Disable

To enable a resource on the NetScaler appliance, specify the resource name in the specific resource object.

To enable a load balancing virtual server named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver?action=enable
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json

  - **Payload**

```
{
   "lbvserver":
   {
      "name":"MyFirstLbVServer"
   }
}
```

Note: To disable a resource, in the URL specify the action as "disable".

Unset

To unset the value that is set to a parameter, specify the action as "unset" and in the payload, specify the parameters to be unset.

To unset the load balancing method and the comments specified for a load balancing virtual server named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver?action=unset
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json

  - **Payload**

```
{
   "lbvserver":
```

```
    {
        "name":"MyFirstLbVServer",
        "lbmethod":true,
        "comment":true,
    }
}
```

Bind/Unbind

To bind a resource to another, specify the name of the two resources and specify the weight for the binding.

To bind a service named "svc_prod" to a load balancing virtual server named "MyFirstLbVServer", by specifying a certain weight for the binding:

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver_service_binding/
- **HTTP Method.** PUT
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver_service_binding+json
  - **Payload**

```
{
    "lbvserver_service_binding":
    {
        "name":"MyFirstLbVServer",
        "servicename":"svc_prod",
        "weight":111,
    }
}
```

Note: To unbind, specify the arguments in the URL as follows:

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver_service_binding/MyFirstLbVServer?args=servicename:svc_prod
- **HTTP Method.** DELETE

Bulk operations

You can create, retrieve, update, and delete multiple resources simultaneously and thus minimize network traffic. For example, you can add multiple load balancing virtual servers in the same operation. To perform a bulk operation, specify the required parameters in the same request payload.

To account for the failure of some operations within the bulk operation, NITRO allows you to configure one of the following behaviors:

- **Exit.** When the first error is encountered, the execution stops. The commands that were executed before the error are committed.

- **Rollback.** When the first error is encountered, the execution stops. The commands that were executed before the error are rolled back. Rollback is only supported for add and bind commands.

- **Continue.** All the commands in the list are executed even if some commands fail.

You must specify the behavior of the bulk operation in the request header using the X-NITRO-ONERROR parameter.

To add two load balancing virtual servers in one operation and continue if one command fails:

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/

- **HTTP Method.** POST

- **Request.**

  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver_list+json
    X-NITRO-ONERROR:continue

  - **Payload**

```
{
   "lbvserver":
   [
      {
         "name":"new_lbvserver1",
         "servicetype":"http"
      },

      {
         "name":"new_lbvserver2",
         "servicetype":"http"
      }
   ]
}
```

- **Response**

  - **Header**

    HTTP/1.0 207 Multi Status

  - **Payload**

```
{
   "errorcode":273,
   "message":"Resource already exists",
   "severity":"ERROR",
   "response":
   [
      {
         "errorcode": 0,
```

```
            "message": "Done",
            "severity": "NONE"
         },
         {
            "errorcode": 273,
            "message":"Resource already exists",
            "severity": "ERROR"
         }
      ]
   }
```

Binding NetScaler Resources

NetScaler resources form relationships with each other through the process of binding. This is how services are associated with an lbvserver (by binding them to it), or how various policies are bound to an lbvserver. Each binding relationship is represented by its own object. A binding resource has properties representing the name of each NetScaler resource in the binding relationship. It can also have other properties related to that relationship (for example, the weight of the binding between an lbvserver resource and a service resource).

Note: Unlike for NetScaler entities, you use a PUT HTTP method, instead of POST, for adding new binding resources.

For more information on the REST messages, see the Configuration node of the <NITRO_SDK_HOME>/index.html file.

To bind a service to a load balancing virtual server named "MyFirstLbVServer" and specify a weight for the binding:

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver_service_binding/MyFirstLbVServer?action=bind
- **HTTP Method.** PUT
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver_service_binding+json

  - **Payload**

```
{
   "lbvserver_service_binding":
   {
      "servicename":"svc_prod",
      "weight":20,
      "name":"MyFirstLbVServer"
   }
}
```

To retrieve list of all the services bound to a virtual server "lbv1":

- **URL.**
  http://10.102.29.60/nitro/v1/config/lbvserver_service_binding/lbv1?attrs=servicename
- **HTTP Method.** GET

For more information on retrieving information, see the "Retrieving properties of a resource" section in Configuring NetScaler Features.

Globally Bind Resources

Some NetScaler resources can be bound globally to affect the whole system. For example, if a compression policy is bound to an lbvserver, the policy affects only the traffic on that lbvserver. However, if bound globally, it can affect any traffic on the appliance, regardless of which virtual servers handle the traffic.

The names of NITRO resources that can be used to bind resources globally have the pattern <featurename>global_<resourcetype>_binding. For example, the object aaaglobal_preauthenticationpolicy_binding is used to bind preauthentication policies globally.

To bind the policy named preautpol1 globally at priority 200:

- **URL.** http://10.102.29.60/nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding?action=bind
- **HTTP Method.** PUT
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.aaaglobal_aaapreauthenticationpolicy_binding+j
  - **Payload**

```
{
   "aaaglobal_aaapreauthenticationpolicy_binding":
   {
      "policy":"preautpol1",
      "priority":200
   }
}
```

Configuring a NetScaler Cluster

You can use NITRO to add or create and manage a NetScaler cluster.

Cluster Instance Operations

All operations on a cluster instance must be performed on the `clusterinstance` object.

To create a cluster instance with ID 1:

- **URL.** http://10.102.29.60/nitro/v1/config/clusterinstance/
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.clusterinstance+json

  - **Payload**

```
{
   "clusterinstance":
   {
      "clid":1,
      "preemption":"ENABLED"
   }
}
```

Cluster Node Operations

All operations on a cluster node must be performed on the `clusternode` object.

To add a cluster node with NSIP address 10.102.29.60:

- **URL.** http://10.102.29.60/nitro/v1/config/clusternode/
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.clusternode+json

  - **Payload**

```
{
   "clusternode":
   {
      "nodeid":1,
      "ipaddress":"10.102.29.60",
      "state":"ACTIVE",
      "backplane":"1/1/2"
   }
}
```

Add a Cluster IP Address

To define a cluster IP address, specify the required parameters in the `nsip` object.

To configure a cluster IP address on NetScaler appliance with IP address 10.102.29.60:

- **URL.** http://10.102.29.60/nitro/v1/config/nsip/
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.nsip+json
  - **Payload**

```
{
   "nsip":
   {
      "ipaddress":"10.102.29.61",
      "netmask":"255.255.255.255",
      "type":"CLIP"
   }
}
```

Add a Spotted IP Address

To configure an IP address as spotted, specify the required parameters in the `nsip` object. This configuration must be done on the cluster IP address.

To configure a spotted SNIP address on a node with ID 1:

- **URL.** http://10.102.29.60/nitro/v1/config/nsip/
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.nsip+json
  - **Payload**

```
{
   "nsip":
   {
      "ipaddress":"10.102.29.77",
      "netmask":"255.255.255.0",
      "type":"SNIP",
      "ownernode":1
   }
}
```

Join NetScaler Appliance to Cluster

To join an appliance to a cluster, specify the required parameters in the `cluster` object.

To join a NetScaler appliance to a cluster:

- **URL.** http://10.102.29.60/nitro/v1/config/cluster/
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.cluster+json

  - **Payload**

```
{
   "cluster":
   {
      "clip":"10.102.29.61",
      "password":"verysecret"
   }
}
```

Linkset Operations

To configure a linkset, do the following:

1. Create a linkset by specifying the required parameters in the `linkset` object.

   To add a linkset LS/1:

   - **URL.** http://10.102.29.60/nitro/v1/config/linkset/
   - **HTTP Method.** POST
   - **Request.**
     - **Header**

       Cookie:NITRO_AUTH_TOKEN=tokenvalue
       Content-Type:application/vnd.com.citrix.netscaler.linkset+json

     - **Payload**

```
{
   "linkset":
   {
      "id":"LS/1"
   }
}
```

2. Bind the required interfaces to the linkset by specifying the interfaces in the `linkset_interface_binding` object.

   To bind interfaces 1/1/2 and 2/1/2 to linkset LS/1:

   - **URL.** http://10.102.29.60/nitro/v1/config/linkset_interface_binding/LS%2F1?action=bind
   - **HTTP Method.** PUT
   - **Request.**
     - **Header**

       Cookie:NITRO_AUTH_TOKEN=tokenvalue
       Content-Type:application/vnd.com.citrix.netscaler.linkset_interface_binding+json

     - **Payload**

```
{
   "linkset_interface_binding":
   {
      "id":"LS/1",
      "ifnum":"1/1/2 2/1/2"
   }
}
```

Retrieving Feature Statistics

The NetScaler appliance collects statistics about the usage of its features and the corresponding resources. NITRO can retrieve these statistics.

- URL to get statistics of a feature must have the format `http://<NSIP>/nitro/v1/stat/<feature_name>`.
- URL to get the statistics of a resource must have the format: `http://<NSIP>/nitro/v1/stat/<resource_type>/<resource_name>`.

For more information on the REST messages, see the Statistics node of the <NITRO_SDK_HOME>/index.html file.

To get the statistics of a lbvserver named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/stat/lbvserver/MyFirstLbVServer
- **HTTP Method.** GET
- **Request.**
  - **Header.**

    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json
- **Response.**
  - **Header**

    HTTP/1.0 200 OK
  - **Payload**

```
{
   "lbvserver":
   [
      {
         "name":"MyFirstLbVServer",
         "establishedconn":0,
         "vslbhealth":0,
         "primaryipaddress":"0.0.0.0",
         ...
      }
   ]
}
```

Note: Not all NetScaler features and resources have statistic objects associated with them.

Managing AppExpert Applications

To export an AppExpert application, specify the parameters needed for the export operation in the `apptemplateinfo` object. Optionally, you can specify basic information about the AppExpert application template, such as the author of the configuration, a summary of the template functionality, and the template version number, in the `template_info` object. This information is stored as part of the template file that is created.

To export an AppExpert application named "MyApp1":

- **URL.** http://10.102.29.60/nitro/v1/config/apptemplateinfo?action=export
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.apptemplateinfo+json

  - **Payload**

```
{
   "apptemplateinfo":
   {
      "appname":"MyApp1",
      "apptemplatefilename":"BizAp.xml",
      "template_info":
      {
          "templateversion_major":"2",
          "templateversion_minor":"1",
          "author":"XYZ",
          "introduction":"Intro",
          "summary":"Summary"
      },
   }
}
```

To import an AppExpert application, specify the parameters needed for the import operation in the `apptemplateinfo` object.

To import an AppExpert application named "MyApp1":

- **URL.** http://10.102.29.60/nitro/v1/config/apptemplateinfo?action=import
- **HTTP Method.** POST
- **Request.**
  - **Header**

Cookie:NITRO_AUTH_TOKEN=tokenvalue
Content-Type:application/vnd.com.citrix.netscaler.apptemplateinfo+json
X-NITRO-ONERROR:rollback

- **Payload**

```
{
  "apptemplateinfo":
  {
     "apptemplatefilename":"BizAp.xml",
     "deploymentfilename":"BizAp_deployment.xml",
     "appname":"MyApp1"
  }
}
```

To import an AppExpert application by specifying different deployment settings:

- **URL.** http://10.102.29.60/nitro/v1/config/apptemplateinfo?action=import
- **HTTP Method.** POST
- **Request.**
  - **Header**

    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.apptemplateinfo+json
    X-NITRO-ONERROR:rollback

  - **Payload**

```
{
  "apptemplateinfo":
  {
     "apptemplatefilename":"BizAp.xml",
     "appname":"Myapp2"
      "deploymentinfo":
      {
         "appendpoint":
         [
            {
               "ipv46":"11.2.3.8",
               "port":80,
               "servicetype":"HTTP"
            }
         ],
         "service":
         [
            {
               "ip":"12.3.3.15",
               "port":80,
               "servicetype":"SSL"
            },
            {
               "ip":"14.5.5.16",
               "port":443,
```

```
                    "servicetype":"SSL"
                }
            ],
        }
    }
}
```

Handling Exceptions

The response header provides the status of an operation by using HTTP status codes and the response payload provides the requested resource object (for GET method) and error details (for unsuccessful operation). NITRO does not provide a response payload for successful POST, PUT and DELETE methods. For successful GET method, the response payload consists only the requested resource object.

The following table provides the HTTP status codes:

Status	HTTP Status Code	Description
Success	200 OK	Request successfully executed.
	201 CREATED	Entity created.
Failure	400 Bad Request	Incorrect request provided.
	401 unauthorized	Not provided login credentials.
	403 forbidden	User is unauthorized
	404 Not Found	User is trying to access a resource not present in the NetScaler.
	405 Method Not Allowed	User is trying to access request methods not supported by NITRO.
	406 Not Acceptable	None of the values supplied by the user in the Accept header can be satisfied by the server.
	409 Conflict	The resource already exists on the NetScaler.
	503 Service Unavailable	The service is not available.
	599	NetScaler specific error code.
Warning	209 X-NITRO-WARNING	Warnings are captured by specifying the login URL as http://<nsip>/nitro/v1/config/login/?warning=yes.
Combination of success and failure (for bulk operation with X-NITRO-ONERROR set as continue)	207 Multi Status	Some commands are executed successfully and some have failed.

Note: The content-type in the response header of an unsuccessful operation, consists of error MIME type instead of resource MIME type.

For a more detailed description of the error codes, see the API reference available in the <NITRO_SDK_HOME>/doc folder.

NITRO Changes Across NetScaler Releases

NetScaler has introduced some changes in the NITRO API since the NetScaler 9.3 release. This could raise some compatibility issues for the following users:

- Users migrating from NetScaler 9.3 to 10.1
- Users migrating from NetScaler 9.3 to 10.5

Note: There are no changes introduced since the NetScaler 10.1 release. Therefore, you should not face any compatibility issues when migrating from NetScaler 10.1 to 10.5.

These NITRO changes from 9.3 to 10.1 or 10.5 are categorized as follows:

Note: Unless otherwise specified, these changes are applicable to both REST and SDKs.

Resources Removed

Resource	Replace with...	Comments
lbmonitor_lbmetrictable_binding	lbmonitor_metric_binding	

APIs Removed

Resource	API	Comments
vserver	GET	Perform the GET operation on specific virtual server types such as lb/cr/cs.
filterpolicy	POST with "action=unset"	This API is removed as unsetting the attributes('action') of a policy makes it invalid.
auditsyslogpolicy	POST with "action=unset"	This API is removed as unsetting the attributes('action') of a policy makes it invalid.
auditnslogpolicy	POST with "action=unset"	This API is removed as unsetting the attributes('action') of a policy makes it invalid.
authorizationpolicy	POST with "action=unset"	This API is removed as unsetting the attributes('action') of a policy makes it invalid.

API Return Type Changed

Resource	API	Comments
snmpengineid	GET	Return type changed to an array.
nshostname	GET	Return type changed to an array.

Attribute Type Changed

Resource	Attribute	Comments
appfwpolicy_lbvserver_binding	activepolicy	Data type changed from Boolean to Integer.
appfwpolicy_appfwglobal_binding	activepolicy	Data type changed from Boolean to Integer.
vlan	portbitmap	Data type changed from uint to ulong.
vlan	tagbitmap	Data type changed from uint to ulong.

Attributes Removed

Resource	Attribute	Replace with...	Comments
policypatset_pattern_binding	indextype	- NA -	This attribute is moved to 'policypatset' resource as this attribute is applicable at patset level.
system_stats	powersupply1failure	powersupply1status	Change is applicable from NetScaler 9.3 (65.8).
system_stats	powersupply2failure	powersupply2status	Change is applicable from NetScaler 9.3 (65.8).
server_servicegroup_binding	servicetype	svctype	
server_service_binding	servicetype	svctype	
crvserver	hits	- NA -	Hits are calculated per policy binding hence moved this parameter to binding resources.
crvserver	dstvsvr	destinationvserver	
crvserver	destvserver	domain	
crvserver	dnsvserver	dnsvservername	
appflowpolicylabel	type	policylabeltype	
sslcipher	ciphgrpals	ciphergroupname	This change is applicable for sslcipher_*_binding resources also.
csvserver_cspolicy_binding	targetvserver	targetlbvserver	
csvserver_cspolicy_binding	targetvserver	targetlbvserver	
rewriteaction	allow_unsafe_pi1, allow_unsafe_pi	bypassSafetyCheck	

SDK Specific Changes

Class	Method	Replace with...	Comments
Routerbgp	- NA -	- NA -	This class is removed as all router configurations are deprecated in 9.2.
dnsptrrec	get(dnsptrrec obj, nitro_service session)	get(nitro_service session, String reversedomain)	
dnsaddrec	get(dnsaddrec obj, nitro_service session)	get(nitro_service session, String hostname)	
dnsnsrec	get(dnsnsrec obj, nitro_service session)	get(nitro_service session, String domain)	
snmpengineid	unset(nitro_service session, String[] args)	unset(nitro_service session, snmpengineid resource, String[] args)	
arp	arp.get(nitro_service session, String ipaddress)	arp.get(nitro_service session, arp resource)	
nsip	get(nitro_service session, String ipaddress)	get(nitro_service client, nsip resource)	
nsip6	get(nitro_service session, String ipv6address)	get(nitro_service session, nsip6 resource)	
dnsmxrec	dnsmxrec.get(dnsmxrec obj, nitro_service session)	dnsmxrec[] get(nitro_service service, dnsmxrec_args args)	

Unsupported NetScaler Operations

Some NetScaler operations that are available through the command line interface and through the configuration utility, are not available through NITRO APIs. The following list provides the NetScaler operations not supported by NITRO:

- install API
- diff API on nsconfig resource
- UI-internal APIs (update, unset, and get)
- show ns info
- Application firewall APIs:
  - importwsdl
  - importcustom
  - importxmlschema
  - importxmlerrorpage
  - importhtmlerrorpage
  - rmwsdl
  - rmcustom
  - rmxmlschema
  - rmxmlerrorpage
  - rmhtmlerrorpage
- CLI-specific APIs:
  - ping
  - ping6
  - traceroute
  - traceroute6
  - nstrace
  - scp
  - configaudit

- show defaults
- show permission
- batch
- source

XML API

Developers and administrators can use the NetScaler Application Programming Interface (API), nsconfig, to implement customized client applications. The nsconfig API, which mirrors the NetScaler command line interface (CLI), is based on the Web Services Description (WSDL) specification. It includes a filterwsdl command to reduce compilation time and file size. You can secure your API applications at the NetScaler IP address or at the IP address of the subnet on which the NetScaler is deployed.

The following topics describe the properties and use of the API.

Introduction	General information about the API, requirements, and software-version information.
The NS Config Interface	How to use the API.
Examples of API Usage	Basic examples of how to use the API.
The Web Service Description Language (WSDL)	How to use the WSDL-based interface schema to support your client applications, and how to use WSDL Filter to reduce file size and compilation time.
Securing API Access	How to secure API access.

Introduction to the API

The API enables programmatic communications between client applications and the NetScaler appliance, providing the following benefits:

- Developers can control the NetScaler from a custom application. The API enables the client application to configure and monitor the NetScaler.
- Developers can create client applications easily and quickly, using a language and platform with which they are comfortable.
- The API provides a secure, end-to-end, standards-based framework that integrates into the existing infrastructure.

Based on the Simple Object Access Protocol (SOAP) over HTTP, the API consists of the NSConfig interface. NSConfig includes methods for setting and querying the configuration. These methods allow the client application using the NSConfig interface to perform almost all operations that an administrator would normally perform with the CLI or GUI.

In addition, the NetScaler provides an interface description, based on the Web Services Definition Language (WSDL), that facilitates the development of client applications.

Hardware and Software Requirements

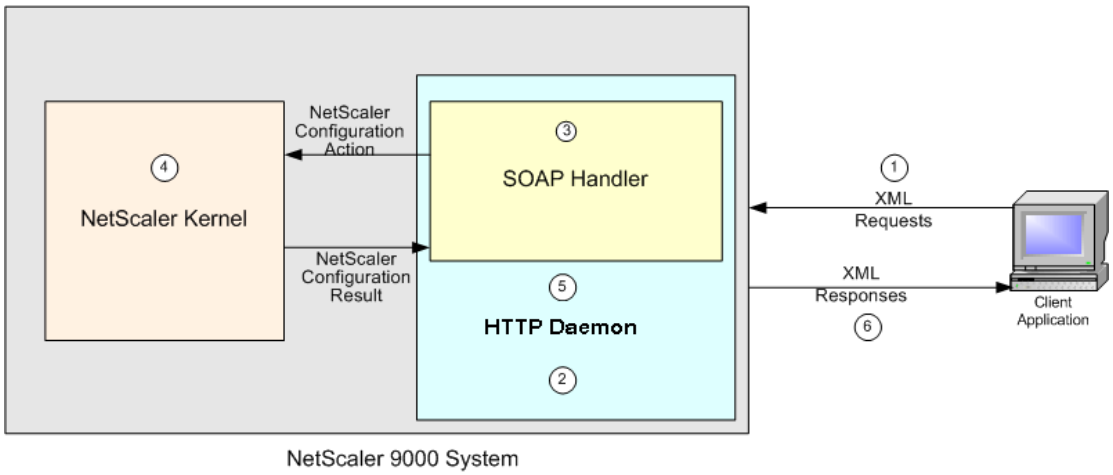
To work with the API, your system needs to meet the following hardware and software setup and requirements:

- A client workstation.
- Access to a NetScaler, version 8.0 or higher.
- A SOAP client tool kit (supporting SOAP version 1.1 and above), and the development environment for the tool kit. For example, if you use a Visual Basic tool kit, you must have Visual Basic installed on your system.

API Architecture

The API architecture is designed to allow NSConfig client requests to be routed, through the HTTP daemon running on the target NetScaler, to a SOAP handler that translates the SOAP request into a call to the (internal) kernel configuration API.

Figure 1. The API Architecture



The order in which the NetScaler processes requests through the API is as follows:

- The client formats a request containing XML conforming to the SOAP protocol and sends it to the NetScaler.
- The HTTPD server instance on the NetScaler routes this request to a SOAP handler.
- The SOAP handler interprets the SOAP headers and maps the enclosed request to an internal configuration function.
- The kernel acts on the request and returns one or more responses.
- The SOAP handler translates the response(s) to a SOAP response message.
- The XML response is sent back to the client in an HTTP response.

The NSConfig Interface

The NSConfig interface closely mirrors the structure of the NetScaler command line interface (CLI). Administrators and programmers who are familiar with the CLI can easily create and implement custom applications to query or set the configuration on their NetScaler.

The NSConfig interface includes methods for most of the CLI commands. In most cases the method and the command name are the same. See the PortType section of the WSDL for a complete list of methods and their names.

For example, you use the add lb vserver CLI command to create a load balancing virtual server, as follows:

add lb vserver <vServerName> <serviceType> [<IPAddress> <port>]

where:

<vServerName> = A name for the virtual server.

<serviceType> = (HTTP | FTP | TCP | UDP).

<IPAddress> = The IP address used by the virtual server.

<port> = The port that the virtual server listens on.

Following is the corresponding API call, in the C language:

```
int ns__addlbvserver(void *handle,
      string vServerName,
      string serviceType,
      string IPAddress,
      unsignedShort port,
    ns__addlbvserverResponse *out);
```

Note: The exact syntax of the API call depends on the language used to write the client program. The above `ns__addlbvserver` function prototype is similar to the one that would be generated by the gSOAP package at http://www.cs.fsu.edu/~engelen/soap.html.

The result returned for all NSConfig requests consists of:

Rc

An integer return code. The value is zero if the request succeeded. A non-zero value indicates that the request failed.

Message

A string message. Contains meaningful information only if the request fails (rc is non-zero) (for example, “Required argument missing”).

List

A type-specific list of result entities. This element is present only for requests that retrieve information from the NetScaler. For example, the API method names starting with get, which correspond to the CLI show commands, return a list.

Command names in the NetScaler CLI typically consist of three terms, separated by spaces, identifying the operation, the feature that is being operated on, and the specific item that is being operated on. For example, to create a new application firewall profile, you type add appfw profile, followed by the command arguments. The corresponding API methods omit the spaces. For example, the API method for add appfw profile is `addappfwprofile`. The same principle applies to CLI command names that have only two terms. For example, add monitor becomes `addmonitor`. The other exceptions to this pattern are as follows:

1. The CLI show command is changed to get in the API, as shown below.

   show lb vserver => `getlbvserver`

   show service => `getservice`

2. The following commands are omitted from the API:

   - Commands that apply to the CLI itself (for example, clear CLI prompt).
   - The batch, ping, grep, more, shell, and scp commands.
   - The show router bgp and show router map commands.
   - All stat commands.

3. Message "part" names in the API are the same as the corresponding CLI argument names. As in the CLI, case does not matter, and these names can be abbreviated. For more information, *Citrix NetScaler Command Reference Guide* at http://support.citrix.com/article/CTX132384

4. The result of a GET method (which corresponds to a show command in the CLI) is always an array of a type defined in the WSDL. The elements of these complex types generally correspond to arguments to the corresponding add/set command/method.

5. Authorization must be performed once, by sending a login request. The response contains a Set-Cookie HTTP header, and the cookie must be sent with each subsequent request. This is addressed in the Perl examples using by HTTP::Cookies. HTTP::Cookies are used for API client authentication purposes (to log into the NetScaler). In Perl, SOAP::Lite cannot perform this authentication process; HTTP::Cookies are used instead.

6. In some programming languages, such as Perl, it is possible to invoke the programming language API without using the WSDL.

Examples of API Usage

The following examples show how to develop an API call from a standard CLI command, how to generate the SOAP request, and how the NetScaler responds to that request:

Example: Setting the Configuration

Example: Querying the Configuration

Example: Setting the Configuration

This example shows a CLI command, the corresponding API method, the resulting XML request, and the XML response that is sent back to the client.

Note: The actual API method and the XML SOAP message contents may differ from the example shown below. The XML shown will be encased in a SOAP envelope, which will in turn be carried in an HTTP message. For more information, see the W3C web site at http://www.w3.org/TR/SOAP.

The following CLI command creates a Load Balancing virtual server:

> add lb vserver vipLB1 HTTP 10.100.101.1 80

Following is the corresponding API method:

> ns__addlbvserver (handle, “vipLB1”, “HTTP”, “10.100.101.1”, 80, &out);

The XML generated for this request is as follows.

```
<ns:addlbvserver>
<vServerName xsi:type="xsd:string" >vipLB1</vServerName>
<serviceType xsi:type="ns:vservicetypeEnum>HTTP</ serviceType>
<IPAddress xsi:type="xsd:string">10.100.101.1</IPAddress>
<port xsi:type="xsd:unsignedInt" >80</port>
< /ns:addlbvserver >
```

The XML response to the above request is as follows.

```
<ns:addlbvserverResponse>
<rc xsi:type="xsd:unsignedInt">0</rc>
<message xsi:type="xsd:string">Done</message>
</ns:addlbvserverResponse>
```

Example: Querying the Configuration

This example shows an API request that queries the configuration and receives a list of entities.

Note: The actual API method and the XML SOAP message contents may differ from the example shown below.

The following CLI command shows the configured Load Balancing virtual servers:

> show lb vservers

Sample output of the show lb vservers command is as follows.

```
> show lb vservers
2 configured virtual servers:
1)  vipLB1 (10.100.101.1:80) - HTTP Type: ADDRESS State:
   DOWN
   Method: LEASTCONNECTION Mode: IP
   Persistence: NONE
2)  vipLB2 (10.100.101.2:80) - HTTP Type: ADDRESS State:
   DOWN
   Method: LEASTCONNECTION Mode: IP
   Persistence: NONE
Done
```

Following is the corresponding API method to show the list of Load Balancing virtual servers.

ns__getlbvserver(handle, NULL, &out)

The XML generated for this request is as follows.

```
<ns:getlbvserver></ns:getlbvserver>
```

The XML response to the above request is as follows.

```
<ns:getlbvserverResponse>
   <rc xsi:type="xsd:unsignedInt">0</rc>
   <message xsi:type="xsd:string">Done</message>
   <List xsi:type="SOAP-ENC:Array"
      SOAP-ENC:arrayType="ns:lbvserver[2]">
      <item xsi:type="ns:lbvserver">
      <vServerName xsi:type="xsd:string>vipLB1
         </vServerName>
         <serviceType xsi:type="xsd:string>HTTP</ serviceType>
         <IPAddress xsi:type="xsd:string >10.100.101.1
         </IPAddress>
      <port xsi:type="xsd:unsignedInt">80</port>
   </item>
   <item xsi:type="ns:lbvserver">
```

```
            <vServerName xsi:type="xsd:string>vipLB2
            </vServerName>
            <serviceType xsi:type="xsd:string>HTTP</ serviceType>
            <IPAddress xsi:type="xsd:string >10.100.101.2
            </IPAddress>
               <port xsi:type="xsd:unsignedInt">80</port>
            </item>
         </List>
      </ns:getlbvserverResponse>
```

The Web Service Definition Language (WSDL)

The NetScaler WSDL describes services for the entire range of NetScaler services. The NetScaler provides two WSDL files:

NSConfig.wsdl

Configuration APIs are defined in this file. The NSConfig.wsdl file is found on the NetScaler at http://<NSIP>/api/NSConfig.wsdl, where <NSIP> is the IP address of your NetScaler. This file is much larger than the NSStat.wsdl file. With the help of a third-party tool (such as gSOAP), developers can use this file to generate client stubs. A custom application can then call the stubs to send requests to the NetScaler. The application can be in any standard programming language that is supported by the third-party tool. Common programming languages for this purpose include Perl, Java, C, and C#. You can use the filterwsdl command to select only the service definitions that are relevant to the API calls made in your script.

NSStat.wsdl

Statistical APIs are defined in this file. The NSStat.wsdl file is found on the NetScaler at http://<NSIP>/api/NSStat.wsdl, where <NSIP> is the IP address of your NetScaler.

Creating Client Applications with the NSConfig.wsdl File

A client application can be created by importing the NSConfig.wsdl file with the gSOAP WSDL Importer to create a header file with C or C++ declarations of the SOAP methods. The gSOAP compiler is then used to translate this header file into stubs for the client application.

1. Get the NSConfig.h header file from the WSDL file.

   a. Run the wsdl2h program that comes with gSOAP on the WSDL file. The wsdl2h program is in the following location.

      > ./wsdl2h NSConfig.wsdl

      The output of wsdl2h is as follows:

      ```
      **  The gSOAP WSDL parser for C and C++ 1.0.2
      **  Copyright (C) 2001-2004 Robert van Engelen, Genivia, Inc.
      **  All Rights Reserved. This product is provided "as is", without any warranty.
      Saving NSConfig.h
      Reading file 'NSConfig.wsdl'
      Cannot open file 'typemap.dat'
      Problem reading type map file typemap.dat.
      Using internal type definitions for C instead.
      ```

   b. Run the soapcpp2 program to compile the header file and complete the process, as shown below. > soapcpp2 NSConfig.h
2. Generate the XML files and stubs as follows:

   > ./soapcpp2 -c -i NSConfig.h

   Following is sample output for this command:

   ```
   **  The gSOAP Stub and Skeleton Compiler for C and C++ 2.4.1
   **  Copyright (C) 2001-2004 Robert van Engelen, Genivia, Inc.
   **  All Rights Reserved. This product is provided "as is", without any warranty.
   Saving soapStub.h
   Saving soapH.h
   Saving soapC.c
   Saving soapClient.c
   Saving soapServer.c
   Saving soapClientLib.c
   Saving soapServerLib.c
   Using ns1 service name: NSConfigBinding
   Using ns1 service location: http://NetScaler.com/api Using ns1 schema namespace: urn:NSConfig
   Saving soapNSConfigBindingProxy.h client proxy
   Saving soapNSConfigBindingObject.h server object
   ```

```
Saving NSConfigBinding.addserver.req.xml sample SOAP/XML request
Saving NSConfigBinding.addserver.res.xml sample SOAP/XML response
Saving NSConfigBinding.disableserver.req.xml sample SOAP/ XML request
Saving NSConfigBinding.disableserver.res.xml sample SOAP/ XML response
Saving NSConfigBinding.enableserver.req.xml sample SOAP/ XML request
Saving NSConfigBinding.enableserver.res.xml sample SOAP/ XML response
[ ... Similar lines clipped ... ]
Saving NSConfigBinding.nsmap namespace mapping table
Compilation successful
```

This creates the stub files soapC.c, soapClient.c and stdsoap2.c.

3. Link the stub files you created with your source code to create a stand-alone binary that invokes the API.

Filter WSDL

The NetScaler WSDL describes services for the entire range of NetScaler services. When you use the NetScaler API in your scripts, by linking to the WSDL and attempting to compile the application, the entire WSDL is included, unnecessarily increasing compilation time and the size of the program.

Filter WSDL is a tool for selecting only those service definitions from the NetScaler WSDL that are relevant to the API calls made in the script. You can use the filter WSDL tool to filter NSConfig.wsdl and NSStat.wsdl files.

The NetScaler provides two WSDL files, one for the configuration APIs (NSConfig.wsdl) and the other for statistical APIs (NSStat.wsdl). The WSDL file for the configuration API is much larger. Therefore, it is important to use filter WSDL when compiling programs written with the configuration API.

Filter WSDL is a program that works on the Windows, FreeBSD and Linux platforms, and it can be run from the CLI.

The syntax for running filter WSDL is as follows:

filterwsdl <fromwsdl> <pattern>

where:

fromwsdl = The wsdl file that you want to filter

pattern = API method names or patterns that should be filtered

For example, if you want to filter all the service definitions for the API method addlbvserver from the NetScaler WSDL file, NSConfig.wsdl, you can use the command:

> filterwsdl NSConfig.wsdl "addlbvserver"

The output of this command is sent to the screen by default, but it can be redirected to a file on the NetScaler by using the UNIX redirect operator (>). The output of the previous command can be saved into a file called NSConfig-Custom.wsdl by using the command as follows:

> filterwsdl NSConfig.wsdl "addlbvserver" > NSConfig-Custom.wsdl

In this case, the original WSDL file is 1.58 MB, but the filtered WSDL file is 6 KB.

The pattern used in the filterwsdl command can include the + and - operators and the wildcard operator (*) to create more generic filters.

For example, if you want to filter the service definitions for all the available load balancing methods, you can use the following command:

> filterwsdl NSConfig.wsdl "*lb"*

This command will filter all the Load Balancing methods but will also include GSLB methods, because the pattern lb will be matched by all GSLB methods also. To include only LB methods and exclude all GSLB methods, use the command as follows:

> filterwsdl NSConfig.wsdl +"*lb" -"glsb"*

Securing API Access

Secure access to CLI objects can be based on the NetScaler IP address or on the subnet IP address on which the NetScaler is deployed. To provide secured API access based on the NetScaler IP address, you must configure the NetScaler to use transparent SSL mode with clear text port.

To configure secure API access based on the NetScaler IP

1. Create a loopback SSL service and configure it use transparent SSL mode with clear text port:

   add service secure_xmlaccess 127.0.0.1 SSL 443 -clearTextPort 80

2. Add certificate and key:

   add certkey cert1 –cert /nsconfig/ssl/ssl/cert1024.pem –key /nsconfig/ssl/ssl/rsakey.pem

   Note: You can use an existing certificate and key or use the NetScaler Certificate Authority Tool to create a key and test certificate for secure access.

3. Bind the certificate and key to the service:

   bind certkey secure_xmlaccess cert1 -Service

4. Add a custom TCP monitor to monitor the SSL service you have added:

   add monitor ssl_mon TCP -destport 80

5. Bind the custom TCP monitor to the SSL service:

   bind monitor ssl_mon secure_xmlaccess

To configure secure API access based on the subnet IP

1. Create an SSL VIP in the appropriate subnet:

   add vserver <vServerName> SSL <Subnet-IP> 443

2. Create a loopback HTTP service:

   add service <serviceName> 127.0.0.1 HTTP 80

3. Bind the service to the SSL VIP:

   bind lb vserver <vServerName> <serviceName>

4. Add the certificate and the key:

   add certkey cert1 –cert /nsconfig/ssl/ssl/cert1024.pem –key /nsconfig/ssl/ssl/rsakey.pem

   Note: You can use an existing certificate and key or use the NetScaler Certificate Authority Tool to create a key and test certificate.

5. Bind the Certificate and the Key to the SSL VIP:

   bind certkey <vServerName> cert1

AppExpert

Contents

AppExpert

The following topics provide a conceptual reference and configuration instructions for the AppExpert and other features of the NetScaler appliance.

Action Analytics	Collects run-time statistics on the basis of pre-defined criteria. When used with policies, the feature also provides you with the infrastructure for automatic, real-time traffic optimization.
AppExpert Applications and Templates	Simplify configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, Access Gateway applications, and entity templates.
Entity Templates	Describes how to use entity templates to set up and configure individual NetScaler entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.
HTTP Callouts	An HTTP request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation.
Pattern Sets	Allow string matching during the evaluation of a default syntax policy.
Policies and Expressions	Rules that determine the operations that the NetScaler appliance must perform.
Rate Limiting	Defines the maximum load for a given network entity or virtual entity on the NetScaler appliance.
Responder	Bases responses on who sends the request, where it is sent from, and other criteria with security and system management implications.
Rewrite	Rewrites information in the requests or responses handled by the NetScaler appliance.
String Maps	Perform pattern matching in all NetScaler features that use the default policy syntax.

Action Analytics

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the action analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data (for example, URLs and HTTP methods) by configuring default syntax expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions tool in the configuration utility.

Action Analytics

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the action analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data (for example, URLs and HTTP methods) by configuring default syntax expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions tool in the configuration utility.

Configuring a Selector

A selector is a filter for identifying requests. It consists of up to five individual default syntax expressions that identify request attributes such as the client IP address and the URL in the request. Each expression is a non-compound default syntax expression and is considered to be in an AND relationship with the other expressions. Following are some examples of selector expressions:

- `HTTP.REQ.URL`
- `CLIENT.IP.SRC`
- `HTTP.RES.BODY(1000).AFTER_STR(\"<string>\").BEFORE_STR(\"<string>\")"`
- `CLIENT.IP.SRC.SUBNET(24)`

Selectors are used in rate limiting and action analytics configurations. A selector is optional in a rate limiting configuration, but is required in a action analytics configuration.

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

If you modify an expression in a selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a selector named myLimitSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1. If you change the expression in myLimitSelector1, you might receive an error when binding dnsRateLimit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

The NetScaler appliance provides the following built-in selectors for some of the most common use cases:

Table 1. Built-in Selectors

Selector	Selector Expressions
`Top_URL`	`HTTP.REQ.URL`
`Top_CLIENTS`	`CLIENT.IP.SRC`
`Top_URL_CLIENTS_LBVSERVER`	1. `HTTP.REQ.URL` 2. `CLIENT.IP.SRC` 3. `HTTP.REQ.LB_VSERVER.NAME`

Top_URL_CLIENTS_CSVSERVER	1. HTTP.REQ.URL 2. CLIENT.IP.SRC 3. HTTP.REQ.CS_VSERVER.NAME
Top_MSSQL_QUERY_DB_LBVSERVER	1. MSSQL.REQ.QUERY.TEXT 2. MSSQL.REQ.LB_VSERVER.NAME
Top_MYSQL_QUERY_DB_LBVSERVER	1. MYSQL.REQ.QUERY.TEXT 2. MYSQL.REQ.LB_VSERVER.NAME

You can also configure a selector with expressions that identify the request attributes of your choice. For example, you might want to create a record for a request that arrives with a specific header. To evaluate the header, you can add `HTTP.REQ.HEADER("<header_name>")` to the selector that you intend to use.

To configure a selector by using the command line interface

At the command prompt, type the following commands to configure a selector and verify the configuration:

- add stream selector <*name*> <*rule*> ...
- show stream selector

Example

```
> add stream selector myselector HTTP.REQ.URL CLIENT.IP.SRC
 Done
> show stream selector myselector
    Name: myselector
    Expressions:
        1) HTTP.REQ.URL
        2) CLIENT.IP.SRC
 Done
>
```

To modify or remove a selector by using the command line interface

- To modify a selector, type the set stream selector command, the name of the selector, and the rule parameter with the expressions. Enter the existing expressions that you want to retain, along with the new expressions that you want to add.
- To remove a selector, type the rm stream selector command and the name of the selector.

Parameters for configuring a selector

name

The name of the selector. Must begin with a letter, a number, or the underscore character (_). Additional characters allowed, after the first character, are the number sign (#), period (.), space ( ), colon (:), at sign (@), equal sign (=) and hyphen (-). If the name includes one or more spaces, enclose the name in quotation marks or single quotes (for example, "my selector" or 'my selector'). Maximum length: 31 characters.

rule

A set of up to five individual, non-compound default syntax expressions that are treated as being in a logical AND relationship with one another. Each expression identifies one component of a request or response. For example, the expression HTTP.REQ.URL identifies the URL component in the request, and CLIENT.IP.SRC identifies the client IP address.

You can change an expression if the selector is not yet specified in an identifier. If the selector is specified in an identifier, you can only change the order of the expressions, not the expressions themselves.

To configure a selector by using the configuration utility

1. Navigate to AppExpert > Action Analytics > Selectors.
2. In the details pane, do one of the following:
   - To create a selector, click Add.
   - To modify a selector, select the selector, and then click Open.
3. In the Create Limit Selector or Configure Limit Selector dialog box, set one or more of the following parameters:
   - Name
   - Expressions

     To add the expression to the selector configuration, click Add. To remove an expression from the selector configuration, in the Expression box, select the expression, and then click Remove.

     Note: In the Expressions box, enter a valid parameter. For example, enter `HTTP`. Then, enter a period after this parameter. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. To select the next keyword in this expression prefix, double-click the selection in the drop-down menu. The Expressions text box displays both the first and second keywords for the expression prefix, for example, `HTTP.REQ`. Continue adding expression components until the complete expression is formed.
4. Click Add.
5. Continue adding up to five non-compound expressions.
6. Click Create or OK.

Configuring a Stream Identifier

You configure a stream identifier to specify parameters for collecting statistical data from requests identified by a given selector. An identifier specifies the selector to be used, the statistics collection interval, the sample count, and the field on which the records are to be sorted.

The NetScaler appliance includes the following built-in stream identifiers for common use cases. All the built-in identifiers specify a sample count of 1 and an interval of 1 minute. Additionally, they sort the data on the REQUESTS attribute. They differ only in being associated with different built-in selectors. Each built-in identifier is associated with a built-in selector of the same name (for example, the built in identifier Top_URL is associated with the built-in selector Top_URL). Following are the built-in identifiers:

- Top_URL
- Top_CLIENTS
- Top_URL_CLIENTS_LBVSERVER
- Top_URL_CLIENTS_CSVSERVER
- Top_MSSQL_QUERY_DB_LBVSERVER
- Top_MYSQL_QUERY_DB_LBVSERVER

For more information about the built-in selectors, see "Configuring a Selector."

Note: The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

You cannot modify a built-in identifier's configuration. However, you can create an identifier with a configuration of your choice.

To configure a stream identifier by using the command line interface

At the command prompt, type the following commands to configure a stream identifier and verify the configuration:

- add stream identifier <*name*> <*selectorName*> [-interval <*positive_integer*>] [-SampleCount <*positive_integer*>] [-sort <*sort*>]
- show stream identifier <*name*>

Example

```
> add stream identifier myidentifier Top_URL -interval 10 -sampleCount 100
 Done
```

Parameters for configuring a stream identifier

name (Name)

A name for the stream identifier. Must begin with an ASCII alphabetic character or an underscore (_). After the first character, use only ASCII alphanumeric characters and underscores. Maximum length: 31 characters.

selectorName (Selector)

The name of the selector. Must begin with a letter, a number, or the underscore character (_). Additional characters allowed, after the first character, are the number sign (#), period (.), space ( ), colon (:), at sign (@), equal sign (=) and hyphen (-). If the name includes one or more spaces, enclose the name in quotation marks or single quotes (for example, "my selector" or 'my selector').

When this parameter is modified, the appliance flushes all the records that have been created for the stream identifier, including any records that have been created for pending or in-progress responses. For an in-progress response, the appliance does not replace the flushed record, and the data associated with that data transfer is lost.

Maximum length: 31 characters.

interval (Interval)

The number of minutes up to which an inactive record must be retained. Therefore, this is a record's expiry time. The interval is divided into four subintervals. When the interval progresses by a subinterval, the appliance discards one fourth of the data that it collected during the trailing subinterval. For example, an interval of 2 minutes is divided into four subintervals of 30 seconds each. Every 30 seconds, the appliance discards one-fourth of the data collected during the previous 30 seconds. Statistics for response times and concurrent connections are dynamic in nature, and depend on recent activity. Statistics for the number of requests and bandwidth consumption are also aged over the interval to eliminate stale data.

When this parameter is modified, the appliance flushes all accumulated session records, except any records that might be associated with pending or in-progress responses at the moment the parameter is modified. For records that might be associated with pending or in-progress responses, the appliance only updates the expiry time (interval time).

Maximum value: 4294967295. Default: 1.

sampleCount (Sample Count)

The size of the sample from which a request should be selected for evaluation. The smaller the sample count, the more accurate is the statistical data. If you want the appliance to evaluate all requests, set the sample count to 1. However, a setting of 1

can result in the consumption of a considerable amount of memory and processing resources.

When this parameter is modified, the appliance flushes all accumulated session records, except any records that might be associated with pending or in-progress responses at the moment the parameter is modified. For records that might be associated with pending or in-progress responses, the appliance only updates the expiry time (interval time).

Minimum value: 1. Maximum value: 4294967295. Default: 1.

sort (Sort)

Sort the records, in descending order of their values in the specified statistics column. This sorting is performed during data collection, and it enables the evaluation of the data through NetScaler policies (for example, compression and caching policies) that use functions such as `IS_TOP(n)`.

When this parameter is modified, the appliance flushes all accumulated session records, except any records that might be associated with pending or in-progress responses at the moment the parameter is modified. For records that might be associated with pending or in-progress responses, the appliance only updates the expiry time (interval time).

Possible values: REQUESTS, CONNECTIONS, RESPTIME, BANDWIDTH, NONE. Default: REQUESTS.

To configure a stream identifier by using the configuration utility

1. Navigate to AppExpert > Action Analytics > Stream Identifiers.
2. In the details pane, do one of the following:
   - To create a stream identifier, click Add.
   - To modify a stream identifier, select the identifier, and then click Open.
3. In the Configure Stream Identifier dialog box, set one or more of the following parameters:
   - Name
   - Selector
   - Interval
   - Sample Count
   - Sort
4. Click Create or OK, and then click Close.

Viewing Statistics

You can view the collected statistics in tabular format in the command-line interface and in graphical format in the configuration utility.

The following table describes the collected statistics:

Table 1. Statistical Information Displayed for a Stream Identifier

Statistics	Column name in the output of the stat stream identifier <*identifier name*> command	Description
Number of requests	`Req`	The number of requests for which records were created in the last `<interval>` number of minutes.
Bandwidth consumed	`BandW`	The total bandwidth consumed by the requests that were received in the last `<interval>` number of minutes. The total bandwidth of a request is the bandwidth consumed by the request and its response. The value is rounded off to the next higher or next lower integer value. Consequently, it might differ slightly from the expected value. For example, if a request's total bandwidth consumption is 2.2 KB, one instance of the request might be shown as having consumed 2 KB and two instances might be shown as having consumed 4 KB, but three instances might be shown as having consumed 7 KB.
Response time	`RspTime`	The average response time for all the requests received in the last `<interval>` number of minutes.

Concurrent connections	Conn	The total number of concurrent connections that are currently open.

To view the statistical data collected for a stream identifier by using the command line

At the command prompt, type:

stat stream identifier <name> [<pattern> ...] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-sortBy <sortBy> [<sortOrder>]

Examples

Example 1 sorts the output on the BandW column, in the descending order. Example 2 sorts the output in Example 1, on the Req column, and in the ascending order

Example 1

```
> stat stream identifier myidentifier -sortBy BandW Descending -fullValues
Stream Session statistics
              Req          BandW
User1         508         125924
User2        5020          12692
User3        2025           4316

           RspTime          Conn
User1        5694             0
User2         109             0
User3           3             0
 Done
```

Example 2

```
> stat stream identifier myidentifier -sortBy Req Ascending –fullValues
Stream Session statistics
              Req          BandW
User1         508         125924
User3        2025           4316
User2        5020          12692

           RspTime          Conn
User1        5694             0
User3           3             0
User2         109             0
 Done
```

Parameters for viewing the statistical data collected for a stream identifier

name (Name)

The name of the identifier. Maximum length: 127.

fullValues

Display the complete row title. If you do not specify this option, the row title is shortened to reduce the width of the display. Only the first few characters and the last few characters of each row title are displayed, separated by a string of periods. For example, the row title `/mypagename.html` is shortened to `/myp....html`.

ntimes

Run the command `n` times, once every 7 seconds.

logFile

The name of a log file that contains the data that you want the appliance to analyze. Possible values: `NSLOG`, `NONE`. Default: `NSLOG`.

sortBy

Sort the output on the specified attribute, in the order specified for the sortOrder parameter. Possible values: `BandW`, `Conn`, `Req`, and `RspTime`.

sortOrder

The order in which you want to sort the output. Possible values: Ascending, Descending. Default: Descending.

To view the statistical data collected for a stream identifier by using the configuration utility

1. Navigate to AppExpert > Action Analytics > Stream Identifiers.
2. Select the stream identifier whose sessions you want to view, and then click Stream Sessions. For information about how you can group the output on the basis of the values collected for various selector expressions, see "Grouping Records on Attribute Values."

Grouping Records on Attribute Values

Statistical information such as the number of times a particular URL has been accessed overall and per client, and the total number of GET and POST requests per client can provide valuable insights into whether any of your resources need to be expanded to meet the demand or be optimized for delivery. To obtain such statistics, you must use an appropriate set of selector expressions, and then use the pattern parameter in the stat stream identifier command. The grouping is based on the pattern that is specified in the command. Grouping can be performed concurrently on the values of multiple expressions.

In the command-line interface, you can group the output by using patterns of your choice. In the configuration utility, the pattern depends on the choices you make when drilling down through the values of various selector expressions. For example, consider a selector that has the expressions `HTTP.REQ.URL`, `CLIENT.IP.SRC`, and `HTTP.REQ.LB_VSERVER.NAME`, in that order. The statistics home page displays icons for each of these expressions. If you click the icon for `CLIENT.IP.SRC`, the output is based on the patterns `* ? *`. The output displays statistics for each client IP address. If you click an IP address, the output is based on the patterns `* <IP address> ?` and `? <IP address> *` where `<IP address>` is the IP address you selected. In the resulting output, if you click a URL, the pattern used is `<URL> <IP address> ?`.

To group the records on the values of selector expressions by using the command line interface

At the command prompt, enter the following command to group the records on the basis of a selector expression:

stat stream identifier <name> [<pattern> ...]

Examples

Each example uses a different pattern to demonstrate the effect of the pattern on the output of the stat stream identifier command. The selector expressions are `HTTP.REQ.URL` and `HTTP.REQ.HEADER("UserHeader")`, in that order. The requests contain a custom header whose name is `UserHeader`. Note that in the examples, a given statistical value changes as determined by the grouping, but the sum total of the values for a given field remains the same.

Example 1

In the following command, the pattern used is `? ?`. The appliance groups the output on the values collected for both selector expressions. The row headers consist of the expression values separated by a question mark (?). The row with the header `/mysite/mypage1.html?Ed` displays statistics for requests made by user `Ed` for the URL `/mysite/mypage1.html`.

> stat stream identifier myidentifier ? ? -fullValues
Stream Session statistics

```
                                  Req             BandW
/mysite/mypage2.html?Grace          1              2553
/mysite/mypage1.html?Grace          2                 4
/mysite/mypage1.html?Ed             8                16
/mysite/mypage2.html?Joe            1              2554
/mysite/mypage1.html?Joe            5                10
/mysite/?Joe                    1               4

                               RspTime            Conn
/mysite/mypage2.html?Grace          0                 0
/mysite/mypage1.html?Grace          0                 0
/mysite/mypage1.html?Ed             0                 0
/mysite/mypage2.html?Joe            0                 0
/mysite/mypage1.html?Joe            0                 0
/mysite/?Joe                    6               0
 Done
```

Example 2

In the following command, the pattern used is `* ?`. The appliance groups the output on the values accumulated for the second expression `HTTP.REQ.HEADER("UserHeader")`. The rows display statistics for all requests made by users `Grace`, `Ed`, and `Joe`.

```
> stat stream identifier myidentifier * ?
Stream Session statistics
            Req    BandW  RspTime    Conn
Grace         3     2557       0       0
Ed            8       16       0       0
Joe           7     2568       6       0
 Done
```

Example 3

In the following command, the pattern used is `? *`, which is the default pattern. The output is grouped on the values collected for the first selector expression. Each row displays statistics for one URL.

```
> stat stream identifier myidentifier ? * -fullValues
Stream Session statistics
                              Req             BandW
/mysite/mypage2.html            2              5107
/mysite/mypage1.html           15                30
/mysite/                        1                 4

                              RspTime            Conn
/mysite/mypage2.html            0                 0
/mysite/mypage1.html            0                 0
/mysite/                        6                 0
 Done
```

Example 4

In the following command, the pattern used is `* *`. The appliance displays one set of collective statistics for all the requests received, with no row title.

```
> stat stream identifier myidentifier * *
Stream Session statistics
            Req    BandW  RspTime     Conn
             18     5141        6        0
 Done
```

Example 5

In the following command, the pattern is `/mysite/mypage1.html *`. The appliance displays one set of collective statistics for all the requests received for the URL `/mysite/mypage1.html`, with no row title.

```
> stat stream identifier myidentifier /mysite/mypage1.html *
Stream Session statistics
            Req    BandW  RspTime     Conn
             15       30        0        0
 Done
```

Parameters for grouping records on the values of selector expressions

name

The name of the stream identifier for which you want to view statistics.

pattern

A pattern consisting of asterisks (*) and question marks (?). The pattern can also begin with a text string. Each element in the pattern has a one-to-one correspondence with the expressions in the selector that is configured for the stream identifier. A question mark specifies that the values accumulated for the corresponding selector expression must be considered when grouping is performed on the records. Values on which grouping is performed are displayed in the output as row titles. If two or more fields have to be considered for grouping, they are separated by a question mark in the output. An asterisk specifies that the values accumulated for the corresponding expression must not be considered when grouping is performed on the records.

As an example, consider that you have configured a selector that consists of the expressions `HTTP.REQ.URL` and `CLIENT.IP.SRC` (in that order), and that the appliance has accumulated records of a number of requests for two URLs, `example.com/abc.html` and `example.com/def.html`, from two client IP addresses, 192.0.2.10 and 192.0.2.11.

With a pattern of `? ?`, the appliance performs grouping on both fields and displays statistics for the following:

- Requests for `example.com/abc.html` from 192.0.2.10, with a row title of `example.com/abc.html?192.0.2.10`.
- Requests for `example.com/abc.html` from 192.0.2.11, with a row title of `example.com/abc.html?192.0.2.11`.
- Requests for `example.com/def.html` from 192.0.2.10, with a row title of `example.com/def.html?192.0.2.10`.
- Requests for `example.com/def.html` from 192.0.2.11, with a row title of `example.com/def.html?192.0.2.11`.

With a pattern of `* ?`, the appliance performs grouping on only the client IP address values and displays statistics for the following requests:

- All requests from 192.0.2.10, with the IP address as the row title.
- All requests from 192.0.2.11, with the IP address as the row title.

With a pattern of `? *`, the appliance performs grouping on only the URL values and displays statistics for the following requests:

- All requests for `example.com/abc.html`, with the URL as the row title.
- All requests for `example.com/def.html`, with the URL as the row title.

With a pattern of `* *`, the appliance displays one set of collective statistics for all the requests received, with no row title.

If the pattern begins with a text string, the appliance performs a lookup for all the records that have the string in the first field. For example, if the pattern in the previous example is changed to `example.com/abc.html ?`, the appliance displays statistics for requests for `example.com/abc.html` from each unique client IP address. A string can be used only for the first selector expression.

The one-to-one correspondence with the selector expressions means that the pattern can have a maximum of five elements. If you do not specify a pattern, the appliance assumes a pattern of `? * * * *` and groups the records on the values of the first expression in the selector. Maximum length: 639.

To group the records on the values of selector expressions by using the configuration utility

1. Navigate to AppExpert > Action Analytics > Stream Identifiers.
2. In the details pane, click the stream identifier for which you want to view statistics, and then click Stream Sessions.
3. On the Home page, click the icon for the stream selector by which you want to group the output.
4. To return to the Home page from the statistics page for a selector expression, click Home.
5. To view statistics for the value of a given selector expression, click the value. You can repeat this step for a selector expression value in each subsequent output until you obtain the statistics you want.

Clearing a Stream Session

You can flush all the records that have been accumulated for a stream identifier.

To clear a stream session by using the command line interface

At the command prompt, enter the following commands to clear a stream session and verify the results:

- clear stream session <name>
- stat stream identifier <name>

Example

This example uses the stat stream identifier command first, so that a comparison can be made with the stat stream identifier command that is used for verifying the result of the clear stream session command.

```
>stat stream identifier myidentifier
Stream Session statistics
                Req    BandW  RspTime     Conn
/aed....html      2        0        0        0
/               636      303       12        0
 Done
>clear stream session myidentifier
 Done
>stat stream identifier myidentifier
 Done
```

To clear a stream session by using the configuration utility

1. Navigate to AppExpert > Action Analytics > Stream Identifiers.
2. Select the stream identifier whose sessions you want to clear, and then click Clear Sessions.

Configuring a Policy for Analyzing and Optimizing Traffic

To put the selector-identifier pair in your action analytics configuration into effect, you must associate the pair with the point in the traffic flow at which you want to collect statistics. You can do so by configuring a default syntax policy and referencing the stream identifier from the policy rule. You can use compression policies, caching policies, rewrite policies, application firewall policies, responder policies, and any other policies whose action is based on a Boolean expression.

The action analytics feature introduces a set of default syntax expressions and functions for collecting and evaluating data. The expression `ANALYTICS.STREAM(<identifier_name>)` is used for referencing the identifier that you want to use. The expression `COLLECT_STATS` is used to collect statistical data. Functions such as `IS_TOP(<uint>)` and `IS_TOP_FREQUENTS(<uint>)` are used for making automatic, real-time traffic optimization decisions.

- **IS_TOP(<number>).** Finds if a given object is in the top <number> of elements. For example, is the element among the top 10 elements. When multiple elements have the count, they are considered to be similar in nature. The sort function must be turned on to avoid an undef condition.

- **IS_TOP_FREQUENTS(<frequency>).** Finds if a given object is in the top <frequency> of the elements that are in the top elements. For example, is the element among the top 50% of all the top elements maintained. Elements having the same values are considered similar in nature. The sort function must be turned on to avoid an undef condition.

It is your policy configuration that determines whether the NetScaler appliance must only collect data from traffic or also perform an action. If the appliance must only collect statistical data, you can configure a policy with the rule `ANALYTICS.STREAM(<identifier_name>).COLLECT_STATS` and the action `NOOP`. The NOOP policy must be the policy with the highest priority at the bind point. This policy is sufficient if you are only collecting statistics. Traffic optimization decisions, such as what to compress or cache, must be based on manual, periodic evaluation of the statistical data.

If, in addition to collecting statistics, the appliance must also perform an action on the traffic, you must configure the gotoPriorityExpression parameter of the NOOP policy such that another policy that has the desired rule and action is evaluated subsequently. This second policy must have a rule that begins with the `ANALYTICS.STREAM(<identifier_name>)` prefix and a function that evaluates the data.

Following is an example of two responder policies that are configured and bound globally. The policy `responder_stat_collection` enables the appliance to collect statistics based on the identifier, `myidentifier`. The policy `responder_notify` evaluates the data that is collected.

Example

```
> add responder action send_notification respondwith '"You are in the Top 10 list for bandwidth consumption
 Done
> add responder policy responder_stat_collection' ANALYTICS.STREAM("myidentifier").COLLECT_STATS' NOOP
Done
> add responder policy responder_notify 'ANALYTICS.STREAM("myidentifier").BANDWIDTH.IS_TOP(10)' send_n
 Done
> bind responder global responder_stat_collection 10 NEXT
 Done
> bind responder global responder_notify 20 END
 Done
```

Use Case: Limiting Bandwidth Consumption per User or Client Device

Your web site, application, or file hosting service has finite network and server resources available to it to serve all its users. One of the most important resources is bandwidth. Substantial bandwidth consumption by only a subset of the user base can result in network congestion and reduced resource availability to other users. To prevent network congestion, you might have to limit a client's bandwidth consumption by using temporary service denial techniques such as responding to a client request with an HTML page if it has exceeded a preconfigured bandwidth value over a fixed time period leading up to the request.

In general, you can regulate bandwidth consumption either per client device or per user. This use case demonstrates how you can limit bandwidth consumption per client to 100 MB over a time period of one hour. The use case also demonstrates how you can regulate bandwidth consumption per user to 100 MB over a time period of one hour, by using a custom header that provides the user name. In both cases, the tracking of bandwidth consumption over a moving time period of one hour is achieved by setting the interval parameter in the stream identifier to 60 minutes. The use cases also demonstrate how you can import an HTML page to send to a client that has exceeded the limit. Importing an HTML page not only simplifies the configuration of the responder action in these use cases, but also simplifies the configuration of all responder actions that need the same response.

To limit bandwidth consumption per user or client device by using the command line interface

In the command-line interface, perform the following tasks to configure action analytics for limiting a client's or user's bandwidth consumption. Each step includes sample commands and their output.

1. **Set up your load balancing configuration.** Configure load balancing virtual server `mysitevip`, and then configure all the services that you need. Bind the services to the virtual server. The following example creates ten services and binds the services to `mysitevip`.

   ```
   > add lb vserver mysitevip HTTP 192.0.2.17 80
    Done
   > add service service[1-10] 192.0.2.[240-249] HTTP 80
   service "service1" added
   service "service2" added
   service "service3" added
   .
   .
   .
   service "service10" added
    Done
   > bind lb vserver vserver1 service[1-10]
   service "service1" bound
   ```

```
service "service2" bound
service "service3" bound
.
.
.
service "service10" bound
 Done
```

2. **Configure the stream selector.** Configure one of the following stream selectors:

   - To limit bandwidth consumption per client, configure a stream selector that identifies the client IP address.

     ```
     > add stream selector myselector CLIENT.IP.SRC
      Done
     ```

   - To limit bandwidth consumption per user on the basis of the value of a request header that provides the user name, configure a stream selector that identifies the header. In the following example, the name of the header is `UserHeader`.

     ```
     > add stream selector myselector HTTP.REQ.HEADER(“UserHeader”)
      Done
     ```

3. **Configure a stream identifier.** Configure a stream identifier that uses the stream selector. Set the interval parameter to 60 minutes.

   ```
   > add stream identifier myidentifier myselector -interval 60 -sampleCount 1 -sort BANDWIDTH
    Done
   ```

4. **Configure the responder action.** Import the HTML page that you want to send to users or clients that have exceeded the bandwidth consumption limit, and then use the page in responder action `crossed_limits`.

   ```
   > import responder htmlpage http://192.0.2.20:80/stdpages/wait.html crossed-limits.html
   This operation may take some time, Please wait...

    Done
   > add responder action crossed_limits respondwithhtmlpage crossed-limits.html
    Done
   ```

5. **Configure the responder policies.** Configure responder policy `myrespol1` with the rule `ANALYTICS.STREAM("myidentifier").COLLECT_STATS` and the action `NOOP`. Then, configure policy `myrespol2` for determining whether a client or user has crossed the 100 MB limit. The policy `myrespol2` is configured with the responder action `crossed_limits`.

   ```
   > add responder policy myrespol1 'ANALYTICS.STREAM("myidentifier").COLLECT_STATS' NOOP
    Done
   > add responder policy myrespol2 'ANALYTICS.STREAM("myidentifier").BANDWIDTH.GT(1048576)' crossed_
    Done
   ```

6. **Bind the responder policies to the load balancing virtual server.** The policy `myrespol1`, which only collects statistical data, must have the higher priority and a GOTO expression of `NEXT`.

```
> bind lb vserver mysitevip -policyName myrespol1 -priority 1 -gotoPriorityExpression NEXT
 Done
> bind lb vserver mysitevip -policyName myrespol2 -priority 2 -gotoPriorityExpression END
 Done
```

7. **Test the configuration.** Test the configuration by sending test HTTP requests, from multiple clients or users, to the load balancing virtual server and using the stat stream identifier command to view the statistics that are collected for the specified identifier. The following output displays statistics for clients.

```
> stat stream identifier myidentifier -sortBy BandW –fullValues
Stream Session statistics
                    Req         BandW
192.0.2.30          5000         3761
192.0.2.31          29          2602
192.0.2.32          25          51

                    RspTime     Conn
192.0.2.30          2           0
192.0.2.31          0           0
192.0.2.32          0           0
 Done
>
```

AppExpert Applications and Templates

An AppExpert application is a collection of configuration information that you set up on the Citrix NetScaler appliance for securing and optimizing traffic for a Web application, such as Microsoft SharePoint. Managing AppExpert applications is simplified by a graphical user interface (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Additionally, it consolidates all deployment tasks in one view, so you can quickly configure target IP addresses for clients and specify host servers.

Prebuilt application templates for widely used Web applications, such as Microsoft Outlook Web Access and Microsoft SharePoint, are available on the AppExpert Templates page of the Citrix Community website at "http://community.citrix.com/display/ns/AppExpert+Templates."

Each prebuilt template provides you with an initial configuration for managing the associated Web application. You can customize prebuilt application templates for your organization. If a prebuilt application template does not suit your requirements, you can create a custom application without using a template.

Regardless of whether you use a prebuilt application template or you create a custom application, you can export the configuration to a template file. You can then share the template with other administrators or import the template to other NetScaler appliances that require a similar AppExpert application configuration.

To get started with an AppExpert application, you must first obtain the appropriate application template and import the template to the NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

AppExpert Application Terminology

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

Public Endpoint. The IP address and port combination at which the NetScaler appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent to a public endpoint. An AppExpert application can be assigned multiple endpoints. You configure public endpoints after you import a template.

Application Unit. An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The NetScaler services associated with these policies are Compression, Caching, Rewrite, Responder, and application firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units, thereby ensuring that all client requests are processed.

Application units and their associated rules, policies, and actions are included in AppExpert application templates.

Service. The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format <IP address>:<Port>. A web application that serves a large number of requests is usually hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the NetScaler appliance. Services are deployment-specific, and are therefore not included in templates. You must configure services after you import a template.

Application Unit Rule. Either a classic expression or a default syntax expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a default syntax expression that identifies a traffic subset that consists of four image types:

```
HTTP.REQ.URL.SUFFIX.EQ("bmp") || HTTP.REQ.URL.SUFFIX.EQ("gif") ||
HTTP.REQ.URL.SUFFIX.EQ("png") || HTTP.REQ.URL.SUFFIX.EQ("jpg")
```

For more information about default syntax expressions and classic policy expressions, see "Policies and Expressions."

Traffic Subset. A set of client requests that require a common set of traffic optimization and security policies. A traffic subset is managed by an application unit and is defined by a rule.

How an AppExpert Application Works

When the endpoint receives a client request, the NetScaler appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.

If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

Getting Started with an AppExpert Application

The process of setting up an AppExpert application begins with downloading the appropriate AppExpert application template from the Citrix Community Web site at "http://community.citrix.com/display/ns/AppExpert+Templates." The template that you need depends on the NetScaler release running on your appliance.

After you download the template, you must import the template to the NetScaler appliance, configure deployment settings, and then verify the configuration to make sure that the AppExpert application is working as expected.

Importing an AppExpert Application Template

You can either import the template file directly from your local computer or upload the template to the appliance and then import it. For more information about uploading a template to the NetScaler appliance, see "Uploading and Downloading Template Files."

During import, along with the template file that you specify in the AppExpert Template Wizard, you can include a deployment file that contains deployment details. If you choose to include a deployment file, you do not have to provide any additional information. All application-configuration information is imported from the template file, and all deployment-specific information for the application is imported from the deployment file. The NetScaler appliance imports all configuration settings from the deployment file through the NITRO API, and the wizard displays the configuration summary screen for your verification. If you do not include a deployment file, the wizard displays screens on which you can specify deployment information. During import, if an error occurs, any changes are automatically rolled back, preserving the configuration that was in place before you attempted to import the AppExpert application. For more information about the format of application templates and deployment files, see "Understanding NetScaler Application Templates and Deployment Files." For more information about how the template and deployment files are imported through the NITRO API, see "NITRO API."

Note: The deployment file must contain information about only one public endpoint. Additionally, the application template file and the deployment file must be valid XML files. You cannot import a template file that is in GZIP format.

During import, you can configure only one public endpoint, but you can specify as many services and service groups as you want the AppExpert application to manage. After you import the template, you can specify additional endpoints, services, and service groups for the configuration. If the public endpoint that you configure during import uses the HTTPS protocol, and you are not providing a deployment file, you must also specify a server certificate for the public endpoint. Additionally, if variables have been configured for the template, a Specify Variable Values page appears in the wizard. On this page, you can choose to specify new values for the variables. Configuring deployment settings (a minimum of one public endpoint and one or more services) during template import is not mandatory; you can choose to skip these steps during import and, instead, configure these settings after you import the template. Note, however, that you can configure additional AppExpert

application features, such as AAA, only after you specify at least one public endpoint.

For more information about configuring endpoints after you import a template, see "Configuring Public Endpoints." For more information about configuring services and service groups after you import a template, see "Configuring Services and Service Groups." For more information about configuring variables for a NetScaler application, see "Creating Variables in Application Templates."

To import an AppExpert application template to the NetScaler appliance

1. Navigate to AppExpert > Applications.
2. In the details pane, click Applications, and then click Import.
3. Follow the instructions in the AppExpert Template Wizard.

Verifying and Testing the Configuration

Verification is an important step in the process of setting up the NetScaler application. Before you proceed with other configuration tasks, you must verify that the state of the entities, such as endpoints and application units, are UP, and then test the entities for correct processing.

Verifying the Configuration

The graphical user interface (GUI) includes icons that indicate the states of the entities in the AppExpert application. These icons are displayed for applications and application units and are based on the health checks that the NetScaler appliance performs periodically on services and entities. The following table lists the icons and describes their meanings.

Table 1. Descriptions of State Indicator Icons

Icon	Entity	Indicates that
	Application	At least one public endpoint is up. The application will accept client requests from the public endpoints that are up.
	Application unit	The application unit is up. The application unit is up when at least one service or service group is up.
	Application	The public endpoint is out of service (disabled). This indicator is displayed when only one public endpoint is configured for the AppExpert application.
	Application	All the endpoints that are configured for the application are out of service. This indicator is displayed only when multiple endpoints are configured for the application.
	Application unit	All the services configured for the application unit are down.

You must ensure that the icons for each application and its application units are green at all times. If the icon that is displayed for an application is not green, verify that you have

configured the public endpoints correctly. If the icon that is displayed for an application unit is not green, verify that the services are configured correctly. However, note that a green indicator does not mean that the state of all associated entities is UP. It only means that the application has sufficient resources (endpoints and services) to serve client requests. To verify that the state of all associated entities is UP, check the health of all the entities on the statistics page for the application. For more information about viewing the application statistics page, see "Viewing Application Statistics."

Testing the Configuration by Using Hit Counters

You can test the configuration by sending test HTTP requests for web application content through the NetScaler appliance, and then verifying that the requests are being processed by the right application units, by viewing the hit counters for the various AppExpert application entities. For example, to verify that the endpoint is receiving requests, you can view the hit counter for the AppExpert application. To verify that the configured application unit rules are being matched as expected, you can view the hit counters for the AppExpert application units.

Note: To view hit counters for policies and actions that are configured for AppExpert applications, you must go to the associated feature node. For example, to view the hit counter for a Rewrite policy that is configured for an AppExpert application, you must go to the Rewrite feature node in the NetScaler configuration utility.

For a test example, consider an AppExpert application that includes an application unit called "WebPages" for processing web page content, and an application unit called "Images" for processing images. In this example, the rule that is configured for the WebPages application unit includes an expression that checks whether an HTML file is being requested. The Images application unit includes an expression that checks whether an image file is being requested.

Consider an HTML file called sitehome.html, located at /var/www/html/myapplicationpages/, on a backend server with an IP address of 192.0.2.10. In addition to HTML content, the HTML file also references images stored on the server. An HTTP request for the HTML file, sent directly to the server, would be as follows:

```
http://192.0.2.10/myapplicationpages/sitehome.html
```

To send a test request for this file through the NetScaler appliance, in the URL, replace the IP address of the server with the IP address of the public endpoint that is configured for the AppExpert application. For example, if the IP address of the public endpoint is 192.0.2.11, your test URL would be as follows:

```
http://192.0.2.11/myapplicationpages/sitehome.html
```

After you send the request, you must view the hit counter for the application to verify that the public endpoint received the request, view the hit counter for the WebPages application unit to verify that the request for the HTML file matched the rule configured for the application unit, and view the hit counter for the Images application unit to verify that the requests for the images matched the rule configured for the application unit.

For the application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints, and the total hit count.

To view the hit counter for an application or application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, click the application or application unit for which you want to view the hit counter.
3. Click Hits.

Customizing the Configuration

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

You can configure public endpoints and services for the AppExpert application and specify only a subset of the endpoints and services for each application unit. When you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for the new traffic subset or modify an existing application unit rule. You can also specify the order of evaluation of the traffic subsets that the AppExpert application manages.

Finally, you can modify the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.

The order in which you perform these tasks depends on your requirement. However, before you configure a service for an application, you must configure the service for the parent application.

Configuring Public Endpoints

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click Activate All.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
   - If you want to create a new public endpoint, click Add. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click OK.

     In the Create public endpoint dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, provide additional settings, and then click OK.

     For more information about the parameters in the Create public endpoint and Configure Public Endpoint dialog boxes, see "Content Switching."
   - If you want to modify a public endpoint, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, modify settings for the endpoint, and then click OK.

     For more information about the parameters in the Configure Public Endpoint dialog box, see "Content Switching."
4. Click Close.

Configuring Endpoints for an Application Unit

When you configure multiple public endpoints for an AppExpert application, by default, all endpoints are bound to each application unit, and each application unit processes the requests received by all the endpoints. However, you can specify that a given application unit manages the traffic that is received by only a subset of the endpoints that are configured for the AppExpert application.

To configure endpoints for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application unit, do one of the following:
   - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click OK.

Configuring Services and Service Groups

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click Configure Backend Services.
3. In the Configure Backend Services dialog box, do one of the following:
   - To configure services, click the Services tab.
   - To configure service groups, click the Service Groups tab.
4. On the Service or Service Groups tab, do one of the following:
   - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
   - If you want to specify all the services or service groups, click Activate All.
   - If you want to create a new service or service group, click Add. Then, in the Create Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click Create.
   - If you want to modify a service, click the service, and then click Open. Then, in the Configure Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click OK.

For information about the settings in the Create Service, Configure Service, and Create Service Group dialog boxes, see "Load Balancing."

Configuring Services, Service Groups, and Load Balancing Parameters for an Application Unit

When you configure services and service groups for an AppExpert application, by default, all the services and service groups are bound to each application unit. However, depending on how you have configured your web application, the application resources that are managed by an application unit might be hosted on only some of the servers that are configured as services for the AppExpert application. Or, a set of servers might host content that is meant for the requests received at one or more specific public endpoints. In such scenarios, if all the services and service groups that are configured for the AppExpert application are associated with the application unit, a request that is forwarded to a server that does not host the requested content might not be served or might be served incorrect content. Therefore, you must ensure that each application unit is configured to manage only those services that can serve the requested content.

When configuring services and service groups for an application unit, you might choose to specify load balancing settings such as the weights that services must be assigned and the desired load balancing, persistence, and spillover methods. For more information about these settings, see Load Balancing.

To configure services or service groups for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click Configure Backend Services.
3. In the Configure Backend Services dialog box, do one of the following:
   - To configure services, click the Services tab.
   - To configure service groups, click the Service Groups tab.
4. In the Services or Service Groups tab, do one of the following:
   - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.
   - To specify all services or service groups, click Activate All.
5. On the Method and Persistence and Advanced tabs, specify the desired parameters.
6. Click OK.

Creating Application Units

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. In the **Create** Application Unit dialog box, specify values for the following parameters:
   - Name*—The name that you want to assign to the application unit.
   - Rule*—The rule that identifies the traffic subset that the application unit will manage.
   - Classic Syntax—To specify that you want to configure a classic expression in the Rule box, click this option button.
   - Default Syntax—To specify that you want to configure a default syntax expression in the Rule box, click this option button.

   *A required parameter
4. Click Create.

Configuring Application Unit Rules

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Applications.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click Open.
3. In the Configure Application Unit dialog box, do the following:
   a. To specify the format of the new expression, do one of the following:
      - To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
      - To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
   b. In the Rule box, configure the expression.
4. Click OK.

Specifying the Order of Evaluation of Application Units

Application unit rules are evaluated in the order in which they are placed in the graphical user interface (GUI). The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units

1. Navigate to AppExpert > Applications.
2. In the details pane, do the following:
   - To move an application unit up by one step, right-click the application unit, and then click Move Up.
   - To move an application unit down by one step, right-click the application unit, and then click Move Down.

Configuring Policies for Application Units

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

Note: When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or default syntax. Additionally, when you configure default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks. For information about configuring policies and expressions in both formats, see "Policies and Expressions."

Configuring Compression Policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click Switch to Default Syntax if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click Switch to Classic Syntax to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.

     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the default syntax view, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit.
   - If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

     You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.

     For information about modifying a compression policy, see "Compression."
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Compression Policy dialog box, configure the policy, and then click Create.

     For information about modifying a compression policy, see "Compression."
   - If you are configuring a default syntax expression, do the following:
     - In the Goto Expression column, select a Goto expression.
     - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click Apply Changes, and then click Close.

Configuring Caching Policies

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the Configure Cache Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

     You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Cache Policy dialog box, modify the policy, and then click OK.

     For information about modifying a Caching policy, see "Integrated Caching."
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Cache Policy dialog box, configure the policy, and then click Create.

     For information about modifying a Caching policy, see "Integrated Caching."
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click Apply Changes, and then click Close.

Configuring Rewrite Policies

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the Configure Rewrite Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

     You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click OK.

     For information about modifying a Rewrite policy, see "Rewrite."
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Rewrite Policy dialog box, configure the policy, and then click Create.

     For information about modifying a Rewrite policy, see "Rewrite."
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click Apply Changes, and then click Close.

Configuring Responder Policies

You can use only default syntax policies and expressions to configure Responder policies.

To configure Responder policies for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the Configure Responder Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Responder Policy dialog box, modify the policy, and then click OK.

     For information about modifying a Responder policy, see "Responder."
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Responder Policy dialog box, configure the policy, and then click Create.

     For information about modifying a Responder policy, see "Responder."
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click Apply Changes, and then click Close.

Configuring Application Firewall Policies

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Application Firewall column.
3. In the Configure Application Firewall Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.

     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.
   - To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK.

     For information about modifying a application firewall policy, see "Policies."
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Application Firewall Policy dialog box, configure the policy, and then click Create.

     For information about modifying a application firewall policy, see "Policies."
4. Click Apply Changes, and then click Close.

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer

The Application Visualizer is a graphical representation of an AppExpert application. The Visualizer displays the public endpoints, application units, backend services, and policies that are configured for the application. You can use the Visualizer to obtain a visual overview of an AppExpert application's configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

You can also use the Application Visualizer to monitor some AppExpert application parameters. For more information about monitoring application parameters by using the Application Visualizer, see "Monitoring an Application by Using the Application Visualizer."

To view an AppExpert application by using the Application Visualizer

1. Navigate to AppExpert > Applications.

2. In the details pane, click the name of the application that you want to view, and then click Visualizer.

3. Do one or more of the following:

   - To optimize the display area, choose Best Fit, Zoom In, or Zoom out. If an item that you want to see disappears from view after zooming in, you can click and drag the viewable area.
   - To save the graph as an image file, click Save Image.
   - To find a particular entity, in the Search in field, type an entity name. In the view area, the entity names that begin with the search string are highlighted. To restrict the search, click the drop-down menu and select the specific entity that you want to search for.
   - To view the policies that an application uses, click one or more icons to display feature-specific policies. The policy types are Compression, Filter, Rewrite, Responder, Cache, application firewall, Authorization, Auditing, HTML Injection, SureConnect, Priority Queuing, and Traffic.
   - To view the rule that is configured for an application unit, click the curve that connects the public endpoint to the application unit. The rule is displayed on the Related Tasks tab.
   - To view the binding information for an application unit, policy, or monitor, click the displayed icon, click the Related Tasks tab, and then click Show Bindings
   - To view member services, click the icon for the service, click the Related Tasks tab, and then click Show Member Services.
   - To view detailed statistics for a public endpoint or application unit, click the icon that is displayed, click the Related Tasks tab, and then click Statistics.
   - To view the Load Balancing Visualizer for an application unit, click the application unit, click Related Tasks, and then click Visualizer.

   - To view the number of requests received per second at a given point in time by the load balancing virtual server and the number of hits per second at a given point in time for rewrite, responder, and cache policies, click Show Stats. The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually. To refresh this information, click Refresh Stats.

To configure and view entities in an AppExpert application by using the Application Visualizer

1. Navigate to AppExpert > Applications.

2. In the details pane, click the name of the application that you want to configure or view, and then click Visualizer.

3. Do one or more of the following:

   - To configure an entity that is displayed in the viewing area, click the icon for the entity, click the Related Tasks tab, and then click Modify public endpoint.

     In the Application Visualizer, you can modify only public endpoints and services.
   - To bind additional monitors to a service, click the Available Resources tab, select Monitors from the drop-down list, and then click and drag a monitor to a service.
   - To unbind a service from an application unit, click the curve that connects the application unit and the service, click Related Tasks, and then click Unbind.
   - To unbind a monitor from a service, click the curve that connects the service and the monitor, click Related Tasks, and then click Unbind.
   - To modify a monitor, click the monitor, click Related Tasks, and then click Open.
   - To modify the binding parameters for a monitor, click the curve that connects the monitor to the associated service, click Related Tasks, and then click Modify Parameters.
   - To apply a common service configuration across multiple service containers that are displayed when the services bound to a vserver do not have the same configuration, click the service container whose configuration you want to apply to all the containers, and then, in Related Tasks, click Apply Configuration.
   - To view a comparative list of the parameters whose values differ across service containers, click the icon for a container, click the Related Tasks tab, and then click Service Attributes Diff. The comparative list helps you determine which service container has the service configuration that you want to apply to all the containers. After you determine which service container has the configuration you want, right-click the container, and then click Apply this Configuration.
   - To copy the configuration of an entity (other than the configuration of the AppExpert application) to the local computer’s clipboard, click the entity, click the Related Tasks tab, and then click Copy Properties. You can then paste the configuration information in a word processing document or spreadsheet.

Monitoring a NetScaler Application

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. You can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

Viewing Application Statistics

In the Applications node, you can select an application and view the Statistics page for the application. On the Statistics page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the Statistics page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application

1. Navigate to AppExpert > Applications.
2. In the details pane, click the application for which you want to view statistics, and then click Statistics.

Monitoring an Application by Using the Application Visualizer

You can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer

1. Navigate to AppExpert > Applications.
2. In the details pane, select the application for which you want to view statistical information, and then click Visualizer.
3. In the Application Visualizer window, do the following:
   - To view the statistics, click Show Stats.

     The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.
   - To refresh the statistical information, click Refresh Stats.

Viewing Hits

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count. For instructions on viewing hit counters, see "Verifying and Testing the Configuration."

Deleting an Application

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.

When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application

1. Navigate to AppExpert > Applications.
2. In the details pane, click the name of the application that you want to delete, and then click Remove.

Configuring Authentication, Authorization, and Auditing

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring Authentication

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, click the name of the application for which you want to configure authentication, and then click Authentication.
3. In the Authentication Wizard, on the Introduction page, click Next.
4. Follow the instructions in the Authentication Wizard.

Configuring Authorization

You can configure authorization for users and groups to enable then to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, click the AppExpert application for which you want to configure user or group access, and then click Authorization.
3. Do one of the following:
   - If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the application tree. Then, right-click the user or group and click Allow.
   - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.

     The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
4. Click Close.

Configuring Auditing

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application’s public endpoints.

To configure auditing policies for an application

1. Navigate to AppExpert > Applications.
2. In the details pane, click the application for which you want to configure auditing policies, and then click Auditing.
3. In the Configure Auditing Policies dialog box, click Insert Policy.
   - To specify an existing auditing policy, under Policy Name, click the name of the policy, and then do the following:
     - To modify the priority that is assigned to the policy by default, under Priority, double-click the priority, and then type a new priority value.
     - To modify the settings of the audit server, under Server, double-click the name of the server, and then, in the Configure Auditing Server dialog box, modify the settings as appropriate. You can modify all the settings in this dialog box except the name of the audit server and the audit type. For more information about the settings in the Configure Auditing Server dialog box, see "Auditing Policies."
   - To create a new auditing policy, under Policy Name, click New Policy, and then, in the Create Auditing Policy dialog box, do the following:
     - In the Name box, type a name for the policy.
     - The Name box already contains the string that is required at the beginning of the server name. You cannot modify the string.
     - From the Auditing Type list, select the auditing type (either SYSLOG or NSLOG).
     - If the audit server you want to specify is already listed in the Server list, select the server from the list, and then, if you want to modify the server settings, click Modify. In the Configure Auditing Server dialog box, modify the settings as appropriate, and then click OK. For more information about the settings in the Configure Auditing Server dialog box, see "Auditing Policies."
     - If you want to configure a new audit server, click New, and then, in the Create Auditing Server dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click OK.
     - Click Create.
   - To change the priorities for the new auditing policies you created, under Priority, for each policy for which you want to change the priority, double-click the priority value and type new priority value.
   - To regenerate priorities, click Regenerate Priorities.
   - To unbind a policy, click the policy, and then click Unbind Policy.
   - To modify a policy, click the policy, and then click Modify Policy.
4. Click Apply Changes, and then click Close.

Disabling AAA for an Application

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application

1. Navigate to AppExpert > Applications.
2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:
   - To disable AAA for the application, click Turn Off AAA.
   - To enable AAA for the application, click Turn On AAA.

Setting Up a Custom NetScaler Application

If an AppExpert application template is not available for the Web application that you want to manage through the NetScaler appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.

After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.

Creating an Application

When you create an AppExpert application, the appliance creates a container to which you can add application units. The *default* application unit is not created until you create the first application unit.

To create an AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click Applications, and then click Add.
3. In the Create Application dialog box, in Name, enter a name for the application, and then click OK.

Creating Application Units

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. In the **Create** Application Unit dialog box, specify values for the following parameters:
   - Name*—The name that you want to assign to the application unit.
   - Rule*—The rule that identifies the traffic subset that the application unit will manage.
   - Classic Syntax—To specify that you want to configure a classic expression in the Rule box, click this option button.
   - Default Syntax—To specify that you want to configure a default syntax expression in the Rule box, click this option button.

   *A required parameter
4. Click Create.

Configuring Public Endpoints for an AppExpert Application

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the NetScaler appliance.

To configure public endpoints for an AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click Activate All.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
   - If you want to create a new public endpoint, click Add. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click OK.

     In the Create public endpoint dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, provide additional settings, and then click OK.

     For more information about the parameters in the Create public endpoint and Configure Public Endpoint dialog boxes, see "Content Switching."
   - If you want to modify a public endpoint, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, modify settings for the endpoint, and then click OK.

     For more information about the parameters in the Configure Public Endpoint dialog box, see "Content Switching."
4. Click Close.

Configuring Public Endpoints for an Application Unit

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see "Configuring Endpoints for an Application Unit."

To configure endpoints for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application unit, do one of the following:
   - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click OK.

Configuring Services and Service Groups for an AppExpert Application

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.

To configure a service or service group for the AppExpert application

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click Configure Backend Services.
3. In the Configure Backend Services dialog box, do one of the following:
   - To configure services, click the Services tab.
   - To configure service groups, click the Service Groups tab.
4. On the Service or Service Groups tab, do one of the following:
   - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
   - If you want to specify all the services or service groups, click Activate All.
   - If you want to create a new service or service group, click Add. Then, in the Create Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click Create.
   - If you want to modify a service, click the service, and then click Open. Then, in the Configure Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click OK.

For information about the settings in the Create Service, Configure Service, and Create Service Group dialog boxes, see "Load Balancing."

Configuring Services and Service Groups for an Application Unit

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click Configure Backend Services.
3. In the Configure Backend Services dialog box, do one of the following:
   - To configure services, click the Services tab.
   - To configure service groups, click the Service Groups tab.
4. In the Services or Service Groups tab, do one of the following:
   - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.
   - To specify all services or service groups, click Activate All.
5. On the Method and Persistence and Advanced tabs, specify the desired parameters.
6. Click OK.

Configuring Policies

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see "Configuring Policies for Application Units."

Creating and Managing Template Files

After you set up an AppExpert application and customize it to suit your requirements, you can create a template from the application and then share the template with other administrators. Or, you can create a template and then import the template to other NetScaler appliances that require a similar AppExpert application configuration. This simplifies and expedites the process of setting up similar applications on other appliances. You can also export a content switching configuration to a template file. When creating a template file, you can configure variables in the policy expressions and actions that are configured for an application.

AppExpert application template files can be exported either to the template directory on the NetScaler appliance or to a folder on your local computer. You can then upload and download the templates to and from the NetScaler appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

Exporting an AppExpert Application to a Template File

When you export an AppExpert application, all application-configuration information is exported to a template file and all deployment-specific information is exported to a deployment file. The string `_deployment` is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the `/nsconfig/nstemplates/applications` directory on the NetScaler appliance and the deployment file is stored in the `/nsconfig/nstemplates/applications/deployment_files/` directory. For more information about the format of application templates and deployment files, see "Understanding NetScaler Application Templates and Deployment Files". If you have configured Access Gateway application, when you export the AppExpert configuration, you can choose to include the Access Gateway policies in the template.

To export an AppExpert application to a template file

1. Navigate to AppExpert > Applications.
2. In the details pane, click the name of the application that you want to export as a template file, and then click Export.
3. In the Export...as Template dialog box, do the following:
   a. In the Name box, modify the name of the template, if necessary.
   b. If you want to configure variables for the template, click Configure Variables, and then, in the Configure Variables dialog box, configure the variables that you want.

      For more information about configuring variables in application templates, see "Creating Variables in Application Templates".
   c. If you want to export the template file to the application templates directory on the appliance, make sure that Browse (Appliance) is displayed.
   d. If you want to export the template file to your computer, click the Browse (Appliance) drop-down menu, click Local, browse to the location to which you want to save the file, and then click Save.
   e. Provide the following information:
      - **Introduction Description**—Any text that introduces the AppExpert application template during import. This text is displayed on the Specify Application Name page of the AppExpert Template Wizard when the template is imported.
      - **Summary Description**—Any summary that you might want to display on the Summary page of the AppExpert Template Wizard when the template is imported.
      - **Author**—The name of the author of the template.
      - **Major**—The major version number of the template.
      - **Minor**—The minor version number of the template. This number is appended to the major version number and displayed on the Summary page of the AppExpert Template Wizard, during import, in the format Major.Minor.
   f. Click OK.

      If Access Gateway policies have been configured for the application, you will be prompted to include the Access Gateway configuration in the application template. If you want to include the Access Gateway configuration in the template, at the prompt, click Yes.

Exporting a Content Switching Virtual Server Configuration to a Template File

You can also export a content switching configuration as an application template. You can export a content switching virtual server configuration to an application template either from the Content Switching Virtual Servers pane or from the Content Switching Visualizer. Configuration information, which includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies, is exported to a template file and all deployment-specific information is exported to a deployment file. The string "_deployment" is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory. For more information about the format of application templates and deployment files, see "Understanding NetScaler Application Templates and Deployment Files." The configuration information that is exported includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies.

However, if the content switching virtual server is already configured as the public endpoint for an AppExpert application, you cannot export the configuration to a template file . In this scenario, you must export the associated AppExpert application to a template. For more information about exporting an AppExpert application to a template file, see "Exporting an AppExpert Application to a Template File."

To export a content switching configuration to an application template file from the Content Switching Visualizer

1. Navigate to Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Visualizer.
3. In the Content Switching Visualizer, click the icon for the content switching vserver, click Related Tasks, and then click Create Template.
4. In the Export...as Template dialog box, enter a name for the template file, and then do one of the following:
   - To export the template file to the appliance, make sure that Browse (Appliance) is displayed.
   - To export the template file to your computer, click the Browse (Appliance) drop-down menu, click Local, browse to the location to which you want to save the file, and then click Save.
5. Provide the following information:
   - **Introduction Description**—Any text that introduces the AppExpert application template during import. This text is displayed on the Specify Application Name page of the AppExpert Template Wizard when the template is imported.
   - **Summary Description**—Any summary that you might want to display on the Summary page of the AppExpert Template Wizard when the template is imported.
   - **Author**—The name of the author of the template.
   - **Major**—The major version number of the template.
   - **Minor**—The minor version number of the template. This number is appended to the major version number and displayed on the Summary page of the AppExpert Template Wizard, during import, in the format `Major.Minor`.
6. Click OK.

To export a content switching configuration to an application template file from the Content Switching Virtual Servers pane

1. Navigate to Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Create AppExpert Template.
3. Perform steps 4 through 6 described in "To export a content switching configuration to an application template file from the Content Switching Visualizer".

Creating Variables in Application Templates

Application templates support the declaration of variables in the policy expressions and actions that are configured for an application. The ability to declare variables in policy expressions and actions enables you to replace preconfigured values in expressions (for example, configurable parameters such as the host name of a server or the target for a Rewrite action) with values that suit the environment into which you are importing the template. If variables have been configured for an AppExpert application template, the AppExpert Template Wizard, which appears when you import an AppExpert application template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the template.

As an example, consider the following policy expression that is configured to evaluate the value of the Host header in an HTTP request:

```
HTTP.REQ.HEADER("Host").CONTAINS("server1")
```

If you want the server name to be configurable at import time, you can specify the string "server1" as a variable. When importing the template, you can specify a new value for the variable on the Variables tab.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

In the export application template wizard, you can define variables in certain fields (fields with an adjacent  button) for the following entities:

- Cache policies
- Rewrite policies
- Rewrite actions
- Responder policies
- Responder actions

To configure a variable in a policy expression or action

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application that you want to export to a template file, and then click Export.
3. In the Export...as Template dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click Configure Variables.
4. In the Configure Variables dialog box, click the tab that lists the policy expression or action for which you want to configure a variable, select the expression, and then click Configure Variables.
5. In the Variables dialog box, click the  button next to the expression or value in which you want to create a variable.
6. In the Variables dialog box, do the following:
   - To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click Add. In the Add Variable dialog box, specify a name and a description for the variable, and then click Create.
   - The name of the variable, its value, and the description you provided appear in the Available Variables listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.
   - To modify a variable, in the Available Variables list, click the variable, and then click Open. In the Add Variable dialog box, modify the value and the description, and then click OK.
   - To view all the strings that are assigned to a given variable, in the Available Variables listing, click the name of the variable. The strings that are assigned to the variable are highlighted.
   - To view a list of all the entities and parameters in which the variable is used, in the Available Variables listing, click the variable whose references you want to view, and then click Show References.
   - To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click Use Existing Selection, and then click the name of the variable to which you want to assign the string.

     If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.
7. Click Close.

Uploading and Downloading Template Files

Template files can be uploaded from your local computer to the NetScaler appliance or downloaded from the appliance to your local computer. On the appliance, AppExpert application templates are always stored in the AppExpert application templates directory, which is `/nsconfig/nstemplates/applications/`.

To upload an AppExpert application template from your local computer to the NetScaler appliance

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click Application Templates, and then click Upload.
4. In the Upload Application Template dialog box, browse to the directory in which the template file is stored, click the template file, and then click Select.

   The template file is uploaded to the AppExpert application template directory on the appliance.

To download an AppExpert application template from the NetScaler appliance to your local computer

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click the AppExpert application template that you want to download, and click Download.
4. In the Download Application Template dialog box, browse to the location to which you want to save the file, and then click Save.

Renaming an Application Template

You can rename an application template that is stored in the AppExpert application templates folder on the appliance.

To rename an AppExpert applications template

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click the AppExpert application template that you want to rename, and then click Rename.
4. Enter a new name for the template, and then click Close.

Deleting an AppExpert Application Template

You can delete an application template that you no longer need.

To delete an AppExpert application template

1. Navigate to AppExpert > Templates.
2. In the details pane, click the template that you want to delete, and then click Remove.

Understanding NetScaler Application Templates and Deployment Files

When you export a NetScaler application, the following two files are automatically created:

- **NetScaler application template file.** Contains application-configuration information such as application units, rules, and configured policies.
- **Deployment file.** Contains deployment-specific information such as public endpoints, services, associated IP addresses, and configured variables.

In the application template and deployment file, each unit of application-configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, each public endpoint and associated endpoint details are encapsulated within the `<appendpoint>` and `</appendpoint>` tags, and all the endpoint elements are encapsulated within the `<appendpoint_list>` and `</appendpoint_list>` tags.

Note: After you export a NetScaler application, you can add elements, remove elements, and modify existing elements before importing the application to a NetScaler appliance.

Example of a NetScaler Application Template

Following is an example of a template file that was created from a NetScaler application called "SharePoint_Team_Site":

```
<?xml version="1.0" encoding="UTF-8" ?>
<template>
<template_info>
  <application_name>SharePoint_Team_Site</application_name>
  <templateversion_major>1</templateversion_major>
  <templateversion_minor>1</templateversion_minor>
  <author>Ed</author>
  <introduction>An application for managing a SharePoint team site with images, reports, and, XML content.
  <summary>This template includes variables</summary>
  <version_major>9</version_major>
  <version_minor>3</version_minor>
  <build_number>38</build_number>
</template_info>
<apptemplate>
  <rewrite>
    <rewriteaction_list>
      <rewriteaction>
        <name>Rw_name</name>
        <type>replace</type>
        <target>HTTP.REQ.BODY(10000).AFTER_REGEX(re/number/).BEFORE_REGEX(re/address/)</target>
        <stringbuilderexpr>"NA"</stringbuilderexpr>
        <allow_unsafe_pi1>NO</allow_unsafe_pi1>
```

```
        </rewriteaction>
        <rewriteaction>
          .
          .
          .
        </rewriteaction>
        .
        .
        .
      </rewriteaction_list>
      <rewritepolicy_list>
        <rewritepolicy>
          <name>Rw_number_NA</name>
          <rule>HTTP.REQ.BODY(100000).CONTAINS("admin")</rule>
          <action>Rw_name</action>
        </rewritepolicy>
        <rewritepolicy>
          .
          .
          .
        </rewritepolicy>
        .
        .
        .
      </rewritepolicy_list>
    </rewrite>
    <appunit_list>
      <appunit>
        <name>SharePoint_Team_Sitedefault</name>
        <rule />
        <expressiontype>PE</expressiontype>
        <servicetype>HTTP</servicetype>
        <ipv46>0.0.0.0</ipv46>
        <ipmask>*</ipmask>
        <port>0</port>
        <range>1</range>
        <persistencetype>NONE</persistencetype>
        <timeout>2</timeout>
        <persistencebackup>NONE</persistencebackup>
        <backuppersistencetimeout>2</backuppersistencetimeout>
        <lbmethod>LEASTCONNECTION</lbmethod>
        <persistmask>255.255.255.255</persistmask>
        <v6persistmasklen>128</v6persistmasklen>
        <pq>OFF</pq>
        <sc>OFF</sc>
        <m>IP</m>
        <datalength>0</datalength>
        <dataoffset>0</dataoffset>
        <sessionless>DISABLED</sessionless>
        <state>ENABLED</state>
        <connfailover>DISABLED</connfailover>
        <clttimeout>180</clttimeout>
        <somethod>NONE</somethod>
        <sopersistence>DISABLED</sopersistence>
        <redirectportrewrite>DISABLED</redirectportrewrite>
        <downstateflush>DISABLED</downstateflush>
```

```
        <gt2gb>DISABLED</gt2gb>
        <ipmapping>0.0.0.0</ipmapping>
        <disableprimaryondown>DISABLED</disableprimaryondown>
        <insertvserveripport>OFF</insertvserveripport>
        <authentication>OFF</authentication>
        <authn401>OFF</authn401>
        <push>DISABLED</push>
        <pushlabel>none</pushlabel>
        <l2conn>OFF</l2conn>
      </appunit>
      <appunit>
        .
        .
        .
      </appunit>
      .
      .
      .
    </appunit_list>
    </apptemplate>
    <parameters>
      <property_list>
        <property>
          <variable_definition_list>
            <variable_definition>
              <name>body_size</name>
              <defaultvalue>10000</defaultvalue>
              <description>Evaluation Scope</description>
              <startindex>14</startindex>
              <length>5</length>
            </variable_definition>
            .
            .
            .
          </variable_definition_list>
          <object_type>rewriteaction</object_type>
          <object_name>Rw_name</object_name>
          <name>target</name>
        </property>
        .
        .
        .
      </property_list>
    </parameters>
  </template>
```

Example of a Deployment File

Following is the deployment file associated with the "SharePoint_Team_Site" application in the preceding example:

```
<?xml version="1.0" encoding="UTF8" ?>
<template_deployment>
  <template_info>
    <application_name>SharePoint_Team_Site</application_name>
    <templateversion_major>1</templateversion_major>
    <templateversion_minor>1</templateversion_minor>
    <author>Ed</author>
    <introduction>An application for managing a SharePoint team site with images, reports, and, XML conter
    <summary>This template includes variables</summary>
    <version_major>9</version_major>
    <version_minor>3</version_minor>
    <build_number>38</build_number>
  </template_info>
  <appendpoint_list>
    <appendpoint>
      <ipv46>10.111.111.1</ipv46>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </appendpoint>
  </appendpoint_list>
  <service_list>
    <service>
      <ip>10.102.29.5</ip>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </service>
    <service>
      .
      .
      .
    </service>
    .
    .
    .
  </service_list>
  <variable_list>
    <variable>
      <name>body_size</name>
      <description>Evaluation Scope</description>
      <value>10000</value>
    </variable>
    <variable>
      .
      .
      .
    </variable>
    .
    .
    .
  </variable_list>
</template_deployment>
```

Access Gateway Applications

When you configure an AppExpert application to manage a web application through the Citrix® NetScaler® appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure Access Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.

You can also configure Access Gateway policies for intranet subnets, file shares, and other network resources.

Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the Access Gateway home page.

You can configure the entities in the Access Gateway Applications feature only by using the configuration utility.

How an Access Gateway Application Works

When you create an AppExpert application in the Applications node in the configuration utility, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application’s configured public endpoint is automatically created for the Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The NetScaler appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application's public endpoint. Traffic received at the AppExpert application’s public endpoint is first evaluated against the Access Gateway policies and then evaluated against the policies configured for AppExpert application’s application units.

The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert application. Therefore, before you configure Access Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the Access Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

How a NetScaler Configuration for a File Share Works

On the NetScaler appliance, you can configure Authorization policies for a file share that is hosted on your organization's network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The NetScaler configuration for a file share cannot be saved in AppExpert application templates.

How a NetScaler Configuration for an Intranet Subnet Works

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the NetScaler appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet's IP address and netmask, respectively.

The NetScaler configuration for an intranet subnet cannot be saved in AppExpert application templates.

How the Other Resources Category Works

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the NetScaler appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The NetScaler appliance applies the configured Access Gateway policies to any requests that match the configured rule.

The NetScaler configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

Entity Naming Conventions

The Access Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (_). The name that you provide for the entity is appended to this string. If the name of a subnet is "subnet1," the name of the profile begins with "subnet1_." When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

Adding File Shares

When creating a file share, you provide the network path to the file share. Any policies that you configure for a file share use the rule that is automatically created when you created the file share.

To configure a file share

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, click File Shares, and then do one of the following:
   - To add a file share, click File Shares, and then click Add.
   - To modify a file share, click File Shares, and then click Open.
3. In the Create File Share or Configure File Share dialog box, do the following:
   a. In the Name box, type a name for the file share you are adding. This parameter cannot be changed for an existing file share.
   b. In the Path box, type the path to the file share.

      The path to the file share may use either the name of the server or the IP address of the server.
   c. In Bookmark, in the Text to Display box, type a name for the file share as you would want it to appear on the Access Gateway home page.
   d. Click Create or OK, and then click Close.

Adding Intranet Subnets

You can specify authorization and Traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   - To add an intranet subnet, click Intranet Subnets, and then click Add.
   - To modify an intranet subnet, click an intranet subnet, and then click Open.
3. In the Create Intranet Subnet or Configure Intranet Subnet dialog box, do the following:
   a. In the Name box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
   b. In the IP Address box, type the IP address of the intranet subnet.
   c. In the Netmask box, type the netmask that will be used for the intranet subnet.
   d. Click Create or OK, and then click Close.

Adding Other Resources

For a network resource that you add to Other Resources, you must configure a classic expression that identifies the subset of traffic associated with the resource. For more information about configuring a classic expression, see the Policy Configuration and Reference.

To configure a resource in Other Resources

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   - To add a resource, click Other Resources, and then click Add.
   - To modify a resource, click a resource, and then click Open.
3. In the Create Resource or Configure Resource dialog box, do the following:
   a. In the Name box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
   b. In the Rule box, type the rule that will identify the subset of traffic that is associated with the resource you are adding.

      Alternatively, click Configure, and then create the rule in the Create Expression dialog box.
   c. Click Create or OK, and then click Close.

Configuring Authorization Policies

You can configure Access Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the Authorization column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.
3. Do one of the following:
   - If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the <application name> tree. Then, right-click the user or group and click Allow.
   - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the <application name> tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.

     The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
4. Click Close.

Configuring Traffic Policies

The traffic policies that you configure for the resources in the Access Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application time-out, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Access Gateway Applications.

2. In the details pane, in the Traffic column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.

3. In the Configure Traffic Policies dialog box, do the following:

   - To specify an existing traffic policy, click Insert Policy, and then, in the Policy Name column, click the name of the policy.

   - To configure a new policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Traffic Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Request Profile, either select an existing request profile or click New to configure a new request profile. You can also select an existing profile and then click Modify to modify the profile.

     For more information about configuring a traffic policy or profile, see Access Gateway 10, Enterprise Edition at http://edocs.citrix.com/.

   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.

   - To regenerate the priorities assigned to the policies, click Regenerate Priorities.

   - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.

   - To unbind a policy, click the policy, and then click Unbind Policy.

4. Click Apply Changes, and then click Close.

Configuring Clientless Access Policies

Clientless access, when configured for a resource on the NetScaler appliance, allows end-users to access the resource without using the Access Gateway client software. Users can use web browsers to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the Access Gateway Applications node

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the Clientless Access column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.
3. In the Configure Clientless Access Policies dialog box, do the following:
   - To specify an existing clientless access policy, click Insert Policy, and then, in the Policy Name column, click the name of the policy.
   - To configure a new clientless access policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Clientless Access Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Profile, either select an existing profile or click New to configure a new profile. You can also select an existing profile and then click Modify to modify the profile.

     For more information about configuring a clientless access policy or profile, see Access Gateway 10, Enterprise Edition at http://edocs.citrix.com/.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
   - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
   - To unbind a policy, click the policy, and then click Unbind Policy.
4. Click Apply Changes, and then click Close.

Configuring TCP Compression Policies

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see Access Gateway 10, Enterprise Edition at http://edocs.citrix.com/.

To configure a TCP compression policy for a resource in the Access Gateway Applications node

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Access Gateway Applications.

2. In the details pane, in the TCP Compression column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.

3. In the Configure TCP Compression Policies dialog box, do the following:

   - To specify an existing TCP compression policy, click Insert Policy, and then, in the Policy Name column, click the name of the policy.

   - To create a new TCP compression policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create TCP Compression Policy dialog box, in the Policy Name box, after the underscore ("_"), type a name for the policy. Then, in Action, either select an existing action or click New and configure a new action. You can also click View to view the configured compression type.

     For more information about configuring a TCP compression policy or action, see Access Gateway 10, Enterprise Edition at http://edocs.citrix.com/.

   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy.

   - To regenerate the priorities assigned to the policies, click Regenerate Priorities.

   - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.

   - To unbind a policy, click the policy, and then click Unbind Policy.

4. Click Apply Changes, and then click Close.

Configuring Bookmarks

You can configure bookmarks for an application or for a resource that you configure in the Other Resources category if you want the application or resource to be accessible from the Access Gateway home page.

To configure a bookmark for an Access Gateway application or a resource in the Other Resources category

1. In the navigation pane of the NetScaler configuration utility, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, click the application or resource for which you want to configure a bookmark, and then click Configure Bookmark.
3. In the Create Bookmark dialog box, configure values for the parameters.

   For more information about the parameters in the Create Bookmark dialog box, see Access Gateway 10, Enterprise Edition at http://edocs.citrix.com/.
4. Click Create, and then click Close.

AppQoE

Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, *fair queuing*. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle queuing of all requests to a web site or application as one group before load balancing, instead of as separate streams after load balancing.

The features that are integrated into AppQoE are HTTP Denial-of-Service Protection (HDOSP), Priority Queuing (PQ), SureConnectSureConnect and . Collectively these services provide protection against a number of problems:

- **Simple overload.** Any server, no matter how robust, can accept only a limited number of connections at one time. When a protected web site or application receives too many requests at once, the Surge Protection feature detects the overload and queues the excess connections til the server can accept them. The Priority Queuing feature ensures that whoever most needs access to a resource is provided access without having to wait behind other lower-priority requests. The SureConnect feature displays an alternate web page that notifies users that the resource that they requested is not available.

- **Denial-of-Service (DOS) attacks.** Any public-facing resource is vulnerable to attacks whose purpose is to bring that service down and deny legitimate users access to it. The Surge Protection, Priority Queuing, and SureConnect features help manage DOS attacks as well as other types of high load. In addition, the HTTP Denial-of-Service Protection feature targets DOS attacks against your web sites, sending challenges to suspected attackers and dropping connections if the clients do not send an appropriate response.

Until the current version of the NetScaler operating system, these features were implemented at the service level, which means that each service was assigned its own queues. While service-level queues work, they also have some disadvantages, most of which are due to the NetScaler appliance having to load balance requests before implementing any of the protection features that rely on queuing. Implementing protection features before queuing has a number of advantages, some of which are listed below:

- Absolute priority of connections as configured in the priority queuing feature can be maintained.

- Connections are not flushed if a service transitions state, as they are in a service-level queue.

- During periods of high load, such as a denial-of-service attack, HTTP DoS and SureConnect come into play before load balancing, allowing these features to detect and divert unwanted or lower-priority traffic from the load balancer before the load balancer must cope with it.

In addition to implementing fair queuing, AppQoE integrates a set of features that each provide a different set of tools to achieve a common goal: protecting your networked resources from excessive or inappropriate demand. Putting these features into a common framework enables you to configure and implement them more easily.

Enabling AppQoE

To configure AppQoE, you must first enable the feature.

To enable AppQoE by using the command line

At the command prompt, type the following commands:

- enable ns feature appqoe
- show ns feature

Example

```
> enable ns feature appqoe
 Done
> show ns feature

      Feature                 Acronym           Status
      -------                 -------           ------
 1)    Web Logging              WL               ON
 2)    Surge Protection         SP               ON
 3)    Load Balancing           LB               ON
...
29)   AppQoE                   AppQoE            ON
Done
```

To enable AppQoE by using the configuration utility

1. Navigate to System > Settings.
2. In the details pane, click Configure Advanced Features.
3. In the Configure Advanced Features dialog box, select the AppQoE check box.
4. Click OK.

AppQOE Actions

After enabling the AppQoE feature, you must configure one or more actions for handling requests.

Important: No specific individual parameters are required to create an action, but you must include at least one parameter or you cannot create the action.

To configure an AppQoE action by using the command line

At the command prompt, type the following commands:

- add appqoe action <name> [-priority <priority>] [-respondWith (ACS|NS) [<customfile>] [-altContentSvcName <string>] [-altContentPath <string>] [-maxConn <positive_integer>] [-delay <usecs>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-dosAction (SimpleResponse | HICResponse)]

- show appqoe action

Example

To configure priority queuing with policy queue depths of 10 and 1000 for medium and lowest priority queues, respectively:

```
> add appqoe action appqoe-act-basic-prhigh -priority HIGH
 Done

> add appqoe action appqoe-act-basic-prmedium -priority MEDIUM -polqDepth 10
 Done

> add appqoe action appqoe-act-basic-prlow -priority LOW -polqDepth 1000
 Done

> show appqoe action
1)     Name: appqoe-act-basic-prhigh
       ActionType: PRIORITY_QUEUING
       Priority: HIGH
       PolicyQdepth: 0
       Qdepth: 0

2)     Name: appqoe-act-basic-prmedium
       ActionType: PRIORITY_QUEUING
       Priority: MEDIUM
       PolicyQdepth: 10
       Qdepth: 0
```

3) Name: appqoe-act-basic-prlow
ActionType: PRIORITY_QUEUING
Priority: LOW
PolicyQdepth: 1000
Qdepth: 0
Done

To modify an existing AppQoE action by using the command line

At the command prompt, type the following commands:

- set appqoe action <name> [-priority <priority>] [-altContentSvcName <string>] [-altContentPath <string>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-maxConn <positive_integer>] [-delay <usecs>] [-dosTrigExpression <expression>] [-dosAction (SimpleResponse | HICResponse)]
- show appqoe action

To remove an AppQoE action by using the command line

At the command prompt, type the following commands:

- rm appqoe action <name>
- show appqoe action

Parameters for configuring an AppQoE action

name

A name for the new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.

priority

The priority queue to which the request is assigned. When a protected web server or application is heavily loaded and cannot accept additional requests, specifies the order in which waiting requests are to be fulfilled when resources are available. The choices are:

1. **HIGH.** Fulfills the request as soon as resources are available.
2. **MEDIUM.** Fulfills the request after it has fulfilled all requests in the HIGH priority queue.

3. **LOW.** Fulfills the request after it has fulfilled all requests in the HIGH and MEDIUM priority queues.

4. **LOWEST.** Fulfills the request only after it has fulfilled all requests in higher-priority queues.

If priority is not configured, then the NetScaler appliance assigns the request to the LOWEST priority queue by default.

respondWith

Configures the NetScaler ADC to take the specified Responder action when the specified threshold is reached. Must be used with one of the following settings:

- **ACS:** Serves content from an alternate content service. Threshold: maxConn (maximum connections) or delay.

- **NS:** Serves a built-in response from the NetScaler ADC. Threshold: maxConn (maximum connections) or delay.

- **NO ACTION:** Serves no alternative content. Assigns connections to the LOWEST priority queue if the maxConn (maximum connections) or delay threshold is reached.

altContentSvcName

If `-responseWith ACS` is specified, the name of the alternative content service, usually an absolute URL to the web server that hosts the alternate content.

altContentPath

If `-responseWith ( ACS | NS )` is specified, the path to the alternative content.

polqDepth

Policy queue depth threshold value for the policy queue associated with this action. When the number of connections in the policy queue associated with this action increases to the specified number, subsequent requests are assigned to the LOWEST policy queue. Minimum value: 1 Maximum value: 4,294,967,294

priqDepth

Policy queue depth threshold value for the specified priority queue. If the number of requests in the specified queue on the virtual server to which the policy associated with the current action is bound increases to the specified number, subsequent requests are assigned to the LOWEST priority queue. Minimum value: 1 Maximum value: 4,294,967,294

maxConn

The maximum number of connections that can be open for requests that match the policy rule. Minimum value: 1 Maximum value: 4,294,967,294

delay

The delay threshold, in microseconds, for requests that match the policy rule. If a matching request has been delayed for longer than the threshold, the NetScaler appliance performs the specified action. If NO ACTION is specified, then the appliance assigns requests to the LOWEST priority queue. Minimum value: 1 Maximum value:

599999,999

dosTrigExpression

Adds an optional second-level check to trigger DoS actions.

dosAction

Action to take when the ADC determines that it or a protected server is under DoS attack. Possible values: SimpleResponse, HICResponse

To configure an AppQoE action by using the configuration utility

1. Navigate to App-Expert > AppQoE > Actions.
2. In the details pane, do one of the following:
   - To create a new action, click Add.
   - To modify an existing action, select the action, and then click Edit.
3. In the Create AppQoE Action or the Configure AppQoE Action screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the AppQoE Action" as follows (asterisk indicates a required parameter):
   - Name—name
   - Action type—respondWith
   - Priority—priority
   - Policy Queue Depth—polqDepth
   - Queue Depth—priqDepth
   - DOS Action—dosAction
4. Click Create or OK.

AppQoE Parameters

In the AppQoE parameters, you configure the session life of an AppQoE session, the file name of the file containing the customized response, and the number of client connections that can be placed in a queue.

To configure the AppQoE parameter settings by using the command line

At the command prompt, type the following commands:

- set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>] [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]
- show appqoe parameter

Parameters for configuring the AppQoE parameters

sessionLife

Number of seconds to wait after displaying alternate content before the ADC displays the same content again. Default value: 300 Maximum Minimum value: 1 Maximum value: 4,294,967,294

avgwaitingclient

The average number of client requests that can be in the service waiting queue. Default value: 1000000 Maximum value: 4,294,967,294

MaxAltRespBandWidth

The maximum bandwidth to consume when sending alternate responses. If the maximum is reached, the ADC quits sending the alternate content til bandwidth consumption drops. Default value: 100 Minimum value: 1 Maximum value: 4,294,967,294

dosAtckThrsh

The denial-of-service attack threshold. The number of connections that must be waiting in queues before the ADC responds with DoS protection measures. Default value: 2000 Minimum value: 0 Maximum value: 4,294,967,294

To configure the AppQoE parameter settings by using the configuration utility

1. Navigate to AppExpert > AppQoE.
2. In the details pane, click Configure AppQoE Parameters.
3. In the Configure AppQoE params screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the AppQoE Parameters" as follows (asterisk indicates a required parameter):
   - Session Life (secs)—sessionLife
   - Average waiting client—avgwaitingclient
   - Alternate Response Bandwidth Limit(Mbps) —MaxAltRespBandWidth
   - DOS Attack Threshold —dosAttackThresh
4. Click OK.

AppQoE Policies

To implement AppQoE, you must configure at least one policy to tell your NetScaler ADC how to distinguish the connections to be queued in a specific queue.

To configure an AppQoE policy by using the command line

At the command prompt, type the following command:

add appqoe policy <name> -rule <expression> -action <string>

Example

The following example selects requests with a User-Agent header that contains "Android", and assigns them to the medium priority queue. These requests come from smartphones and tablets that run the Google Android operating system.

```
> add appqoe action appqoe-act-primd -priority MEDIUM
Done
> add appqoe policy appqoe-pol-primd -rule "HTTP.REQ.HEADER(\"User-Agent\").CONTAINS(\"Android\")" -acti
Done
> sh appqoe policy appqoe-pol-primd
      Name: appqoe-pol-primd
      Rule: HTTP.REQ.HEADER("User-Agent").CONTAINS("Android")
      Action: appqoe-act-primd
      Hits: 0

Done
```

Parameters for configuring an AppQoE policy

name

A name for the AppQoE policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the type of action.

rule

A NetScaler expression that tells the appliance which connections it should handle. For complete information about policy expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX132362.

action

The AppQoE action to perform when a connection matches the policy.

To configure an AppQoE policy by using the configuration utility

1. Navigate to App-Expert > AppQoE > Policies.
2. In the details pane, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the policy, and then click Edit.
3. If you are creating a new policy, in the Create AppQoE Policy dialog, in the Name text box, type a name for your new policy.

   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the purpose and effect of this policy.

   If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.
4. In the Action drop-down list, choose the AppQoE action to perform when the policy matches a connection. Click the plus (+) to open the Add AppQoE Action dialog and add a new action.
5. In the Rule text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:
   a. In the Create Expression dialog box, click Add.
   b. In the Add Expression dialog box, select a common expression from the Frequently Used Expressions drop-down list, or use the Construct Expression drop-down lists to create the expression that defines which traffic to filter.

      If you choose to create your own expression, you start by selecting the first term from the first drop-down list on the left side of the Construct Expression area. The choices in that list are:

      - HTTP: All traffic to port 80 and port 443.
      - SYS:
      - CLIENT:
      - SERVER:
      - ANALYTICS:
      - TEXT:

      The default choice is HTTP. After you make a choice in the first drop-down list (or accept the default), you can choose the next term in your expression from the drop-down list to the right of it. The terms in that list and other lists that follow change depending on your previous choices; the lists offer only terms that are valid choices. Continue to select terms until you have finished the expression.

Use the Help and Preview Expression areas for assistance when creating the expression. For a complete description of the available choices, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX132362.

c. When you have created the expression that you want, click OK. The expression is added in the Expression text box.

6. Click Create. The expression appears in the Rule text box.

Entity Templates

An entity template is a collection of configuration information for an individual entity on a Citrix® NetScaler® appliance. It provides a specification and a set of defaults for a configurable NetScaler entity, such as a policy, virtual server, service, or action. By using a template that defines a set of defaults, you can quickly configure multiple entities that require a similar configuration while eliminating several configuration steps.

Entity templates are available only in the configuration utility. You use the NetScaler configuration utility to create, manage, and use any type of entity template. You can share entity templates with other administrators and manage local folders that contain the templates. You can also import entity templates from and export entity templates to your local computer.

Before creating a template, you should be familiar with the configuration of the entity.

Note: You use entity templates to configure individual entities. To configure multiple entities related to a particular Web application, you must use an application template. For more information, see "AppExpert Applications and Templates."

How Entity Templates Work

When you create a template for a NetScaler entity, you specify default values for the entity. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard. All the information and settings you provide are stored in the template file.

When a user imports the entity template to a NetScaler appliance, a wizard guides the user through the various pages that you configured for the template. The wizard displays the read-only parameter values and prompts the user to specify values for the configurable parameters. After the user follows the instructions in the wizard, the appliance creates the entity with the configured values.

For example, you can create an entity template for HTTP services that provides a text box for a service name and assigns preset values for the service protocol, timeouts, thresholds, and monitors. Later, when you use the template to create new HTTP services, a wizard prompts you for a service name and supplies the preset values that you would otherwise have configured manually.

The procedure for creating entity templates for load balancing virtual servers is different than the AppExpert procedure for creating other entity templates. For more information, see "Creating an Entity Template."

In addition, the procedure for using the template to create the load balancing virtual server entity is different. For more information, see "Creating an Entity from a Template."

Configuring an Entity Template

You can create or modify an entity template either from the AppExpert feature node or from the associated NetScaler feature node for the entity. For example, you can create a content switching virtual server entity template in either the AppExpert feature node or the content switching feature node in the configuration utility.

If you create a template that is not based on an existing entity, you can specify the following options and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available parameters.
- The entities that must be bound to the entity for which the template is being created.

  For example, when you are creating a cache redirection virtual server template, you can specify the policies that you want to bind to the cache redirection virtual servers that you create from the template. However, only binding information is included in the template. The bound entities are not included. If the entity template is imported to another NetScaler appliance, the bound entities must exist on the appliance at import time for the binding to succeed. If none of the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exist on the target appliance, they are bound to the entity that is created from the template.

When you create a template based on an existing entity, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

The procedure for creating a load balancing virtual server is distinctly different from the procedure for creating other entity templates. For more information, see Creating an Entity Template.

Creating an Entity Template

You can create entity templates in either the AppExpert node or the NetScaler feature node that corresponds to the type of entity. For example, you can create a content switching virtual server template from the entity templates tab of the AppExpert feature's Templates node or in the Content Switching node. You can also specify the parameters that you want the template to store, and specify whether you want the template import wizard to prompt the user for certain parameter values.

However, when creating load balancing virtual servers, you do not have the option of specifying parameter values that you want stored in the template. You create a load balancing virtual server template by selecting an existing load balancing virtual server and configuring any variables that you might want to create in existing parameters and bound policies. The variables can be assigned values when you create a load balancing virtual server from the template. The template stores load balancing parameters such as the virtual server's IP address and port number, bound policies, actions, and variable definitions. A deployment file is also created, automatically, from the load balancing configuration. The deployment file stores deployment-specific information, such as information about bound services, service groups, and the name-value pairs of variables. If the bound entities that are included in the template are already configured on the NetScaler appliance to which the template is imported, duplicates are created, with names that are generated automatically in a particular format. The duplicate entities are based on the parameter information stored in the entity template.

When you create a load balancing virtual server template from the AppExpert node, the template is always saved to the `/nsconfig/nstemplates/entities/lb vserver/` folder. If you want to save the template to a different folder, create the template from the Virtual Servers pane in the Load Balancing node. The deployment file is created with the name with which you save the template file, but with the string `_deployment` appended to the name. The deployment file is saved to the `/nsconfig/nstemplates/entities/lb vserver/deployment_files/` folder. For more information about deployment files for load balancing virtual server templates, see "Understanding Load Balancing Entity Templates and Deployment Files."

Note: You can use either of the first two procedures for creating any template, except for a load balancing virtual server template. For creating a load balancing virtual server template, use the third or fourth procedure.

To create an entity template by using the AppExpert feature node

1. Navigate to AppExpert > Templates.
2. In the details pane, on the Entity Templates tab, do one of the following:
   - To create a new template, click Add. In the Select the Template Type dialog box, select the template type, and then click OK.
   - To create a duplicate of an existing entity template, in the details pane, select the entity template, and then click Add.
3. In the Create...Template dialog box, follow the instructions to create a template.

   If you are creating a duplicate of an existing entity template, in the Create...Template dialog box, on the Specify Template Name page, you must change the name of the entity template.
4. Click Finish, and then click Exit.

To create an entity template by using its corresponding feature node

1. In the navigation pane of the NetScaler configuration utility, select the feature (for example, Content Switching), and then select the entity (for example, Virtual Servers), for which you want to create the entity template.
2. At the top of the details pane, click Entity Templates, and then click Create Template.
3. In the Create...Template dialog box, follow the instructions to create a template.
4. Click Finish, and then click Exit.

To create a load balancing virtual server template from the AppExpert node

1. Navigate to AppExpert > Templates.
2. In the details pane, on the LB Templates tab, click Add.
3. In the Select Load Balancing Virtual Server dialog box, select the load balancing virtual server whose configuration you want to save to a template file, and then click OK.
4. In the Create Template dialog box, provide the following information:
   - Name. The name of the template.

     Note: The Folder field shows the location to which the template will be saved. You cannot modify the path that is displayed.
   - Configure Variables. Configure variables for the load balancing template. For more information, see "Configuring Variables in Load Balancing Virtual Server Templates."
   - Introduction Description. A description of the virtual server for which you are creating a template.
   - Summary Description. A summary of the configuration or additional instructions for other administrators, such as a description of any additional steps that need to be followed after the entity is successfully created.
   - Author. The creator of the template.
   - Major. An optional major version number of your choice, to be specified if you want to maintain versions of your template.
   - Minor. An optional minor version number of your choice, to be specified if you want to maintain minor versions of your template.

     You can maintain versions by incrementing one or both of the version numbers each time you maintain the template. The Entity Template Wizard concatenates and displays the major and minor version numbers during import. For example, if the major version number is 1 and the minor version is 1, the Entity Template Wizard displays a version number of 1.1.
5. Click OK.

To create a load balancing virtual server template from the Load Balancing Virtual Servers pane

1. Navigate to Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server on which to base the template,, and then click Create Template. You might have to click the scroll arrow at the bottom right of the pane to bring the Create Template button into view.
3. In the Create Template dialog box, provide the following information:
   - Name. The name of the template.
   - Folder. The location to which the template will be saved.

     Note: If you want to save the template to the appliance, you can save it only to the `/nsconfig/nstemplates/entities/lb vserver/` directory (the path displayed by default in Folder. If you want to save the template file to a folder on your computer, click the down-arrow on the Browse button, click Local, and then select a folder.
   - Configure Variables. Configure variables for the load balancing template. For more information, see "Configuring Variables in Load Balancing Virtual Server Templates."
   - Introduction Description. A description of the virtual server for which you are creating a template.
   - Summary Description. A summary of the configuration or additional instructions for other administrators, such as a description of any additional steps that need to be followed after the entity is successfully created.
   - Author. The creator of the template.
   - Major. An optional major version number of your choice, to be specified if you want to maintain versions of your template.
   - Minor. An optional minor version number of your choice, to be specified if you want to maintain minor versions of your template.

     You can maintain versions by incrementing one or both of the version numbers each time you maintain the template. The Entity Template Wizard concatenates and displays the major and minor version numbers during import. For example, if the major version number is 1 and the minor version is 1, the Entity Template Wizard displays a version number of 1.1.
4. Click OK.

Configuring Variables in Load Balancing Virtual Server Templates

Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing the template. The Entity Template Wizard, which appears when you import a template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the entity template. This wizard page appears only when you import a template that is configured with existing variables.

As an example, consider the following expression configured for a policy that is bound to a load balancing virtual server for which you are creating a template. The expression evaluates the value of the Accept-Language header in an HTTP request.

```
HTTP.REQ.HEADER("Accept-Language").CONTAINS("en-us")
```

If you want the value of the header to be configurable at import time, you can specify the string `en-us` as a variable. When importing the template, you can specify a new value for the variable on the Specify Variable Values page.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

To configure variables in a load balancing virtual server template

1. Navigate to Load Balancing > Virtual Servers.
2. In the details pane, right-click the virtual server that you want to export to a template file, and then click Create Template.
3. In the Create Template dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click Configure Variables.
4. In the Configure Variables dialog box, click the tab that lists the entity for which you want to configure a variable, select the entity, and then click Configure Variables.
5. In the Variables for <Entity Type>: <Entity Name> dialog box, click the  button next to the parameter value or expression in which you want to create a variable.
6. In the Variables for <Field Name> dialog box, do the following:

   - To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click Add. In the Create Variable dialog box, specify a name and a description for the variable, and then click Create.

     The name of the variable, its value, and the description you provided appear in the Available Variables listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.

   - To modify a variable, in the Available Variables list, click the variable, and then click Open. In the Create Variable dialog box, modify the value and the description, and then click OK.

     The new value that you specify will not replace the text selected in the text box that displays the configured expression or value. However, when you import the template, the new value will be displayed as the default value for the variable in the template import wizard.

   - To view all the strings that are assigned to a given variable, in the Available Variables listing, click the name of the variable. The strings that are assigned to the variable are highlighted.

   - To view a list of all the parameters, expressions, and actions in which the variable is used, in the Available Variables listing, click the variable whose references you want to view, and then click Show References.

   - To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click Use existing Variable, and then click the name of the variable to which you want to assign the string.

     If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the

new value.

7. Click Close.

Modifying an Entity Template

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. The NetScaler appliance does not provide you with the option of modifying a load balancing virtual server template.

To modify an entity template by using the AppExpert feature node

1. Navigate to AppExpert > Templates.
2. In the details pane, on the Entity Templates tab, select the template you want to change, and then click Open.
3. In the Modify...Template dialog box, follow the instructions to modify a template.
4. Click Finish, and then click Exit.

To modify an entity template by using its corresponding feature node

1. In the navigation pane, select the feature (for example, Content Switching), and then select the entity (for example, Virtual Servers) for which you want to modify the entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage <feature entity name> Entity Templates dialog box, select the template that you want to modify, and then click Modify.
4. In the Modify <template name> Template dialog box, follow the instructions to modify a template.
5. Click Finish, and then click Exit.
6. Click Close.

Deleting an Entity Template

Deleting an entity template does not affect any objects that have been created by using the template. You can delete a load balancing virtual server template only from the AppExpert feature node.

To delete an entity template by using the AppExpert feature node

1. Navigate to AppExpert > Templates.
2. In the details pane, on the Entity Templates tab, click the template you want to delete, and then click Remove.

To delete an entity template by using its corresponding feature node

1. In the navigation pane, select the feature (for example, Content Switching) and then select the entity (for example, Virtual Servers), for which you want to delete the entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage...Entity Templates dialog box, select the template that you want to delete, and then click Delete.

Creating an Entity from a Template

You can create an entity from an entity template either from the AppExpert feature node in the NetScaler configuration utility or from the NetScaler feature node that corresponds to the type of entity that you want to create. For example, you can create a content switching virtual server from a template with either the AppExpert feature node or the content switching feature node in the configuration utility.

The procedure for creating a load balancing virtual server from a template is different than the AppExpert procedure for creating other entities from templates.

After you create an instance of an entity using an entity template, you can configure it in the same way that you would any other object of that type, such as by using the configuration utility or the command line.

To create an entity from a template by using the AppExpert feature node

1. Navigate to AppExpert > Templates.
2. In the details pane, do one of the following:
   a. To create any entity other than a load balancing virtual server from a template, on the Entity Templates tab, click the template that you want to use, and then click Use Template.
   b. To create a load balancing virtual server from a template, on the LB Templates tab, click the template that you want to use, and then click Use Template.
3. In the <Entity Template Name> wizard, follow the instructions to create the entity on the NetScaler.
4. Click Finish, and then click Exit.

To create an entity from a template by using its corresponding feature node

1. In the navigation pane, expand a feature node (for example, Content Switching), and then click an entity subnode (for example, Virtual Servers).
2. At the top of the details pane, click Entity Templates, and then click Use Template.
3. Click the name of the template that you want to use.
4. In the Use <template name> Template wizard, follow the instructions to create the entity.

   Only templates that match the current context are displayed. For example, in the details pane for content switching virtual servers, only entity templates for content switching virtual servers appear, if configured.
5. Click Finish, and then click Exit.

To create a load balancing virtual server by using a load balancing virtual server template

1. Navigate to Load Balancing > Virtual Servers.
2. In the details pane, click Use Template.
3. In the Entity Template Wizard, follow the instructions to create a load balancing virtual server on the NetScaler.

   Only templates that match the current context are displayed. For example, when you click Browse (Appliance), only entity templates for load balancing virtual servers appear, if configured.
4. Click Finish, and then click Exit.

   Note: The Entity Template Wizard includes a Specify Variable Values page on which you can specify new values for variables. For more information about configuring variables in load balancing virtual server templates, see "Configuring Variables in Load Balancing Virtual Server Templates."

Managing Entity Template Folders

You can organize only load balancing virtual server template folders.

To organize load balancing virtual server template folders

1. Navigate to AppExpert > Templates > LB Templates.
2. In the Manage LB Templates dialog box, do one of the following:
   - To change the name of a folder, select the folder and click Rename.

     You can also click the folder that you want to rename, and then press F2. You cannot rename the top-level default folder.
   - To remove the folder, select the folder and click Delete.

     You can also click the folder that you want to remove, and then press the Delete key. You cannot remove the top-level default folder.
3. Click Close.

Uploading and Downloading Entity Templates

You can import the entity templates that are stored on your local computer. You can also download entity templates from the NetScaler appliance to your local computer and then import them to other NetScaler appliances.

Note: You cannot upload or download load balancing virtual server templates.

To upload an entity template to the NetScaler appliance

1. In the navigation pane of the NetScaler configuration utility, expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage...Entity Templates dialog box, click the top-level folder, and then click Upload.
4. In the Upload Entity Template dialog box, navigate to the template file that you want to upload, and then click Select.
5. Click Close.

To download an entity template from the NetScaler appliance

1. In the navigation pane of the NetScaler configuration utility, expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage...Entity Templates dialog box, click the template that you want to download, and then click Download.
4. In the Download Entity Template dialog box, navigate to the location at which you want to save the template on your local computer, enter a file name, and then click Save.
5. Click Close.

Understanding Load Balancing Entity Templates and Deployment Files

Load balancing entity templates are created in the same way that NetScaler application templates are created. When you export a load balancing virtual server to a template file, the following two files are automatically created:

- **Load balancing virtual server template file.** Contains XML elements that store the values of the parameters that are configured for the load balancing virtual server. The file also contains XML elements for storing information about bound policies.
- **Deployment file.** Contains XML elements that store deployment-specific information such as services, service groups, and configured variables.

In the template and deployment files, each unit of configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, the load balancing method parameter, `lbMethod`, is encapsulated within the `<lbmethod>` and `</lbmethod>` tags.

Note: After you export a load balancing virtual server, you can add elements, remove elements, and modify existing elements before importing the configuration information to a NetScaler appliance.

Example of a Load Balancing Virtual Server Template

Following is an example of a template file that was created from a load balancing virtual server called "Lbvip":

```
<?xml version="1.0" encoding="UTF-8" ?>
 <template>
  <template_info>
   <entity_name>Lbvip</entity_name>
   <version_major>10</version_major>
   <version_minor>0</version_minor>
   <build_number>40.406</build_number>
  </template_info>
  <entitytemplate>
   <lbvserver_list>
    <lbvserver>
     <name>Lbvip</name>
     <servicetype>HTTP</servicetype>
     <ipv46>0.0.0.0</ipv46>
     <ipmask>*</ipmask>
     <port>0</port>
     <range>1</range>
     <persistencetype>NONE</persistencetype>
     <timeout>2</timeout>
```

```
        <persistencebackup>NONE</persistencebackup>
        <backuppersistencetimeout>2</backuppersistencetimeout>
        <lbmethod>LEASTCONNECTION</lbmethod>
        <persistmask>255.255.255.255</persistmask>
        <v6persistmasklen>128</v6persistmasklen>
        <pq>OFF</pq>
        <sc>OFF</sc>
        <m>IP</m>
        <datalength>0</datalength>
        <dataoffset>0</dataoffset>
        <sessionless>DISABLED</sessionless>
        <state>ENABLED</state>
        <connfailover>DISABLED</connfailover>
        <clttimeout>180</clttimeout>
        <somethod>NONE</somethod>
        <sopersistence>DISABLED</sopersistence>
        <sopersistencetimeout>2</sopersistencetimeout>
        <redirectportrewrite>DISABLED</redirectportrewrite>
        <downstateflush>DISABLED</downstateflush>
        <gt2gb>DISABLED</gt2gb>
        <ipmapping>0.0.0.0</ipmapping>
        <disableprimaryondown>DISABLED</disableprimaryondown>
        <insertvserveripport>OFF</insertvserveripport>
        <authentication>OFF</authentication>
        <authn401>OFF</authn401>
        <push>DISABLED</push>
        <pushlabel>none</pushlabel>
        <l2conn>OFF</l2conn>
        <appflowlog>DISABLED</appflowlog>
        <icmpvsrresponse>PASSIVE</icmpvsrresponse>
        <lbvserver_cmppolicy_binding_list>
          <lbvserver_cmppolicy_binding>
            <name>Lbvip</name>
            <policyname>NOPOLICY-COMPRESSION</policyname>
            <priority>100</priority>
            <gotopriorityexpression>END</gotopriorityexpression>
            <bindpoint>REQUEST</bindpoint>
          </lbvserver_cmppolicy_binding>
        </lbvserver_cmppolicy_binding_list>
      </lbvserver>
    </lbvserver_list>
  </entitytemplate>
</template>
```

Example of a Deployment File

Following is the deployment file associated with the virtual server in the preceding example:

```
<?xml version="1.0" encoding="UTF-8" ?>
  <template_deployment>
```

```
    <template_info>
      <entity_name>Lbvip</entity_name>
      <version_major>10</version_major>
      <version_minor>0</version_minor>
      <build_number>40.406</build_number>
    </template_info>
    <service_list>
      <service>
      <ip>1.2.3.4</ip>
      <port>80</port>
      <servicetype>HTTP</servicetype>
      </service>
    </service_list>
    <servicegroup_list>
      <servicegroup>
        <name>svcgrp</name>
        <servicetype>HTTP</servicetype>
        <servicegroup_servicegroupmember_binding_list>
          <servicegroup_servicegroupmember_binding>
            <ip>1.2.3.90</ip>
            <port>80</port>
          </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.8.0</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.8.1</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.9.0</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
      </servicegroup_servicegroupmember_binding_list>
    </servicegroup>
  </servicegroup_list>
</template_deployment>
```

HTTP Callouts

For certain types of requests, or when certain criteria are met during policy evaluation, you might want to stall policy evaluation briefly, retrieve information from a server, and then perform a specific action that depends on the information that is retrieved. At other times, when you receive certain types of requests, you might want to update a database or the content hosted on a Web server. HTTP callouts enable you to perform all these tasks.

An HTTP callout is an HTTP request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation. The information that is retrieved from the server can be analyzed by default syntax policy expressions, and an appropriate action can be performed. You can configure HTTP callouts for HTTP content switching, TCP content switching, rewrite, responder, and for the token-based method of load balancing.

Before you configure an HTTP callout, you must set up an application on the server to which the callout will be sent. The application, which is called the *HTTP callout agent* , must be configured to respond to the HTTP callout request with the required information. The HTTP callout agent can also be a Web server that serves the data for which the NetScaler appliance sends the callout. You must make sure that the format of the response to an HTTP callout does not change from one invocation to another.

After you set up the HTTP callout agent, you configure the HTTP callout on the NetScaler appliance. Finally, to invoke the callout, you include the callout in a default syntax policy in the appropriate NetScaler feature and then bind the policy to the bind point at which you want the policy to be evaluated.

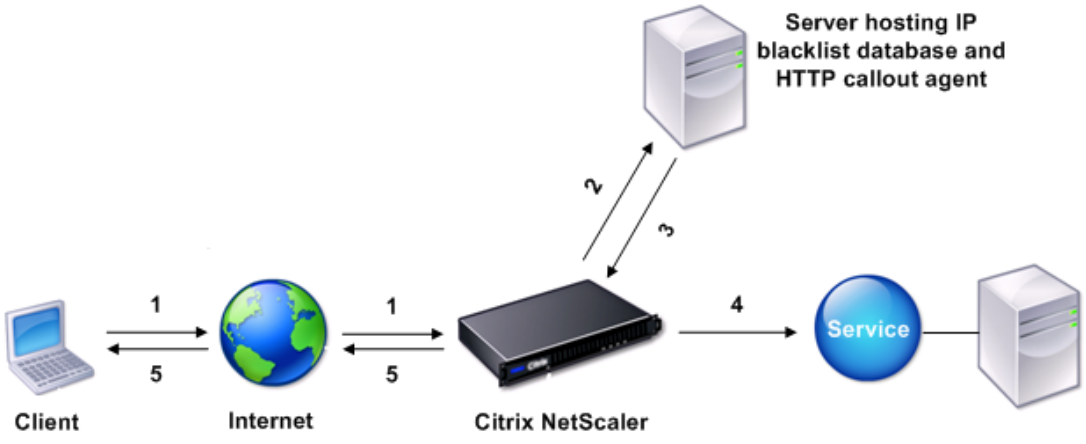
After you have configured the HTTP callout, you must verify the configuration to make sure that the callout is working correctly.

How an HTTP Callout Works

When the NetScaler appliance receives a client request, the appliance evaluates the request against the policies bound to various bind points. During this evaluation, if the appliance encounters the HTTP callout expression, SYS.HTTP_CALLOUT(<name>), it stalls policy evaluation briefly and sends a request to the HTTP callout agent by using the parameters configured for the specified HTTP callout. Upon receiving the response, the appliance inspects the specified portion of the response, and then either performs an action or evaluates the next policy, depending on whether the evaluation of the response from the HTTP callout agent evaluates to TRUE or FALSE, respectively. For example, if the HTTP callout is included in a responder policy, if the evaluation of the response evaluates to TRUE, the appliance performs the action associated with the responder policy.

If the HTTP callout configuration is incorrect or incomplete, or if the callout invokes itself recursively, the appliance raises an UNDEF condition, and updates the undefined hits counter.

The following figure illustrates the working of an HTTP callout that is invoked from a globally bound responder policy. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client's IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client's IP address is listed, and sends a response that the NetScaler appliance evaluates. If the response indicates that the client's IP address is not blacklisted, the appliance forwards the response to the configured service. If the client's IP address is blacklisted, the appliance resets the client connection



1: Client request
2: HTTP callout request to check whether the client is blacklisted
3: Response from HTTP callout agent
4: Request forwarded to service if 3 indicates a safe IP address
5: Connection RESET if 3 indicates a bad IP address

Figure 1. HTTP Callout Entity Model

Notes on the Format of HTTP Requests and Responses

The NetScaler appliance does not check for the validity of the HTTP callout request. Therefore, before you configure HTTP callouts, you must know the format of an HTTP request. You must also know the format of an HTTP response, because configuring an HTTP callout involves configuring expressions that evaluate the response from the HTTP callout agent.

Format of an HTTP Request

An HTTP request contains a series of lines that each end with a carriage return and a line feed, represented as either <CR><LF> or \r\n.

The first line of a request (the *message line*) contains the HTTP method and target. For example, a message line for a GET request contains the keyword GET and a string that represents the object that is to be fetched, as shown in the following example:

GET /mysite/mydirectory/index.html HTTP/1.1\r\n

The rest of the request contains HTTP headers, including a required Host header and, if applicable, a message body.

The request ends with a bank line (an extra <CR><LF> or \r\n).

Following is an example of a request:

```
Get /mysite/index.html HTTP/1.1\r\n
Host: 10.101.101.10\r\n
Accept: */*\r\n
\r\n
```

Format of an HTTP Response

An HTTP response contains a status message, response HTTP headers, and the requested object or, if the requested object cannot be served, an error message.

Following is an example of a response:

HTTP/1.1 200 OK\r\n
Content-Length: 55\r\n
Content-Type: text/html\r\n
Last-Modified: Wed, 12 Aug 1998 15:03:50 GMT\r\n
Accept-Ranges: bytes\r\n
ETag: “04f97692cbd1:377”\r\n
Date: Thu, 19 Jun 2008 19:29:07 GMT\r\n
\r\n
<55-character response>

Configuring an HTTP Callout

When configuring an HTTP callout, you specify the destination and format of the request, the expected format of the response, and, finally, the portion of the response that you want to analyze.

For the destination, you either specify the IP address and port of the HTTP callout agent or engage a load balancing, content switching, or cache redirection virtual server to manage the HTTP callout requests. In the first case, the HTTP callout requests will be sent directly to the HTTP callout agent. In the second case, the HTTP callout requests will be sent to the virtual IP address (VIP) of the specified virtual server. The virtual server will then process the request in the same way as it processes a client request. For example, if you expect a large number of callouts to be generated, you can configure instances of the HTTP callout agent on multiple servers, bind these instances (as services) to a load balancing virtual server, and then specify the load balancing virtual server in the HTTP callout configuration. The load balancing virtual server then balances the load on those configured instances as determined by the load balancing algorithm.

For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as a default syntax expression (an expression-based HTTP callout).

Note: The appliance does not check for the validity of the request. You must make sure that the request is a valid request. An incorrect or incomplete HTTP callout configuration results in a runtime UNDEF condition that is not associated with an action. The UNDEF condition merely updates the Undefined Hits counter, which enables you to troubleshoot an incorrectly configured HTTP callout. However, the appliance parses the HTTP callout request to enable you to configure certain NetScaler features for the callout. This can lead to an HTTP callout invoking itself. For information about callout recursion and how you can avoid it, see "Avoiding HTTP Callout Recursion."

Finally, regardless of whether you use HTTP request attributes or an expression to define the format of the HTTP callout request, you must specify the format of the response from the HTTP callout agent and the portion of the response that you want to evaluate. The response can be a Boolean value, a number, or text. The portion of the response that you want to evaluate is specified by an expression. For example, if you specify that the response contains text, you can use `HTTP.RES.BODY(<unit>)` to specify that the appliance must evaluate only the first <unit> bytes of the response from the callout agent.

At the command line, you first create an HTTP callout by using the add command. When you add a callout, all parameters are set to a default value of NONE, except the HTTP method, which is set to a default value of GET. You then configure the callout's parameters by using the set command. The set command is used to configure both types of callouts (attribute-based and expression-based). The difference lies in the parameters that are used for configuring the two types of callouts. Accordingly, the command-line instructions that follow include a set command for configuring an attribute-based callout and a set command for configuring an expression-based callout. In the configuration utility, all of these configuration tasks are performed in a single dialog box.

Note: Before you put an HTTP callout into a policy, you can modify all configured parameters except the return type. Once an HTTP callout is in a policy, you cannot completely modify an expression that is configured in the callout. For example, you

cannot change `HTTP.REQ.HEADER("myval")` to `CLIENT.IP.SRC`. However, you can modify the operators and arguments that are passed to the expression. For example, you can change `HTTP.REQ.HEADER("myVal1")` to `HTTP.REQ.HEADER("myVal2")`, or `HTTP.REQ.HEADER("myVal")` to `HTTP.REQ.HEADER("myVal").AFTER_STR(<string>)`. If the set command fails, create a new HTTP callout.

HTTP callout configuration involves configuring default syntax expressions. For more information about configuring default syntax expressions, see "Configuring Default Syntax Expressions: Getting Started."

To configure an HTTP callout by using the command line interface

At the command prompt, do the following:

1. Create a HTTP callout.

   add policy httpCallout <name>

   Example

   > add policy httpCallout mycallout

2. Configure the details of the HTTP callout.

   - To configure an attribute-based HTTP callout, type:

     set policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-port <port|*>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (GET | POST)] [-hostExpr <string>] [-urlStemExpr <string>] [-headers <name(value)> ...] [-parameters <name(value)> ...] [-resultExpr <string>]

     Example

     > set policy httpCallout mycallout -vserver lbv1 -returnType num -httpMethod GET -hostExpr 'http.re
     -urlStemExpr "http.req.url" -parameters Name("My Name") -headers Name("MyHeader")
     -resultExpr "http.res.body(10000).length"

   - To configure an expression-based HTTP callout, type:

     set policy httpCallout <name> [-vServer <string>] [-returnType <returnType>] [-httpMethod (GET | POST)] [-fullReqExpr <string>] [-resultExpr <string>]

     Example

     > set policy httpCallout mycallout1 -vserver lbv1 -returnType num -httpMethod GET
     -fullReqExpr q{"GET " + http.req.url + "HTTP/" + http.req.version.major + "." + http.req.version.mino
     "r\nHost:10.101.10.10\r\nAccept: */*\r\n\r\n"}

3. Verify the configurations of the HTTP callout.

   show policy httpCallout <name>

To configure an HTTP callout by using the configuration utility

- Navigate to AppExpert > HTTP Callouts.
- In the details pane, do one of the following:
  - To create an HTTP callout, click Add.
  - To modify an existing HTTP callout, select the HTTP callout, and then click Open.
- In the Create HTTP Callout dialog box or Configure HTTP Callout dialog box, configure the parameters of the HTTP callout. For a description of the parameter, hover the mouse cursor over the check box.
- Click Create or OK.

Verifying the Configuration

For an HTTP callout to work correctly, all the HTTP callout parameters and the entities associated with the callout must be configured correctly. While the NetScaler appliance does not check the validity of the HTTP callout parameters, it indicates the state of the bound entities, namely the server or virtual server to which the HTTP callout is sent. The following table lists the icons and describes the conditions under which the icons are displayed.

Table 1. Icons That Indicate the States of Entities Bound to an HTTP Callout

Icon	Indicates that
	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is UP.
	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is OUT OF SERVICE.
	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is DOWN.

For an HTTP callout to function correctly, the icon must be green at all times. If the icon is not green, check the state of the callout server or virtual server to which the HTTP callout is sent. If the HTTP callout is not working as expected even though the icon is green, check the parameters configured for the callout.

You can also verify the configuration by sending test requests that match the policy from which the HTTP callout is invoked, checking the hits counter for the policy and the HTTP callout, and verifying the responses that the NetScaler appliance sends to the client.

Note: An HTTP callout can sometimes invoke itself recursively a second time. If this happens, the hits counter is incremented by two counts for each callout that is generated by the appliance. For the hits counter to display the correct value, you must configure the HTTP callout in such a way that it does not invoke itself a second time. For more information about how you can avoid HTTP callout recursion, see "Avoiding HTTP Callout Recursion."

To view the hits counter for an HTTP callout

1. Navigate to AppExpert > HTTP Callouts.
2. In the details pane, click the HTTP callout for which you want to view the hits counter, and then view the hits in the Details area.

Invoking an HTTP Callout

After you configure an HTTP callout, you invoke the callout by including the `SYS.HTTP_CALLOUT(<name>)` expression in a default syntax policy rule. In this expression, <name> is the name of the HTTP callout that you want to invoke.

You can use default syntax expression operators with the callout expression to process the response and then perform an appropriate action. The return type of the response from the HTTP callout agent determines the set of operators that you can use on the response. If the part of the response that you want to analyze is text, you can use a text operator to analyze the response. For example, you can use the `CONTAINS(<string>)` operator to check whether the specified portion of the response contains a particular string, as in the following example:

SYS.HTTP_CALLOUT(mycallout).contains("Good IP address")

If you use the preceding expression in a responder policy, you can configure an appropriate responder action.

Similarly, if the part of the response that you want to evaluate is a number, you can use a numeric operator such as GT(int). If the response contains a Boolean value, you can use a Boolean operator.

Note: An HTTP callout can invoke itself recursively. HTTP callout recursion can be avoided by combining the HTTP callout expression with a default syntax expression that prevents recursion. For information about how you can avoid HTTP callout recursion, see "Avoiding HTTP Callout Recursion."

You can also cascade HTTP callouts by configuring policies that each invoke a callout after evaluating previously generated callouts. In this scenario, after one policy invokes a callout, when the NetScaler appliance is parsing the callout before sending the callout to the callout server, a second set of policies can evaluate the callout and invoke additional callouts, which can in turn be evaluated by a third set of policies, and so on. Such an implementation is described in the following example.

First, you could configure an HTTP callout called myCallout1, and then configure a responder policy, Pol1, to invoke myCallout1. Then, you could configure a second HTTP callout, myCallout2, and a responder policy, Pol2. You configure Pol2 to evaluate myCallout1 and invoke myCallout2. You bind both responder policies globally.

To avoid HTTP callout recursion, myCallout1 is configured with a unique custom HTTP header called "Request1." Pol1 is configured to avoid HTTP callout recursion by using the default syntax expression,

HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout Request\").NOT.

Pol2 uses the same default syntax expression, but excludes the .NOT operator so that the policy evaluates myCallout1 when the NetScaler appliance is parsing it. Note that myCallout2 identifies its own unique header called "Request2," and Pol2 includes a default syntax expression to prevent myCallout2 from invoking itself recursively.
Example

```
> add policy httpCallout myCallout1

Done

> set policy httpCallout myCallout1 -IPAddress 10.102.3.95 -port 80 -returnType TEXT -hostExpr
 "\"10.102.3.95\"" -urlStemExpr "\"/cgi-bin/check_clnt_from_database.pl\"" -headers Request1
("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"

Done

> add responder policy Pol1 "HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout Request\").NOT &&
SYS.HTTP_CALLOUT(myCallout1).CONTAINS(\"IP Matched\")" RESET

Done

> bind responder global Pol1 100 END -type OVERRIDE

Done

> add policy httpCallout myCallout2

Done

> set policy httpCallout myCallout2 -IPAddress 10.102.3.96 -port 80 -returnType TEXT -hostExpr
"\"10.102.3.96\"" -urlStemExpr "\"/cgi-bin/check_clnt_location_from_database.pl\"" -headers Request2
("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(200)"

 Done

> add responder policy Pol2 "HTTP.REQ.HEADER(\"Request2\").EQ(\"Callout Request\").NOT &&
 HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout Request\") && SYS.HTTP_CALLOUT(myCallout2).CONTAINS
(\"APAC\")" RESET

 Done

> bind responder global Pol2 110 END -type OVERRIDE

Done
```

Avoiding HTTP Callout Recursion

Even though the NetScaler appliance does not check for the validity of the HTTP callout request, it parses the request once before it sends the request to the HTTP callout agent. This parsing allows the appliance to treat the callout request as any other incoming request, which in turn allows you to configure several useful NetScaler features (such as integrated caching, SureConnect, and Priority Queuing) to work on the callout request.

However, during this parsing, the HTTP callout request can hit the same policy and therefore invoke itself recursively. The appliance detects the recursive invocation and raises an undefined (UNDEF) condition. However, the recursive invocation results in the policy and HTTP callout hit counters being incremented by two counts each instead of one count each.

To prevent a callout from invoking itself, you must identify at least one unique characteristic of the HTTP callout request, and then exclude all requests with this characteristic from being processed by the policy rule that invokes the callout. You can do so by including another default syntax expression in the policy rule. The expression must precede the `SYS.HTTP_CALLOUT(<name>)` expression so that it is evaluated before the callout expression is evaluated. For example:

<Expression that prevents callout recursion> && SYS.HTTP_CALLOUT(<name>)

When you configure a policy rule in this way, when the appliance generates the request and parses it, the compound rule evaluates to FALSE, the callout is not generated a second time, and the hit counters are incremented correctly.

One way by which you can assign a unique characteristic to an HTTP callout request is to include a unique custom HTTP header when you configure the callout. Following is an example of an HTTP callout called "myCallout." The callout generates an HTTP request that checks whether a client's IP address is present in a database of blacklisted IP addresses. The callout includes a custom header called "Request," which is set to the value "Callout Request." A globally bound responder policy, "Pol1," invokes the HTTP callout but excludes all requests whose Request header is set to this value, thus preventing a second invocation of myCallout. The expression that prevents a second invocation is `HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT`.

Example

```
> add policy httpCallout myCallout
 Done

> set policy httpCallout myCallout -IPAddress 10.102.3.95 -port 80 -returnType TEXT -hostExpr "\"10.102.3.95
Done

> add responder policy Pol1 "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT && SYS.HTTP_CALL
Done

> bind responder global Pol1 100 END -type OVERRIDE
Done
```

Note: You can also configure an expression to check whether the URL of the request includes the URL stem expression that is configured for the HTTP callout. If you want to implement this scenario, make sure that the HTTP callout agent is dedicated to respond only to HTTP callouts and not to other client requests directed through the appliance. If the HTTP callout agent is an application or Web server that serves other client requests, such an expression will prevent the appliance from processing those client requests. Instead, use a unique custom header as described earlier.

Deployment Scenarios for HTTP Callouts

These topics demonstrate the configuration of HTTP callouts to perform various useful tasks. In all cases, the NetScaler appliance performs a callout to an external server where a callout agent is configured to respond to the request from the NetScaler appliance on the basis of data that is present on the external server. The callout agent is a program, for example, a CGI script, that is deployed in a container (for example, Apache Tomcat).

Note that the examples should be used only as a guideline when you want to create scripts that work in your deployment. The IP addresses and other entities used in these deployment scenarios should be modified to suit your environment.

Filtering Clients by Using an IP Blacklist

HTTP callouts can be used to block requests from clients that are blacklisted by the administrator. The list of clients can be a publicly known blacklist, a blacklist that you maintain for you organization, or a combination of both.

The NetScaler appliance checks the IP address of the client against the pre-configured blacklist and blocks the transaction if the IP address has been blacklisted. If the IP address is not in the list, the appliance processes the transaction.

To implement this configuration, you must perform the following tasks:

1. Enable responder on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response to the HTTP callout, and then bind the policy globally.
4. Create an HTTP callout agent on the remote server.

Enabling Responder

You must enable responder before you can use it.

To enable responder by using the configuration utility

1. Make sure that you have installed the responder license.
2. In the navigation pane, right-click Responder, and then click Enable Responder feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP-Callout-1, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see "Configuring an HTTP Callout."

Table 1. Parameters and Values for HTTP-Callout-1

Parameter	Value
Name	HTTP-Callout-1
Server to receive callout request	
IP Address	10.103.9.95
Port	80
Request to send to the server	
Method	GET
Host Expression	10.102.3.95
URL Stem Expression	"/cgi-bin/check_clnt_from_database.pl"
Headers	
Name	Request
Value-expression	Callout Request
Parameters	
Name	Cip
Value-expression	CLIENT.IP.SRC
Server Response	
Return Type	TEXT
Expression to extract data from the response	HTTP.RES.BODY(100)

Configuring a Responder Policy and Binding it Globally

After you configure the HTTP callout, verify the callout configuration, and then configure a responder policy to invoke the callout. While you can create a responder policy in the Policies sub-node and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

To create a responder policy and bind it globally by using the configuration utility

1. In the navigation pane, expand Responder.
2. In the details pane, under Policy Manager, click Policy Manager.
3. In the Responder Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, under Policy Name, click New Policy.
5. In the Create Responder Policy dialog box, do the following:
    a. In Name, type Policy-Responder-1.
    b. In Action, select RESET.
    c. In Undefined-Result Action, select Global undefined-result action.
    d. In Expression, type the following default syntax expression:

        "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT && SYS.HTTP_CALLOUT(HTTP-Callout-1

    e. Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Creating an HTTP Callout Agent on the Remote Server

You must now create an HTTP callout agent on the remote callout server that will receive callout requests from the NetScaler appliance and respond appropriately. The HTTP callout agent is a script that is different for each deployment and must be written with the server specifications in mind, such as the type of database and the scripting language supported.

Following is a sample callout agent that verifies whether the given IP address is part of an IP blacklist. The agent has been written in the Perl scripting language and uses a MYSQL database.

The following CGI script checks for a given IP address on the callout server.

```
#!/usr/bin/perl -w
print "Content-type: text/html\n\n";
	use DBI();
	use CGI qw(:standard);
#Take the Client IP address from the request query
	my $ip_to_check = param('cip');
# Where a MYSQL database is running
	my $dsn = 'DBI:mysql:BAD_CLIENT:localhost';
# Database username to connect with
	my $db_user_name = ‘dbuser’;
# Database password to connect with
	my $db_password = 'dbpassword';
	my ($id, $password);
# Connecting to the database
	my $dbh = DBI->connect($dsn, $db_user_name, $db_password);
	my $sth = $dbh->prepare(qq{ select * from bad_clnt });
	$sth->execute();
	while (my ($ip_in_database) = $sth->fetchrow_array()) {
	chomp($ip_in_database);
# Check for IP match
	if ($ip_in_database eq $ip_to_check) {
	    print "\n IP Matched\n";
                                        $sth->finish();
                                    exit;
	     }
      }
      print "\n IP Failed\n";
      $sth->finish();
      exit;
```

ESI Support for Fetching and Updating Content Dynamically

Edge Side Includes (ESI) is a markup language for edge-level dynamic Web content assembly. It helps in accelerating dynamic Web-based applications by defining a simple markup language to describe cacheable and non-cacheable Web page components that can be aggregated, assembled, and delivered at the network edge. By using HTTP callouts on the NetScaler appliance, you can read through the ESI constructs and aggregate or assemble content dynamically.

To implement this configuration, you must perform the following tasks:

1. Enable rewrite on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a rewrite action to replace the ESI content with the callout response body.
4. Configure a rewrite policy to specify the conditions under which the action is performed, and then bind the rewrite policy globally.

Enabling Rewrite

Rewrite must be enabled before it is used on the NetScaler appliance. The following procedure describes the steps to enable the rewrite feature.

To enable rewrite by using the configuration utility

1. Make sure that you have installed the rewrite license.
2. In the navigation pane, right-click Rewrite, and then click Enable Rewrite feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP-Callout-2, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see "Configuring an HTTP Callout."

Table 1. Parameters and Values for HTTP-Callout-2

Parameter	Value
Name	HTTP-Callout-2
Server to receive callout request	
IP Address	10.102.56.51
Port	80
Request to send to the server	
Method	GET
Host Expression	10.102.56.51:80
URL Stem Expression	"HTTP.RES.BODY(500).AFTER_STR(\"src=\").BEFORE_STR(\"/>\")"
Headers	
Name	Name
Value-expression	Callout
Server Response	
Return Type	TEXT
Expression to extract data from the response	HTTP.RES.BODY(100)

Configuring the Rewrite Action

Create a rewrite action, Action-Rewrite-1, to replace the ESI content with the callout response body. Use the parameter settings shown in the following table.

Table 1. Parameters and Values for Action-Rewrite-1

Parameter	Value
Name	Action-Rewrite-1
Type	Replace
Expression to choose target text reference	"HTTP.RES.BODY(500).AFTER_STR (\" <example>\").BEFORE_STR (\"</example>\")"
String expression for replacement text	"SYS.HTTP_CALLOUT(HTTP-Callout-2)"

To configure the rewrite action by using the configuration utility

1. Navigate to Rewrite > Actions.
2. In the details pane, click Add.
3. In the Create Rewrite Action dialog box, in Name, type Action-Rewrite-1.
4. In Type, select REPLACE.
5. In Expression to choose target text reference, type the following default syntax expression:

   "HTTP.RES.BODY(500).AFTER_STR(\"<example>\").BEFORE_STR(\"</example>\")"
6. In the String expression for replacement text, type the following string expression:

   "SYS.HTTP_CALLOUT(HTTP-Callout-2)"
7. Click Create, and then click Close.

Creating the Rewrite Policy and Binding it Globally

Create a rewrite policy, Policy-Rewrite-1, with the parameter settings shown in the following table. You can create a rewrite policy in the Policies subnode and then bind it globally by using the Rewrite Policy Manager. Alternatively, you can use the Rewrite Policy Manager to perform both these tasks simultaneously. This demonstration uses the Rewrite Policy Manager to perform both tasks.

Table 1. Parameters and Values for Policy-Rewrite-1

Parameter	Value
Name	Policy-Rewrite-1
Action	Action_Rewrite-1
Undefined Result Action	-Global undefined-result action-
Expression	"HTTP.REQ.HEADER(\"Name\").CONTAINS (\"Callout\").NOT"

To configure a rewrite policy and bind it globally by using the configuration utility

1. In the navigation pane, expand Rewrite.
2. In the details pane, under Policy Manager, click Rewrite Policy Manager.
3. In the Rewrite Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.
5. In the Create Rewrite Policy dialog box, do the following:
    a. In Name, type Policy-Rewrite-1.
    b. In Action, select Action-Rewrite-1.
    c. In Undefined-Result Action, select Global undefined-result action.
    d. In Expression, type the following default syntax expression:

        "HTTP.REQ.HEADER(\"Name\").CONTAINS(\"Callout\").NOT"

    e. Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Access Control and Authentication

In high security zones, it is mandatory to externally authenticate the user before a resource is accessed by clients. On the NetScaler appliance, you can use HTTP callouts to externally authenticate the user by evaluating the credentials supplied. In this example, the assumption is that the client is sending the user name and password through HTTP headers in the request. However, the same information could be fetched from the URL or the HTTP body.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling Responder

The responder feature must be enabled before it is used on the NetScaler appliance.

To enable responder by using the configuration utility

1. Make sure that the responder license is installed.
2. In the navigation pane, right-click Responder, and then click Enable Responder feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP-Callout-3, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see "Configuring an HTTP Callout."

Table 1. Parameters and Values for HTTP-Callout-3

Parameter	Value
Name	HTTP-Callout-3
Server to receive callout request	
IP Address	10.103.9.95
Port	80
Request to send to the server	
Method	GET
Host Expression	10.102.3.95
URL Stem Expression	“/cgi-bin/authenticate.pl”
Headers	
Name	Request
Value-expression	Callout Request
Parameters	
Name	Username
Value-expression	HTTP.REQ.HEADER("Username").VALUE(0)
Name	Password
Value-expression	HTTP.REQ.HEADER("Password").VALUE(0)
Server Response	
Return Type	TEXT
Expression to extract data from the response	HTTP.RES.BODY(100)

Creating a Responder Policy to Analyze the Response

Create a responder policy, Policy-Responder-3, that will check the response from the callout server and RESET the connection if the source IP address has been blacklisted. Create the policy with the parameters settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

Table 1. Parameters and Values for Policy-Responder-3

Parameter	Value
Name	Policy-Responder-3
Action	RESET
Undefined-Result-Action	-Global undefined-result action-
Expression	"HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT && SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\"Authentication Failed\")"

To create a responder policy and bind it globally by using the configuration utility

1. In the navigation pane, expand Responder.
2. In the details pane, under Policy Manager, click Responder Policy Manager.
3. In the Responder Policy Manger dialog box, click Override Global.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.
5. In the Create Responder Policy dialog box, do the following:
    a. In Name, type Policy-Responder-3.
    b. In Action, select RESET.
    c. In Undefined-Result Action , select Global undefined-result action.
    d. In the Expression text box, type:

        "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT && SYS.HTTP_CALLOUT(HTTP-Callo

    e. Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Creating an HTTP Callout Agent on the Remote Server

You now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds appropriately. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

Following is sample callout agent pseudo-code that verifies whether the supplied user name and password are valid. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

To verify the supplied user name and password by using pseudo-code

1. Accept the user name and password supplied in the request and format them appropriately.
2. Connect to the database that contains all the valid user names and passwords.
3. Check the supplied credentials against your database.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

OWA-Based Spam Filtering

Spam filtering is the ability to dynamically block emails that are not from a known or trusted source or that have inappropriate content. Spam filtering requires an associated business logic that indicates that a particular kind of message is spam. When the NetScaler appliance processes Outlook Web Access (OWA) messages based on the HTTP protocol, HTTP callouts can be used to filter spam.

You can use HTTP callouts to extract any portion of the incoming message and check with an external callout server that has been configured with rules that are meant for determining whether a message is legitimate or spam. In case of spam email, for security reasons, the NetScaler appliance does not notify the sender that the email is marked as spam.

The following example conducts a very basic check for various listed keywords in the email subject. These checks can be more complex in a production environment.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Create a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling Responder

The responder feature must be enabled before it can be used on the NetScaler appliance.

To enable responder by using the configuration utility

1. Make sure that the responder license is installed.
2. In the navigation pane, right-click Responder, and then click Enable Responder feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP-Callout-4, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see "Configuring an HTTP Callout."

Table 1. Parameters and Values for HTTP-Callout-4

Parameter	Value
Name	HTTP-Callout-4
Server to receive callout request	
IP Address	10.103.56.51
Port	80
Request to send to the server	
Method	POST
Host Expression	fffffff
URL Stem Expression	"/cgi-bin/Callout/spam_filter.pl"
Headers	
Name	Request
Value-expression	Callout Request
Parameters	
Name	Subject
Value-expression	("\"" + HTTP.REQ.BODY(1000).AFTER_STR("urn:schemas:httpmail:subject=").BEFORE_STR("\n").TO_LOWER + "\"")
Server Response	
Return Type	BOOL
Expression to extract data from the response	HTTP.RES.BODY(100) .CONTAINS(\"Matched\")

Creating a Responder Action

Create a responder action, Action-Responder-4. Create the action with the parameter settings shown in the following table.

Table 1. Parameters and Values for Action-Responder-4

Parameter	Value
Name	Action-Responder-4
Type	Respond with
Target	"\"HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-Control: no-cache\r\n\r\n\""

To create a responder action by using the configuration utility

1. Navigate to Responder > Actions.
2. In the details pane, click Add.
3. In the Create Responder Action dialog box, in Name, type Action-Responder-4.
4. In Type, click Respond with.
5. In Target, type:

   "\"HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-W
6. Click Create, and then click Close.

Creating a Responder Policy to Invoke the HTTP Callout

Create a responder policy, Policy-Responder-4, that will check the request body and, if the body contains the word "*subject*," invoke the HTTP callout to verify the email. Create the policy with the parameter settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind it globally.

Table 1. Parameters and Values for Policy-Responder-4

Parameter	Value
Name	Policy-Responder-4
Action	Action-Responder-4
Undefined-Result-Action	-Global undefined-result action-
Expression	"HTTP.REQ.BODY(1000).CONTAINS(\"urn:schemas:httpmail:subject\") && SYS.HTTP_CALLOUT(HTTP-Callout-4)"

To create a responder policy by using the configuration utility

1. In the navigation pane, expand Responder.
2. In the details pane, under Policy Manager, click Responder policy manager.
3. In the Responder Policy Manger dialog box, click Override Global.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.
5. In the Create Responder Policy dialog box, do the following:
    a. In Name, type Policy-Responder-4.
    b. In Action, click Action-Responder-4.
    c. In Undefined-Result Action, click Global undefined-result action.
    d. In the Expression text box, type:

        "HTTP.REQ.BODY(1000).CONTAINS(\"urn:schemas:httpmail:subject\") && SYS.HTTP_CALLOUT(HTTP-C

    e. Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Creating an HTTP Callout Agent on the Remote Server

You will now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds accordingly. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

The following pseudo-code provides instructions for creating a callout agent that checks a list of words that are generally understood to indicate spam mails. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

To identify spam email by using pseudo-code

1. Accept the email subject provided by the NetScaler appliance.
2. Connect to the database that contains all the terms against which the email subject is checked.
3. Check the words in the email subject against the spam word list.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

Dynamic Content Switching

This use case provides dynamic content switching by using an HTTP callout to get the name of the load balancing virtual server to which the request is forwarded.

1. Add a content switching virtual server.

   > add cs vserver cs_vserver1 HTTP 10.102.29.196 80

2. Create an HTTP callout.

   > add policy httpCallout http_callout1

3. Configure the HTTP callout to respond with the name of the load balancing virtual server from a request that contains the client IP address in the HTTP header "X-CLIENT-IP".

   > set policy httpCallout http_callout1 -IPAddress 10.217.14.23 -port 80 -returnType TEXT -hostExpr "\"ww

4. Configure the content switching action to retrieve the callout response.

   > add cs action cs_action1 -targetVserverExpr 'SYS.HTTP_CALLOUT(http_callout1)'

   Note: You must bind a load balancing virtual server to the content switching virtual server to account for:

   - The non-availability of the load balancing virtual server that the callout resolves to.
   - A UNDEF condition that results from the execution of the callout.

   > bind cs vserver cs_vserver1 -lbvserver default_lbvip

5. Configure the content switching policy.

   > add cs policy cs_policy1 -rule true -action cs_action1

6. Binding the content switching policy to the content switching virtual server.

   > bind cs vserver cs_vserver1 -policyName cs_policy1 -priority 10

Pattern Sets and Data Sets

Policy expressions for string matching operations on a large set of string patterns tend to become long and complex. Resources consumed by the evaluation of such complex expressions are significant in terms of processing cycles, memory, and configuration size. You can create simpler, less resource-intensive expressions by using pattern matching.

Depending on the type of patterns that you want to match, you can use one of the following features to implement pattern matching:

- A *pattern set* is an array of indexed patterns used for string matching during default syntax policy evaluation. Example of a pattern set: imagetypes {svg, bmp, png, gif, tiff, jpg}.
- A *data set* is a specialized form of pattern set. It is an array of patterns of types number (integer), IPv4 address, or IPv6 address.

In many cases, you can use either pattern sets or data sets. However, in cases where you want specific matches for numerical data or IPv4 and IPv6 addresses, you must use data sets.

Note: Pattern sets and data sets can be used only in default syntax policies.

To use pattern sets or data sets, first create the pattern set or data set and bind patterns to it. Then, when you configure a policy for comparing a string in a packet, use an appropriate operator and pass the name of the pattern set or data set as an argument.

How String Matching works with Pattern Sets and Data Sets

A pattern set or data set contains a set of patterns, and each pattern is assigned a unique index. When a policy is applied to a packet, an expression identifies a string to be evaluated, and the operator compares the string to the patterns defined in the pattern set or data set until a match is found or all patterns have been compared. Then, depending on its function, the operator returns either a boolean value that indicates whether or not a matching pattern was found or the index of the pattern that matches the string.

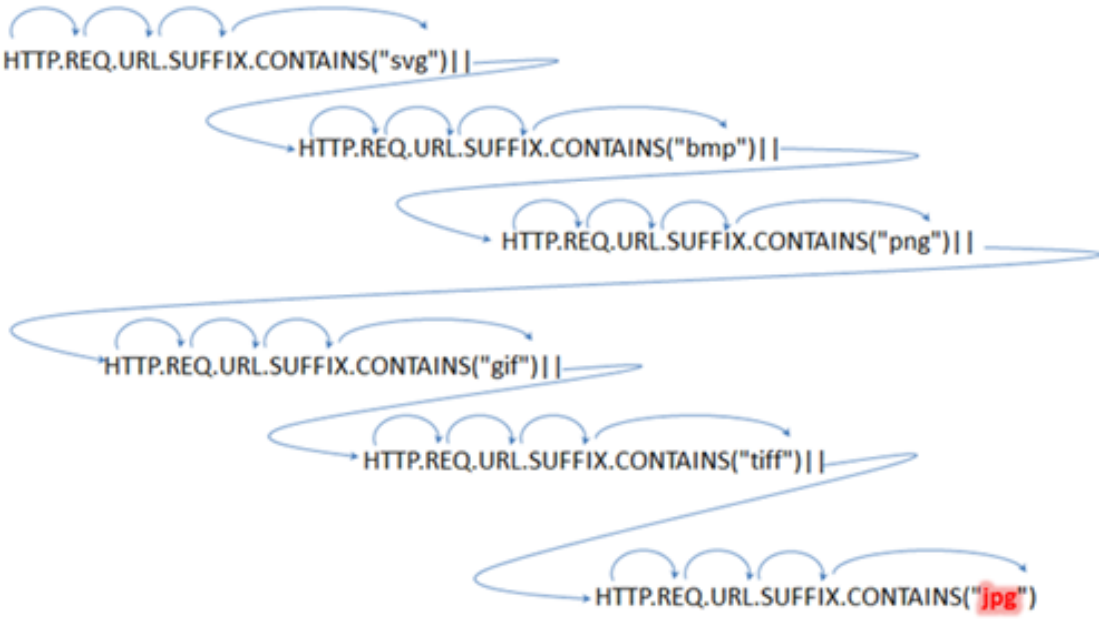
Note: This topic explains the working of a pattern set. Data sets work the same way. The only difference between pattern sets and data sets is the type of patterns defined in the set.

Consider the following use case to understand how patterns can be used for string matching.

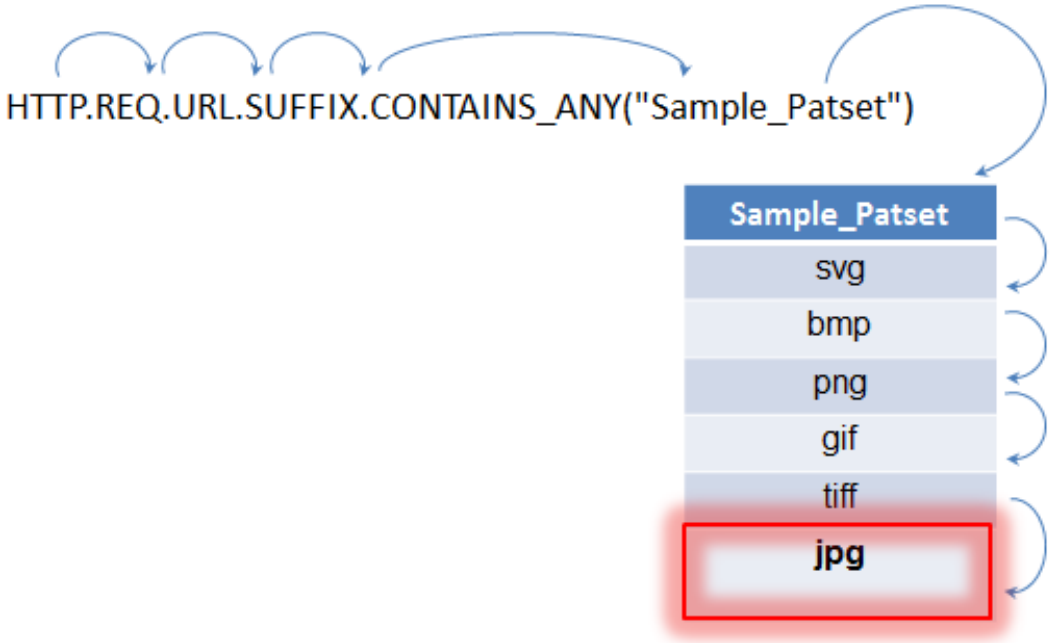
You want to determine whether the URL suffix (target text) contains any of the image file extensions. Without using pattern sets, you would have to define a complex expression, as follows:

```
HTTP.REQ.URL.SUFFIX.CONTAINS("svg") || HTTP.REQ.URL.SUFFIX.CONTAINS("bmp") || HTTP.REQ.URL.SUFFIX
HTTP.REQ.URL.SUFFIX.CONTAINS("gif") || HTTP.REQ.URL.SUFFIX.CONTAINS("tiff") || HTTP.REQ.URL.SUFFIX.
```

If the URL has a suffix of "jpg," with the above compound expression, the NetScaler appliance has to iterate through the entire compound expression sequentially, from one sub expression to the next, to determine that the request refers to a jpg image. The following figure shows the steps in the process.



When a compound expression includes hundreds of sub expressions, the above process is resource intensive. A better alternative is an expression that invokes a pattern set, as shown in the following figure.



During policy evaluation as shown above, the operator (CONTAINS_ANY) compares the string identified in the request with the patterns defined in the pattern set until a match is found. With the `Sample_Patset` expression, the multiple iterations through six sub expressions are reduced to just one.

By eliminating the need to configure compound expressions that perform string matching with multiple OR operations, pattern sets or data sets simplify configuration and accelerate processing of requests and responses.

Configuring a Pattern Set

To configure a pattern set, you must specify the strings that are to serve as patterns. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

Note: Pattern sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern "product1," for example, is not the same as the string pattern "Product1."

Points to remember about index values

- You cannot bind the same index value to more than one pattern.
- An automatically assigned index value is one number larger than the highest index value of the existing patterns within the pattern set. For example, if the highest index value of existing patterns in a pattern set is 104, the next automatically assigned index value will be 105.
- If you do not specify an index for the first pattern, index value 1 is automatically assigned to that pattern.
- Index values are not regenerated automatically if one or more patterns are deleted or modified. For example, if the set contains five patterns, with indexes from 1 through 5, and if the pattern with an index of 3 is deleted, the other index values in the pattern set are not automatically regenerated to produce values from 1 through 4.
- The maximum index value that can be assigned to a pattern is 4294967290. If that value is already assigned to a pattern in the set, you must manually assign index values to any newly added patterns. An unused index value that is lower than a currently used value cannot be assigned automatically.

To configure a pattern set by using the command line interface

At the command prompt, do the following:

1. Create a pattern set.

   add policy patset <name>

   Example:

   > add policy patset samplepatset

2. Bind patterns to the pattern set.

   bind policy patset <name> <string> [-index <positive_integer>]

Example:

> bind policy patset samplepatset product1 -index 1

Note: Repeat this step for all the patterns you want to bind to the pattern set.

3. Verify the configuration.

   show policy patset <name>

To configure a pattern set by using the configuration utility

1. Navigate to AppExpert > Pattern Sets.
2. In the details pane, click Add to open the Create Pattern Set dialog box.
3. Specify a name for the pattern set in the Name text box.
4. Under Specify Pattern, type the first pattern and, optionally, specify values for the following parameters:
   - Treat back slash as escape character—Select this check box to specify that any backslash characters that you might include in the pattern are to be treated as escape characters.
   - Index—A user assigned index value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click Add.
6. Repeat steps 4 and 5 to add additional patterns, and then click Create.

Configuring a Data Set

To configure a data set, you must specify the strings that are to serve as patterns, and assign a type (number, IPv4 address, or IPv6 address) to each pattern. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

Note: Data sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern "product1," for example, is not the same as the string pattern "Product1."

The rules applied for index values of data sets are the same as those applied for pattern sets. For information about index values, see "Configuring a Pattern Set."

To configure a data set by using the command line interface

At the command prompt, do the following:

1. Create a data set.

   add policy dataset <name> <type>

   Example:

   > add policy dataset sampledataset ipv4

2. Bind patterns to the data set.

   bind policy dataset <name> <value> [-index <positive_integer>]

   Example:

   > bind policy dataset sampledataset 10.102.29.1 -index 1

   Note: Repeat this step for all the patterns you want to bind to the data set.

3. Verify the configuration.

   show policy dataset <name>

To configure a data set by using the configuration utility

Navigate to AppExpert > Data Sets, click Add and specify the relevant details.

Using Pattern Sets and Data Sets

Default syntax policy expressions that take pattern sets or data sets as an argument can be used to perform string matching operations.

The usage is as follows:

<text>.<operator>("<name>")

where,

- `<text>` is the expression that identifies a string in a packet. Example: `HTTP.REQ.HEADER("Host")`.
- `<operator>` is one of the operators described in the following table.

  Table 1. Operators for pattern sets and data sets

Operator	Description
`<text>.CONTAINS_ANY(<name>)`	Returns true if the target text contains one or more of the patterns defined in the specified pattern set or data set.
`<text>.SUBSTR_ANY(<name>)`	Returns the first string that matches any pattern defined in the specified pattern set or data set.
`<text>.BEFORE_STR_ANY(<name>)`	Returns the text that is present before the first occurrence of any of the patterns defined in the specified pattern set or data set.
`<text>.AFTER_STR_ANY(<name>)`	Returns the text that is present after the first occurrence of any of the patterns defined in the specified pattern set or data set.
`<text>.EQUALS_ANY (<name>)`	Returns true if the target text exactly matches any of the patterns defined in the specified pattern set or data set.
`<text>.ENDSWITH_ANY(<name>)`	Returns true if the target text ends with any of the patterns that are defined in the specified pattern set or data set.
`<text>.STARTSWITH_ANY(<name>)`	Returns true if the target text starts with any of the patterns that are defined in the specified pattern set or data set.

`<text>.STARTSWITH_INDEX(<name>)`	Evaluates whether the target text starts with any of the patterns that are defined in the specified pattern set or data set. If a match is found, the index of the matching pattern is returned. Otherwise, 0 is returned.
`<text>.ENDSWITH_INDEX(<name>)`	Evaluates whether the target text ends with any of the patterns that are defined in the specified pattern set or data set. If a match is found, the index of the matching pattern is returned. Otherwise, 0 is returned.
`<text>.CONTAINS_INDEX(<name>)`	Evaluates whether the target text contains any of the patterns that are defined in the specified pattern set or data set. If a match is found, the index of the matching pattern is returned. Otherwise, 0 is returned.
`<text>.EQUALS_INDEX(<name>)`	Evaluates whether the target text exactly matches any of the patterns that are defined in the specified pattern set or data set. If an exact match is found, the index of the pattern is returned. Otherwise, 0 is returned.

- `<name>` is the name of the pattern set or data set

For sample usage, see "Sample Usage."

Sample Usage

To understand the usage of pattern sets in expressions, consider the example of a pattern set named "imagetypes."

Table 1. Pattern set "imagetypes"

Patterns	Index value
svg	1
bmp	2
png	3
gif	4
tiff	5
jpg	6

Example 1: Determine whether the suffix of an HTTP request is one of the file extensions defined in the "imagetypes" pattern set.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_ANY("imagetypes")`
- **Sample URL.** http://www.example.com/homepageicon.jpg
- **Result.** TRUE

Example 2: Determine whether the suffix of an HTTP request is one of the file extensions defined in the "imagetypes" pattern set, and return the index of that pattern.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes")`
- **Sample URL.** http://www.example.com/mylogo.gif
- **Result.** 4 (The index value of the pattern "gif".)

Example 3: Use the index value of a pattern to determine whether the URL suffix is within a specified index-value range.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").GE(3) && HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").LE(5)`
- **Sample URL.** http://www.example.com/mylogo.gif
- **Result.** TRUE (The index value of gif file types is 4.)

Example 4: Implement one set of policies for file extensions bmp, jpg, and png, and a different set of policies for gif, tiff, and svg files.

An expression that returns the index of a matched pattern can be used to define traffic subsets for a web application. The following two expressions could be used in content switching policies for a content switching virtual server:

- `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").LE(3)`
- `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").GE(4)`

Policies and Expressions

The following topics provide the conceptual and reference information that you require for configuring advanced policies on the Citrix® NetScaler® appliance.

Introduction to Policies and Expressions	Describes the purpose of expressions, policies, and actions, and how different NetScaler applications make use of them.
Configuring Advanced Policies	Describes the structure of advanced policies and how to configure them individually and as policy banks.
Configuring Advanced Expressions: Getting Started	Describes expression syntax and semantics, and briefly introduces how to configure expressions and policies.
Advanced Expressions: Evaluating Text	Describes expressions that you configure when you want to operate on text (for example, the body of an HTTP POST request or the contents of a user certificate).
Advanced Expressions: Working with Dates, Times, and Numbers	Describes expressions that you configure when you want to operate on any type of numeric data (for example, the length of a URL, a client's IP address, or the date and time that an HTTP request was sent).
Advanced Expressions: Parsing HTTP, TCP, and UDP Data	Describes expressions for parsing IP and IPv6 addresses, MAC addresses, and data that is specific to HTTP and TCP traffic.
Advanced Expressions: Parsing SSL Certificates	Describes how to configure expressions for SSL traffic and client certificates, for example, how to retrieve the expiration date of a certificate or the certificate issuer.
Advanced Expressions: IP and MAC Addresses, Throughput, VLAN IDs	Describes expressions that you can use to work with any other client- or server-related data not discussed in other chapters.
Typecasting Data	Describes expressions for transforming data of one type to another.
Regular Expressions	Describes how to pass regular expressions as arguments to operators in advanced expressions.
Configuring Classic Policies and Expressions	Provides details on how to configure the simpler policies and expressions known as classic policies and classic expressions.

Expressions Reference	A reference for classic and advanced expression arguments.
Summary Examples of Advanced Expressions and Policies	Examples of classic and advanced expressions and policies, in both quick reference and tutorial format, that you can customize for your own use.
Tutorial Examples of Advanced Policies for Rewrite	Examples of advanced policies for use in the Rewrite feature.
Tutorial Examples of Classic Policies	Examples of classic policies for NetScaler features such as application firewall and SSL.
Migration of Apache mod_rewrite Rules to Advanced Policies	Examples of functions that were written using the Apache HTTP Server mod_rewrite engine, with examples of these functions after translation into Rewrite and Responder policies on the NetScaler.

Introduction to Policies and Expressions

For many NetScaler features, policies control how a feature evaluates data, which ultimately determines what the feature does with the data. A policy uses a logical expression, also called a rule, to evaluate requests, responses, or other data, and applies one or more actions determined by the outcome of the evaluation. Alternatively, a policy can apply a profile, which defines a complex action.

Some NetScaler features use default syntax policies, which provide greater capabilities than do the older, classic, policies. If you migrated to a newer release of the NetScaler software and have configured classic policies for features that now use default syntax policies, you might have to manually migrate policies to the default syntax.

Classic and Default Syntax Policies

Classic policies evaluate basic characteristics of traffic and other data. For example, classic policies can identify whether an HTTP request or response contains a particular type of header or URL.

Default syntax policies can perform the same type of evaluations as classic policies. In addition, default syntax policies enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, transforming data in the body of a request into an HTTP header).

In addition to assigning a policy an action or profile, you bind the policy to a particular point in the processing associated with the NetScaler features. The bind point is one factor that determines when the policy will be evaluated.

Benefits of Using Default Syntax Policies

Default syntax policies use a powerful expression language that is built on a class-object model, and they offer several options that enhance your ability to configure the behavior of various NetScaler features. With default syntax policies, you can do the following:

- Perform fine-grained analyses of network traffic from layers 2 through 7.
- Evaluate any part of the header or body of an HTTP or HTTPS request or response.
- Bind policies to the multiple bind points that the default syntax policy infrastructure supports at the default, override, and virtual server levels.
- Use goto expressions to transfer control to other policies and bind points, as determined by the result of expression evaluation.
- Use special tools such as pattern sets, policy labels, rate limit identifiers, and HTTP callouts, which enable you to configure policies effectively for complex use cases.

Additionally, the configuration utility extends robust graphical user interface support for default syntax policies and expressions and enables users who have limited knowledge of networking protocols to configure policies quickly and easily. The configuration utility also includes a policy evaluation feature for default syntax policies. You can use this feature to evaluate a default syntax policy and test its behavior before you commit it, thus reducing the risk of configuration errors.

Basic Components of a Classic or Default Syntax Policy

Following are a few characteristics of both classic and default syntax policies:

Name.

Each policy has a unique name.

Rule.

The rule is a logical expression that enables the NetScaler feature to evaluate a piece of traffic or another object.

For example, a rule can enable the NetScaler to determine whether an HTTP request originated from a particular IP address, or whether a Cache-Control header in an HTTP request has the value “No-Cache.”

Default syntax policies can use all of the expressions that are available in a classic policy, with the exception of classic expressions for the SSL VPN client. In addition, default syntax policies enable you to configure more complex expressions.

Bindings.

To ensure that the NetScaler can invoke a policy when it is needed, you associate the policy, or bind it, to one or more bind points.

You can bind a policy globally or to a virtual server. For more information, see "About Policy Bindings."

An associated action.

An action is a separate entity from a policy. Policy evaluation ultimately results in the NetScaler performing an action.

For example, a policy in the integrated cache can identify HTTP requests for .gif or .jpeg files. An action that you associate with this policy determines that the responses to these types of requests are served from the cache.

For some features, you configure actions as part of a more complex set of instructions known as a profile. For more information, see "Order of Evaluation Based on Traffic Flow."

How Different NetScaler Features Use Policies

The NetScaler supports a variety of features that rely on policies for operation. The following table summarizes how the NetScaler features use policies.

Table 1. NetScaler Feature, Policy Type, and Policy Usage

Feature Name	Policy Type	How You Use Policies in the Feature
System	Classic	For the Authentication function, policies contain authentication schemes for different authentication methods. For example, you can configure LDAP and certificate-based authentication schemes. You also configure policies in the Auditing function.
DNS	Default	To determine how to perform DNS resolution for requests.

SSL	Classic and Default	To determine when to apply an encryption function and add certificate information to clear text. To provide end-to-end security, after a message is decrypted, the SSL feature re-encrypts clear text and uses SSL to communicate with Web servers.
Compression	Classic and Default	To determine what type of traffic is compressed.
Integrated Caching	Default	To determine whether HTTP responses are cacheable.
Responder	Default	To configure the behavior of the Responder function.
Protection Features	Classic	To configure the behavior of the Filter, SureConnect, and Priority Queuing functions.
Content Switching	Classic and Default	To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.

AAA - Traffic Management	Classic Exceptions: · Traffic policies support only default syntax policies · Authorization policies support both classic and default syntax policies.	To check for client-side security before users log in and establish a session. Traffic policies, which determine whether single sign-on (SSO) is required, use only the default syntax. Authorization policies authorize users and groups that access intranet resources through the appliance.
Cache Redirection	Classic	To determine whether responses are served from a cache or from an origin server.

Rewrite	Default	To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a new home page, or a new server, or a selected server based on the address of the incoming request, or you can modify the data to mask server information in a response for security purposes. The URL Transformer function identifies URLs in HTTP transactions and text files for the purpose of evaluating whether a URL should be transformed.
Application Firewall	Classic and Default	To identify characteristics of traffic and data that should or should not be admitted through the firewall.
Access Gateway, Clientless Access function	Default	To define rewrite rules for general Web access using the Access Gateway.
Access Gateway	Classic	To determine how the Access Gateway performs authentication, authorization, auditing, and other functions.

About Actions and Profiles

Policies do not themselves take action on data. Policies provide read-only logic for evaluating traffic. To enable a feature to perform an operation based on a policy evaluation, you configure actions or profiles and associate them with policies.

Note: Actions and profiles are specific to particular features. For information about assigning actions and profiles to features, see the documentation for the individual features.

About Actions

Actions are steps that the NetScaler takes, depending on the evaluation of the expression in the policy. For example, if an expression in a policy matches a particular source IP address in a request, the action that is associated with this policy determines whether the connection is permitted.

The types of actions that the NetScaler can take are feature specific. For example, in Rewrite, actions can replace text in a request, change the destination URL for a request, and so on. In Integrated Caching, actions determine whether HTTP responses are served from the cache or an origin server.

In some NetScaler features actions are predefined, and in others they are configurable. In some cases, (for example, Rewrite), you configure the actions using the same types of expressions that you use to configure the associated policy rule.

About Profiles

Some NetScaler features enable you to associate profiles, or both actions and profiles, with a policy. A profile is a collection of settings that enable the feature to perform a complex function. For example, in the application firewall, a profile for XML data can perform multiple screening operations, such as examining the data for illegal XML syntax or evidence of SQL injection.

Use of Actions and Profiles in Particular Features

The following table summarizes the use of actions and profiles in different NetScaler features. The table is not exhaustive. For more information about specific uses of actions and profiles for a feature, see the documentation for the feature.

Table 1. Use of Actions and Profiles in Different NetScaler Features

ure	Use of an Action	Use of a Profile

cation all	Synonymous with a profile	All application firewall features use profiles to defin behaviors, including pattern-based learning. You add these profiles to policies.
ss way	The following features of the Access Gateway use actions: · **Pre-Authentication.** Uses Allow and Deny actions. You add these actions to a profile. · **Authorization.** Uses Allow and Deny actions. You add these actions to a policy. · **TCP Compression.** Uses various actions. You add these actions to a policy.	The following features use a profile: · Pre-Authentication · Session · Traffic · Clientless Access After configuring the profiles, you add them to polic
ite	You configure URL rewrite actions and add them to a policy.	Not used.
rated ing	You configure caching and invalidation actions within a policy	Not used.
Traffic gement	You select an authentication type, set an authorization action of ALLOW or DENY, or set auditing to SYSLOG or NSLOG.	You can configure session profiles with a default tim authorization action.
ction ures	You configure actions within policies for the following functions: · Filter · Compression · Responder · SureConnect	Not used.
	You configure actions within SSL policies	Not used.
m	The action is implied. For the Authentication function, it is either Allow or Deny. For Auditing, it is Auditing On or Auditing Off.	Not used.
	The action is implied. It is either Drop Packets or the location of a DNS server.	Not used.
ffload	The action is implied. It is based on a policy that you associate with an SSL virtual server or a service.	Not used.
pression	Determine the type of compression to apply to the data	Not used.
ent hing	The action is implied. If a request matches the policy, the request is directed to the virtual server associated with the policy.	Not used.
e ection	The action is implied. If a request matches the policy, the request is directed to the origin server.	Not used.

About Policy Bindings

A policy is associated with, or bound to, an entity that enables the policy to be invoked. For example, you can bind a policy to request-time evaluation that applies to all virtual servers. A collection of policies that are bound to a particular bind point constitutes a policy bank.

Following is an overview of different types of bind points for a policy:

Request time global.

A policy can be available to all components in a feature at request time.

Response time global.

A policy can be available to all components in a feature at response time.

Request time, virtual server-specific.

A policy can be bound to request-time processing for a particular virtual server. For example, you can bind a request-time policy to a cache redirection virtual server to ensure that particular requests are forwarded to a load balancing virtual server for the cache, and other requests are sent to a load balancing virtual server for the origin.

Response time, virtual server-specific.

A policy can also be bound to response-time processing for a particular virtual server.

User-defined policy label.

For default syntax policies, you can configure custom groupings of policies (policy banks) by defining a policy label and collecting a set of related policies under the policy label.

Other bind points.

The availability of additional bind points depends on type of policy (classic or default syntax), and specifics of the relevant NetScaler feature. For example, classic policies that you configure for the Access Gateway have user and group bind points.

For additional information about default syntax policy bindings, see "Binding Policies That Use the Default Syntax" and Configuring a Policy Bank for a Virtual Server. For additional information about classic policy bindings, see "Configuring a Classic Policy."

About Evaluation Order of Policies

For classic policies, policy groups and policies within a group are evaluated in a particular order, depending on the following:

- The bind point for the policy, for example, whether the policy is bound to request-time processing for a virtual server or global response-time processing. For example, at request time, the NetScaler evaluates all request-time classic policies before evaluating any virtual server-specific policies.

- The priority level for the policy. For each point in the evaluation process, a priority level that is assigned to a policy determines the order of evaluation relative to other policies that share the same bind point. For example, when the NetScaler evaluates a bank of request-time, virtual server-specific policies, it starts with the policy that is assigned to the lowest priority value. In classic policies, priority levels must be unique across all bind points.

For default syntax policies, as with classic policies, the NetScaler selects a grouping, or bank, of policies at a particular point in overall processing. Following is the order of evaluation of the basic groupings, or banks, of default syntax policies:

1. Request-time global override
2. Request-time, virtual server-specific (one bind point per virtual server)
3. Request-time global default
4. Response-time global override
5. Response-time virtual server-specific
6. Response-time global default

However, within any of the preceding banks of policies, the order of evaluation is more flexible than in classic policies. Within a policy bank, you can point to the next policy to be evaluated regardless of the priority level, and you can invoke policy banks that belong to other bind points and user-defined policy banks.

Order of Evaluation Based on Traffic Flow

As traffic flows through the NetScaler and is processed by various features, each feature performs policy evaluation. Whenever a policy matches the traffic, the NetScaler stores the action and continues processing until the data is about to leave the NetScaler. At that point, the NetScaler typically applies all matching actions. Integrated Caching, which only applies a final Cache or NoCache action, is an exception.

Some policies affect the outcome of other policies. Following are examples:

- If a response is served from the integrated cache, some other NetScaler features do not process the response or the request that initiated it.
- If the Content Filtering feature prevents a response from being served, no subsequent features evaluate the response.

If the application firewall rejects an incoming request, no other features can process it.

Classic and Default Syntax Expressions

One of the most fundamental components of a policy is its rule. A policy rule is a logical expression that enables the policy to analyze traffic. Most of the policy's functionality is derived from its expression.

An expression matches characteristics of traffic or other data with one or more parameters and values. For example, an expression can enable the NetScaler to accomplish the following:

- Determine whether a request contains a certificate.
- Determine the IP address of a client that sent a TCP request.
- Identify the data that an HTTP request contains (for example, a popular spreadsheet or word processing application).
- Calculate the length of an HTTP request.

About Classic Expressions

Classic expressions enable you to evaluate basic characteristics of data. They have a structured syntax that performs string matching and other operations.

Following are a few simple examples of classic expressions:

- An HTTP response contains a particular type of Cache Control header.

```
res.http.header Cache-Control contains public
```

- An HTTP response contains image data.

```
res.http.header Content-Type contains image/
```

- An SSL request contains a certificate.

```
req.ssl.client.cert exists
```

About Default Syntax Expressions

Any feature that uses default syntax policies also uses default syntax expressions. For information about which features use default syntax policies, see the table "NetScaler Feature, Policy Type, and Policy Usage."

Default syntax expressions have a few other uses. In addition to configuring default syntax expressions in policy rules, you configure default syntax expressions in the following situations:

Integrated Caching:

You use default syntax expressions to configure a selector for a content group in the integrated cache.

Load Balancing:

You use default syntax expressions to configure token extraction for a load balancing virtual server that uses the TOKEN method for load balancing.

Rewrite:

You use default syntax expressions to configure rewrite actions.

Rate-based policies:

You use default syntax expressions to configure limit selectors when configuring a policy to control the rate of traffic to various servers.

Following are a few simple examples of default syntax expressions:

- An HTTP request URL contains no more than 500 characters.

```
http.req.url.length <= 500
```

- An HTTP request contains a cookie that has fewer than 500 characters.

```
http.req.cookie.length < 500
```

- An HTTP request URL contains a particular text string.

```
http.req.url.contains(".html")
```

Converting Classic Expressions to the Newer Default Expression Syntax

You can convert a classic expression to the default expression syntax by using the nspepi conversion tool. You can also use the tool to convert all the classic expressions in the NetScaler configuration to the default syntax (with the exception of NetScaler entities that currently support only classic expressions).

The conversion tool does not convert policies configured for the following features, because the features currently support only classic policies:

- Authentication, Pre-authentication
- SSL
- Cache redirection
- VPN (session, traffic, and tunnel traffic)
- Content filtering (The responder feature not only provides you with functionality that is equivalent to that provided by the content filtering feature but also surpasses the content filtering feature in the use cases that it supports. Additionally, responder supports the more powerful default syntax for policy expressions.)

The following NetScaler features support both classic and default syntax expressions and, therefore, support the conversion of classic expressions to default syntax expressions:

- Application firewall policies
- Authorization policies
- Named expressions
- Compression policies
- Content switching policies
- User-defined, rule-based tokens/persistency (the –rule parameter value that is specified for a load balancing virtual server)

About the Conversion Process

When parsing a NetScaler configuration file, the conversion tool performs the following actions:

1. In commands that create classic named expressions, the conversion tool replaces the names of the classic expressions with default syntax expressions.

2. In commands that support only the classic syntax, if classic named expressions are used, the conversion tool replaces the names of the classic expressions with the actual classic expressions they represent. This action ensures that the names of expressions in classic-only features do not reference the default syntax expressions created from Step 1.

3. In commands associated with entities that support both the classic syntax and the default syntax, the conversion tool replaces all classic expressions in commands with default syntax expressions.

Example

Consider the following sample configuration commands:

```
add policy expression ne_c1 "METHOD == GET"
add policy expression ne_c2 "ne_c1 || URL == /*.htm "
add filter policy pol1 -rule "ne_c2" -reqAction YES
add cmp policy pol2 -rule "REQ.HTTP.HEADER Accept CONTAINS \'text/html\'" -resAction COMPRESS
add cmp policy pol3 -rule "ne_c1 || ne_c2" -resAction GZIP
```

In the commands that create the classic named expressions `ne_c1` and `ne_c2`, the tool replaces the names of the expressions with actual default syntax expressions. This action, which corresponds to Step 1 described earlier, results in the following commands:

```
add policy expression ne_c1 "HTTP.REQ.METHOD.EQ(\"GET\")"

add policy expression ne_c2 "HTTP.REQ.URL.SUFFIX.EQ(\"htm\")"
```

The filter policy command supports only the classic syntax. Therefore, the conversion tool replaces the classic named expression `ne_c1` with the actual classic expression it represents. Note that the tool replaces `ne_c1` in the expression for `ne_c2`, and then replaces `ne_c2` in the filter policy with the classic expression. This action, which corresponds to Step 2 described earlier, results in the following command:

```
add filter policy pol1 -rule "METHOD == GET || URL == /*.htm"
-reqAction YES
```

The compression feature supports both classic and default syntax expressions. Therefore, in the command that creates the compression policy `pol2`, the conversion tool replaces the expression with a default syntax expression. This action, which corresponds to Step 3 described earlier, results in the following command:

```
add cmp policy pol2 -rule
"HTTP.REQ.HEADER(\"Accept\").AFTER_STR(\"text/html\").LENGTH.GT(0)"
-resAction COMPRESS
```

The command that creates the compression policy `pol3` is unaffected by the conversion process because, after the conversion process is complete, `ne_c1` and `ne_c2` reference the default syntax expressions that result from Step 1.

Client security messages are not supported in the newer default policy format and, therefore, are lost. The `SYS.EVAL_CLASSIC_EXPR` function is replaced with a default policy expression. The following entities support the `SYS.EVAL_CLASSIC_EXPR` function:

- DNS policies
- Rate limit selectors
- Cache selectors
- Cache policies
- Content switching policies
- Rewrite policies
- URL transformation policies
- Responder policies
- Application firewall policies
- Authorization policies
- Compression policies
- CVPN access policies

After performing the conversion, the tool saves the changes in a new configuration file. The new configuration file is created in the directory in which the input file exists. The name of the new configuration file is the same as the name of the input configuration file except for the string `new_` used as a prefix. Conversion warnings are reported in a warning line at the end of the screen output. Additionally, a warning file is created in the directory in which the input configuration file resides. For more information about the warning file and the types of warnings that are reported, see "Conversion Warnings."

Converting Expressions

You can use the `nspepi` tool to convert a single classic expression to the default syntax. The `nspepi` tool must be run from the shell prompt on the NetScaler appliance.

To convert a classic expression to the default syntax by using the command line interface

At the shell prompt, type:

`nspepi -e` `"<classic expression>"`

Example

```
root@NS# nspepi -e "REQ.HTTP.URL == /*.htm"
 "HTTP.REQ.URL.REGEX_MATCH(re#/(.*)\.htm#)"
```

Parameters for converting a classic expression to a default syntax expression

e

Specifies that the input is a single classic expression. This option is mutually exclusive with the `-f` option, which specifies that the input is a NetScaler configuration file.

classic expression

The classic expression that you want to convert to the default syntax.

Converting a NetScaler Configuration File

You can use the `nspepi` tool to convert all the classic expressions in a NetScaler configuration file to the default syntax (except for those commands that do not support the default syntax). The `nspepi` tool must be run from the shell prompt on the NetScaler appliance.

To convert all the classic expressions in a NetScaler configuration file to the default syntax by using the command line interface

At the shell prompt, type:

`nspepi -f` `"<ns config file>" -v`

Example

```
root@NS# nspepi -f ns.conf
OUTPUT: New configuration file created: new_ns.conf
OUTPUT: New warning file created: warn_ns.conf
WARNINGS: Total number of warnings due to bind commands: 18
WARNINGS: Line numbers which has bind command issues: 305, 306, 706, 707, 708, 709, 710, 711, 712, 713,
714, 715, 767, 768, 774, 775, 776, 777
root@NS#
```

Parameters for converting the classic expressions in a NetScaler configuration file to the default syntax

f

Specifies that the input is a NetScaler configuration file. This option is mutually exclusive with the `-e` option, which specifies that the input is a single classic expression.

ns config file

The full path to the NetScaler configuration file. If the NetScaler configuration file is in the present working directory, the name of the NetScaler configuration file is sufficient.

v

The verbose option. If this option is specified, the output of the conversion tool is printed to the screen. The configuration file and the warning file are created even if this option is used.

Conversion Warnings

When classic expressions that are included in CLI commands are upgraded to the default syntax, the number of characters in the expression might exceed the 1499-character limit. The commands that include expressions longer than 1499 characters fail when the configuration is being applied. You must manually update these commands.

In addition, multiple classic policies can be bound to a given bind point with priority 0 or with equal priority, but the default syntax policy infrastructure does not support a priority value of 0 or policies with the same priority at a given bind point. These commands fail when the configuration is being applied. The commands must be updated manually with the correct priority values.

The line numbers of lines that threw a warning during conversion are listed at the end of the output in a warning line. In addition, a warning file is created in the same directory as the one in which the old and new configuration files reside. The name of the warning file is the same as the name of the input configuration file except that the string `warn_` is added as a prefix.

About Migration from Classic to Default Syntax Policies and Expressions

The NetScaler supports either classic or default syntax policies within a feature. You cannot have both types in the same feature. Over the past few releases, some NetScaler features have migrated from using classic policies and expressions to default syntax policies and expressions. If a feature of interest to you has changed to the default syntax format, you may have to manually migrate the older information. Following are guidelines for deciding if you need to migrate your policies:

- If you configured classic policies in a version of the Integrated Caching feature prior to release 9.0 and then upgrade to version 9.0 or later, there is no impact. All legacy policies are migrated to the default syntax policy format.
- For other features, you need to manually migrate classic policies and expressions to the default syntax if the feature has migrated to the default syntax.

Before You Proceed

Before configuring expressions and policies, be sure you understand the relevant NetScaler feature and the structure of your data, as follows:

- Read the documentation on the relevant feature.
- Look at the data stream for the type of data that you want to configure.

You may want to run a trace on the type of traffic or content that you want to configure. This will give you an idea of the parameters and values, and operations on these parameters and values, that you need to specify in an expression.

Configuring Default Syntax Policies

You can create default syntax policies for various NetScaler features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the Access Gateway. Policies control the behavior of these features.

When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a *policy bank*. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure *policy labels*. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.

For some features, you can use the policy manager to configure and bind policies.

Rules for Names in Identifiers Used in Policies

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (_). The remaining characters can be ASCII alphanumeric characters or underscores (_).

The names of these identifiers must not begin with the following reserved words:

- The words `ALT`, `TRUE`, or `FALSE` or the `Q` or `S` one-character identifier.
- The special-syntax indicator `RE` (for regular expressions) or `XP` (for XPath expressions).
- Expression prefixes, which currently are the following:
  - `CLIENT`
  - `EXTEND`
  - `HTTP`
  - `SERVER`
  - `SYS`
  - `TARGET`
  - `TEXT`
  - `URL`
  - `MYSQL`
  - `MSSQL`

Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be `IGNORECASE`, `YEAR`, or `LATIN2_CZECH_CS` (a MySQL character set).

Note: The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with `TRUE`, `True`, or `true`.

Creating or Modifying a Policy

All policies have some common elements. Creating a policy consists, at minimum, of naming the policy and configuring a rule. The policy configuration tools for the various features have areas of overlap, but also differences. For the details of configuring a policy for a particular feature, including associating an action with the policy, see the documentation for the feature.

To create a policy, begin by determining the purpose of the policy. For example, you may want to define a policy that identifies HTTP requests for image files, or client requests that contain an SSL certificate. In addition to knowing the type of information that you want the policy to work with, you need to know the format of the data that the policy is analyzing.

Next, determine whether the policy is globally applicable, or if it pertains to a particular virtual server. Also consider the effect that the order in which your policies are evaluated (which will be determined by how you bind the policies) will have on the policy that you are about to configure.

To create a policy by using the command line interface

At the command prompt, type the following commands to create a policy and verify the configuration:

- `add responder|dns|cs|rewrite|cache policy <policyName> -rule <expression> [<feature-specific information>]`
- show rewrite policy <name>

Example 1:

```
add rewrite policy "pol_remove-ae" true "act_remove-ae"
 Done
> show rewrite policy pol_remove-ae
        Name: pol_remove-ae
        Rule: true
        RewriteAction: act_remove-ae
        UndefAction: Use Global
        Hits: 0
        Undef Hits: 0
        Bound to: GLOBAL RES_OVERRIDE
        Priority: 90
        GotoPriorityExpression: END
 Done
>
```

Example 2:

```
add cache policy BranchReportsCachePolicy -rule q{http.req.url.query.value("actionoverride").contains("
Done
   show cache policy BranchReportsCachePolicy
      Name: BranchReportsCachePolicy
      Rule: http.req.url.query.value("actionoverride").contains("branchReports")
      CacheAction: CACHE
      Stored in group: DEFAULT
      UndefAction: Use Global
      Hits: 0
      Undef Hits: 0
 Done
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see "Configuring Default Syntax Expressions in a Policy."

Parameters for creating or modifying a policy

policyName

A unique name for the policy. (Cannot be changed for an existing policy.)

Note that in the Content Switching feature, the name cannot start with app_ because this is a reserved name. Policies with this name are not displayed in the configuration utility.

expression

A logical expression. See "Configuring Default Syntax Expressions: Getting Started."

feature-specific information

Varies by feature. Includes a built-in or user-defined action that you associate with the policy. See the documentation for the feature to which the policy applies.

To create or modify a policy by using the configuration utility

1. In the navigation pane, expand the name of the feature for which you want to configure a policy, and then click Policies. For example, you can select Content Switching, Integrated Caching, DNS, Rewrite, or Responder.

2. In the details pane, click Add, or select an existing policy and click Open. A policy configuration dialog box appears.

3. Specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in "Parameters for creating or modifying a policy.")

4. Click Create, and then click Close.

5. Click Save. A policy is added.

   Note: After you create a policy, you can view the policy's details by clicking the policy entry in the configuration pane. Details that are highlighted and underlined are links to the corresponding entity (for example, a named expression).

Policy Configuration Examples

These examples show how policies and their associated actions are entered at the command line interface. In the configuration utility, the expressions would appear in the Expression window of the feature-configuration dialog box for the integrated caching or rewrite feature.

Following is an example of creating a caching policy. Note that actions for caching policies are built in, so you do not need to configure them separately from the policy.

```
add cache policy BranchReportsCachePolicy -rule q{http.req.url.query.value("actionoverride").contains("bra
```

Following is an example of a Rewrite policy and action:

```
add rewrite action myAction1 INSERT_HTTP_HEADER "myHeader" "valueForMyHeader"
add rewrite policy myPolicy1 "http.req.url.contains(\"myURLstring\")" myAction1
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see "Configuring Default Syntax Expressions in a Policy."

Binding Policies That Use the Default Syntax

After defining a policy, you indicate when the policy is to be invoked by binding the policy to a bind point and specifying a priority level. You can bind a policy to only one bind point. A bind point can be global, that is, it can apply to all virtual servers that you have configured. Or, a bind point can be specific to a particular virtual server, which can be either a load balancing or a content switching virtual server. Not all bind points are available for all features.

The order in which policies are evaluated determines the order in which they are applied, and features typically evaluate the various policy banks in a particular order. Sometimes, however, other features can affect the order of evaluation. Within a policy bank, the order of evaluation depends on the values of parameters configured in the policies. Most features apply all of the actions associated with policies whose evaluation results in a match with the data that is being processed. The integrated caching feature is an exception.

Feature-Specific Differences in Policy Bindings

You can bind policies to built-in, global bind points (or banks), to virtual servers, or to policy labels.

However, the NetScaler features differ in terms of the types of bindings that are available. The following table summarizes how you use policy bindings in various NetScaler features that use policies.

Table 1. Feature-Specific Bindings for Policies

Feature Name	Virtual Servers Configured in the Feature	Policies Configured in the Feature	Bind Points Configured for the Policies	Use of Po the Featu
DNS	none	DNS policies	Global	To deterr how to pe DNS resol requests.

Content Switching **Note:** This feature can support either or classic policies or policies that use the default syntax, but not both.	Content Switching (CS)	Content Switching policies	· Content switching or cache redirection virtual server · Policy label	To determ what serv group of s is respons serving responses on charac of an inco request. Request character include d type, lang cookies, H method, type, and associate server.
Integrated Caching	none	Caching policies	· Global override · Global default · Policy label · Load balancing, content switching, or SSL offload virtual server	To determ whether I responses stored in, served fro NetScaler appliance integrate
Responder	none	Responder policies	· Global override · Global default · Policy label · Load balancing, content switching, or SSL offload virtual server	To config behavior Responde function.

Rewrite	none	Rewrite policies	· Global override · Global default · Policy label · Load balancing, content switching, or SSL offload virtual server	To identif data that want to m before se The polic provide ru modifying data. For exam can modi data to re request t selected s based on address o incoming or to mas informati response security purposes.
URL Transform function in the Rewrite feature	none	Transformation policies	· Global override · Global default · Policy label	To identif in HTTP transacti text files purpose o evaluatin whether a should be altered.
Access Gateway (clientless VPN functions only)	VPN server	Clientless Access policies	· VPN Global · VPN server	To determ how the A Gateway performs authentic authoriza auditing, other fun and to de rewrite ru general W access us Access Ga

Bind Points and Order of Evaluation

For a policy to take effect, you must ensure that the policy is invoked at some point during processing. To do so, you associate the policy with a bind point. The collection of policies that is bound to a bind point is known as a policy bank.

Following are the bind points that the NetScaler evaluates, listed in the typical order of evaluation within a policy bank

1. **Request-time override.** When a request flows through a feature, the NetScaler first evaluates request-time override policies for the feature.

2. **Request-time Load Balancing virtual server.** If policy evaluation cannot be completed after all the request-time override policies have been evaluated, the NetScaler processes request-time policies for load balancing virtual servers.

3. **Request-time Content Switching virtual server.** If policy evaluation cannot be completed after all the request-time policies for load balancing virtual servers have been evaluated, the NetScaler processes request-time policies for content switching virtual servers.

4. **Request-time default.** If policy evaluation cannot be completed after all request-time, virtual server-specific policies have been evaluated, the NetScaler processes request-time default policies.

5. **Response-time override.** At response time, the NetScaler starts with policies that are bound to the response-time override bind point.

6. **Response-time Load Balancing virtual server.** If policy evaluation cannot be completed after all response-time override policies have been evaluated, the NetScaler process the response-time policies for load balancing virtual servers.

7. **Response-time Content Switching virtual server.** If policy evaluation cannot be completed after all policies have been evaluated for load balancing virtual servers, the NetScaler process the response-time policies for content switching virtual servers.

8. **Response-time default.** If policy evaluation cannot be completed after all response-time, virtual-server-specific policies have been evaluated, the NetScaler processes response-time default policies.

Policy Evaluation across Features

In addition to attending to evaluation of policies within a feature, if you have bound policies to a content switching virtual server, note that these policies are evaluated before other policies. Binding a policy to a content switching vserver produces a different result in NetScaler versions 9.0.x and later than in 8.x versions. In NetScaler 9.0 and later versions, evaluation occurs as follows:

- Content switching policies are evaluated before other policies. If a content switching policy evaluates to TRUE, the target load balancing vserver is selected.

- If all content switching policies evaluate to FALSE, the default load balancing vserver under the content switching VIP is selected.

After a target load balancing vserver is selected by the content switching process, policies are evaluated in the following order:

1. Policies that are bound to the global override bind point.

2. Policies that are bound to the default load balancing vserver.

3. Policies that are bound to the target content switching vserver.

4. Policies that are bound to the global default bind point.

To be sure that the policies are evaluated in the intended order, follow these guidelines:

- Make sure that the default load balancing vserver is not directly reachable from the outside; for example, the vserver IP address can be 0.0.0.0.
- To prevent exposing internal data on the load balancing default vserver, configure a policy to respond with a “503 Service Unavailable” status and bind it to the default load balancing vserver.

Entries in a Policy Bank

Each entry in a policy bank has, at minimum, a policy and a priority level. You can also configure entries that change the priority-based evaluation order, and you can configure entries that invoke external policy banks.

The following table summarizes each entry in a policy bank.

Table 2. Format of Each Entry in a Policy Bank

Policy Name	Priority	Goto Expression	Invocation Type	Policy Bank to Be Invoked
The policy name, or a “dummy” policy named NOPOLICY. The NOPOLICY entry controls evaluation flow without processing a rule.	An integer.	Optional. Identifies the next policy in the bank to evaluate, or ends any further evaluation	Optional. Indicates that an external policy bank will be invoked. This field restricts the choices to a global policy label or a virtual server.	Optional. Used with Invocation Type. This is the label for a policy bank or a virtual server name. The NetScaler returns to the current bank after processing the external bank.

If the policy evaluates to TRUE, the NetScaler stores the action that is associated with the policy. If the policy evaluates to FALSE, the NetScaler evaluates the next policy. If the policy is neither TRUE nor FALSE, the NetScaler uses the associated Undef (undefined) action.

Evaluation Order within a Policy Bank

Within a policy bank, the evaluation order depends on the following items:

A priority.

The most minimal amount of information about evaluation order is a numeric priority level. The lower the number, the higher the priority.

A Goto expression.

If supplied, the Goto expression indicates the next policy to be evaluated, typically within the same policy bank.. Goto expressions can only proceed forward in a bank. To prevent looping, a policy bank configuration is not valid if a Goto statement points backwards in the bank.

Invocation of other policy banks.

Any entry can invoke an external policy bank. The NetScaler provides a built-in entity named NOPOLICY that does not have a rule. You can add a NOPOLICY entry in a policy bank when you want to invoke another policy bank, but do not want to process any other rules prior to the invocation. You can have multiple NOPOLICY entries in multiple policy banks.

Values for a Goto expression are as follows:

NEXT.

This keyword selects the policy with the next higher priority level in the current policy bank.

An integer.

If you supply an integer, it must match the priority level of another policy in the current policy bank.

END.

This keyword stops evaluation after processing the current policy, and no additional policies in this bank are processed.

Blank.

If the Goto expression is empty, it is the same as specifying END.

A numeric expression.

This is a default syntax expression that resolves to a priority number for another policy in the current bank.

USE_INVOCATION_RESULT.

This phrase can be used only if you are invoking an external policy bank. Entering this phrase causes the NetScaler to perform one of the following actions:

- If the final Goto in the invoked policy bank has a value of END or is empty, the invocation result is END, and evaluation stops.
- If the final Goto expression in the invoked policy bank is anything other than END, the NetScaler performs a NEXT.

The following table illustrates a policy bank that uses Goto statements and policy bank invocations.

Table 3. Example of a Policy Bank That Uses Gotos and External Bank Invocations

Policy Name	Priority	Goto	Invocation	Policy Bank to Be Invoked
ClientCertificatePolicy (rule: does the request contain a client certificate?)	100	300	None	None
SubnetPolicy (rule: is the client from a private subnet?)	200	NEXT	None	None
NOPOLICY	300	USE INVOCATION RESULT	Request vserver	My_Request_VServer
NOPOLICY	350	USE INVOCATION RESULT	Policy Label	My_Policy_Label
WorkingHoursPolicy (rule: is it working hours?)	400	END	None	None

How Policy Evaluation Ends

Evaluation of a policy bank ends when one of the following takes place:

- A policy evaluates to TRUE and its Goto statement value is END.

  No further policies or policy banks in this feature are evaluated.

- An external policy bank is invoked, its evaluation returns an END, and the Goto statement uses a value of USE_INVOCATION_RESULT or END.

  Evaluation continues with the next policy bank for this feature. For example, if the current bank is the request-time override bank, the NetScaler next evaluates request-time policy banks for the virtual servers.

- The NetScaler has walked through all the policy banks in this feature, but has not encountered an END.

  If this is the last entry to be evaluated in this policy bank, the NetScaler proceeds to the next feature.

How Features Use Actions after Policy Evaluation

After evaluating all relevant policies for a particular data point (for example, an HTTP request), the NetScaler stores all the actions that are associated with any policy that matched the data.

For most features, all the actions from matching policies are applied to a traffic packet as it leaves the NetScaler. The Integrated Caching feature only applies one action: CACHE or NOCACHE. This action is associated with the policy with the lowest priority value in the “highest priority” policy bank (for example, request-time override policies are applied before virtual server-specific policies).

Binding a Policy Globally

The following binding procedures are typical. However, refer to the documentation for the feature of interest to you for complete instructions.

To bind an Integrated Caching policy globally by using the command line interface

At the command prompt, type the following commands to bind an Integrated Caching policy and verify the configuration:

- bind cache global <policy> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
- show cache global

  Example

  ```
  bind cache global _nonPostReq -priority 100 -type req_default
  Done
  > show cache global
  1)      Global bindpoint: REQ_DEFAULT
         Number of bound policies: 2

  2)      Global bindpoint: RES_DEFAULT
         Number of bound policies: 1
  Done
  ```

  The type argument is optional to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

To bind a Rewrite policy globally by using the command line interface

At the command prompt, type the following commands to bind a Rewrite policy and verify the configuration:

- bind rewrite global <policyName> <priority> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
- show rewrite global

  Example

```
bind rewrite global pol_remove-pdf 100
 Done
> show rewrite global
1)      Global bindpoint: REQ_DEFAULT
        Number of bound policies: 1

2)      Global bindpoint: REQ_OVERRIDE
        Number of bound policies: 1

 Done
```

The type argument is optional for globally bound policies, to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

To bind a compression policy globally by using the command line interface

At the command prompt, type the following commands to bind a compression policy and verify the configuration:

- bind cmp global <policyName> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
- show cmp global

Example

```
> bind cmp global cmp_pol_1 -priority 100
 Done
> show cmp policy cmp_pol_1
        Name: cmp_pol_1
        Rule: HTTP.REQ.URL.SUFFIX.EQ("BMP")
        Response Action: COMPRESS
        Hits: 0

        Policy is bound to following entities
        1) GLOBAL REQ_DEFAULT
        Priority: 100
        GotoPriorityExpression: END
 Done
>
```

To bind a Responder policy globally by using the command line interface

At the command prompt, type the following commands to bind a Responder policy and verify the configuration:

- bind responder global <policyName> <priority> [-type OVERRIDE | DEFAULT]
- show responder global

Example

```
bind responder global pol404Error1 200
Done
> show responder global
1)      Global bindpoint: REQ_DEFAULT
        Number of bound policies: 1

Done
```

To bind a DNS policy globally by using the command line interface

At the command prompt, type the following commands to bind a DNS policy and verify the configuration:

- bind dns global <policyName> <priority>
- show dns global

Example

```
> bind dns global pol_ddos_drop1 150
Done
> show dns global
Policy name : pol_ddos_drop
        Priority : 100
        Goto expression : END
Policy name : pol_ddos_drop1
        Priority : 150
Done
>
```

To bind an Integrated Caching, Responder, Rewrite, or Compression policy globally by using the configuration utility

1. In the navigation pane, click the name of the feature for which you want to bind the policy.
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point to which you want to bind the policy (for example, for Integrated Caching, Rewrite, or Compression, you could select Request and Default Global). The Responder does not differentiate between request-time and response-time policies.
4. Click Insert Policy and, from the Policy Name pop-up menu, select the policy name. A priority is assigned automatically to the policy, but you can click the cell in the Priority column and drag it anywhere within the dialog box if you want the policy to be evaluated after other policies in this bank. The priority is automatically reset. Note that priority values within a policy bank must be unique.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is bound successfully.

To bind a DNS policy globally by using the configuration utility

1. In the navigation pane, expand DNS, and then click Policies.
2. In the details pane, click Global Bindings.
3. In the global bindings dialog box, click Insert Policy, and select the policy that you want to bind globally.
4. Click in the Priority field and enter the priority level.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Binding a Policy to a Virtual Server

A globally bound policy applies to all load balancing and content switching virtual servers.

Note that when binding a policy to a virtual server, you must identify it as a request-time or a response-time policy.

To bind a policy to a load balancing or content switching virtual server by using the command line interface

At the command prompt, type the following commands to bind a policy to a load balancing or content switching virtual server and verify the configuration:

- `bind lb|cs vserver <virtualServerName> -policyName <policyName> -priority <positiveInteger> -type REQUEST|RESPONSE`
- show lb vserver <name>

Example

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50
 Done
> show lb vserver lbvip
        lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
        State: DOWN
        Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)
        Time since last state change: 28 days, 01:57:26.350
        Effective State: DOWN
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none

1)      Policy : ns_cmp_msapp Priority:50
2)      Policy : cf-pol Priority:1      Inherited
 Done
```

To bind a policy to an SSL offload virtual server by using the command line interface

At the command prompt, type the following commands to bind a policy to an SSL offload virtual server and verify the configuration:

bind ssl vserver <vServerName>@ -policyName <policyName> -priority <positiveInteger>

To bind a policy to a virtual server by using the configuration utility

1. In the navigation pane, expand Load Balancing, Content Switching, SSL Offload, AAA-Application Traffic, or Access Gateway, and then click Virtual Servers.
2. In the details pane, double-click the virtual server to which you want to bind the policy, and then click Open.
3. On the Policies tab, click the icon for the type of policy that you want to bind (the choices are feature-specific), and then click the name of the policy. Note that for some features, you can bind both classic policies and policies that use the default syntax to the virtual server.
4. If you are binding a policy to a Content Switching virtual server, in the Target field select a load balancing virtual server to which traffic that matches the policy is sent.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Displaying Policy Bindings

You can display policy bindings to verify that they are correct.

To display policy bindings by using the command line interface

At the command prompt, type the following commands to display policy bindings and verify the configuration:

show rewrite policy <name>

Example

```
> show rewrite policy pol_remove-pdf
        Name: pol_remove-pdf
        Rule: http.req.url.contains(".pdf")
        RewriteAction: act_remove-ae
        UndefAction: Use Global
        Hits: 0
        Undef Hits: 0
        Bound to: GLOBAL REQ_DEFAULT
        Priority: 100
        GotoPriorityExpression: END
 Done
>
```

To display global policy bindings for Integrated Caching, Rewrite, or Responder by using the configuration utility

1. In the navigation pane, expand the feature that contains the policy that you want to view, and then click Policies.
2. In the details pane, click the policy. Bound policies have a check mark next to them.
3. At the bottom of the page, under Details, next to Bound to, view the entity to which the policy is bound.

To display global policy bindings for DNS or Clientless Access in the Access Gateway by using the configuration utility

1. In the navigation pane, expand DNS, and then click Policies.
2. In the details pane, click Global Bindings.

To display global policy bindings for Content Switching by using the configuration utility

1. In the navigation pane, expand Content Switching, and then click Policies.
2. In detailed pane, select policy.
3. In the details pane, click Show Bindings.

Unbinding a Policy

If you want to re-assign a policy or delete it, you must first remove its binding.

To unbind an integrated caching, rewrite, or compression default syntax policy globally by using the command line interface

At the command prompt, type the following commands to unbind an integrated caching, rewrite, or compression default syntax policy globally and verify the configuration:

- `unbind cache|rewrite|cmp global <policyName> [-type req_override|req_default|res_override|res_default] [-priority <positiveInteger>]`
- `show cache|rewrite|cmp global`

Example

```
> unbind cache global_nonPostReq
 Done
> show cache global
1)      Global bindpoint: REQ_DEFAULT
       Number of bound policies: 1

2)      Global bindpoint: RES_DEFAULT
       Number of bound policies: 1

 Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

To unbind a responder policy globally by using the command line interface

At the command prompt, type the following commands to unbind a responder policy globally and verify the configuration:

- unbind responder global `<policyName>` [-type override|default] [-priority <positiveInteger>]
- `show responder global`

Example

```
> unbind responder global pol404Error
 Done
> show responder global
1)      Global bindpoint: REQ_DEFAULT
        Number of bound policies: 1

 Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

To unbind a DNS policy globally by using the command line interface

At the command prompt, type the following commands to unbind a DNS policy globally and verify the configuration:

- unbind responder global <policyName>
- unbind responder global

Example

```
 unbind dns global dfgdfg
 Done
 show dns global
Policy name : dfgdfggfhg
        Priority : 100
        Goto expression : END
 Done
```

To unbind a default syntax policy from a virtual server by using the command line interface

At the command prompt, type the following commands to unbind a default syntax policy from a virtual server and verify the configuration:

- unbind cs vserver <name> -policyName <policyName> [-priority <positiveInteger>] [-type REQUEST|RESPONSE]
- show lb vserver <name>

Example

```
 unbind cs vserver vs-cont-switch  -policyName pol1
 Done
> show cs vserver vs-cont-switch
        vs-cont-switch (10.102.29.10:80) - HTTP Type: CONTENT
        State: UP
        Last state change was at Wed Aug 19 08:56:55 2009 (+18 ms)
        Time since last state change: 0 days, 02:47:55.750
```

```
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        State Update: DISABLED
        Default:        Content Precedence: RULE
        Vserver IP and Port insertion: OFF
        Case Sensitivity: ON
        Push: DISABLED  Push VServer:
        Push Label Rule: none
 Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

To unbind an integrated caching, responder, rewrite, or compression default syntax policy globally by using the configuration utility

1. In the navigation pane, click the feature with the policy that you want to unbind (for example, Integrated Caching).
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point with the policy that you want to unbind, for example, Default Global.
4. Click the policy name that you want to unbind, and then click Unbind Policy.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is unbound successfully.

To unbind a DNS policy globally by using the configuration utility

1. In the navigation pane, expand DNS, and then click Policies.
2. In the details pane, click Global Bindings.
3. In the Global Bindings dialog box, select policy and click unbind policy.
4. Click OK. A message in the status bar indicates that the policy is unbinded successfully.

To unbind a default syntax policy from a load balancing or content switching virtual server by using the configuration utility

1. In the navigation pane, expand Load Balancing or Content Switching, and then click Virtual Servers.
2. In the details pane, double-click the virtual server from which you want to unbind the policy.
3. On the Policies tab, in the Active column, clear the check box next to the policy that you want to unbind.
4. Click OK. A message in the status bar indicates that the policy is unbinded successfully.

Creating Policy Labels

In addition to the built-in bind points where you set up policy banks, you can also configure user-defined policy labels and associate policies with them.

Within a policy label, you bind policies and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. The NetScaler also permits you to define an arbitrary evaluation order as follows:

- You can use “goto” expressions to point to the next entry in the bank to be evaluated after the current one.
- You can use an entry in a policy bank to invoke another bank.

Creating Policy Labels

Each feature determines the type of policy that you can bind to a policy label, the type of load balancing virtual server that you can bind the label to, and the type of content switching virtual server from which the label can be invoked. For example, a TCP policy label can only be bound to a TCP load balancing virtual server. You cannot bind HTTP policies to a policy label of this type. And you can invoke a TCP policy label only from a TCP content switching virtual server.

After configuring a new policy label, you can invoke it from one or more banks for the built-in bind points.

To create a caching policy label by using the command line interface

At the command prompt, type the following commands to create a Caching policy label and verify the configuration:

- add cache policylabel <labelName> -evaluates req|res
- show cache policylabel<labelName>

Example

```
> add cache policylabel lbl-cache-pol -evaluates req
 Done

> show cache policylabel lbl-cache-pol
        Label Name: lbl-cache-pol
        Evaluates: REQ
        Number of bound policies: 0
        Number of times invoked: 0
 Done
>
```

To create a Content Switching policy label by using the command line interface

At the command prompt, type the following commands to create a Content Switching policy label and verify the configuration:

- add cs policylabel <labelName> http|tcp|rtsp|ssl
- show cs policylabel <labelName>

Example

```
> add cs policylabel lbl-cs-pol http
 Done
> show cs policylabel lbl-cs-pol
        Label Name: lbl-cs-pol
        Label Type: HTTP
        Number of bound policies: 0
        Number of times invoked: 0
 Done
```

To create a Rewrite policy label by using the command line interface

At the command prompt, type the following commands to create a Rewrite policy label and verify the configuration:

- add rewrite policylabel <labelName> http_req|http_res|url|text|clientless_vpn_req|clientless_vpn_res
- show rewrite policylabel <labelName>

Example

```
> add rewrite policylabel lbl-rewrt-pol http_req
 Done

> show rewrite policylabel lbl-rewrt-pol
        Label Name: lbl-rewrt-pol
        Transform Name: http_req
        Number of bound policies: 0
        Number of times invoked: 0
 Done
```

To create a Responder policy label by using the command line interface

At the command prompt, type the following commands to create a Responder policy label and verify the configuration:

- add responder policylabel <labelName>
- show responder policylabel <labelName>

Example

```
> add responder policylabel lbl-respndr-pol
 Done

> show responder policylabel lbl-respndr-pol
```

```
    Label Name: lbl-respndr-pol
    Number of bound policies: 0
    Number of times invoked: 0
Done
```

Note: Invoke this policy label from a policy bank. For more information, see "Binding a Policy to a Policy Label."

To create a policy label by using the configuration utility

1. In the navigation pane, expand the feature for which you want to create a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, Content Switching, or Responder.
2. In the details pane, click Add.
3. In the Name box, enter a unique name for this policy label.
4. Enter feature-specific information for the policy label. For example, for Integrated Caching, in the Evaluates drop-down menu, you would select REQ if you want this policy label to contain request-time policies, or select RES if you want this policy label to contain response-time policies. For Rewrite, you would select a Transform name.
5. Click Create.
6. Configure one of the built-in policy banks to invoke this policy label. For more information, see "Binding a Policy to a Policy Label." A message in the status bar indicates that the policy label is created successfully.

Binding a Policy to a Policy Label

As with policy banks that are bound to the built-in bind points, each entry in a policy label is a policy that is bound to the policy label. As with policies that are bound globally or to a vserver, each policy that is bound to the policy label can also invoke a policy bank or a policy label that is evaluated after the current entry has been processed. The following table summarizes the entries in a policy label.

Name

The name of a policy, or, to invoke another policy bank without evaluating a policy, the "dummy" policy name NOPOLICY.

You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.

Priority

An integer. This setting can work with the Goto expression.

Goto Expression

Determines the next policy to evaluate in this bank. You can provide one of the following values:

NEXT:

Go to the policy with the next higher priority.

END:

Stop evaluation.

USE_INVOCATION_RESULT:

Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT.

Positive number:

The priority number of the next policy to be evaluated.

Numeric expression:

An expression that produces the priority number of the next policy to be evaluated.

The Goto can only proceed forward in a policy bank.

If you omit the Goto expression, it is the same as specifying END.

Invocation Type

Designates a policy bank type. The value can be one of the following:

Request Vserver:

Invokes request-time policies that are associated with a virtual server.

Response Vserver:

Invokes response-time policies that are associated with a virtual server.

Policy label:

Invokes another policy bank, as identified by the policy label for the bank.

Invocation Name

The name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

Configuring a Policy Label or Virtual Server Policy Bank

After you have created policies, and created policy banks by binding the policies, you can perform additional configuration of polices within a label or policy bank. For example, before you configure invocation of an external policy bank, you might want to wait until you have configured that policy bank.

Configuring a Policy Label

A policy label consists of a set of policies and invocations of other policy labels and virtual server-specific policy banks. An Invoke parameter enables you to invoke a policy label or a virtual server-specific policy bank from any other policy bank. A special-purpose NoPolicy entry enables you to invoke an external bank without processing an expression (a rule). The NoPolicy entry is a “dummy” policy that does not contain a rule.

For configuring policy labels from the NetScaler command line, note the following elaborations of the command syntax:

- gotoPriorityExpression is configured as described in "Entries in a Policy Bank."
- The type argument is required. This is unlike binding a conventional policy, where this argument is optional.
- You can invoke the bank of policies that are bound to a virtual server by using the same method as you use for invoking a policy label.

To configure a policy label by using the command line interface

At the command prompt, type the following commands to configure a policy label and verify the configuration:

- `bind cache|rewrite|responder policylabel <policylabelName> -policyName <policyName> -priority <priority> [-gotoPriorityExpression <gotopriorityExpression>] [-invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>]`
- `show cache|rewrite|responder policylabel <policylabelName>`

Example

```
bind cache policylabel _reqBuiltinDefaults -policyName  _nonGetReq -priority 100
Done
show cache policylabel _reqBuiltinDefaults
        Label Name: _reqBuiltinDefaults
        Evaluates: REQ
        Number of bound policies: 3
        Number of times invoked: 0
1)      Policy Name: _nonGetReq
        Priority: 100
        GotoPriorityExpression: END
2)      Policy Name: _advancedConditionalReq
        Priority: 200
        GotoPriorityExpression: END
```

```
3)     Policy Name: _personalizedReq
       Priority: 300
       GotoPriorityExpression: END
Done
```

To invoke a policy label from a Rewrite policy bank with a NOPOLICY entry by using the command line interface

At the command prompt, type the following commands to invoke a policy label from a Rewrite policy bank with a NOPOLICY entry and verify the configuration:

- bind rewrite global <policyName> <priority> <gotoPriorityExpression> -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>
- `show rewrite global`

  Example

```
> bind rewrite global NOPOLICY 100 -type REQ_DEFAULT -invoke policylabel lbl-rewrt-pol
Done
> show rewrite global
1)     Global bindpoint: REQ_DEFAULT
       Number of bound policies: 1

2)     Global bindpoint: REQ_OVERRIDE
       Number of bound policies: 1
Done
```

To invoke a policy label from an Integrated Caching policy bank by using the command line interface

At the command prompt, type the following commands to invoke a policy label from an Integrated Caching policy bank and verify the configuration:

- `bind cache global NOPOLICY -priority <priority> -gotoPriorityExpression <gotopriorityExpression> -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>`
- `show cache global`

  Example

```
bind cache global NOPOLICY -priority 100 -gotoPriorityExpression END -type REQ_DEFAULT -invoke polic
Done
> show cache global
```

1) Global bindpoint: REQ_DEFAULT
Number of bound policies: 2

2) Global bindpoint: RES_DEFAULT
Number of bound policies: 1

Done

To invoke a policy label from a Responder policy bank by using the command line interface

At the command prompt, type the following commands to invoke a policy label from a Responder policy bank and verify the configuration:

- `bind responder global NOPOLICY <priority> <gotoprioritыExpression> -type OVERRIDE|DEFAULT -invoke vserver|policylabel <policyLabelName>|<vserverName>`
- `show responder global`

Example

> bind responder global NOPOLICY 100 NEXT -type DEFAULT -invoke policylabel lbl-respndr-pol
Done
> show responder global
1) Global bindpoint: REQ_DEFAULT
Number of bound policies: 2

Done

To configure a policy label by using the configuration utility

1. In the navigation pane, expand the feature for which you want to configure a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, or Responder.

2. In the details pane, double-click the label that you want to configure.

3. If you are adding a new policy to this policy label, click Insert Policy, and in the Policy Name field, select New Policy. For more information about adding a policy, see "Creating or Modifying a Policy." Note that if you are invoking a policy bank, and do not want a rule to be evaluated prior to the invocation, click Insert Policy, and in the Policy Name field select NOPOLICY.

4. For each entry in this policy label, configure the following:

   Policy Name:

   This is already determined by the Policy Name, new policy, or NOPOLICY entry that you inserted in this bank.

   Priority:

   A numeric value that determines either an absolute order of evaluation within the bank, or is used in conjunction with a Goto expression.

   Expression:

   The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see "Configuring Default Syntax Expressions: Getting Started."

   Action:

   The action to be taken if this policy evaluates to TRUE.

   Goto Expression:

   Optional. Used to augment the Priority level to determine the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see the table "Entries in a Policy Bank."

   Invoke:

   Optional. Invokes another policy bank.

5. Click Ok. A message in the status bar indicates that the policy label is configured successfully.

Configuring a Policy Bank for a Virtual Server

You can configure a bank of policies for a virtual server. The policy bank can contain individual policies, and each entry in the policy bank can optionally invoke a policy label or a bank of policies that you configured for another virtual server. If you invoke a policy label or policy bank, you can do so without triggering an expression (a rule) by selecting a NOPOLICY “dummy” entry instead of a policy name.

To add policies to a virtual server policy bank by using the command line interface

At the command prompt, type the following commands to add policies to a virtual server policy bank and verify the configuration:

- `bind lb|cs vserver <virtualServerName> <serviceType> [-policyName <policyName>] [-priority <positiveInteger>] [-gotoPriorityExpression <expression>] [-type REQUEST|RESPONSE]`
- `show lb|cs vserver <virtualServerName>`

Example

```
add lb vserver vs-cont-sw TCP
Done
show lb vserver vs-cont-sw
      vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS
      State: DOWN
      Last state change was at Wed Aug 19 10:04:02 2009 (+279 ms)
      Time since last state change: 0 days, 00:02:14.420
      Effective State: DOWN
      Client Idle Timeout: 9000 sec
      Down state flush: ENABLED
      Disable Primary Vserver On Down : DISABLED
      No. of Bound Services :  0 (Total)      0 (Active)
      Configured Method: LEASTCONNECTION
      Mode: IP
      Persistence: NONE
      Connection Failover: DISABLED
Done
```

To invoke a policy label from a virtual server policy bank with a NOPOLICY entry by using the command line interface

At the command prompt, type the following commands to invoke a policy label from a virtual server policy bank with a NOPOLICY entry and verify the configuration:

- `bind lb|cs vserver <virtualServerName> -policyName NOPOLICY_REWRITE|NOPOLICY_CACHE|NOPOLICY_RESPONDER -priority <integer> -type REQUEST|RESPONSE -gotoPriorityExpression <gotopriorityExpression> -invoke reqVserver|resVserver|policyLabel <vserverName>|<labelName>`

- `show lb vserver`

  Example

  > bind lb vserver vs-cont-sw -policyname NOPOLICY-REWRITE -priority 200 -type REQUEST -gotoPriorityEx
  Done

To configure a virtual server policy bank by using the configuration utility

1. In the left navigation pane, expand Load Balancing, Content Switching, SSL Offload, AAA - Application Traffic, or Access Gateway, as appropriate, and then click Virtual Servers.

2. In the details pane, select the virtual server that you want to configure, and then click Open.

3. In the Configure Virtual Server dialog box click the Policies tab.

4. To create a new policy in this bank, click the icon for the type of policy or policy label that you want to add to the virtual server's bank of policies, click Insert Policy. Note that if you want to invoke a policy label without evaluating a policy rule, select the NOPOLICY "dummy" policy.

5. To configure an existing entry in this policy bank, enter the following:

   Priority:

   A numeric value that determines either an absolute order of evaluation within the bank or is used in conjunction with a Goto expression.

   Expression:

   The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see "Configuring Default Syntax Expressions: Getting Started."

   Action: on:

   The action to be taken if this policy evaluates to TRUE.

   Goto Expression:

   Optional. Determines the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see "Entries in a Policy Bank."

   Invoke:

   Optional. To invoke another policy bank, select the name of the policy label or virtual server policy bank that you want to invoke.

6. When you are done, click OK. A message in the status bar indicates that the policy is configured successfully.

Invoking or Removing a Policy Label or Virtual Server Policy Bank

Unlike a policy, which can only be bound once, you can use a policy label or a virtual server's policy bank any number of times by invoking it. Invocation can be performed from two places:

- From the binding for a named policy in a policy bank.
- From the binding for a NOPOLICY "dummy" entry in a policy bank.

Typically, the policy label must be of the same type as the policy from which it is invoked. For example, you would invoke a responder policy label from a responder policy.

Note: When binding or unbinding a global NOPOLICY entry in a policy bank at the command line, you specify a priority to distinguish one NOPOLICY entry from another.

To invoke a rewrite or integrated caching policy label by using the command line interface

At the command prompt, type the one of the following commands to invoke a rewrite or integrated caching policy label and verify the configuration:

- bind cache global <policy> -priority <positive_integer> [**-gotoPriorityExpression** <expression>] **-type REQ_OVERRIDE**|**REQ_DEFAULT**|**RES_OVERRIDE**|**RES_DEFAULT**] **-invoke reqvserver**|**resvserver**|**policylabel** <label_name>
- bind rewrite global<policy> -priority <positive_integer> [**-gotoPriorityExpression** <expression>] **-type REQ_OVERRIDE**|**REQ_DEFAULT**|**RES_OVERRIDE**|**RES_DEFAULT**] **-invoke reqvserver**|**resvserver**|**policylabel** <label_name>
- show cache global|show rewrite global

  Example

  > bind cache global _nonPostReq2 -priority 100 -type req_override -invoke policylabel lbl-cache-pol
  Done
  > show cache global
  1) Global bindpoint: REQ_DEFAULT
  Number of bound policies: 2

  2) Global bindpoint: RES_DEFAULT
  Number of bound policies: 1

  3) Global bindpoint: REQ_OVERRIDE

```
        Number of bound policies: 1

    Done
```

To invoke a responder policy label by using the command line interface

At the command prompt, type the following commands to invoke a responder policy label and verify the configuration:

- **bind responder global** <policy_Name> <priority_as_positive_integer> [<gotoPriorityExpression>] **-type REQ_OVERRIDE|REQ_DEFAULT|OVERRIDE|DEFAULT -invoke vserver|policylabel** <label_name>

- **show responder global**

  Example

```
> bind responder global pol404Error1 300 -invoke policylabel lbl-respndr-pol
 Done
> show responder global
1)      Global bindpoint: REQ_DEFAULT
        Number of bound policies: 2

 Done
>
```

To invoke a Virtual Server Policy Bank by using the command line interface

At the command prompt, type the following commands to invoke a Virtual Server Policy Bank and verify the configuration:

- **bind lb vserver** <vserver_name> **-policyName** <policy_Name> **-priority** <positive_integer> [**-gotoPriorityExpression** <expression>] **-type REQUEST|RESPONSE -invoke reqvserver|resvserver|policylabel** <policy_Label_Name>

- **bind lb vserver** <vserver_name>

  Example

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 100
 Done

> show lb vserver lbvip
        lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
        State: DOWN
```

```
        Last state change was at Wed Jul 15 05:54:24 2009 (+166 ms)
        Time since last state change: 28 days, 06:37:49.250
        Effective State: DOWN
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none

1)      CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority: 100   Hits: 0

1)      Policy : pol-ssl Priority:0
2)      Policy : ns_cmp_msapp Priority:100
3)      Policy : cf-pol Priority:1      Inherited
 Done
>
```

To remove a rewrite or integrated caching policy label by using the command line interface

At the command prompt, type one of the following commands to remove a rewrite or integrated caching policy label and verify the configuration:

- unbind rewrite global <policyName> -priority <positiveInteger> -type **REQ_OVERRIDE**|**REQ_DEFAULT**|**RES_OVERRIDE**|**RES_DEFAULT**
- unbind cache global <policyName> -priority <positiveInteger> -type **REQ_OVERRIDE**|**REQ_DEFAULT**|**RES_OVERRIDE**|**RES_DEFAULT**
- show rewrite global|show cache global

  Example

```
> unbind rewrite global NOPOLICY -priority 100 -type REQ_OVERRIDE
 Done
> show rewrite global
1)      Global bindpoint: REQ_DEFAULT
        Number of bound policies: 1

 Done
```

To remove a responder policy label by using the command line interface

At the command prompt, type the following commands to remove a responder policy label and verify the configuration:

- unbind responder global <policyName> -priority <positiveInteger> **-type OVERRIDE|DEFAULT**
- **show responder global**

Example

```
> unbind responder global NOPOLICY -priority 100 -type REQ_DEFAULT
 Done
> show responder global
1)      Global bindpoint: REQ_DEFAULT
        Number of bound policies: 1

 Done
```

To remove a Virtual Server policy label by using the command line interface

At the command prompt, type one of the following commands to remove a Virtual Server policy label and verify the configuration:

- unbind lb vserver <virtualServerName> -policyName **NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority** <positiveInteger>
- unbind cs vserver <virtualServerName> -policyName **NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority** <positiveInteger>
- show lb vserver|show cs vserver

Example

```
> unbind lb vserver lbvip -policyName ns_cmp_msapp -priority 200
 Done
> show lb vserver lbvip
        lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
        State: DOWN
        Last state change was at Wed Jul 15 05:54:24 2009 (+161 ms)
        Time since last state change: 28 days, 06:47:54.600
        Effective State: DOWN
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
```

```
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none

    1)      CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority: 100   Hits: 0

    1)      Policy : pol-ssl Priority:0
    2)      Policy : cf-pol Priority:1      Inherited
     Done
```

To invoke a policy label or virtual server policy bank by using the configuration utility

1. Bind a policy, as described in "Binding a Policy Globally", "Binding a Policy to a Virtual Server", or "Binding a Policy to a Policy Label." Alternatively, you can enter a NOPOLICY “dummy” entry instead of a policy name. You do this if you do not want to evaluate a policy before evaluating the policy bank.

2. In the Invoke field, select the name of the policy label or virtual server policy bank that you want to evaluate if traffic matches the bound policy. A message in the status bar indicates that the policy label or virtual server policy bank is invoked successfully.

To remove a policy label invocation by using the configuration utility

1. Open the policy and clear the Invoke field. Unbinding the policy also removes the invocation of the label. A message in the status bar indicates that the policy label is removed successfully.

Configuring and Binding Policies with the Policy Manager

Some applications provide a specialized Policy Manager in the NetScaler configuration utility to simplify configuring policy banks. It also lets you find and delete policies and actions that are not being used.

The Policy Manager is currently available for the Rewrite, Integrated Caching, Responder, and Compression features.

The following are keyboard equivalents for the procedures in this section:

- For editing a cell in the Policy Manager, you can tab to the cell and click F2 or press the SPACE bar on the keyboard.
- To select an entry in a drop-down menu, you can tab to the entry, press the space bar to view the drop-down menu, use the UP and DOWN ARROW keys to navigate to the entry that you want, and press the space bar again to select the entry.
- To cancel a selection in a drop-down menu, press the Escape key.
- To insert a policy, tab to the row above the insertion point and press Control + Insert, or click Insert Policy.
- To remove a policy, tab to the row that contains the policy and press Delete.

Note: Note that when you delete the policy, the NetScaler searches the Goto Expression values of other policies in the bank. If any of these Goto Expression values match the priority level of the deleted policy, they are removed.

To configure policy bindings by using the Policy Manager

1. In the navigation pane, click the feature for which you want to configure policies. The choices are Responder, Integrated Caching, Rewrite or Compression.

2. In the details pane, click Policy Manager.

3. If you are configuring classic policy bindings for compression, in the Compression Policy Manager dialog box, click **Switch to Classic Syntax**. The dialog box switches to the classic syntax view and displays the Switch to Default Syntax button. At any time before you complete configuring policy bindings, if you want to configure bindings for policies that use the default syntax, click the Switch to Default Syntax button.

4. For features other than Responder, to specify the bind point, click Request or Response, and then click one of the request-time or response-time bind points. The options are Override Global, LB Virtual Server, CS Virtual Server, Default Global, or Policy Label. If you are configuring the Responder, the Request and Response flow types are not available.

5. To bind a policy to this bind point, click Insert Policy, and select a previously configured policy, a NOPOLICY label, or the New policy option. Depending on the option that you select, you have the following choices:

   - **New policy:** Create the policy as described in "Creating or Modifying a Policy," and then configure the priority level, GoTo expression, and policy invocation as described in the table, "Format of Each Entry in a Policy Bank."

   - **Existing policy**, **NOPOLICY**, or **NOPOLICY<feature name>**: Configure the priority level, GoTo expression, and policy invocation as described in the table, "Format of Each Entry in a Policy Bank." The **NOPOLICY** or **NOPOLICY<feature name>** options are available only for policies that use default syntax expressions.
6. Repeat the preceding steps to add entries to this policy bank.

7. To modify the priority level for an entry, you can do any of the following:

   - Double-click the Priority field for an entry and edit the value.

   - Click and drag a policy to another row in the table.

   - Click Regenerate Priorities.

   In all three cases, priority levels of all other policies are modified as needed to accommodate the new value. Goto Expressions with integer values are also updated automatically. For example, if you change a priority value of 10 to 100, all policies with a Goto Expression value of 10 are updated to the value 100.

8. To change the policy, action, or policy bank invocation for an row in the table, click the down arrow to the right of the entry and do one of the following:

   - To change the policy, select another policy name or select New Policy and follow the steps in "Creating or Modifying a Policy."

   - To change the Goto Expression, select Next, End, USE_INVOCATION_RESULT, or select more and enter an expression whose result returns the priority level of

another entry in this policy bank.

- To modify an invocation, select an existing policy bank, or click New Policy Label and follow the steps in "Binding a Policy to a Policy Label."

9. To unbind a policy or a policy label invocation from this bank, click any field in the row that contains the policy or policy label, and then click Unbind Policy.

10. When you are done, click Apply Changes. A message in the status bar indicates that the policy is bound successfully.

To remove unused policies by using the Policy Manager

1. In the navigation pane, click the feature for which you want to configure the policy bank. The choices are Responder, Integrated Caching, or Rewrite.

2. In the details pane, click <Feature Name> policy manager.

3. In the <Feature Name> Policy Manager dialog box, click Cleanup Configuration.

4. In the Cleanup Configuration dialog box, select the items that you want to delete, and then click Remove.

5. In the Remove dialog box, click Yes.

6. Click Close. A message in the status bar indicates that the policy is removed successfully.

Configuring Default Syntax Expressions: Getting Started

Default syntax policies evaluate data on the basis of information that you supply in default syntax expressions. A default syntax expression analyzes data elements (for example, HTTP headers, source IP addresses, the NetScaler system time, and POST body data). In addition to configuring a default syntax expression in a policy, in some NetScaler features you configure default syntax expressions outside of the context of a policy.

To create a default syntax expression, you select a prefix that identifies a piece of data that you want to analyze, and then you specify an operation to perform on the data. For example, an operation can match a piece of data with a text string that you specify, or it can transform a text string into an HTTP header. Other operations match a returned string with a set of strings or a string pattern. You configure compound expressions by specifying Boolean and arithmetic operators, and by using parentheses to control the order of evaluation.

Default syntax expressions can also contain classic expressions. You can assign a name to a frequently used expression to avoid having to build the expression repeatedly.

Expression Characteristics

Policies and a few other entities include rules that the NetScaler uses to evaluate a packet in the traffic flowing through it, to extract data from the NetScaler system itself, to send a request (a “callout”) to an external application, or to analyze another piece of data. A rule takes the form of a logical expression that is compared against traffic and ultimately returns values of TRUE or FALSE.

The elements of the rule can themselves return TRUE or FALSE, string, or numeric values.

Before configuring a default syntax expression, you need to understand the characteristics of the data that the policy or other entity is to evaluate. For example, when working with the Integrated Caching feature, a policy determines what data can be stored in the cache. With Integrated Caching, you need to know the URLs, headers, and other data in the HTTP requests and responses that the NetScaler receives. With this knowledge, you can configure policies that match the actual data and enable the NetScaler to manage caching for HTTP traffic. This information helps you determine the type of expression that you need to configure in the policy.

Basic Elements of a Default Syntax Expression

A default syntax expression consists of, at a minimum, a prefix (or a single element used in place of a prefix). Most expressions also specify an operation to be performed on the data that the prefix identifies. You format an expression of up to 1,499 characters as follows:

```
<prefix>.<operation> [<compound-operator> <prefix>.<operation>. . .]
```

where

<prefix>

is an anchor point for starting an expression.

The prefix is a period-delimited key that identifies a unit of data. For example, the following prefix examines HTTP requests for the presence of a header named Content-Type:

```
http.req.header("Content-Type")
```

Prefixes can also be used on their own to return the value of the object that the prefix identifies.

<operation>

identifies an evaluation that is to be performed on the data identified by the prefix.

For example, consider the following expression:

```
http.req.header("Content-Type").eq("text/html")
```

In this expression, the following is the operator component:

```
eq("text/html")
```

This operator causes the NetScaler to evaluate any HTTP requests that contain a Content-Type header, and in particular, to determine if the value of this header is equal to the string “text/html.” For more information, see "Operations."

<compound-operator>

is a Boolean or arithmetic operator that forms a compound expression from multiple prefix or prefix.operation elements.

For example, consider the following expression:

```
http.req.header("Content-Type").eq("text/html") &&
http.req.url.contains(".html")
```

Prefixes

An expression prefix represents a discrete piece of data. For example, an expression prefix can represent an HTTP URL, an HTTP Cookie header, or a string in the body of an HTTP POST request. An expression prefix can identify and return a wide variety of data types, including the following:

- A client IP address in a TCP/IP packet
- NetScaler system time
- An external callout over HTTP
- A TCP or UDP record type

In most cases, an expression prefix begins with one of the following keywords:

CLIENT:

Identifies a characteristic of the client that is either sending a request or receiving a response, as in the following examples:

- The prefix `client.ip.dst` designates the destination IP address in the request or response.
- The prefix `client.ip.src` designates the source IP address.

HTTP:

Identifies an element in an HTTP request or a response, as in the following examples:

- The prefix `http.req.body(integer)` designates the body of the HTTP request as a multiline text object, up to the character position designated in integer.
- The prefix `http.req.header("header_name")` designates an HTTP header, as specified in header_name.
- The prefix `http.req.url` designates an HTTP URL in URL-encoded format.

SERVER:

Identifies an element in the server that is either processing a request or sending a response.

SYS:

Identifies a characteristic of the NetScaler that is processing the traffic.

Note: Note that DNS policies support only SYS, CLIENT, and SERVER objects.

In addition, in the Access Gateway, the Clientless VPN function can use the following types of prefixes:

TEXT:

Identifies any text element in a request or a response.

TARGET:

Identifies the target of a connection.

URL:

Identifies an element in the URL portion of an HTTP request or response.

As a general rule of thumb, any expression prefix can be a self-contained expression. For example, the following prefix is a complete expression that returns the contents of the HTTP header specified in the string argument (enclosed in quotation marks):

```
http.res.header.("myheader")
```

Or you can combine prefixes with simple operations to determine TRUE and FALSE values. For example, the following returns a value of TRUE or FALSE:

```
http.res.header.("myheader").exists
```

You can also use complex operations on individual prefixes and multiple prefixes within an expression, as in the following example:

```
http.req.url.length + http.req.cookie.length <= 500
```

Which expression prefixes you can specify depends on the NetScaler feature. The following table describes the expression prefixes that are of interest on a per-feature basis

Table 1. Permitted Types of Expression Prefixes in Various NetScaler Features

Feature	Types of Expression Prefix Used in the Feature
DNS	`SYS, CLIENT, SERVER`
Responder in Protection Features	`HTTP, SYS, CLIENT`
Content Switching	`HTTP, SYS, CLIENT`
Rewrite	`HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN`
Integrated Caching	`HTTP, SYS, CLIENT, SERVER`
Access Gateway, Clientless Access	`HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN`

Note: For details on the permitted expression prefixes in a feature, see the documentation for that feature.

Single-Element Expressions

The simplest type of default syntax expression contains a single element. This element can be one of the following:

- `true`. A default syntax expression can consist simply of the value `true`. This type of expression always returns a value of TRUE. It is useful for chaining policy actions and triggering Goto expressions.
- `false`. A default syntax expression can consist simply of the value `false`. This type of expression always returns a value of FALSE.
- A prefix for a compound expression. For example, the prefix `HTTP.REQ.HOSTNAME` is a complete expression that returns a host name and `HTTP.REQ.URL` is a complete expression that returns a URL. The prefix could also be used in conjunction with operations and additional prefixes to form a compound expression.

Operations

In most expressions, you also specify an operation on the data that the prefix identifies. For example, suppose that you specify the following prefix:

```
http.req.url
```

This prefix extracts URLs in HTTP requests. This expression prefix does not require any operators to be used in an expression. However, when you configure an expression that processes HTTP request URLs, you can specify operations that analyze particular characteristics of the URL. Following are a few possibilities:

- Search for a particular host name in the URL.
- Search for a particular path in the URL.
- Evaluate the length of the URL.
- Search for a string in the URL that indicates a time stamp and convert it to GMT.

The following is an example of a prefix that identifies an HTTP header named Server and an operation that searches for the string IIS in the header value:

```
http.res.header("Server").contains("IIS")
```

Following is an example of a prefix that identifies host names and an operation that searches for the string “www.mycompany.com” as the value of the name:

```
http.req.hostname.eq("www.mycompany.com")
```

Basic Operations on Expression Prefixes

The following table describes a few of the basic operations that can be performed on expression prefixes.

Table 1. Basic Operations for Expressions

Operation	Determines Whether or Not
`CONTAINS(<string>)`	The object matches <string>. Following is an example: `http.req.header("Cache-Control").contains("no-cache")`
`EXISTS`	A particular item is present in an object. Following is an example: `http.res.header("MyHdr").exists`
`EQ(<text>)`	A particular non-numeric value is present in an object. Following is an example: `http.req.method.eq(post)`
`EQ(<integer>)`	A particular numeric value is present in an object. Following is an example: `client.ip.dst.eq(10.100.10.100)`
`LT(<integer>)`	An object's value is less than a particular value. Following is an example: `http.req.content_length.lt(5000)`
`GT(<integer>)`	An object's value is greater than a particular value. Following is an example: `http.req.content_length.gt(5)`

The following table summarizes a few of the available types of operations.

Table 2. Basic Types of Operations

Operation Type	Description

Text operations	Match individual strings and sets of strings with any portion of a target. The target can be an entire string, the start of a string, or any portion of text in between the start and the end of the string. For example, you can extract the string "XYZ" from "XYZSomeText". Or, you can compare an HTTP header value with an array of different strings. You can also transform text into another type of data. Following are examples: · Transform a string into an integer value · Create a list from the query strings in a URL · Transform a string into a time value
Numeric operations	Numeric operations include applying arithmetic operators, evaluating content length, the number of items in a list, dates, times, and IP addresses.

Compound Default Syntax Expressions

You can configure a default syntax expression that contains Boolean or arithmetic operators and multiple atomic operations. The following compound expression contains a boolean AND:

```
http.req.hostname.eq("mycompany.com") && http.req.method.eq(post)
```

The following expression adds the value of two targets, and compares the result to a third value:

```
http.req.url.length + http.req.cookie.length <= 500
```

A compound expression can contain any number of logical and arithmetic operators. The following expression evaluates the length of an HTTP request on the basis of its URL and cookie, evaluates text in the header, and performs a Boolean AND on these two results:

```
http.req.url.length + http.req.cookie.length <= 500 &&
http.req.header.contains("some text")
```

You can use parentheses to control the order of evaluation in a compound expression.

Booleans in Compound Expressions

You configure compound expressions with the following operators:

&&.

This operator is a logical AND. For the expression to evaluate to TRUE, all components that are joined by the And must evaluate to TRUE. Following is an example:

```
http.req.url.hostname.eq("myHost") &&
http.req.header("myHeader").exists
```

||.

This operator is a logical OR. If any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE.

!.

Performs a logical NOT on the expression.

In some cases, the NetScaler configuration utility offers AND, NOT, and OR operators in the Add Expression dialog box. However, these are of limited use. Citrix recommends that you use the operators &&, ||, and ! to configure compound expressions that use Boolean logic.

Parentheses in Compound Expressions

You can use parentheses to control the order of evaluation of an expression. The following is an example:

```
http.req.url.contains("myCompany.com") ||
(http.req.url.hostname.eq("myHost") &&
http.req.header("myHeader").exists)
```

The following is another example:

```
(http.req.header("Content-Type").exists &&
http.req.header("Content-Type").eq("text/html")) ||
(http.req.header("Transfer-Encoding").exists ||
http.req.header("Content-Length").exists)
```

Compound Operations for Strings

The following table describes operators that you can use to configure compound operations on string data.

Table 1. String-Based Operations for Compound Default Syntax Expressions

All string operations	
Operations that produce a string value	
str + str	Concatenates the value of the expression on the left of the operator with the value on the right. Following is an example: `http.req.hostname + http.req.url.protocol`
str + num	Concatenates the value of the expression on the left of the operator with a numeric value on the right. Following is an example: `http.req.hostname + http.req.url.content_length`
num + str	Concatenates the numeric value of the expression on the left side of the operator with a string value on the right. Following is an example: `http.req.url.content_length + http.req.url.hostname`
str + ip	Concatenates the string value of the expression on the left side of the operator with an IP address value on the right. Following is an example: `http.req.hostname + 10.00.000.00`
ip + str	Concatenates the IP address value of the expression on the left of the operator with a string value on the right.Following is an example: `client.ip.dst + http.req.url.hostname`
str1 ALT str2	Uses the string1 or string2 value that is derived from the expression on either side of the operator, as long as neither of these expressions is a compound expressions. Following is an example: `http.req.hostname alt client.ip.src`
Operations on strings that produce a result of TRUE or FALSE	

str == str	Evaluates whether the strings on either side of the operator are the same. Following is an example:
	
	`http.req.header("myheader") ==`
	`http.res.header("myheader")`

str <= str	Evaluates whether the string on the left side of the operator is the same as the string on the right, or precedes it alphabetically.
str >= str	Evaluates whether the string on the left side of the operator is the same as the string on the right, or follows it alphabetically.

str < str	Evaluates whether the string on the left side of the operator precedes the string on the right alphabetically.
str > str	Evaluates whether the string on the left side of the operator follows the string on the right alphabetically.
str !!= str	Evaluates whether the strings on either side of the operator are different.
Logical operations on strings	

bool && bool	This operator is a logical AND. When evaluating the components of the compound expression, all components that are joined by the AND must evaluate to TRUE. Following is an example:
	
	`http.req.method.eq(GET) &&`
	`http.req.url.query.contains("viewReport && my_pagelabel")`

bool || bool	This operator is a logical OR. When evaluating the components of the compound expression, if any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE. Following is an example:
	
	`http.req.url.contains(".js") ||`
	`http.res.header.("Content-Type").contains("javascript")`

!bool	`Performs a logical NOT on the expression.`

Compound Operations for Numbers

You can configure compound numeric expressions. For example, the following expression returns a numeric value that is the sum of an HTTP header length and a URL length:

```
http.req.header.length + http.req.url.length
```

The following tables describes operators that you can use to configure compound expressions for numeric data.

Table 1. Arithmetic Operations on Numbers

Operator	Description
num + num	Add the value of the expression on the left of the operator to the value of the expression on the right. Following is an example: `http.req.content_length + http.req.url.length`
num – num	Subtract the value of the expression on the right of the operator from the value of the expression on the left.
num * num	Multiply the value of the expression on the left of the operator with the value of the expression on the right. Following is an example: `client.interface.rxthroughput * 9`
num / num	Divide the value of the expression on the left of the operator by the value of the expression on the right.
num % num	Calculate the modulo, or the numeric remainder on a division of the value of the expression on the left of the operator by the value of the expression on the right. For example, the values "15 mod 4" equals 3, and "12 mod 4" equals 0.
~number	Returns a number after applying a bitwise logical negation of the number. The following example assumes that numeric.expression returns 12 (binary 1100): `~numeric.expression.` The result of applying the ~ operator is -11 (a binary 1110011, 32 bits total with all ones to the left). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

number ^ number	Compares two bit patterns of equal length and performs an XOR operation on each pair of corresponding bits in each number argument, returning 1 if the bits are different, and 0 if they are the same. Returns a number after applying a bitwise XOR to the integer argument and the current number value. If the values in the bitwise comparison are the same, the returned value is a 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): `numeric.expression1 ^ numeric.expression2` The result of applying the ^ operator to the entire expression is 6 (binary 0110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.
number | number	Returns a number after applying a bitwise OR to the number values. If either value in the bitwise comparison is a 1, the returned value is a 1. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): `numeric.expression1 | numeric.expression2` The result of applying the | operator to the entire expression is 14 (binary 1110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.
number & number	Compares two bit patterns of equal length and performs a bitwise AND operation on each pair of corresponding bits, returning 1 if both of the bits contains a value of 1, and 0 if either bits are 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): `numeric.expression1 & numeric.expression2` The whole expression evaluates to 8 (binary 1000). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

num << num	Returns a number after a bitwise left shift of the number value by the right-side number argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3: `numeric.expression1 << numeric.expression2` The result of applying the LSHIFT operator is 96 (a binary 1100000). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.
num >> num	Returns a number after a bitwise right shift of the number value by the integer argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3: `numeric.expression1 >> numeric.expression2` The result of applying the RSHIFT operator is 1 (a binary 0001). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

Table 2. Numeric Operators That Produce a Result of TRUE or FALSE

Operator	Description
num == num	Determine if the value of the expression on the left of the operator is equal to the value of the expression on the right.
num != num	Determine if the value of the expression on the left of the operator is not equal to the value of the expression on the right.
num > num	Determine if the value of the expression on the left of the operator is greater than the value of the expression on the right.
num < num	Determine if the value of the expression on the left of the operator is less than the value of the expression on the right.
num >= num	Determine if the value of the expression on the left of the operator is greater than or equal to the value of the expression on the right.
num <= num	Determine if the value of the expression on the left of the operator is less than or equal to the value of the expression on the right

Functions for Data Types in the Policy Infrastructure

The NetScaler policy infrastructure supports the following numeric data types:

- Integer (32 bits)
- Unsigned long (64 bits)
- Double (64 bits)

Simple expressions can return all of these data types. Therefore, you can create compound expressions that use arithmetic operators and logical operators to evaluate or return values of these data types. Additionally, you can use all of these values in policy expressions. Literal constants of type unsigned long can be specified by appending the string `ul` to the number. Literal constants of type double contain a period (.), an exponent, or both.

Arithmetic Operators, Logical Operators, and Type Promotion

In compound expressions, the following standard arithmetic and logical operators can be used for the double and unsigned long data types:

- +, -, *, and /
- %, ~, ^, &, |, <<, and >> (do not apply to double)
- ==, !=, >, <, >=, and <=

All of these operators have the same meaning as in the C programming language.

In all cases of mixed operations between operands of type integer, unsigned long, and double, type promotion is performed so that the operation can be performed on operands of the same type. A type of lower precedence is automatically promoted to the type of the operand with the highest precedence involved in the operation. The order of precedence (higher to lower) is as follows:

- Double
- Unsigned long
- Integer

Therefore, an operation that returns a numeric result returns a result of the highest type involved in the operation.

For example, if the operands are of type integer and unsigned long, the integer operand is automatically converted to type unsigned long. This type conversion is performed even in simple expressions in which the type of data identified by the expression prefix does not match the type of data that is passed as the argument to the function. To illustrate such an example, in the operation `HTTP.REQ.CONTENT_LENGTH.DIV(3ul)`, the integer returned by the prefix `HTTP.REQ.CONTENT_LENGTH` is automatically converted to unsigned long (the type of the data passed as the argument to the `DIV()` function), and an unsigned long

division is performed. Similarly, the argument can be promoted in an expression. For example, `HTTP.REQ.HEADER("myHeader").TYPECAST_DOUBLE_AT.DIV(5)` promotes the integer `5` to type double and performs double-precision division.

The following table describes the arithmetic and Boolean functions that can be used with the integer, unsigned long, and double data types. For information about expressions for casting data of one type to data of another type, see "Typecasting Data."

Function	Description
`<prefix>.ADD(<integer>|<unsigned long>|<double>)`	Adds the argument to the value of the expression prefix and returns the result **Example:** `http.req.content_length.add(10)`
`<prefix>.SUB(<integer>|<unsigned long>|<double>)`	Subtracts the argument from the value of the prefix and returns the result. **Example:** `http.req.header.length.sub(10)`
`<prefix>.DIV(<integer>|<unsigned long>|<double>)`	Divides the value of the prefix by the argument and returns the quotient. **Example:** `http.req.content_length.div(2)`
`<prefix>.MUL(<integer>|<unsigned long>|<double>)`	Multiplies the value of the prefix by the argument and returns the product. **Example:** `http.req.content_length.mul(2)`
`<prefix>.BETWEEN(<lower_integer>, <higher_integer>|<lower_unsigned_long, higher_unsigned_long>|<lower_double>, <higher_double>)`	Returns a Boolean `TRUE` if the value of the prefix is greater than or equal to t value argument and less than or equal to the higher value argument. **Example:** `http.req.content_length.between(5, 500)`
`<prefix>.EQ(<integer>|<unsigned long>|<double>)`	Returns a Boolean `TRUE` if the value of the prefix is equal to the argument. **Example:** `http.req.content_length.eq(50)`
`<prefix>.NE(<integer>|<unsigned long>|<double>)`	Returns a Boolean `TRUE` if the value of the prefix is not equal to the argumen **Example:** `http.req.content_length.ne(50)`
`<prefix>.GE(<integer>|<unsigned long>|<double>)`	Returns a Boolean `TRUE` if the value of the prefix is greater than or equal to t argument. **Example:** `http.req.content_length.ge(500)`

<prefix>.GT(<integer>|<unsigned long>|<double>)	Returns a Boolean TRUE if the value of the prefix is greater than the argumen **Example:** http.req.content_length.gt(500)
<prefix>.LE(<integer>|<unsigned long>|<double>)	Returns a Boolean TRUE if the value of the prefix is less than or equal to the argument. **Example:** http.req.content_length.le(5)
<prefix>.LT(<integer>|<unsigned long>|<double>)	Returns a Boolean TRUE if the value of the prefix is less than the argument. **Example:** http.req.content_length.lt(5)
<prefix>.NEG	Returns the negative of the value of the prefix. This function cannot be used v prefix that returns data of type unsigned long. **Example:** http.req.content_length.neg If the content length is 30 characters, the NEG function in the above example value of ▫30.
<prefix>.BITAND(<integer>|<unsigned long>)	Returns the result of a bitwise AND operation performed on the binary equiva the argument and the value returned by the prefix. The bitwise AND operation operates on each pair of corresponding bits in the bit strings. The operation returns 1 only if both bits are equal to 1. If either bi if both bits are 0, the operation returns 0. If the binary equivalent of an opera contains fewer than 32 bits, the function implicitly adds leading zeros to make operand 32 bits wide before performing the operation. The BITAND function be used with the double data type. **Example:** http.req.header (\"test\").contains_index(\"patternset1\").bitand(4) In the above example, assume that the index returned by the CONTAINS_IND pattern set function is an integer value of 12. The BITAND function performs AND operation between the binary value of 12, which is 00000000000000000000000000001100 (32 bits wide) and the binary value of 4, 00000000000000000000000000001100 (32 bits wide). The resulting bit string th function returns is 00000000000000000000000000000100, whose decimal equiv 4. An ampersand (&) performs a similar function to BITAND but takes two expre operands rather than an expression (the prefix) and the argument.

<prefix>.BITNEG	Returns the value that results from a bitwise negation of the value of the pref data type of the value that is returned is the same as that of the value that wo otherwise be returned by the prefix. This function cannot be used with a prefi returns data of type double. If the binary equivalent of an operand contains fe 32 bits, the function implicitly adds leading zeros to make the operand 32 bits before performing the operation. **Example:** http.req.header(\"test\").contains_index(\"patternset1\").b In the above example, assume that the index returned by the CONTAINS_IND pattern set function is an integer value of 12, whose binary value is 00000000000000000000000000001100 (32 bits wide). The BITNEG function ret 11111111111111111111111111110011, which represents an integer value of - 1 A tilde (~) performs a similar function to that of BITNEG but takes another ex as an argument, instead of operating on an integer prefix expression.
<prefix>.BITOR(<integer>|<unsigned long>)	Returns the result of a bitwise OR operation performed on the value of the pr the argument. The function returns 1 if either or both bits in a corresponding set to 1. If both bits are 0, the function returns 0. The BITOR function cannot with the double data type. If the binary equivalent of an operand contains few 32 bits, the function implicitly adds leading zeros to make the operand 32 bits before performing the operation. **Example:** http.req.header (\"test\").contains_index(\"patternset1\").bitor(7) In the above example, assume that the index returned by the CONTAINS_IND pattern set function is an integer value of 9. The BITOR function performs a bi operation on the binary value of 9, which is 0000000000000000000000000000100 bits wide), and the binary value of 7, which is 0000000000000000000000000000000 bits wide). The function returns 00000000000000000000000000001111, which represents an integer value of 15. The pipe (|) performs a similar function to that of BITOR but takes two expre operands rather than an integer or unsigned long (the argument to the functio expression prefix.

<prefix>.BITXOR(<integer>|<unsigned long>)	Returns the result of a bitwise EXLUSIVE-OR (XOR) operation performed on t of the prefix and the value of the argument. If the values of a pair of correspo bits are the same, the function returns 0. If the bits do not have the same valu function returns 1. If the binary equivalent of an operand contains fewer than the function implicitly adds leading zeros to make the operand 32 bits wide be performing the operation. The BITXOR function cannot be used with the doub type. **Example:** `http.req.header (\"test\").contains_index(\"patternset1\").bitxor(8)` In the above example, assume that the index returned by the CONTAINS_IND pattern set function is an integer value of 15. The BITOR function performs a XOR operation on the binary value of 15, which is 00000000000000000000000000 (32 bits wide), and the binary value of 8, which is 00000000000000000000000000 (32 bits wide). The function returns 00000000000000000000000000000111, whi represents an integer value of 7. A caret (^) performs a similar function to that of BITXOR but takes two expre operands rather than an expression and an argument.
<prefix>.LSHIFT(<integer>|<unsigned long>)	Returns the result of a bitwise left shift operation on the value of the prefix. T number of shifts is <integer> modulo 32. Each leftward shift effectively mu the value of the prefix by 2. If the binary equivalent of an operand contains fe 32 bits, the function implicitly adds leading zeros to make the operand 32 bits before performing the operation. This function cannot be used with a prefix th returns data of type double. **Example:** `http.req.header (\"test\").contains_index(\"pat1\").lshift(` Assume that the index that is returned by the CONTAINS_INDEX operator is 1 left shift operator drops the two leftmost bits in the binary value of 10, which 00000000000000000000000000001010 (32 bits wide), and adds two zeros to the The result is 00000000000000000000000000101000, which represents a decima 40. A double less-than (<<) performs a similar function to that of LSHIFT but tak expressions as operands, instead of an expression and an argument.

`<prefix>.RSHIFT(<integer>|<unsigned long>)`	Returns the result of a bitwise right shift operation on the value of the prefix. number of shifts is `<integer>` modulo 32. Each rightward shift effectively di value of the prefix by 2. If the binary equivalent of an operand contains less th bits, the function implicitly adds leading zeros before performing the operatio make the operand 32 bits wide. This function cannot be used with a prefix tha data of type double. **Example:** `http.req.header (\"test\").contains_index(\"pat1\").Rshift(` Assume that the index that is returned by the `CONTAINS_INDEX` operator is 3 left shift operator drops the two rightmost bits in the binary value of 320, whi 00000000000000000000000101000000 (32 bits wide), and adds two zeros to the The result is 00000000000000000000000001010000, which represents an intege of 80. A double greater-than (>>) performs the same function as `RSHIFT` but takes t expressions as operands, instead of an expression and an argument.
`<prefix>.MOD(<integer>|<unsigned long>)`	Divides the value returned by the preceding function by its argument and retu remainder. The argument must be a non-zero value.

Specifying the Character Set in Expressions

The policy infrastructure on the Citrix® NetScaler® appliance supports the ASCII and UTF-8 character sets. The default character set is ASCII. If the traffic for which you are configuring an expression consists of only ASCII characters, you need not specify the character set in the expression. However, you must specify the character set in every simple expression that is meant for UTF-8 traffic. To specify the UTF-8 character set in a simple expression, you must include the `SET_CHAR_SET(<charset>)` function, with `<charset>` specified as UTF_8, as shown in the following examples:

```
HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8).CONTAINS("ß")

HTTP.RES.BODY(100).SET_CHAR_SET(UTF_8).BEFORE_STR("Bücher").AFTER_STR
("Wörterbuch")
```

In an expression, the `SET_CHAR_SET()` function must be introduced at the point in the expression after which data processing must be carried out in the specified character set. For example, in the expression `HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In the preceding example/).CONTAINS_ANY("Greek_ alphabet")`, if the strings stored in the pattern set "Greek_alphabet" are in UTF-8, you must include the `SET_CHAR_SET(UTF_8)` function immediately before the `CONTAINS_ANY("<string>")` function, as follows:

```
HTTP.REQ.BODY(1000).AFTER_REGEX(re/following
example/).BEFORE_REGEX(re/In the preceding
example/).SET_CHAR_SET(UTF_8).CONTAINS_ANY("Greek_ alphabet")
```

The `SET_CHAR_SET()` function sets the character set for all further processing (that is, for all subsequent functions) in the expression unless it is overridden later in the expression by another `SET_CHAR_SET()` function that changes the character set. Therefore, if all the functions in a given simple expression are intended for UTF-8, you can include the `SET_CHAR_SET(UTF_8)` function immediately after functions that identify text (for example, the `HEADER("<name>")` or `BODY(<int>)` functions). In the second example that follows the first paragraph above, if the ASCII arguments passed to the `AFTER_REGEX()` and `BEFORE_REGEX()` functions are changed to UTF-8 strings, you can include the `SET_CHAR_SET(UTF_8)` function immediately after the `BODY(1000)` function, as follows:

```
HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).AFTER_REGEX(re/Bücher/).BEFOR
E_REGEX(re/Wörterbuch/).CONTAINS_ANY("Greek_alphabet")
```

The UTF-8 character set is a superset of the ASCII character set, so expressions configured for the ASCII character set continue to work as expected if you change the character set to UTF-8.

Compound Expressions with Different Character Sets

In a compound expression, if one subset of expressions is configured to work with data in the ASCII character set and the rest of the expressions are configured to work with data in the UTF-8 character set, the character set specified for each individual expression is considered when the expressions are evaluated individually. However, when processing the compound expression, just before processing the operators, the appliance promotes the character set of the returned ASCII values to UTF-8. For example, in the following compound expression, the first simple expression evaluates data in the ASCII character set while the second simple expression evaluates data in the UTF-8 character set:

```
HTTP.REQ.HEADER("MyHeader") == HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8)
```

However, when processing the compound expression, just before evaluating the "is equal to" Boolean operator, the NetScaler appliance promotes the character set of the value returned by `HTTP.REQ.HEADER("MyHeader")` to UTF-8.

The first simple expression in the following example evaluates data in the ASCII character set. However, when the NetScaler appliance processes the compound expression, just before concatenating the results of the two simple expressions, the appliance promotes the character set of the value returned by `HTTP.REQ.BODY(10)` to UTF-8.

```
HTTP.REQ.BODY(10) + HTTP.REQ.HEADER("MyHeader").SET_CHAR_SET(UTF_8)
```

Consequently, the compound expression returns data in the UTF-8 character set.

Specifying the Character Set Based on the Character Set of Traffic

You can set the character set to UTF-8 on the basis of traffic characteristics. If you are not sure whether the character set of the traffic being evaluated is UTF-8, you can configure a compound expression in which the first expression checks for UTF-8 traffic and subsequent expressions set the character set to UTF-8. Following is an example of a compound expression that first checks the value of "charset" in the request's Content-Type header for "UTF-8" before checking whether the first 1000 bytes in the request contain the UTF-8 string `Bücher`:

```
HTTP.REQ.HEADER("Content-Type").SET_TEXT_MODE(IGNORECASE).TYPECAST_NV
LIST_T('=', '; ', '"').VALUE("charset").EQ("UTF-8") &&
HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).CONTAINS("Bücher")
```

If you are sure that the character set of the traffic being evaluated is UTF-8, the second expression in the example is sufficient.

Character and String Literals in Expressions

During expression evaluation, even if the current character set is ASCII, character literals and string literals, which are enclosed in single quotation marks (') and quotation marks (""), respectively, are considered to be literals in the UTF-8 character set. In a given expression, if a function is operating on character or string literals in the ASCII character set and you include a non-ASCII character in the literal, an error is returned.

Values in Hexadecimal and Octal Formats

When configuring an expression, you can enter values in octal and hexadecimal formats. However, each hexadecimal or octal byte is considered a UTF-8 byte. Invalid UTF-8 bytes result in errors regardless of whether the value is entered manually or pasted from the clipboard. For example, "\xce\x20" is an invalid UTF-8 character because "c8" cannot be followed by "20" (each byte in a multi-byte UTF-8 string must have the high bit set). Another example of an invalid UTF-8 character is "\xce \xa9," since the hexadecimal characters are separated by a white-space character.

Functions That Return UTF-8 Strings

Only the `<text>.XPATH` and `<text>.XPATH_JSON` functions always return UTF-8 strings. The following MYSQL routines determine at runtime which character set to return, depending on the data in the protocol:

- `MYSQL_CLIENT_T.USER`
- `MYSQL_CLIENT_T.DATABASE`
- `MYSQL_REQ_QUERY_T.COMMAND`
- `MYSQL_REQ_QUERY_T.TEXT`
- `MYSQL_REQ_QUERY_T.TEXT(<unsigned int>)`
- `MYSQL_RES_ERROR_T.SQLSTATE`
- `MYSQL_RES_ERROR_T.MESSAGE`
- `MYSQL_RES_FIELD_T.CATALOG`
- `MYSQL_RES_FIELD_T.DB`
- `MYSQL_RES_FIELD_T.TABLE`
- `MYSQL_RES_FIELD_T.ORIGINAL_TABLE`
- `MYSQL_RES_FIELD_T.NAME`
- `MYSQL_RES_FIELD_T.ORIGINAL_NAME`
- `MYSQL_RES_OK_T.MESSAGE`
- `MYSQL_RES_ROW_T.TEXT_ELEM(<unsigned int>)`

Terminal Connection Settings for UTF-8

When you set up a connection to the NetScaler appliance by using a terminal connection (by using PuTTY, for example), you must set the character set for transmission of data to UTF-8.

Classic Expressions in Default Syntax Expressions

Classic expressions describe basic characteristics of traffic. In some cases, you may want to use a classic expression in a default syntax expression. You can do so with the default syntax expression configuration tool. This can be helpful when manually migrating the older classic expressions to the default syntax.

Note that when you upgrade the NetScaler to version 9.0 or higher, Integrated Caching policies are automatically upgraded to default syntax policies, and the expressions in these policies are upgraded to the default syntax.

The following is the syntax for all default syntax expressions that use a classic expression:

```
SYS.EVAL_CLASSIC_EXPR("expression")
```

Following are examples of the `SYS.EVAL_CLASSIC_EXPR("expression")` expression:

```
sys.eval_classic_expr("req.ssl.client.cipher.bits > 1000")
sys.eval_classic_expr("url contains abc")
sys.eval_classic_expr("req.ip.sourceip == 10.102.1.61 -netmask 255.255.255.255")
sys.eval_classic_expr("time >= *:30:00GMT")
sys.eval_classic_expr("e1 || e2")
sys.eval_classic_expr("req.http.urllen > 50")
sys.eval_classic_expr("dayofweek == wedGMT")
```

Configuring Default Syntax Expressions in a Policy

You can configure a default syntax expression of up to 1,499 characters in a policy. The user interface for default syntax expressions depends to some extent on the feature for which you are configuring the expression, and on whether you are configuring an expression for a policy or for another use.

When configuring expressions on the command line, you delimit the expression by using quotation marks (“. . .” or '. . .'). Within an expression, you escape additional quotation marks by using a back-slash (\). For example, the following are standard methods for escaping quotation marks in an expression:

```
"\"abc\""
```

```
‘\"abc\"’
```

You must also use a backslash to escape question marks and other backslashes on the command line. For example, the expression `http.req.url.contains(“\?”)` requires a backslash so that the question mark is parsed. Note that the backslash character will not appear on the command line after you type the question mark. On the other hand, if you escape a backslash (for example, in the expression `'http.req.url.contains("\\\\http")'`), the escape characters are echoed on the command line.

To make an entry more readable, you can escape the quotation marks for an entire expression. At the start of the expression you enter the escape sequence “q” plus one of the following special characters: `/{<|~$^+=&%@`?`.

You enter only the special character at the end of the expression, as follows:

```
q@http.req.url.contains("sometext") && http.req.cookie.exists@
```

```
q~http.req.url.contains("sometext") && http.req.cookie.exists~
```

Note that an expression that uses the { delimiter is closed with }.

For some features (for example, Integrated Caching and Responder), the policy configuration dialog box provides a secondary dialog box for configuring expressions. This dialog enables you to choose from drop-down lists that show the available choices at each point during expression configuration. You cannot use arithmetic operators when using these configuration dialogs, but most other default syntax expression features are available. To use arithmetic operators , write your expressions in free-form format.

To configure a default syntax rule by using the command line interface

At the command prompt, type the following commands to configure a default syntax rule and verify the configuration:

1. `add cache|dns|rewrite|cs policy policyName` **`-rule`** `expression featureSpecificParameters` **`-action`**

2. `show cache|dns|rewrite|cs policy policyName`
   Following is an example of configuring a caching policy:

   Example

   > add cache policy pol-cache -rule http.req.content_length.le(5) -action INVAL
   Done

   > show cache policy pol-cache
   Name: pol-cache
   Rule: http.req.content_length.le(5)
   CacheAction: INVAL
   Invalidate groups: DEFAULT
   UndefAction: Use Global
   Hits: 0
   Undef Hits: 0

   Done

To configure a default syntax policy expression by using the configuration utility

1. In the navigation pane, click the name of the feature where you want to configure a policy, for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching, and then click Policies.

2. Click Add.

3. For most features, click in the Expression field. For Content Switching, click Configure.

4. Click the Prefix icon (the house) and select the first expression prefix from the drop-down list. For example, in Responder, the options are HTTP, SYS, and CLIENT. The next set of applicable options appear in a drop-down list.

5. Double-click the next option to select it, and then type a period (.). Again, a set of applicable options appears in another drop-down list.

6. Continue selecting options until an entry field (signalled by parentheses) appears. When you see an entry field, enter an appropriate value in the parentheses. For example, if you select GT(int) (greater-than, integer format), you specify an integer in the parentheses. Text strings are delimited by quotation marks. Following is an example:

   ```
   HTTP.REQ.BODY(1000).BETWEEN("this","that")
   ```

7. To insert an operator between two parts of a compound expression, click the Operators icon (the sigma), and select the operator type. Following is an example of a configured expression with a Boolean OR (signalled by double vertical bars, ||):

   ```
   HTTP.REQ.URL.EQ("www.mycompany.com")||HTTP.REQ.BODY(1000).BETWEEN(
   "this","that")
   ```

8. To insert a named expression, click the down arrow next to the Add icon (the plus sign) and select a named expression.

9. To configure an expression using drop-down menus, and to insert built-in expressions, click the Add icon (the plus sign). The Add Expression dialog box works in a similar way to the main dialog box, but it provides drop-down lists for selecting options, and it provides text fields for data entry instead of parentheses. This dialog box also provides a Frequently Used Expressions drop-down list that inserts commonly used expressions. When you are done adding the expression, click OK.

10. When finished, click Create. A message in the status bar indicates that the policy expression is configured successfully.

To test a default syntax expression by using the configuration utility

1. In the navigation pane, click the name of the feature for which you want to configure a policy (for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching), and then click Policies.

2. Select a policy and click Open.

3. To test the expression, click the Evaluate icon (the check mark).

4. In the expression evaluator dialog box, select the Flow Type that matches the expression.

5. In the HTTP Request Data or HTTP Response Data field, paste the HTTP request or response that you want to parse with the expression, and click Evaluate. Note that you must supply a complete HTTP request or response, and the header and body should be separated by blank line. Some programs that trap HTTP headers do not also trap the response. If you are copying and pasting only the header, insert a blank line at the end of the header to form a complete HTTP request or response.

6. Click Close to close this dialog box.

Configuring Named Default Syntax Expressions

Instead of retyping the same expression multiple times in multiple policies, you can configure a named expression and refer to the name any time you want to use the expression in a policy. For example, you could create the following named expressions:

ThisExpression:

```
http.req.body(100).contains("this")
```

ThatExpression:

```
http.req.body(100).contains("that")
```

You can then use these named expressions in a policy expression. For example, the following is a legal expression based on the preceding examples:

```
ThisExpression || ThatExpression
```

You can use the name of a default syntax expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

Example 1: Simple Named Expression as a Prefix

The following simple named expression, which identifies a text string, can be used as a prefix to the AFTER_STR("<string>")function, which works with text data:

```
HTTP.REQ.BODY(1000)
```

If the name of the expression is top1KB, you can use top1KB.AFTER_STR("username") instead of HTTP.REQ.BODY(1000).AFTER_STR("username").

Example 2: Compound Named Expression as a Prefix

You can create a compound named expression called basic_header_value to concatenate the user name in a request, a colon (:), and the user's password, as follows:

```
add policy expression basic_header_value "HTTP.REQ.USER.NAME + \":\"
+ HTTP.REQ.USER.PASSWD"
```

You can then use the name of the expression in a rewrite action, as shown in the following example:

```
add rewrite action insert_b64encoded_authorization insert_http_header
authorization '"Basic " + basic_header_value.b64encode'
-bypassSafetyCheck YES
```

In the example, in the expression that is used to construct the value of the custom header, the B64 encoding algorithm is applied to the string returned by the compound named expression.

You can also use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in a rewrite.

To configure a named default syntax expression by using the command line interface

At the command prompt, type the following commands to configure a named expression and verify the configuration:

- add policy expression <name><value>
- show policy expression <name>

Example

```
> add policy expression myExp "http.req.body(100).contains(\"the other\")"
 Done

> show policy expression myExp
1)      Name: myExp  Expr: "http.req.body(100).contains("the other")"  Hits: 0 Type : ADVANCED
 Done
```

The expression can be up to 1,499 characters.

To configure a named expression by using the configuration utility

1. In the navigation pane, expand AppExpert, and then click Expressions.
2. Click Advanced Expressions.
3. Click Add.
4. Enter a name and a description for the expression.
5. Configure the expression by using the process described in "To configure a default syntax policy expression by using the configuration utility." A message in the status bar indicates that the policy expression is configured successfully.

Configuring Default Syntax Expressions Outside the Context of a Policy

A number of functions, including the following, can require a default syntax expression that is not part of a policy:

Integrated Caching selectors:

You define multiple non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND relationship with the others.

Load Balancing:

You configure an expression for the TOKEN method of load balancing for a load balancing virtual server.

Rewrite actions:

Expressions define the location of the rewrite action and the type of rewriting to be performed, depending on the type of rewrite action that you are configuring. For example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

Rate-based policies:

You use default syntax expressions to configure Limit Selectors. You can use these selectors when configuring policies to throttle the rate of traffic to various servers. You define up to five non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND with the others.

To configure a default syntax expression outside a policy by using the command line interface (cache selector example)

At the command prompt, type the following commands to configure a default syntax expression outside a policy and verify the configuration:

- add cache selector <selectorName> <rule>
- show cache selector <selectorName>

Example

```
> add cache selector mainpageSelector "http.req.cookie.value(\"ABC_def\")"
"http.req.url.query.value(\"_ghi\")"selector "mainpageSelector" added
```

```
 Done
> show cache selector mainpageSelector
        Name: mainpageSelector
        Expressions:
                1) http.req.cookie.value("ABC_def")
                2) http.req.url.query.value("_ghi")
 Done
```

Following is an equivalent command that uses the more readable q delimiter, as described in "Configuring Default Syntax Expressions in a Policy":

```
> add cache selector mainpageSelector2 q~http.req.cookie.value("ABC_def")~
q~http.req.url.query.value("_ghi")~selector "mainpageSelector2" added
 Done
> show cache selector mainpageSelector2
        Name: mainpageSelector2
        Expressions:
                1) http.req.cookie.value("ABC_def")
                2) http.req.url.query.value("_ghi")
 Done
```

ns-pi-Adv-exp-eval-txt-wrapper-con

Due to technical difficulties, we are unable to display this topic. Citrix is currently fixing this problem. In the meantime, you can view this topic online:

http://support.citrix.com/proddocs/index.jsp?lang=en&topic=/ns-main-appexpert-10-map/ns-pi-Adv-exp-eval-txt-wrapper-con.html

About Text Expressions

You can configure various expressions for working with text that flows through the NetScaler appliance. Following are some examples of how you can parse text by using a default syntax expression:

- Determine that a particular HTTP header exists.

  For example, you may want to identify HTTP requests that contains a particular Accept-Language header for the purpose of directing the request to a particular server.

- Determine that a particular HTTP URL contains a particular string.

  For example, you may want to block requests for particular URLs. Note that the string can occur at the beginning, middle, or end of another string.

- Identify a POST request that is directed to a particular application.

  For example, you may want to identify all POST requests that are directed to a database application for the purpose of refreshing cached application data.

Note that there are specialized tools for viewing the data stream for HTTP requests and responses. For example, from the following URL, you can download a Firefox Web browser plug-in that displays HTTP request and response headers:

"https://addons.mozilla.org/en-US/firefox/addon/3829"

The following plug-in displays headers, query strings, POST data, and other information:

"https://addons.mozilla.org/en-US/firefox/addon/6647"

After you download these plug-ins, they are accessible from the Firefox Tools menu.

About Operations on Text

A text-based expression consists of at least one prefix to identify an element of data and usually (although not always) an operation on that prefix. Text-based operations can apply to any part of a request or a response. Basic operations on text include various types of string matches.

For example, the following expression compares a header value with a string:

```
http.req.header("myHeader").contains("some-text")
```

Following expressions are examples of matching a file type in a request:

```
http.req.url.suffix.contains("jpeg")

http.req.url.suffix.eq("jpeg")
```

In the preceding examples, the contains operator permits a partial match and the eq operator looks for an exact match.

Other operations are available to format the string before evaluating it. For example, you can use text operations to strip out quotes and white spaces, to convert the string to all lowercase, or to concatenate strings.

Note: Complex operations are available to perform matching based on patterns or to convert one type of text format to another type.

For more information, see the following topics:

- "Pattern Sets and Data Sets."
- "Regular Expressions."
- "Typecasting Data."

Compounding and Precedence in Text Expressions

You can apply various operators to combine text prefixes or expressions. For example, the following expression concatenates the returned values of each prefix:

```
http.req.hostname + http.req.url
```

Following is an example of a compound text expression that uses a logical AND. Both components of this expression must be TRUE for a request to match the expression:

```
http.req.method.eq(post) &&
http.req.body(1024).startswith("destination=")
```

Note: For more information on operators for compounding, see "Compound Default Syntax Expressions."

Categories of Text Expressions

The primary categories of text expressions that you can configure are:

- Information in HTTP headers, HTTP URLs, and the POST body in HTTP requests.

  For more information, see "Expression Prefixes for Text in HTTP Requests and Responses."

- Information regarding a VPN or a clientless VPN.

  For more information, see "Expression Prefixes for VPNs and Clientless VPNs."

- TCP payload information.

  For more information about TCP payload expressions, see "Default Syntax Expressions: Parsing HTTP, TCP, and UDP Data."

- Text in a Secure Sockets Layer (SSL) certificate.

For information about text expressions for SSL and SSL certificate data, see "Default Syntax Expressions: Parsing SSL Certificates" and "Expressions for SSL Certificate Dates."

Note: Parsing a document body, such as the body of a POST request, can affect performance. You may want to test the performance impact of policies that evaluate a document body.

Guidelines for Text Expressions

From a performance standpoint, it typically is best to use protocol-aware functions in an expression. For example, the following expression makes use of a protocol-aware function:

```
HTTP.REQ.URL.QUERY
```

The previous expression performs better than the following equivalent expression, which is based on string parsing:

```
HTTP.REQ.URL.AFTER_STR("?")
```

In the first case, the expression looks specifically at the URL query. In the second case, the expression scans the data for the first occurrence of a question mark.

There is also a performance benefit from structured parsing of text, as in the following expression:

```
HTTP.REQ.HEADER("Example").TYPECAST_LIST_T(',').GET(1)
```

(For more information on typecasting, see "Typecasting Data.") The typecasting expression, which collects comma-delimited data and structures it into a list, typically would perform better than the following unstructured equivalent:

```
HTTP.REQ.HEADER("Example").AFTER_STR(",").BEFORE_STR(",")
```

Finally, unstructured text expressions typically have better performance than regular expressions. For example, the following is an unstructured text expression:

```
HTTP.REQ.HEADER("Example").AFTER_STR("more")
```

The previous expression would generally provide better performance than the following equivalent, which uses a regular expression:

```
HTTP.REQ.HEADER("Example").AFTER_REGEX(re/more/)
```

For more information on regular expressions, see "Regular Expressions."

Expression Prefixes for Text in HTTP Requests and Responses

An HTTP request or response typically contains text, such as in the form of headers, header values, URLs, and POST body text. You can configure expressions to operate on one or more of these text-based items in an HTTP request or response.

The following table describes the expression prefixes that you can configure to extract text from different parts of an HTTP request or response.

Table 1. HTTP Expression Prefixes That Return Text

	Description
`nteger>)`	Returns the body of an HTTP request as a multiline text object, up to the character <integer>. There is no maximum value for the body argument, but you should use as small a va values can affect performance. **Note:** Although it is possible to specify this prefix without an integer argument, th
`ME`	Returns the HTTP host name in the first line of the request, if there is one. Otherwi in the last occurrence of the HOST header. Note that there are two similar prefixes that return host names, as follows: · `http.req.url.hostname` only returns the host name from the URL · `http.req.header("Host")` only returns the value from the Host header. To you must typecast this string, as illustrated in the following example: `http.req.header("host").typecast_http_hostname_t` For more information on typecasting, see "Typecasting Data."
`ME. DOMAIN`	Returns the domain name part of the host name. For example, if the host name is w www.myhost.com:8080, the domain is myhost.com. Returns incorrect results if the host name has an IP address. For information on exp "Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs." All text operations that you specify after this prefix are case insensitive.
`ME. SERVER`	Returns the server name part of the host name. If the host name is www.myhost.co the server is www.myhost.com. All text operations that you specify after this prefix are case insensitive.
	Returns the value of the METHOD in an HTTP request, or matches the method type argument, for example, `http.req.method.eq(get)`. If you enclose the argumen sensitive.

	Returns the HTTP URL.
STNAME	Returns the host name in the HTTP URL. Do not use this prefix in bidirectional policies. Note that there are two similar prefixes that return host names, as follows: · `HTTP.REQ.HOSTNAME` returns the host name from the URL if there is one; oth the last occurrence of the Host header. · `HTTP.REQ.HEADER("Host")` only returns the value from the Host header. To you must typecast this string, as illustrated in the following example: `http.req.header("host").typecast_http_hostname_t` For more information on typecasting, see "Typecasting Data."
STNAME.DOMAIN	Returns the domain name part of the host name. For example, if the host name is w www.myhost.com:8080, the domain is myhost.com. This operation returns incorrect results if the host name has an IP address. For infor addresses, see "Default Syntax Expressions: IP and MAC Addresses, Throughput, VLA All text operations that you specify after this prefix are case insensitive unless expl SET_TEXT_MODE operator.
STNAME.SERVER	Returns the server name part of the host name. For example, if the host name is ww www.myhost.com:8080, the server is www.myhost.com. All text operations that you specify after this prefix are case insensitive.
STNAME.PORT	Returns the port in the host name. The string following and including the first colon value. For example, if the host name is www.mycompany.com:8080, the port is ":80 www.mycompany.com: the port is ":". If the host name is www.mycompany.com, th location just after ".com". If the numerical value in the port is missing, it assumes a default value of 80 or 443
TH	Returns a slash- (/) separated list from the path in a URL. For example, if the URL is http://www.myhost.com/a/b/c/mypage.html?a=1, this p /a/b/c/mypage.html. The expression `http.req.url.path.get(1)` returns "a" from the preceding URL GET operation, see "Expressions for Extracting Segments of URLs."
TH_AND_QUERY	Returns the portion of the URL that follows the host name. For example, if the URL is http://www.myhost.com/a/b/c/mypage.html?a=1, this p /a/b/c/mypage.html?a=1.
OTOCOL	Returns the protocol in the URL. This prefix cannot be used in bidirectional policies. Following is an example: `http.req.hostname + http.req.url.protocol`

ERY	Returns a name-value list, using the delimiters “=” and “&” from the query compon Following is an example: `http.req.url.query.contains("viewReport && my_pagelabel")`
ERY.VALUE	Returns the value from the name-value pair in the argument supplied to this prefix, the query component in the URL. Following is an example: `http.req.url.query.value("action")` The first component that matches the name is selected. The matching process honc NOIGNORECASE text modes. The URLENCODED and the NOURLENCODED text modes
FFIX	Returns the file name suffix in a URL. For example, if the path in the URL is /a/b/c/mypage.html, this suffix selects “htm example: `http.req.url.suffix.contains("jpeg")`
	Returns the AAA user associated with the current HTTP transaction.
XTERNAL_GROUPS	Returns a list of the external groups to which a user belongs. The groups are separa For example, HTTP.REQ.USER.EXTERNAL_GROUPS returns a comma-separated list o which the user belongs.

XTERNAL_GROUPS.IGNORE_EMPTY_ELEMENTS	Ignores the empty elements in the list of external groups to which the user belongs.
	
	If the element delimiter in the list is a comma (","), then the following list has an er
	
	a=10,,b=11, ,c=89
	
	But the element following "b=11" is not considered an empty element.
	
	For example, consider the following header in an HTTP request packet:
	
	Cust_Header : 123,,24, ,15
	
	Then the following expression returns a value of 4:
	
	`HTTP.REQ.HEADER("Cust_Header").TYPECAST_LIST_T(',').  IGNORE_EMP`
	
	The following expression returns a value of 5:
	
	`HTTP.REQ.HEADER("Cust_Header").TYPECAST_LIST_T(',').COUNT.`

XTERNAL_GROUPS(sep)	Returns a list of all the external groups to which the user belongs. The groups are se For example, the following expression gives a list of all the external groups, and the colon (":"): HTTP.REQ.USER.EXTERNAL_GROUPS(':') Parameters: sep - delimiter
ROUPS	Returns a list of the internal and external groups to which the user belongs. The gro (","). In this list, internal groups are listed first, followed by external groups.
ROUPS.IGNORE_EMPTY_ELEMENTS	Ignores the empty elements in the list of groups to which the user belongs. If the element delimiter in the list is a comma (","), then the following list has an er a=10,,b=11, ,c=89 But the element that follows "b=11" is not considered an empty element. For example, consider the following header in an HTTP request packet: Cust_Header : 123,,24, ,15 The following expression returns a value of 4: HTTP.REQ.HEADER("Cust_Header").TYPECAST_LIST_T(','). IGNORE_EMP The following expression returns a value of 5: HTTP.REQ.HEADER("Cust_Header").TYPECAST_LIST_T(',').COUNT
ROUPS(sep)	Returns a list of groups to which the user belongs. The groups in the list are separat the argument. For example, the following expression returns a colon-separated list of all the group HTTP.REQ.USER.GROUPS(':') In this list, internal groups are listed first, followed by external groups. Parameters: sep - delimiter
NTERNAL_GROUPS	Returns a list of internal groups to which the user belongs. The groups are separate For example, the following expression returns a comma-separated list of all the inte belongs. HTTP.REQ.USER.INTERNAL_GROUPS

NTERNAL_GROUPS.IGNORE_EMPTY_ELEMENTS	Ignores the empty elements in the list of internal groups to which the user belongs.
	
	If the element delimiter in the list is a comma (","), then the following list has an er
	
	a=10,,b=11, ,c=89
	
	But the element following "b=11" is not considered an empty element.
	
	For example, consider the following header in an HTTP request packet:
	
	Cust_Header : 123,,24, ,15
	
	The following expression returns a value of 4:
	
	`HTTP.REQ.HEADER("Cust_Header").TYPECAST_LIST_T(',').  IGNORE_EMP`
	
	The following expression returns a value of 5:
	
	`HTTP.REQ.HEADER("Cust_Header").TYPECAST_LIST_T(',').COUNT`

NTERNAL_GROUPS(sep)	Returns a list of the internal groups to which the user belongs. The groups are separ For example, the following expression returns a colon-separated list of all the interr belongs. `HTTP.REQ.USER.INTERNAL_GROUPS(':')` Parameters: sep - delimiter
S_MEMBER_OF(group_name)	Returns a boolean TRUE if the user who is named in the request is a member of the Following is an example: `http.req.user.is_member_of("mygroup")` Parameter: group_name: The name of the group.
AME	Returns the name of the user in the request. Following is an example: `http.req.username.contains("rohit")`
ASSWD	Returns the password of the user.
N	Returns the HTTP version listed in the request. Following is an example: `http.req.version "\"HTTP/1.0\"`

nteger>)	Returns a portion of the HTTP response body. The length of the returned text is equ <integer> argument. If there are fewer characters in the body than are specified in <integer>, the entire an example: `http.res.body(100).suffix('L',1)`
_MSG	Returns the HTTP response status message.
N	Returns the HTTP version listed in the response.
STNAME.EQ(<hostname>)	Returns a Boolean TRUE value if the host name matches the <hostname> argument. insensitive and if textmode is URLENCODED, the host name is decoded before comp name is www.mycompany.com., the following is true: `http.req.url.hostname.eq("www.mycompany.com")`
M_OR_NEGOTIATE	Returns a Boolean TRUE if the request is a part of an NTLM or NEGOTIATE connectio
PN_ENCODE	Converts the URL to the clientless VPN format.

TH.IGNORE_EMPTY_ELEMENTS	Ignores the empty elements in the list. For example, if the element delimiter in the
	list has an empty element following a=10:
	
	a=10,b=11, ,c=89
	
	The element following b=11 is not considered an empty element.
	
	As another example, consider the following header:
	
	Cust_Header : 123,,24, ,15
	
	The following expression returns a value of 4:
	
	`http.req.header("Cust_Header").typecast_list_t(',').ignore_empt`
	
	The following expression returns a value of 5:
	
	`http.req.header("Cust_Header").typecast_list_t(','). count`

ERY.IGNORE_EMPTY_ELEMENTS	This method ignores the empty elements in a name-value list. For example, if the li
	following list has an empty element following a=10:
	
	a=10;;b=11; ;c=89
	
	The element following b=11 is not considered an empty element.
	
	For example, consider the following header:
	
	Cust_Header : a=1;;b=2; ;c=3
	
	The following expression returns a value of 4:
	
	`http.req.header("Cust_Header").typecast_nvlist_t('=',';').ignor`
	
	The following expression returns a value of 5:
	
	`http.req.header("Cust_Header").typecast_nvlist_t('=',';'). coun`

Expression Prefixes for VPNs and Clientless VPNs

The default syntax expression engine provides prefixes that are specific to parsing VPN or Clientless VPN data. This data includes the following:

- Host names, domains, and URLs in VPN traffic.
- Protocols in the VPN traffic.
- Queries in the VPN traffic.

These text elements are often URLs and components of URLs. In addition to applying the text-based operations on these elements, you can parse these elements by using operations that are specific to parsing URLs. For more information, see "Expressions for Extracting Segments of URLs."

The following table describes the expression prefixes for this type of data.

Table 1. VPN and Clientless VPN Expression Prefixes That Return Text

VPN Expression	Description
PN_DECODE	Extracts the original URL from a clientless VPN URL.
PN_ENCODE	Converts a URL to clientless VPN format.
STNAME	Extracts the HTTP host name from the host name in the URL. This prefix cannot be used in bidirectional policies.
STNAME.DOMAIN	Extracts the domain name from the host name. For example, if the host name is www.mycompany.com or www.mycompany.com:80 mycompany.com. This prefix returns incorrect results if the host name is an IP address. For information addresses, see "Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN All text operations after this prefix are case insensitive.
STNAME.EQ (<hostname>)	Returns a Boolean TRUE if the host name matches <hostname>. The comparison is ca For example, if the host name is www.mycompany.com, the following returns TRUE: `vpn.baseurl.hostname.eq("www.mycompany.com")` If the text mode is URLENCODED, the host name is decoded before comparison. For n "Operations for HTTP, HTML, and XML Encoding and “Safe” Characters."

STNAME.SERVER	Evaluates the server portion of the host name. For example, if the host name is www.mycompany.com or www.mycompany.com:80 www.mycompany.com. All text operations after this prefix are case insensitive.
TH	Extracts a slash- (/) separated list from the path component of the URL. For example /a/b/c/mypage.html from the following URL: http://www.mycompany.com/a/b/c/mypage.html?a=1 The following expression selects just the “a”: `http.req.url.path.get(1)` For more information on the GET operation, see "Expressions for Extracting Segments

TH.IGNORE_EMPTY_ELEMENTS	This prefix ignores the elements in a list. For example, the following comma-separat
	after “a=10”:
	
	a=10,,b=11, ,c=89
	
	The element following b=11 contains a space, and by default, is not considered an er
	
	Consider the following HTTP header:
	
	Cust_Header : 123,,24, ,15
	
	The following expression returns a count of 4 when evaluating this header:
	
	`http.req.header("Cust_Header").typecase_list_t(',').ignore_empty`
	
	The following expression returns a count of 5 when evaluating this header:
	
	`http.req.header("Cust_Header").typecase_list_t(','). count`

TH_AND_QUERY	Evaluates the text in the URL that follows the host name. For example, if the URL is http://www.mycompany.com/a/b/c/mypage.html?a=1, th /a/b/c/mypage.html?a=1.
OTOCOL	Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.
ERY	Extracts a name-value list, using the “=” and “&” delimiters from the query string in

ERY.IGNORE_EMPTY_ELEMENTS	This method ignores the empty elements in a name-value list. For example, in the fo is an empty element following “a=10”:
	
	a=10;;b=11; ;c=89
	
	The element following b=11 contains a space and is not considered an empty elemen
	
	Consider the following HTTP header:
	
	Cust_Header : a=1;;b=2; ;c=3
	
	The following expression produces a count of 4 after evaluating this header:
	
	`http.req.header("Cust_Header").typecast_nvlist_t('=',';').ignore`
	
	The following expression produces a count of 5 after evaluating the header:
	
	`http.req.header("Cust_Header").typecast_nvlist_t('=',';').`

FFIX	Evaluates the file name suffix in a URL. For example, if the path is /a/b/c/my.page.html, this operation selects “html.”
_BASEURL	Evaluates the clientless VPN base URL.
_BASEURL.CVPN_DECODE	Extracts the original URL from the clientless VPN formatted URL.
_BASEURL.CVPN_ENCODE	Converts a URL to the clientless VPN format.
_BASEURL.HOSTNAME	Evaluates the host name in the URL. Do not use this prefix in bidirectional policies.
_BASEURL.HOSTNAME.DOMAIN	Evaluates the domain name part of the host name. For example, if the host name is www.mycompany.com or www.mycompany.com:80 mycompany.com. This operation returns incorrect results if the host name is an IP address. For informa addresses, see "Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN All text operations after this prefix are case insensitive.
_BASEURL.HOSTNAME.EQ(<hostname>)	Returns a Boolean TRUE if the host name matches <hostname>. For example, if the host name is www.mycompany.com or www.mycompany.com:80 `vpn.clientless_baseurl. hostname.eq("www.mycompany.com")` The comparison is case insensitive. If the textmode is URLENCODED, the host name is For more information, see "Operations for HTTP, HTML, and XML Encoding and “Safe”
_BASEURL.HOSTNAME.SERVER	Evaluates the server part of a host name. For example, if the host name is www.mycompany.com or www.mycompany.com:80 www.mycompany.com. All text operations after this prefix are case insensitive.

_BASEURL.PATH	Evaluates a slash- (/) separated list in the URL path. For example, this prefix selects /a/b/c/mypage.html from the following URL: http://www.mycompany.com/a/b/c/mypage.html?a=1 The following expression selects “a” from the preceding URL: `http.req.url.path.get(1)` For more information on the GET operation, see "Expressions for Extracting Segments

_BASEURL.PATH.IGNORE_EMPTY_ELEMENTS	Ignores empty elements in a list. For example, if the list delimiter is a comma (,) the element following “a=10”:
	
	a=10,b=11, ,c=89
	
	The element following b=11 contains a space and is not considered an empty elemen
	
	Consider the following HTTP header:
	
	Cust_Header : 123,,24, ,15
	
	The following expression returns a value of 4 after evaluating this header:
	
	`http.req.header("Cust_Header").typecast_list_t(',').ignore_empty`
	
	The following expression returns a value of 5 after evaluating this header:
	
	`http.req.header("Cust_Header").typecast_list_t(',').`

_BASEURL.PATH_AND_QUERY	Evaluates the text following the host name in a URL. For example, this prefix selects /a/b/c/mypage.html?a=1 from the following URL: http://www.mycompany.com/a/b/c/mypage.html?a=1
_BASEURL.PROTOCOL	Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.
_BASEURL.QUERY	Extracts a name-value list that uses the delimiters “=” and “&” from a URL query str

_BASEURL.QUERY.IGNORE_EMPTY_ ELEMENTS	Ignores empty elements in a name-value list. For example, the following list contains “a=10”:
	
	a=10;;b=11; ;c=89
	
	The element following b=11 contains a space and is not considered an empty elemen
	
	As another example, consider the following http header:
	
	Cust_Header : a=1;;b=2; ;c=3
	
	The following expression returns a value of 4 after evaluating the preceding header:
	
	`http.req.header("Cust_Header").typecast_nvlist_t('=',';').ignore`
	
	The following expression returns a value of 5 after evaluating the preceding header:
	
	`http.req.header("Cust_Header").typecast_nvlist_t('=',';')`

_BASEURL.SUFFIX	Evaluates the file suffix in a URL. For example, if the URL path is /a/b/c/mypage.htm html.
_HOSTURL	Selects the clientless VPN host URL.
_HOSTURL.CVPN_DECODE	Selects the original URL from the clientless VPN formatted URL.
_HOSTURL.CVPN_ENCODE	Converts a URL to clientless VPN format.
_HOSTURL.HOSTNAME	Extracts the host name in the URL. Do not use this prefix in bidirectional policies.
_HOSTURL.HOSTNAME.DOMAIN	Extracts the domain name from the host name. For example, if the host name is www www.mycompany.com:8080, the domain is mycompany.com. This operation returns incorrect results if the host name contains an IP address. For i IP addresses, see "Default Syntax Expressions: IP and MAC Addresses, Throughput, VL All text operations after this prefix are case insensitive.
_HOSTURL.HOSTNAME.EQ(<hostname>)	Results in Boolean TRUE if the host name matches the <hostname> argument. The For example, if the host name is www.mycompany.com or www.mycompany.com., t TRUE: `vpn.clilentless_hosturl. hostname.eq("www.mycompany.com")` If the text mode is URLENCODED, the host name is decoded before comparison. For m "Operations for HTTP, HTML, and XML Encoding and “Safe” Characters."
_HOSTURL.HOSTNAME.SERVER	Evaluates the server part of the host name. For example, if the host name is www.mycompany.com or www.mycompany.com:80 www.mycompany.com. The comparison is case insensitive, and all text operations after this method are case

_HOSTURL.PATH	Evaluates a slash- (/) separated list on the path component of the URL. For example, consider the following URL: http://www.mycompany.com/a/b/c/mypage.html?a=1 This prefix selects /a/b/c/mypage.html from the preceding URL.

_HOSTURL.PATH.IGNORE_EMPTY_ELEMENTS	This method ignores the empty elements in a list. For example, if the delimiter in a l contains an empty element after the entry “a=10”:
	
	a=10,b=11, ,c=89
	
	The element following b=11 contains a space and is not considered an empty elemen
	
	Consider the following header:
	
	Cust_Header : 123,,24, ,15
	
	The following expression returns a value of 4 for this header:
	
	`http.req.header("Cust_Header").typecast_list_t(','). ignore_empt`
	
	The following expression returns a value of 5 for the same header:
	
	`http.req.header("Cust_Header").typecast_list_t(',').`

_HOSTURL.PATH_AND_QUERY	Evaluates the portion of the URL that follows the host name. For example, consider the following URL: http://www.mycompany.com/a/b/c/mypage.html?a=1 This prefix returns /a/b/c/mypage.html?a=1 from the preceding URL.
_HOSTURL.PROTOCOL	Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.
_HOSTURL.QUERY	Extracts a name-value list, using the “=” and “&” delimiters from a URL query string.

_HOSTURL.QUERY.IGNORE_EMPTY_ ELEMENTS	Ignores empty elements in a name-value list. For example, the following list uses a s contains an empty element after “a=10”:
	
	a=10;;b=11; ;c=89
	
	In the preceding example, the element following b=11 is not considered an empty ele
	
	Consider the following header:
	
	Cust_Header : a=1;;b=2; ;c=3
	
	The following expression returns a value of 4 after evaluating this header:
	
	`http.req.header("Cust_Header").typecast_nvlist_t('=',';').ignore`
	
	The following expression returns a value of 5 after evaluating the same header:
	
	`http.req.header("Cust_Header").typecast_nvlist_t('=',';')`

_HOSTURL.SUFFIX	Extracts a file name suffix in a URL. For example, if the path is /a/b/c/my.page.html, this prefix selects html.
N	Extracts the domain name part of the host name. For example, if the host name is w www.mycompany.com:8080, the domain is mycompany.com. This prefix returns incorrect results if the host name contains an IP address. For infor addresses, see "Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN All text operations after this prefix case insensitive.
ostname>)	Returns a Boolean TRUE value if the host name matches the <hostname>. The compa For example, if the host name is www.mycompany.com or www.mycompany.com:80 TRUE: `vpn.host.eq("www.mycompany.com")` If the text mode is URLENCODED the host name is decoded before comparison. For m "Operations for HTTP, HTML, and XML Encoding and “Safe” Characters."
R	Extracts the server name part of the host name. For example, if the host name is ww www.mycompany.com:8080, the server is www.mycompany.com. All text operations after this prefix are case insensitive.

Basic Operations on Text

Basic operations on text include operations for string matching, calculating the length of a string, and controlling case sensitivity. You can include white space in a string that is passed as an argument to an expression, but the string cannot exceed 255 characters.

String Comparison Functions

The following table lists basic string matching operations in which the functions return a Boolean TRUE or FALSE.

Table 1. String Comparison Functions

Function	Description
`<text>.CONTAINS(<string>)`	Returns a Boolean TRUE value if the target contains <string>. Following is an example: `http.req.url.contains(".jpeg")`
`<text>.EQ(<string>)`	Returns a Boolean TRUE value if the target is an exact match with <string>. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”: `http.req.url.hostname.eq("myhostabc")`
`<text>.STARTSWITH(<string>)`	Returns a Boolean TRUE value if the target begins with <string>. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”: `http.req.url.hostname.startswith("myhost")`
`<text>.ENDSWITH(<string>)`	Returns a Boolean TRUE value if the target ends with <string>. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”: `http.req.url.hostname.endswith("abc")`

`<text>.NE(<string>)`	Returns a Boolean TRUE value if the prefix is not equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.
`<text>.GT(<string>)`	Returns a Boolean TRUE value if the prefix is alphabetically greater than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.
`<text>.GE(<string>)`	Returns a Boolean TRUE value if the prefix is alphabetically greater than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.
`<text>.LT(<string>)`	Returns a Boolean TRUE value if the prefix is alphabetically lesser than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.
`<text>.LE(<string>)`	Returns a Boolean TRUE value if the prefix is alphabetically lesser than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.

Calculating the Length of a String

The <text>.LENGTH operation returns a numeric value that is equal to the number of characters (not bytes) in a string:

```
<text>.LENGTH
```

For example, you may want to identify request URLs that exceed a particular length. Following is an expression that implements this example:

```
HTTP.REQ.URL.LENGTH < 500
```

After taking a count of the characters or elements in a string, you can apply numeric operations to them. For more information, see "Default Syntax Expressions: Working with Dates, Times, and Numbers."

Considering, Ignoring, and Changing Text Case

The following functions operate on the case (upper-case or lower-case) of the characters in the string.

Table 2. Functions for Considering, Ignoring, and Changing Text Case

Function	Description
`<text>.SET_TEXT_MODE(IGNORECASE|NOIGNORECASE)`	This function turns case sensitivity on or off for all text operations.
`<text>.TO_LOWER`	Converts the target to lowercase for a text block of up to 2 kilobyte (KB). Returns UNDEF if the target exceeds 2 KB. For example, the string “ABCd:” is converted to “abcd:”.
`<text>.TO_UPPER`	Converts the target to uppercase. Returns UNDEF if the target exceeds 2 KB. For example, the string “abcD:” is converted to “ABCD:”.

Stripping Specific Characters from a String

You can use the `STRIP_CHARS(<string>)` function to remove specific characters from the text that is returned by a default syntax expression prefix (the input string). All instances of the characters that you specify in the argument are stripped from the input string. You can use any text method on the resulting string, including the methods used for matching the string with a pattern set.

For example, in the expression `CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(".-_")`, the `STRIP_CHARS(<string>)` function strips all periods (`.`), hyphens (`-`), and underscores (`_`) from the domain name returned by the prefix `CLIENT.UDP.DNS.DOMAIN`. If the domain name that is returned is "a.dom_ai_n-name", the function returns the string "adomainname".

In the following example, the resulting string is compared with a pattern set called "listofdomains":

```
CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(".-_").CONTAINS_ANY("listofdomains"
)
```

Note: You cannot perform a rewrite on the string that is returned by the `STRIP_CHARS(<string>)` function.

The following functions strip matching characters from the beginning and end of a given string input.

Table 3. Functions for Stripping Characters From the Beginning or End of a String

Function	Description
`<text>.STRIP_START_CHARS(s)`	Strips matching characters from the beginning of the input string until the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is `TestLang` and `://_en_us:` is its value, `HTTP.RES.HEADER("TestLang").STRIP_START_CHARS(":/_")` strips the specified characters from the beginning of the value of the header until the first non-matching character `e` is found and returns `en_us:` as a string.
`<text>.STRIP_END_CHARS(s)`	Strips matching characters from the end of the input string to the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is `TestLang` and `://_en_us:` is its value, `HTTP.RES.HEADER("TestLang").STRIP_START_CHARS(":/_")` strips the specified characters from the end of the value of the header until the first non-matching character `s` is found and returns `://_en_us` as a string.

Appending a String to Another String

You can use the `APPEND()` function to append the string representation of the argument to the string representation of the value returned by the preceding function. The preceding function can be one that returns a number, unsigned long, double, time value, IPv4 address, or IPv6 address. The argument can be a text string, number, unsigned long, double, time value, IPv4 address, or IPv6 address. The resulting string value is the same string value that is obtained by using the `+` operator.

Complex Operations on Text

In addition to performing simple string matching, you can configure expressions that examine more complex aspects of text, including examining the length of a string and looking within a text block for patterns rather than specific strings.

Be aware of the following for any text-based operation:

- For any operation that takes a string argument, the string cannot exceed 255 characters.
- You can include white space when you specify a string in an expression.

Operations on the Length of a String

The following operations extract strings on the basis of a character count.

Table 1. String Operations Based on a Character Count

Character Count Operation	Description
`<text>.TRUNCATE(<count>)`	Returns a string after truncating the end of the target by the number of characters in <count>. If the entire string is shorter than <count>, nothing is returned.
`<text>.TRUNCATE(<character>, <count>)`	Returns a string after truncating the text after <character> by the number of characters specified in <count>.
`<text>.PREFIX(<character>, <count>)`	Selects the longest prefix in the target that has at most <count> occurrences of <character>.

	<text>.SUFFIX(<character>, <count>) Selects the longest suffix in the target that has at most <count> occurrences of <character>.
	
	For example, consider the following response body:
	
	`JLEwx`
	
	The following expression returns a value of “JLEwx”:
	
	`http.res.body(100).suffix('L',1)`
	
	The following expression returns “LLEwx”:
	
	`http.res.body(100).suffix('L',2)`

`<text>.SUBSTR(<starting_offset>, <length>)`	Select a string with <length> number of characters from the target object. Begin extracting the string after the <starting_offset>. If the number of characters after the offset are fewer than the value of the <length> argument, select all the remaining characters.
`<text>.SKIP(<character>, <count>)`	Select a string from the target after skipping over the longest prefix that has at most <count> occurrences of <character>.

Operations on a Portion of a String

You can extract a subset of a larger string by using one of the operations in the following table.

Table 1. Basic Operations on a Portion of a String

ext Operation	Description
>.BEFORE_STR(<string>)	Returns the text that precedes the first occurrence of <string>. If there is no match for <string>, the expression returns a text object of 0 length. Following is an example: `http.res.body(1024).after_str("start_string").before_str("end_string").conta`
>.AFTER_STR(<string>)	Returns the text that follows the first occurrence of <string>. If there is no match for <string>, the expression returns a text object of 0 length. Following is an example: `http.res.body(1024).after_str("start_string").before_str("end_string").conta`
>.BETWEEN(<starting g>, <ending string>)	Returns a Boolean TRUE value if the length of the text object is greater than or equal to the sum <sta <ending string> argument lengths, and if a prefix of the target matches <starting string>, and if the su matches <ending string>.
>.PREFIX(<prefix h>)	Returns the starting string from a target block of text that contains the number of characters in the < argument. If the <prefix length> argument exceeds the number of characters in the target, the entire string is se
>.SUFFIX(<suffix h>)	Returns the ending string from a target block of text that contains the number of characters in the <s argument. If the <suffix length> argument exceeds the number characters in the target, the entire str
>.SUBSTR(<string>)	Select the first block of text in the target that matches the <string>.
>.SKIP(<prefix length>)	Selects the text in the target after skipping over a <prefix length> number of characters. If the entire target has fewer characters than <prefix length>, the entire target is skipped.
>.STRIP_END_WS	Selects the text after removing white space from the end of the target.
>.STRIP_START_WS	Selects the text after removing white space from the beginning of the target.

>.UNQUOTE(<character>)	Selects the <character>, removes white space that immediately precedes and follows the <character> remaining text is quoted by <character>, this prefix also removes the quotes. For example, the operation UNQUOTE("") changes the following text: "abc xyz def " To the following: abc xyz def

Operations for Comparing the Alphanumeric Order of Two Strings

The COMPARE operation examines the first nonmatching character of two different strings. This operation is based on lexicographic order, which is the method used when ordering terms in dictionaries.

This operation returns the arithmetic difference between the ASCII values of the first nonmatching characters in the compared strings. The following differences are examples:

- The difference between “abc” and “abd” is -1 (based on the third pair-wise character comparison).
- The difference between “@” and “abc” is -33.
- The difference between “1” and “abc” is -47.

Following is the syntax for the COMPARE operation.

```
<text>.COMPARE(<string>)
```

Extracting an Integer from a String of Bytes That Represent Text

You can use the following functions to treat a string of bytes that represent text as a sequence of bytes, extract 8, 16, or 32 bits from the sequence, and then convert the extracted bits to an integer.

Table 1. Operations for Extracting an Integer from a String of Bytes That Represent Text

Function	Description
`<text>.GET_SIGNED8(<n>)`	Treats the string of bytes represented by text as a sequence of 8-bit signed integers and returns the integer at byte offset n. If the offset makes all or part of the value outside of the current text, an `UNDEF` condition is raised.
`<text>.GET_UNSIGNED8(<n>)`	Treats the string of bytes represented by text as a sequence of 8-bit unsigned integers and returns the integer at byte offset n. If the offset makes all or part of the value outside of the current text, an `UNDEF` condition is raised.

<text>.GET_SIGNED16(<n>, <endianness>)	Treats the text string returned by the prefix as a string of bytes, extracts 16 bits starting at byte offset n, and converts the extracted bit sequence to a 16-bit signed integer. If the offset makes all or part of the value outside of the current text, an UNDEF condition is raised. The first parameter n is the byte offset from the current position in the text string. Providing a byte offset enables the function to handle items that are not aligned on the boundaries that are required by indexes. The second parameter, endianness, takes a mnemonic value of LITTLE_ENDIAN or BIG_ENDIAN. **Note:** In NetScaler 9.2, the parameter n was an index into an array of 16-bit items. In NetScaler 9.3, the parameter is a byte offset. Therefore, if you used this function in NetScaler 9.2, after you upgrade to NetScaler 9.3, you must change n to 2*n to obtain the same results as you did earlier. For example, if the value of n before the upgrade was 4, you must change the value of n to 8. The parameter endianness also no longer takes the values that it did in NetScaler 9.2, which were 0 and 1. Instead, endianness accepts the mnemonic values mentioned earlier. **Example** HTTP.REQ.BODY(100).GET_SIGNED16(8, BIG_ENDIAN)

<text>.GET_UNSIGNED16(<n>, <endianness>)	Treats the text string returned by the prefix as a string of bytes, extracts 16 bits starting at byte offset n, and converts the extracted bit sequence to a 16-bit unsigned integer. If the offset makes all or part of the value outside of the current text, an UNDEF condition is raised. The first parameter n is the byte offset from the current position in the text string. Providing a byte offset enables the function to handle items that are not aligned on the boundaries that are required by indexes. The second parameter, endianness, takes a mnemonic value of LITTLE_ENDIAN or BIG_ENDIAN. **Note:** In NetScaler 9.2, the parameter n was an index into an array of 16-bit items. In NetScaler 9.3, the parameter is a byte offset. Therefore, if you used this function in NetScaler 9.2, after you upgrade to NetScaler 9.3, you must change n to 2*n to obtain the same results as you did earlier. For example, if the value of n before the upgrade was 4, you must change the value of n to 8. The parameter endianness also no longer takes the values that it did in NetScaler 9.2, which were 0 and 1. Instead, endianness accepts the mnemonic values mentioned earlier. **Example** HTTP.REQ.BODY(100).GET_UNSIGNED16(8, LITTLE_ENDIAN)

<text>.GET_SIGNED32(<n>, <endianness>)	Treats the text string returned by the prefix as a string of bytes, extracts 32 bits starting at byte offset n, and converts the extracted bit sequence to a 32-bit signed integer. If the offset makes all or part of the value outside of the current text, an UNDEF condition is raised. The first parameter n is the byte offset from the current position in the text string. Providing a byte offset enables the function to handle items that are not aligned on the boundaries that are required by indexes. The second parameter, endianness, takes a mnemonic value of LITTLE_ENDIAN or BIG_ENDIAN. **Note:** In NetScaler 9.2, the parameter n was an index into an array of 32-bit items. In NetScaler 9.3, the parameter is a byte offset. Therefore, if you used this function in NetScaler 9.2, after you upgrade to NetScaler 9.3, you must change n to 4*n to obtain the same results as you did earlier. For example, if the value of n before the upgrade was 4, you must change the value of n to 16. The parameter endianness also no longer takes the values that it did in NetScaler 9.2, which were 0 and 1. Instead, endianness accepts the mnemonic values mentioned earlier. **Example** HTTP.REQ.BODY(1000).GET_SIGNED32(12, BIG_ENDIAN)
<text>.GET_UNSIGNED32(<n>, <endianness>)	Treats the text string returned by the prefix as a string of bytes, extracts 32 bits starting at byte offset n, and returns the extracted bit sequence as part of a 64-bit unsigned long integer. If the offset makes all or part of the value outside of the current text, an UNDEF condition is raised. The first parameter n is the byte offset from the current position in the text string. Providing a byte offset enables the function to handle items that are not aligned on the boundaries that are required by indexes. The second parameter, endianness, takes a mnemonic value of LITTLE_ENDIAN or BIG_ENDIAN. **Example** HTTP.REQ.BODY(1000).GET_UNSIGNED32(30, LITTLE_ENDIAN)

Converting Text to a Hash Value

You can convert a text string to a hash value by using the `HASH` function. This function returns a 31-bit positive integer as a result of the operation. Following is the format of the expression:

```
<text>.HASH
```

This function ignores case and white spaces. For example, after the operation, the two strings `Ab c` and `a bc` would produce the same hash value.

Encoding and Decoding Text by Applying the Base64 Encoding Algorithm

The following two functions encode and decode a text string by applying the Base64 encoding algorithm

Table 1. Functions for Encoding and Decoding a Text String by Using Base64 Encoding

Function	Description
`text.B64ENCODE`	Encodes the text string (designated by text) by applying the Base64 encoding algorithm.
`text.B64DECODE`	Decodes the Base64-encoded string (designated by text) by applying the Base64 decoding algorithm. The operation raises an `UNDEF` if text is not in B64-encoded format.

Refining the Search in a Rewrite Action by Using the EXTEND Function

The EXTEND function is used in rewrite actions that specify patterns or pattern sets and target the bodies of HTTP packets. When a pattern match is found, the EXTEND function extends the scope of the search by a predefined number of bytes on both sides of the matching string. A regular expression can then be used to perform a rewrite on matches in this extended region. Rewrite actions that are configured with the EXTEND function perform rewrites faster than rewrite actions that evaluate entire HTTP bodies using only regular expressions.

The format of the EXTEND function is EXTEND(m,n), where m and n are the number of bytes by which the scope of the search is extended before and after the matching pattern, respectively. When a match is found, the new search scope comprises m bytes that immediately precede the matching string, the string itself, and the n bytes that follow the string. A regular expression can then be used to perform a rewrite on a portion of this new string.

The EXTEND function can be used only if the rewrite action in which it is used fulfills the following requirements:

- The search is performed by using patterns or patterns sets (not regular expressions)
- The rewrite action evaluates only the bodies of HTTP packets.

Additionally, the EXTEND function can be used only with the following types of rewrite actions:

- replace_all
- insert_after_all
- delete_all
- insert_before_all

For example, you might want to delete all instances of "http://exampleurl.com/" and "http://exampleurl.au/" in the first 1000 bytes of the body. To do this, you can configure a rewrite action to search for all instances of the string exampleurl, extend the scope of the search on both sides of the string when a match is found, and then use a regular expression to perform the rewrite in the extended region. The following example extends the scope of the search by 20 bytes to the left and 50 bytes to the right of the matching string:

```
add rewrite action delurl_example delete_all 'HTTP.REQ.BODY(1000)'
-pattern exampleurl -refineSearch
'extend(20,50).regex_select(re#http://exampleurl.(com|au)#)'
```

Converting Text to Hexadecimal Format

The following function converts text to hexadecimal format and extracts the resulting string:

```
<text>.BLOB_TO_HEX(<string>)
```

For example, this function converts the byte string “abc” to “61:62:63”.

Encrypting and Decrypting Text

In default syntax expressions, you can use the ENCRYPT and DECRYPT functions to encrypt and decrypt text. Data encrypted by the ENCRYPT function on a given NetScaler appliance or high availability (HA) pair is intended for decryption by the DECRYPT function on the same NetScaler appliance or HA pair. The appliance supports the RC4, DES3, AES128, AES192, and AES256 encryption methods. The key value that is required for encryption is not user-specifiable. When an encryption method is set, the appliance automatically generates a random key value that is appropriate for the specified method. The default method is AES256 encryption, which is the most secure encryption method and the one that Citrix recommends.

You do not need to configure encryption unless you want to change the encryption method or you want the appliance to generate a new key value for the current encryption method.

Note: You can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see "Encrypting and Decrypting XML Payloads."

Configuring Encryption

During startup, the appliance runs the `set ns encryptionParams` command with, by default, the AES256 encryption method, and uses a randomly generated key value that is appropriate for AES256 encryption. The appliance also encrypts the key value and saves the command, with the encrypted key value, to the NetScaler configuration file. Consequently, the AES256 encryption method is enabled for the `ENCRYPT` and `DECRYPT` functions by default. The key value that is saved in the configuration file persists across reboots even though the appliance runs the command each time you restart it.

You can run the `set ns encryptionParams` command manually, or use the configuration utility, if you want to change the encryption method or if you want the appliance to generate a new key value for the current encryption method. To use the CLI to change the encryption method, set only the `method` parameter, as shown in "**Example 1: Changing the Encryption Method**." If you want the appliance to generate a new key value for the current encryption method, set the `method` parameter to the current encryption method and the `keyValue` parameter to an empty string (""), as shown in "**Example 2: Generating a New Key Value for the Current Encryption Method**." After you generate a new key value, you must save the configuration. If you do not save the configuration, the appliance uses the newly generated key value only until the next restart, after which it reverts to the key value in the saved configuration.

Parameters for configuring encryption

method

The cipher method (and key length) used to encrypt and decrypt content. Possible values: NONE, RC4, DES3, AES128, AES192, AES256. Default: AES256.

keyValue

The base64-encoded key generation number, method, and key value. Omit this parameter if you enter a command to change the encryption method. To generate a new key value for the current encryption method, specify an empty string ("") as the value of this parameter. The parameter is passed implicitly, with its automatically generated value, to the NetScaler packet engines even when it is not included in the command. Passing the parameter to the packet engines enables the appliance to save the key value to the configuration file and to propagate the key value to the secondary appliance in a high availability setup.

To configure encryption by using the configuration utility

1. Navigate to System > Settings.
2. In the Settings area, click Change Encryption parameters.
3. In the Change Encryption Parameters dialog box, do one of the following:
   - To change the encryption method, in the Method list, select the encryption method that you want.
   - To generate a new key value for the current encryption method, click Generate a new key for the selected method.
4. Click OK.

Using the ENCRYPT and DECRYPT Functions

You can use the ENCRYPT and DECRYPT functions with any expression prefix that returns text. For example, you can use the ENCRYPT and DECRYPT functions in rewrite policies for cookie encryption. In the following example, the rewrite actions encrypt a cookie named MyCookie, which is set by a back-end service, and decrypt the same cookie when it is returned by a client:

```
add rewrite action my-cookie-encrypt-action replace
"HTTP.RES.SET_COOKIE.COOKIE(\"MyCookie\").VALUE(0)"
"HTTP.RES.SET_COOKIE.COOKIE(\"MyCookie\").VALUE(0).ENCRYPT"
-bypassSafetyCheck YES

add rewrite action my-cookie-decrypt-action replace
"HTTP.REQ.COOKIE.VALUE(\"MyCookie\")"
"HTTP.REQ.COOKIE.VALUE(\"MyCookie\").DECRYPT" -bypassSafetyCheck YES
```

After you configure policies for encryption and decryption, save the configuration to bring the policies into effect.

Default Syntax Expressions: Working with Dates, Times, and Numbers

Most numeric data that the NetScaler appliance processes consists of dates and times. In addition to working with dates and times, the appliance processes other numeric data, such as the lengths of HTTP requests and responses. To process this data, you can configure default syntax expressions that process numbers.

A numeric expression consists of an expression prefix that returns a number and sometimes, but not always, an operator that can perform an operation on the number. Examples of expression prefixes that return numbers are `SYS.TIME.DAY`, `HTTP.REQ.CONTENT_LENGTH`, and `HTTP.RES.BODY.LENGTH`. Numeric operators can work with any prefix expression that returns data in numeric format. The GT(<int>) operator, for example, can be used with any prefix expression, such as `HTTP.REQ.CONTENT_LENGTH`, that returns an integer. Numeric expression prefixes and operators are also covered in "Compound Operations for Numbers" and "Default Syntax Expressions: Parsing HTTP, TCP, and UDP Data."

Format of Dates and Times in an Expression

When configuring a default syntax expression in a policy that works with dates and times (for example, the NetScaler system time or a date in an SSL certificate), you specify a time format as follows:

```
GMT|LOCAL [<yyyy>] [<month>] [<d>] [<h>] [<m>] [<s>]
```

Where:

- <yyyy> is a four-digit year after GMT or LOCAL.
- <month> is a three-character abbreviation for the month, for example, Jan, Dec.
- <d> is a day of the week or an integer for the date.

  You cannot specify the day as Monday, Tuesday, and so on. You specify either an integer for a specific day of the month, or you specify a date as the first, second, third weekday of the month, and so on. Following are examples of specifying a day of the week:

  - Sun_1 is the first Sunday of the month.
  - Sun_3 is the third Sunday of the month.
  - Wed_3 is the third Wednesday of the month.
  - 30 is an example of an exact date in a month.
- <h> is the hour, for example, 10h.
- <s> is the number of seconds, for example, 30s.

The following example expression is true if the date is between 2008 Jan and 2009 Jan, based on GMT.

```
http.req.date.between(GMT 2008 Jan, GMT 2009 Jan)
```

The following example expression is true for March and all months that follow March in the calendar year, based on GMT:

```
sys.time.ge(GMT 2008 Mar)
```

When you specify a date and time, note that the format is case sensitive and must preserve the exact number of blank spaces between entries.

Note: In an expression that requires two time values, both must use GMT or both must use LOCAL. You cannot mix the two in an expression.

Note: Unlike when you use the SYS.TIME prefix in a default syntax expression, if you specify SYS.TIME in a rewrite action, the NetScaler returns a string in conventional date format (for example, Sun, 06 Nov 1994 08:49:37 GMT). For example, the following rewrite action replaces the http.res.date header with the NetScaler system time in a conventional date format:

add rewrite action `sync_date replace http.res.date sys.time`

Expressions for the NetScaler System Time

The SYS.TIME expression prefix extracts the NetScaler system time. You can configure expressions that establish whether a particular event occurred at a particular time or within a particular time range according to the NetScaler system time.

The following table describes the expressions that you can create by using the SYS.TIME prefix.

Table 1. Expressions That Return NetScaler System Dates and Times

NetScaler Time Operation	Description
SYS.TIME.BETWEEN(<time1>, <time2>)	Returns a Boolean TRUE if the returned value is later than <time1> and earlier than <time2>. You format the <time1>, <time2> arguments as follows: · They must both be GMT or both LOCAL. · <time2> must be later than <time1>. For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following: · sys.time.between(GMT 2004, GMT 2006) · sys.time.between(GMT 2004 Jan, GMT 2006 Nov) · sys.time.between(GMT 2004 Jan, GMT 2006) · sys.time.between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) · sys.time.between(GMT 2005 May 1, GMT May 2005 1) · sys.time.between(LOCAL 2005 May 1, LOCAL May 2005 1)
SYS.TIME.DAY	Returns the current day of the month as a number from 1 through 31.

SYS.TIME.EQ(<time>)	Returns a Boolean TRUE if the current time is equal to the <time> argument. For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses): · sys.time.eq(GMT 2005) (TRUE in this example.) · sys.time.eq(GMT 2005 Dec) (FALSE in this example.) · sys.time.eq(LOCAL 2005 May) (Evaluates to TRUE or FALSE in this example, depending on the current time zone.) · sys.time.eq(GMT 10h) (TRUE in this example.) · sys.time.eq(GMT 10h 30s) (TRUE in this example.) · sys.time.eq(GMT May 10h) (TRUE in this example.) · sys.time.eq(GMT Sun) (TRUE in this example.) · sys.time.eq(GMT May Sun_1) (TRUE in this example.)
SYS.TIME.NE(<time>)	Returns a Boolean TRUE if the current time is not equal to the <time> argument.

SYS.TIME.GE(<time>)	Returns a Boolean TRUE if the current time is later than or equal to <time>. For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses): · sys.time.ge(GMT 2004) (TRUE in this example.) · sys.time.ge(GMT 2005 Jan) (TRUE in this example.) · sys.time.ge(LOCAL 2005 May) (TRUE or FALSE in this example, depending on the current time zone.) · sys.time.ge(GMT 8h) (TRUE in this example.) · sys.time.ge(GMT 30m) (FALSE in this example.) · sys.time.ge(GMT May 10h) (TRUE in this example.) · sys.time.ge(GMT May 10h 0m) (TRUE in this example.) · sys.time.ge(GMT Sun) (TRUE in this example.) · sys.time.ge(GMT May Sun_1) (TRUE in this example.)

SYS.TIME.GT(<time>)	Returns a Boolean TRUE if the time value is later than the <time> argument. For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses): · sys.time.gt(GMT 2004) (TRUE in this example.) · sys.time.gt(GMT 2005 Jan) (TRUE in this example.) · sys.time.gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · sys.time.gt(GMT 8h) (TRUE in this example.) · sys.time.gt(GMT 30m) (FALSE in this example.) · sys.time.gt(GMT May 10h) (FALSE in this example.) · sys.time.gt(GMT May 10h 0m) (TRUE in this example.) · sys.time.gt(GMT Sun) (FALSE in this example.) · sys.time.gt(GMT May Sun_1) (FALSE in this example.)
SYS.TIME.HOURS	Returns the current hour as an integer from 0 to 23.

SYS.TIME.LE(<time>)	Returns a Boolean TRUE if the current time value precedes or is equal to the <time> argument. For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses): · sys.time.le(GMT 2006) (TRUE in this example.) · sys.time.le(GMT 2005 Dec) (TRUE in this example.) · sys.time.le(LOCAL 2005 May) (TRUE or FALSE depending on the current timezone.) · sys.time.le(GMT 8h) (FALSE in this example.) · sys.time.le(GMT 30m) (TRUE in this example.) · sys.time.le(GMT May 10h) (TRUE in this example.) · sys.time.le(GMT Jun 11h) (TRUE in this example.) · sys.time.le(GMT Wed) (TRUE in this example.) · sys.time.le(GMT May Sun_1) (TRUE in this example.)
SYS.TIME.LT(<time>)	Returns a Boolean TRUE if the current time value precedes the <time> argument. For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses): · sys.time.lt(GMT 2006) (TRUE in this example.) · sys.time.lt.time.lt(GMT 2005 Dec) (TRUE in this example.) · sys.time.lt(LOCAL 2005 May) (TRUE or FALSE depending on the current time zone.) · sys.time.lt(GMT 8h) (FALSE in this example.) · sys.time.lt(GMT 30m) (TRUE in this example.) · sys.time.lt(GMT May 10h) (FALSE in this example.) · sys.time.lt(GMT Jun 11h) (TRUE in this example.) · sys.time.lt(GMT Wed) (TRUE in this example.) · sys.time.lt(GMT May Sun_1) (FALSE in this example.)

SYS.TIME.MINUTES	Returns the current minute as an integer from 0 to 59.
SYS.TIME.MONTH	Extracts the current month and returns an integer from 1 (January) to 12 (December).
SYS.TIME.RELATIVE_BOOT	Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer. If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.
SYS.TIME.RELATIVE_NOW	Calculates the number of seconds between the current NetScaler system time and the specified time, and returns an integer showing the difference. If the designated time is in the past, the integer is negative; if it is in the future, the integer is positive.
SYS.TIME.SECONDS	Extracts the seconds from the current NetScaler system time, and returns that value as an integer from 0 to 59.
SYS.TIME.WEEKDAY	Returns the current weekday as a value from 0 (Sunday) to 6 (Saturday).
SYS.TIME.WITHIN (<time1>, <time2>)	If you omit an element of time in <time1>, for example, the day or hour, it is assumed to have the lowest value in its range. If you omit an element in <time2>, it is assumed to have the highest value of its range. The ranges for the elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. If you specify the year, you must do so in both <time1> and <time2>. For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are shown in parentheses): · sys.time.within(GMT 2004, GMT 2006) (TRUE in this example.) · sys.time.within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.) · sys.time.within(GMT Feb, GMT) (TRUE, May is in the range of February to December.) · sys.time.within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.) · sys.time.within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE in this example.) · sys.time.within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

SYS.TIME.YEAR	Extracts the year from the current system time and returns that value as a four-digit integer.

Expressions for SSL Certificate Dates

You can determine the validity period for SSL certificates by configuring an expression that contains the following prefix:

```
CLIENT.SSL.CLIENT_CERT
```

The following example expression matches a particular time for expiration with the information in the certificate:

```
client.ssl.client_cert.valid_not_after.eq(GMT 2009)
```

The following table describes time-based operations on SSL certificates. To obtain the expression you want, replace *certificate* in the expression in the first column with the prefix expression, "`CLIENT.SSL.CLIENT_CERT`".

Table 1. Operations on Certificate (client.ssl.client_cert) Dates and Times

SSL Certificate Operation	Description
`<certificate>.VALID_NOT_AFTER`	Returns the last day before certificate expiration. The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

<certificate>.VALID_NOT_AFTER.BETWEEN(<time1>, <time2>)	Returns a Boolean TRUE value if the certificate validity is betw the <time1> and <time2> arguments. Both <time1> and <time2 must be fully specified. Following are examples: GMT 1995 Jan is fully specified. GMT Jan is not fully specified GMT 1995 20 is not fully specified. GMT Jan Mon_2 is not fully specified. The <time1> and <time2> arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>. For example, if it is GMT 2005 May 1 10h 15m 30s, and the first Sunday of the month, you can specify the following (evaluation results are in parentheses). · . . .between(GMT 2004, GMT 2006) (TRUE) · . . .between(GMT 2004 Jan, GMT 2006 Nov) (TR · . . .between(GMT 2004 Jan, GMT 2006) (TRUE) · . . .between(GMT 2005 May Sun_1, GMT 2005 Ma Sun_3) (TRUE) · . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE) · . . .between(LOCAL 2005 May 1, LOCAL May 200 (TRUE or FALSE, depending on the NetScaler system time zone.)
<certificate>.VALID_NOT_AFTER.DAY	Extracts the last day of the month that the certificate is valid, returns a number from 1 through 31, as appropriate for the dat

<certificate>.VALID_NOT_AFTER.EQ(<time>)	Returns a Boolean TRUE if the time is equal to the <time> argument. For example, if the current time is GMT 2005 May 1 10h 15m 3 and it is the first Sunday of the month, you can specify the foll (evaluation results for this example are in parentheses): · . . .eq(GMT 2005) (TRUE) · . . .eq(GMT 2005 Dec) (FALSE) · . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone) · . . .eq(GMT 10h) (TRUE) · . . .eq(GMT 10h 30s) (TRUE) · . . .eq(GMT May 10h) (TRUE) · . . .eq(GMT Sun) (TRUE) · . . .eq(GMT May Sun_1) (TRUE)
<certificate>.VALID_NOT_AFTER.GE(<time>)	Returns a Boolean TRUE if the time value is greater than or eq the argument <time>. For example, if the time value is GMT 2005 May 1 10h 15m 30s it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results for this example are in parentheses): · . . .ge(GMT 2004) (TRUE) · . . .ge(GMT 2005 Jan) (TRUE) · . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · . . .ge(GMT 8h) (TRUE) · . . .ge(GMT 30m) (FALSE) · . . .ge(GMT May 10h) (TRUE) · . . .ge(GMT May 10h 0m) (TRUE) · . . .ge(GMT Sun) (TRUE) · . . .ge(GMT May Sun_1) (TRUE)

<certificate>.VALID_NOT_AFTER.GT(<time>)	Returns a Boolean TRUE if the time value is greater than the argument <time>. For example, if the time value is GMT 2005 May 1 10h 15m 30s, it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results for this example are in parentheses): · . . .gt(GMT 2004) (TRUE) · . . .gt(GMT 2005 Jan) (TRUE) · . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · . . .gt(GMT 8h) (TRUE) · . . .gt(GMT 30m) (FALSE) · . . .gt(GMT May 10h) (FALSE) · . . .gt(GMT Sun) (FALSE) · . . .gt(GMT May Sun_1) (FALSE)
<certificate>.VALID_NOT_AFTER.HOURS	Extracts the last hour that the certificate is valid and returns t value as an integer from 0 to 23.
<certificate>.VALID_NOT_AFTER.LE(<time>)	Returns a Boolean TRUE if the time precedes or is equal to the <time> argument. For example, if the time value is GMT 2005 May 1 10h 15m 30s, it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results for this example are in parentheses): · . . .le(GMT 2006) (TRUE) · . . .le(GMT 2005 Dec) (TRUE) · . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · . . .le(GMT 8h) (FALSE) · . . .le(GMT 30m) (TRUE) · . . .le(GMT May 10h) (TRUE) · . . .le(GMT Jun 11h) (TRUE) · . . .le(GMT Wed) (TRUE) · . . .le(GMT May Sun_1) (TRUE)

<certificate>.VALID_NOT_AFTER.LT(<time>)	Returns a Boolean TRUE if the time precedes the <time> argum For example, if the current time is GMT 2005 May 1 10h 15m 3 and it is the first Sunday of the month, you can specify the following: · . . .lt(GMT 2006) (TRUE) · . . .lt(GMT 2005 Dec) (TRUE) · . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · . . .lt(GMT 8h) (FALSE) · . . .lt(GMT 30m) (TRUE) · . . .lt(GMT May 10h) (FALSE) · . . .lt(GMT Jun 11h) (TRUE) · . . .lt(GMT Wed) (TRUE) · . . .lt(GMT May Sun_1) (FALSE)
<certificate>.VALID_NOT_AFTER.MINUTES	Extracts the last minute that the certificate is valid and return value as an integer from 0 to 59.
<certificate>.VALID_NOT_AFTER.MONTH	Extracts the last month that the certificate is valid and returns value as an integer from 1 (January) to 12 (December).
<certificate>.VALID_NOT_AFTER.RELATIVE_BOOT	Calculates the number of seconds to the closest previous or scheduled reboot and returns an integer. If the closest boot tir in the past, the integer is negative. If it is in the future, the in is positive.
<certificate>.VALID_NOT_AFTER.RELATIVE_NOW	Calculates the number of seconds between the current system and the specified time and returns an integer. If the time is in past, the integer is negative; if it is in the future, the integer i positive.
<certificate>.VALID_NOT_AFTER.SECONDS	Extracts the last second that the certificate is valid and return value as an integer from 0 to 59.
<certificate>.VALID_NOT_AFTER.WEEKDAY	Extracts the last weekday that the certificate is valid. Returns number between 0 (Sunday) and 6 (Saturday) to give the week the time value.

<certificate>.VALID_NOT_AFTER.WITHIN(<time1>, <time2>)	Returns a Boolean TRUE if the time lies within all the ranges de by the elements in <time1> and <time2>. If you omit an element of time from <time1>, it is assumed to the lowest value in its range. If you omit an element from <tim it is assumed to have the highest value of its range. If you spec year in <time1>, you must specify it in <time2>. The ranges for elements of time are as follows: month 1-12, da 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. the result to be TRUE, each element in the time must exist in t corresponding range that you specify in <time1>, <time2>. For example, if time is GMT 2005 May 10 10h 15m 30s, and it is second Tuesday of the month, you can specify the following (evaluation results are in parentheses): · . . .within(GMT 2004, GMT 2006) (TRUE) · . . .within(GMT 2004 Jan, GMT 2006 Mar) (FAL May is not in the range of January to March. · . . .within(GMT Feb, GMT) (TRUE, May is in t range for February to December) · . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday lies within the range of the first Sunday through the third Sunday) · . . .within(GMT 2005 May 1 10h, GMT May 2005 17h) (TRUE) · . . .within(LOCAL 2005 May 1, LOCAL May 2005 (TRUE or FALSE, depending on the NetScaler system time zone)
<certificate>.VALID_NOT_AFTER.YEAR	Extracts the last year that the certificate is valid and returns a four-digit integer.
<certificate>.VALID_NOT_BEFORE	Returns the date that the client certificate becomes valid. The return format is the number of seconds since GMT January 1970 (0 hours, 0 minutes, 0 seconds).

`<certificate>.VALID_NOT_BEFORE.BETWEEN(<time1>, <time2>)`	Returns a Boolean TRUE if the time value is between the two t arguments. Both <time1> and <time2> arguments must be fully specified. Following are examples: · GMT 1995 Jan is fully specified. · GMT Jan is not fully specified. · GMT 1995 20 is not fully specified. · GMT Jan Mon_2 is not fully specified. The time arguments must be both GMT or both LOCAL, and <ti must be greater than <time1>. For example, if the time value is GMT 2005 May 1 10h 15m 30s it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results for this example are in parentheses): · `. . .between(GMT 2004, GMT 2006) (TRUE)` · `. . .between(GMT 2004 Jan, GMT 2006 Nov) (TR` · `. . .between(GMT 2004 Jan, GMT 2006) (TRUE)` · `. . .between(GMT 2005 May Sun_1, GMT 2005 Ma Sun_3) (TRUE)` · `. . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)` · `. . .between(LOCAL 2005 May 1, LOCAL May 200 (TRUE or FALSE, depending on the NetScaler system time zone.)`
`<certificate>.VALID_NOT_BEFORE.DAY`	Extracts the last day of the month that the certificate is valid returns that value as a number from 1 through 31 representing day.

<certificate>.VALID_NOT_BEFORE.EQ(<time>)	Returns a Boolean TRUE if the time is equal to the <time> argument. For example, if the time value is GMT 2005 May 1 10h 15m 30s it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results for this example are in parentheses): · . . .eq(GMT 2005) (TRUE) · . . .eq(GMT 2005 Dec) (FALSE) · . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · . . .eq(GMT 10h) (TRUE) · . . .eq(GMT 10h 30s) (TRUE) · . . .eq(GMT May 10h) (TRUE) · . . .eq(GMT Sun) (TRUE) · . . .eq(GMT May Sun_1) (TRUE)
<certificate>.VALID_NOT_BEFORE.GE(<time>)	Returns a Boolean TRUE if the time is greater than (after) or e to the <time> argument. For example, if the time value is GMT 2005 May 1 10h 15m 30s it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results are in parentheses): · . . .ge(GMT 2004) (TRUE) · . . .ge(GMT 2005 Jan) (TRUE) · . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · . . .ge(GMT 8h) (TRUE) · . . .ge(GMT 30m) (FALSE) · . . .ge(GMT May 10h) (TRUE) · . . .ge(GMT May 10h 0m) (TRUE) · . . .ge(GMT Sun) (TRUE) · . . .ge(GMT May Sun_1) (TRUE)

<certificate>.VALID_NOT_BEFORE.GT(<time>)	Returns a Boolean TRUE if the time occurs after the <time> argument. For example, if the time value is GMT 2005 May 1 10h 15m 30s it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results are in parentheses): · . . .gt(GMT 2004) (TRUE) · . . .gt(GMT 2005 Jan) (TRUE) · . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · . . .gt(GMT 8h) (TRUE) · . . .gt(GMT 30m) (FALSE) · . . .gt(GMT May 10h) (FALSE) · . . .gt(GMT May 10h 0m) (TRUE) · . . .gt(GMT Sun) (FALSE) · . . .gt(GMT May Sun_1) (FALSE)
<certificate>.VALID_NOT_BEFORE.HOURS	Extracts the last hour that the certificate is valid and returns t value as an integer from 0 to 23.
<certificate>.VALID_NOT_BEFORE.LE(<time>)	Returns a Boolean TRUE if the time precedes or is equal to the <time> argument. For example, if the time value is GMT 2005 May 1 10h 15m 30s it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results for this example are in parentheses): · . . .le(GMT 2006) (TRUE) · . . .le(GMT 2005 Dec) (TRUE) · . . .le(LOCAL 2005 May) (TRUE or FALSE,depen on the current time zone.) · . . .le(GMT 8h) (FALSE) · . . .le(GMT 30m) (TRUE) · . . .le(GMT May 10h) (TRUE) · . . .le(GMT Jun 11h) (TRUE) · . . .le(GMT Wed) (TRUE) · . . .le(GMT May Sun_1) (TRUE)

<certificate>.VALID_NOT_BEFORE.LT(<time>)	Returns a Boolean TRUE if the time precedes the <time> argum For example, if the time value is GMT 2005 May 1 10h 15m 30s, it is the first Sunday of the month of May in 2005, you can spec the following (evaluation results for this example are in parentheses): · . . .lt(GMT 2006) (TRUE) · . . .lt(GMT 2005 Dec) (TRUE) · . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.) · . . .lt(GMT 8h) (FALSE) · . . .lt(GMT 30m) (TRUE) · . . .lt(GMT May 10h) (FALSE) · . . .lt(GMT Jun 11h) (TRUE) · . . .lt(GMT Wed) (TRUE) · . . .lt(GMT May Sun_1) (FALSE)
<certificate>.VALID_NOT_BEFORE.MINUTES	Extracts the last minute that the certificate is valid. Returns th current minute as an integer from 0 to 59.
<certificate>.VALID_NOT_BEFORE.MONTH	Extracts the last month that the certificate is valid. Returns th current month as an integer from 1 (January) to 12 (December
<certificate>.VALID_NOT_BEFORE.RELATIVE_BOOT	Calculates the number of seconds to the closest previous or scheduled NetScaler reboot and returns an integer. If the close boot time is in the past, the integer is negative; if it is in the future, the integer is positive.
<certificate>.VALID_NOT_BEFORE.RELATIVE_NOW	Returns the number of seconds between the current NetScaler system time and the specified time as an integer. If the design time is in the past, the integer is negative. If it is in the future integer is positive.
<certificate>.VALID_NOT_BEFORE.SECONDS	Extracts the last second that the certificate is valid. Returns th current second as an integer from 0 to 59.
<certificate>.VALID_NOT_BEFORE.WEEKDAY	Extracts the last weekday that the certificate is valid. Returns weekday as a number between 0 (Sunday) and 6 (Saturday).

`<certificate>.VALID_NOT_BEFORE.WITHIN(<time1>, <time2>)`	Returns a Boolean TRUE if each element of time exists within t range defined in the <time1>, <time2> arguments. If you omit an element of time from <time1>, it is assumed to the lowest value in its range. If you omit an element of time fr <time2>, it is assumed to have the highest value in its range. If specify a year in <time1>, it must be specified in <time2>. The ranges for elements of time are as follows: month 1-12, day 1- weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. For example, if the time is GMT 2005 May 10 10h 15m 30s, and the second Tuesday of the month, you can specify the followin (evaluation results are in parentheses): · `. . .within(GMT 2004, GMT 2006) (TRUE)` · `. . .within(GMT 2004 Jan, GMT 2006 Mar)` (FALS is not in the range of January to March.) · `. . .within(GMT Feb, GMT)` (TRUE, May is in the ran February to December.) · `. . .within(GMT Sun_1, GMT Sun_3)` (TRUE, the se Tuesday is between the first Sunday and the third Sunday.) · `. . .within(GMT 2005 May 1 10h, GMT May 2005 17h) (TRUE)` · `. . .within(LOCAL 2005 May 1, LOCAL May 2005` (TRUE or FALSE, depending on the NetScaler system time z
`<certificate>.VALID_NOT_BEFORE.YEAR`	Extracts the last year that the certificate is valid. Returns the current year as a four-digit integer.

Expressions for HTTP Request and Response Dates

The following expression prefixes return the contents of the HTTP Date header as text or as a date object. These values can be evaluated as follows:

- As a number. The numeric value of an HTTP Date header is returned in the form of the number of seconds since Jan 1 1970.

  For example, the expression `http.req.date.mod(86400)` returns the number of seconds since the beginning of the day. These values can be evaluated using the same operations as other non-date-related numeric data. For more information, see "Expression Prefixes for Numeric Data Other Than Date and Time."

- As an HTTP header. Date headers can be evaluated using the same operations as other HTTP headers.

  For more information, see "Default Syntax Expressions: Parsing HTTP, TCP, and UDP Data."

- As text. Date headers can be evaluated using the same operations as other strings.

For more information, see "Default Syntax Expressions: Evaluating Text."

Table 1. Prefixes That Evaluate HTTP Date Headers

Prefix	Description
`HTTP.REQ.DATE`	Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 08:49:37 GMT RFC850. Sunday, 06-Jan-80 09:49:37 GMT ASCTIME. Sun Jan 6 08:49:37 1980
`HTTP.RES.DATE`	Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 8:49:37 GMT RFC850. Sunday, 06-Jan-80 9:49:37 GMT ASCTIME. Sun Jan 6 08:49:37 1980

Generating the Day of the Week, as a String, in Short and Long Formats

The functions, WEEKDAY_STRING_SHORT and WEEKDAY_STRING, generate the day of the week, as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0-6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

Table 1. Functions That Generate the Day of the Week, as a String, in Short and Long Formats

Function	Description
<prefix>.WEEKDAY_STRING_SHORT	Returns the day of the week in short format. The short form is always 3 characters long with an initial capital and the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT returns Sun if the value returned by the WEEKDAY function is 0 and Sat if the value returned by the prefix is 6.
<prefix>.WEEKDAY_STRING	Returns the day of the week in long format. The long form always has an initial capital, with the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING returns Sunday if the value returned by the WEEKDAY function is 0 and Saturday if the value returned by the prefix is 6.

Expression Prefixes for Numeric Data Other Than Date and Time

In addition to configuring expressions that operate on time, you can configure expressions for the following types of numeric data:

- The length of HTTP requests, the number of HTTP headers in a request, and so on.

  For more information, see "Expressions for Numeric HTTP Payload Data Other Than Dates."

- IP and MAC addresses.

  For more information, see "Expressions for IP Addresses and IP Subnets."

- Client and server data in regard to interface IDs and transaction throughput rate.

  For more information, see "Expressions for Numeric Client and Server Data."

- Numeric data in client certificates other than dates.

  For information on these prefixes, including the number of days until certificate expiration and the encryption key size, see "Prefixes for Numeric Data in SSL Certificates."

Converting Numbers to Text

The following functions produce binary strings from a number returned by an expression prefix. These functions are particularly useful in the TCP rewrite feature as replacement strings for binary data. For more information about the TCP rewrite feature, see "Rewrite."

All the functions return a value of type `text`. The `endianness` that some of the functions accept as a parameter is either LITTLE_ENDIAN or BIG_ENDIAN.

Table 1. Functions That Produce a Binary String From a Number

	Description
`TRING`	Produces an 8-bit signed binary string representing the number. If the value is out raised. **Example** `HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_STRING`
`_STRING`	Produces an 8-bit unsigned binary string representing the number. If the value is ou raised. **Example** `HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIGNED8_STRING`
`STRING(<endianness>)`	Produces a 16-bit signed binary string representing the number. If the value is out raised. **Example** `HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)`
`6_STRING(<endianness>)`	Produces a 16-bit unsigned binary string representing the number. If the value is ou raised. **Example** `HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN)`
`STRING(<endianness>)`	Produces a 32-bit signed binary string representing the number. **Example** `HTTP.REQ.BODY(100).AFTER_STR("delim").GET_SIGNED32(0, BIG_ENDIAN).SUB(1).SIGNED32_STRING(BIG_ENDIAN)`

ber>.UNSIGNED8_STRING	Produces an 8-bit unsigned binary string representing the number. If the value is ou raised. **Example** `HTTP.REQ.BODY(100).GET_UNSIGNED8(24).TYPECAST_UNSIGNED_LONG_AT`
ber>.UNSIGNED16_STRING(<endianness>)	Produces a 16-bit unsigned binary string representing the number. If the value is ou raised. **Example** `HTTP.REQ.BODY(100).GET_UNSIGNED16(23, LITTLE_ENDIAN).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UNSIGNED16_ST`
ber>.UNSIGNED32_STRING(<endianness>)	Produces a 32-bit unsigned binary string representing the number. If the value is ou raised. **Example** `HTTP.REQ.BODY(100).AFTER_STR("delim2").GET_UNSIGNED32(0, BIG_ENDIAN).ADD(2).UNSIGNED32_STRING(BIG_ENDIAN)`

Virtual Server Based Expressions

The SYS.VSERVER("<vserver-name>") expression prefix enables you to identify a virtual server. You can use the following functions with this prefix to retrieve information related to the specified virtual server:

- **THROUGHPUT.** Returns the throughput of the virtual server in Mbps (Megabits per second). The value returned is an unsigned long number.

  Usage: SYS.VSERVER("vserver").THROUGHPUT

- **CONNECTIONS.** Returns the number of connections being managed by the virtual server. The value returned is an unsigned long number.

  Usage: SYS.VSERVER("vserver").CONNECTIONS

- **STATE.** Returns the state of the virtual server. The value returned is UP, DOWN, or OUT_OF_SERVICE. One of these values can therefore be passed as an argument to the EQ() operator to perform a comparison that results in a Boolean TRUE or FALSE.

  Usage: SYS.VSERVER("vserver").STATE

- **HEALTH.** Returns the percentage of services in an UP state for the specified virtual server. The value returned is an integer.

  Usage: SYS.VSERVER("vserver").HEALTH

- **RESPTIME.** Returns the response time as an integer representing the number of microseconds. Response time is the average TTFB (Time To First Byte) from all the services bound to the virtual server.

  Usage: SYS.VSERVER("vserver").RESPTIME

- **SURGECOUNT.** Returns the number of requests in the surge queue of the virtual server. The value returned is an integer.

  Usage: SYS.VSERVER("vserver").SURGECOUNT

Example 1

The following rewrite policy aborts rewrite processing if the number of connections at the load balancing virtual server LBvserver exceeds 10000:

```
add rewrite policy norewrite_pol
sys.vserver("LBvserver").connections.gt(10000) norewrite
```

Example 2

The following rewrite action inserts a custom header, TP, whose value is the throughout at the virtual server LBvserver:

```
add rewrite action tp_header insert_http_header TP
SYS.VSERVER("LBvserver").THROUGHPUT
```

Example 3

The following audit log message action writes the average TTFB of the services bound to a virtual server, to the newnslog log file:

```
add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS
Response Time to Servers:\" + sys.vserver(\"ssllb\").resptime + \"
millisec\"" -logtoNewnslog YES -bypassSafetyCheck YES
```

Default Syntax Expressions: Parsing HTTP, TCP, and UDP Data

You can configure default syntax expressions to evaluate and process the payload in HTTP requests and responses. The payload associated with an HTTP connection includes the various HTTP headers (both standard and custom headers), the body, and other connection information such as the URL. Additionally, you can evaluate and process the payload in a TCP or UDP packet. For HTTP connections, for example, you can check whether a particular HTTP header is present or if the URL includes a particular query parameter.

You can configure expressions to transform the URL encoding and apply HTML or XML “safe” coding for subsequent evaluation. You can also use XPATH and JSON prefixes to evaluate date in XML and JSON files, respectively.

You can also use text-based and numeric default syntax expressions to evaluate HTTP request and response data. For more information, see "Default Syntax Expressions: Evaluating Text" and "Default Syntax Expressions: Working with Dates, Times, and Numbers."

About Evaluating HTTP and TCP Payload

The payload of an HTTP request or response consists of HTTP protocol information such as headers, a URL, body content, and version and status information. When you configure a default syntax expression to evaluate HTTP payload, you use a default syntax expression prefix and, if necessary, an operator.

For example, you use the following expression, which includes the `http.req.header(“<header_name>“)` prefix and the `exists` operator, if you want to determine whether an HTTP connection includes a custom header named “myHeader”:

```
http.req.header("myHeader").exists
```

You can also combine multiple default syntax expressions with Boolean and arithmetic operators. For example, the following compound expression could be useful with various NetScaler features, such as Integrated Caching, Rewrite, and Responder. This expression first uses the && Boolean operator to determine whether an HTTP connection includes the Content-Type header with a value of "text/html." If that operation returns a value of FALSE, the expression determines whether the HTTP connection includes a "Transfer-Encoding" or "Content-Length" header.

```
(http.req.header("Content-Type").exists &&
http.req.header("Content-Type").eq("text/html")) ||
(http.req.header("Transfer-Encoding").exists) ||
(http.req.header("Content-Length").exists)
```

The payload of a TCP or UDP packet is the data portion of the packet. You can configure default syntax expressions to examine features of a TCP or UDP packet, including the following:

- Source and destination domains
- Source and destination ports
- The text in the payload
- Record types

The following expression prefixes extract text from the body of the payload:

- HTTP.REQ.BODY(integer). Returns the body of an HTTP request as a multiline text object, up to the character position designated in the *integer* argument. If there are fewer characters in the body than is specified in the argument, the entire body is returned.
- HTTP.RES.BODY(integer). Returns a portion of the HTTP response body. The length of the returned text is equal to the number in the *integer* argument. If there are fewer characters in the body than is specified in integer, the entire body is returned.
- CLIENT.TCP.PAYLOAD(integer). Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the

integer argument.

Following is an example that evaluates to TRUE if a response body of 1024 bytes contains the string “https”, and this string occurs after the string “start string” and before the string “end string”:

```
http.res.body(1024).after_str("start_string").before_str("end_string"
).contains("https")
```

Note: You can apply any text operation to the payload body. For information on operations that you can apply to text, see "Default Syntax Expressions: Evaluating Text."

Expressions for Identifying the Protocol in an Incoming IP Packet

The following table lists the expressions that you can use to identify the protocol in an incoming packet.

Expression	Description
CLIENT.IP.PROTOCOL	Identifies the protocol in IPv4 packets sent by clients.
CLIENT.IPV6.PROTOCOL	Identifies the protocol in IPv6 packets sent by clients.
SERVER.IP.PROTOCOL	Identifies the protocol in IPv4 packets sent by servers.
SERVER.IPV6.PROTOCOL	Identifies the protocol in IPv6 packets sent by servers.

Arguments to the PROTOCOL function

You can pass the Internet Assigned Numbers Authority (IANA) protocol number to the `PROTOCOL` function. For example, if you want to determine whether the protocol in an incoming packet is TCP, you can use `CLIENT.IP.PROTOCOL.EQ(6)`, where `6` is the IANA-assigned protocol number for TCP. For some protocols, you can pass an enumeration value instead of the protocol number. For example, instead of `CLIENT.IP.PROTOCOL.EQ(6)`, you can use `CLIENT.IP.PROTOCOL.EQ(TCP)`. The following table lists the protocols for which you can use enumeration values, and the corresponding enumeration values for use with the `PROTOCOL` function.

Protocol	Enumeration value
Transmission Control Protocol (TCP)	`TCP`
User Datagram Protocol (UDP)	`UDP`
Internet Control Message Protocol (ICMP)	`ICMP`
IP Authentication Header (AH), for providing authentication services in IPv4 and IPv6	`AH`
Encapsulating Security Payload (ESP) protocol	`ESP`
General Routing Encapsulation (GRE)	`GRE`
IP-within-IP Encapsulation Protocol	`IPIP`
Internet Control Message Protocol for IPv6 (ICMPv6)	`ICMPv6`
Fragment Header for IPv6	`FRAGMENT`

Use Case Scenarios

The protocol expressions can be used in both request-based and response-based policies. You can use the expressions in various NetScaler features, such as load balancing, WAN optimization, content switching, rewrite, and listen policies. You can use the expressions with functions such as `EQ()` and `NE()`, to identify the protocol in a policy and perform an action.

Following are some use cases for the expressions:

- In Branch Repeater load balancing configurations, you can use the expressions in a listen policy for the wildcard virtual server. For example, you can configure the wildcard virtual server with the listen policy `CLIENT.IP.PROTOCOL.EQ(TCP)` so that the virtual server processes only TCP traffic and simply bridges all non-TCP traffic. Even though you can use an Access Control List instead of the listen policy, the listen policy provides better control over what traffic is processed.

- For content switching virtual servers of type `ANY`, you can configure content switching policies that switch requests on the basis of the protocol in incoming packets. For example, you can configure content switching policies to direct all TCP traffic to one load balancing virtual server and all non-TCP traffic to another load balancing virtual server.

- You can use the client-based expressions to configure persistence based on the protocol. For example, you can use `CLIENT.IP.PROTOCOL` to configure persistence on the basis of the protocols in incoming IPv4 packets.

Expressions for HTTP and Cache-Control Headers

One common method of evaluating HTTP traffic is to examine the headers in a request or a response. A header can perform a number of functions, including the following:

- Provide cookies that contain data about the sender.
- Identify the type of data that is being transmitted.
- Identify the route that the data has traveled (the Via header).

Note: Note that if an operation is used to evaluate both header and text data, the header-based operation always overrides the text-based operation. For example, the AFTER_STR operation, when applied to a header, overrides text-based AFTER_STR operations for all instances of the current header type.

Prefixes for HTTP Headers

The following table describes expression prefixes that extract HTTP headers.

Table 1. Prefixes That Extract HTTP Headers

	Description
eader_name>")	Returns the contents of the HTTP header specified by the <header_nam cannot exceed 32 characters. Note that this prefix returns the value from the Host header by default you need to typecast it as follows: `http.req.header("host").typecast_http_hostname_t` For more information on typecasting, see "Typecasting Data."
R	Returns the contents of the complete set of HTTP header fields includi "GET /brochures/index.html HTTP/1.1") and the terminating \r\n\r\
	Returns the contents of the HTTP Date header. The following date form RFC822. Sun, 06 Jan 1980 8:49:37 GMT RFC850. Sunday, 06-Jan-80 9:49:37 GMT ASCII TIME. Sun Jan 6 08:49:37 1980 To evaluate a Date header as a date object, see "Default Syntax Expres and Numbers."
	(Name/Value List) Returns the contents of the HTTP Cookie header.

	Returns the HTTP transaction ID. The value is a function of an internal time and system MAC address.
eader_name>")	Returns the contents of the HTTP header specified by the <header_nam cannot exceed 32 characters.
R	Returns the contents of the complete set of HTTP header fields includi "HTTP/1.1 200 OK") and the terminating \r\n\r\n sequence.
2	Returns the HTTP Set-Cookie header object in a response.
("<name>") 2("<name>")	Returns the cookie of the specified name if it is present. If it is not pre 0. Returns UNDEF if more than 15 Set-Cookie headers are present and t these headers.
("<name>").DOMAIN 2("<name>").DOMAIN	Returns the value of the first Domain field in the cookie. For example, Customer = "ABC"; DOMAIN=".abc.com"; DOMAIN=.xyz.com, the followin `http.res.set_cookie.cookie("customer").domain` A string of zero length is returned if the Domain field or its value is abs
.EXISTS("<name>") 2.EXISTS("<name>")	Returns a Boolean TRUE if a Cookie with the name specified in the <nam Set-Cookie header. This prefix returns UNDEF if more than 15 Set-Cookie headers are prese the first 15 headers.
.COOKIE("<name>").EXPIRES 2.COOKIE("<name>").EXPIRES	Returns the Expires field of the cookie. This is a date string that can be object, or as text. If multiple Expires fields are present, the first one is absent, a text object of length zero is returned. To evaluate the returned value as a time object, see "Default Syntax Ex Times, and Numbers."

.COOKIE("<name>").PATH|PATH.GET(n)
2.COOKIE("<name>").PATH|PATH.GET(n)
	Returns the value of Path field of the cookie as a slash- (“/”) separated are treated as single slash. If multiple Path fields are present, the valu
	For example, the following is a cookie with two path fields:
	`Set-Cookie : Customer = "ABC"; PATH="/a//b/c"; PATH=`
	The following expression returns /a//b/c from this cookie:
	`http.res.set_cookie.cookie("Customer").path`
	The following expression returns b:
	`http.res.set_cookie.cookie("Customer").path.get(2)`
	Quotes are stripped from the returned value. A string of zero length is value is absent.

.COOKIE("<name>").PATH.IGNORE_EMPTY_ELEMENTS
 	
2.COOKIE("<name>").PATH.IGNORE_EMPTY_ELEMENTS
	Ignores the empty elements in the list. For example, in the list a=10,b=
	the list is , and the list has an empty element following a=10. The elem
	an empty element.
	
	As another example, in the following expression, if a request contains
	following expression returns a value of 4:
	
	`http.req.header("Cust_Header").typecast_list_t(',').i`
	
	The following expression returns a value of 5:
	
	`http.req.header("Cust_Header").typecast_list_t(',').c`

.COOKIE("<name>").PORT 2.COOKIE("<name>").PORT	Returns the value of Port field of the cookie. Operate as a comma-sepa For example, the following expression returns 80. 2580 from Set-Cookie PATH="/a/b/c"; PORT= "80, 2580": `http.res.set_cookie.cookie("ABC").port` A string of zero length is returned if the Port field or value is absent.

.COOKIE("<name>").PORT.IGNORE_EMPTY_ELEMENTS
 	
2.COOKIE("<name>").PORT.IGNORE_EMPTY_ELEMENTS
	Ignores the empty elements in the list. For example, in the list a=10,b=
	the list is , and the list has an empty element following a=10. The elem
	an empty element.
	
	As another example, in the following expression, if a request contains
	following expression returns a value of 4:
	
	`http.req.header("Cust_Header").typecast_list_t(',').i`
	
	The following expression returns a value of 5:
	
	`http.req.header("Cust_Header").typecast_list_t(',').c`

.COOKIE("<name>").VERSION 2.COOKIE("<name>").VERSION	Returns the value of the first Version field in the cookie as a decimal in For example, the following expression returns 1 from the cookie Set-Co "1"; VERSION = "0" `http.res.set_cookie.cookie("CUSTOMER").version` A zero is returned if the Version field or its value is absent or if the val
.COOKIE("<name>", <integer>) 2.COOKIE("<name>", <integer>)	Returns the nth instance (0-based) of the cookie with the specified nam text object of length 0. Returns UNDEF if more than 15 Set-Cookie headers are present and the
.COOKIE("<name>", <integer>).DOMAIN 2.COOKIE("<name>", <integer>).DOMAIN	Returns the value of the Domain field of the first cookie with the speci following expression returns a value of abc.com from the cookie Set-Co DOMAIN=".abc.com"; DOMAIN=.xyz.com `http.res.set_cookie.cookie("CUSTOMER").domain` A string of zero length is returned if the Domain field or its value is abs

.COOKIE("<name>", <integer>).EXPIRES 2.COOKIE("<name>", <integer>).EXPIRES	Returns the *n*th instance (0-based) of the Expires field of the cookie wi string. The value can be operated upon as a time object that supports Expires attribute is absent a string of length zero is returned.

.COOKIE("<name>", <integer>).PATH | PATH.GET(i)
 	
2.COOKIE("<name>", <integer>).PATH |
	Returns the value of the Path field of the nth cookie, as a '/' separated
	single /.
	
	For example, the following expression returns /a//b/c from the cookie
	PATH="/a//b/c"; PATH= "/x/y/z"
	
	`http.res.set_cookie.cookie("CUSTOMER").path`
	
	The following returns b:
	
	`http.res.set_cookie.cookie("CUSTOMER").path.get(2)`
	
	A string of zero length is returned if the Path field or its value is absen

.COOKIE("<name>",
ORE_EMPTY_ELEMENTS
 	
2.COOKIE("<name>",
ORE_EMPTY_ELEMENTS
	Ignores the empty elements in the list. For example, in the list a=10,b=
	the list is , and the list has an empty element following a=10. The elem
	an empty element.
	
	As another example, in the following expression, if a request contains
	following expression returns a value of 4:
	
	`http.req.header("Cust_Header").typecast_list_t(',').i`
	
	The following expression returns a value of 5:
	
	`http.req.header("Cust_Header").typecast_list_t(',').c`

.COOKIE("<name>", <integer>).PORT 2.COOKIE("<name>", <integer>).PORT	Returns the value or values of the Port field of the named cookie as a ' following expression returns 80, 2580 from the cookie Set-Cookie : Cust PORT= "80, 2580" `http.res.set_cookie.cookie("ABC").port` A string of zero length is returned if the Port field or its value is absent

.COOKIE("<name>",
ORE_EMPTY_ELEMENTS
 	
2.COOKIE("<name>",
ORE_EMPTY_ELEMENTS
	Ignores the empty elements in the list. For example, in the list a=10,b=
	the list is , and the list has an empty element following a=10. The elem
	an empty element.
	
	As another example, in the following expression, if a request contains
	following expression returns a value of 4:
	
	`http.req.header("Cust_Header").typecast_list_t(',').i`
	
	The following expression returns a value of 5:
	
	`http.req.header("Cust_Header").typecast_list_t(',').c`

.COOKIE("<name>", <integer>).VERSION 2.COOKIE("<name>", <integer>).VERSION	Returns the value of Version field of the *n*th cookie as a decimal intege A string of zero length is returned if the Port field or its value is absent
	Returns the HTTP transaction ID. The value is a function of an internal time and system MAC address.

Operations for HTTP Headers

The following table describes operations that you can specify with the prefixes for HTTP headers.

Table 2. Operations That Evaluate HTTP Headers

HTTP Header Operation	Description
`http header .EXISTS`	Returns a Boolean TRUE if an instance of the specified header type exists. Following is an example: `http.req.header("Cache-Control").exists`

`http header.CONTAINS" http header . CONTAINS("<string>")`	Returns a Boolean TRUE if the <string> argument appears in any instance of the header value.
	
	Note: This operation overrides any text-based Contains operations on all instances of the current header type.
	
	Following is an example of request with two headers:
	
	`HTTP/1.1 200 OK\r\n`
	
	`MyHeader: abc\r\n`
	
	`Content-Length: 200\r\n`
	
	`MyHeader: def\r\n`
	
	`\r\n`
	
	The following returns a Boolean TRUE:
	
	`http.res.header("MyHeader"). contains("de")`
	
	The following returns FALSE. Note that the NetScaler does not concatenate the different values.
	
	`http.res.header("MyHeader"). contains("bcd")`

`http header .COUNT`	Returns the number of headers in a request or response, to a maximum of 15 headers of the same type. The result is undefined if there are more than 15 instances of the header.
	
	Following is sample data in a request:
	
	`HTTP/1.1 200 OK\r\n`
	
	`MyHeader: abc\r\n`
	
	`Content-Length: 200\r\n`
	
	`MyHeader: def\r\n`
	
	`\r\n`
	
	When evaluating the preceding request, the following returns a count of 2:
	
	`http.res.header("MyHeader").count`

`http header.AFTER_STR("<string>")`	Extracts the text that follows the first occurrence of the <string> argument. The headers are evaluated from the last instance to the first.
	
	Following is an example of a request:
	
	`HTTP/1.1 200 OK\r\n`
	
	`MyHeader: 111abc\r\n`
	
	`Content-Length: 200\r\n`
	
	`MyHeader: 111def\r\n`
	
	`\r\n`
	
	The following extracts the string "def" from the last instance of MyHeader. This is value "111def."
	
	`http.res.header("MyHeader").after_str("111")`
	
	The following extracts the string "c" from the first instance of MyHeader. This is the value "abc111."
	
	`http.res.header("MyHeader").after_str("1ab")`

`http header.BEFORE_STR("<string>")`	Extracts the text that appears prior to the first occurrence of the input <string> argument. The headers are evaluated from the last instance to the first.
	
	Following is an example of a request that contains headers:
	
	`HTTP/1.1 200 OK\r\n`
	
	`MyHeader: abc111\r\n`
	
	`Content-Length: 200\r\n`
	
	`MyHeader: def111\r\n`
	
	`\r\n`
	
	The following extracts the string "def" from the last instance of MyHeader. This is the value "def111."
	
	`http.res.header("MyHeader").before_str("111")`
	
	The following extracts the string "a" from the first instance of MyHeader. This is the value "abc111."
	
	`http.res.header("MyHeader").before_str("bc1")`

`http header.INSTANCE(<instance number>)`	An HTTP header can occur multiple times in a request or a response. This operation returns the header that occurs <instance number> of places before the final instance. For example, instance(0) selects the last instance of the current type, instance(1) selects the next-to-last instance, and so on. This prefix cannot be used in bidirectional policies.
	
	The <instance number> argument cannot exceed 14. Following is an example of a request with two headers:
	
	`HTTP/1.1 200 OK\r\n`
	
	`MyHeader: abc\r\n`
	
	`Content-Length: 200\r\n`
	
	`MyHeader: def\r\n`
	
	`\r\n`
	
	The following returns a text object that refers to "MyHeader: abc\r\n":
	
	`http.res.header("MyHeader").instance(1)`

`http header.SUBSTR("<string>")`	Extracts the text that matches the <string> argument. The headers are evaluated from the last instance to the first. Following is an example of a request with two headers that contain the string “111”:
	
	`HTTP/1.1 200 OK\r\n`
	
	`MyHeader: abc111\r\n`
	
	`Content-Length: 200\r\n`
	
	`MyHeader: 111def\r\n`
	
	`\r\n`
	
	The following returns "111" from the last instance of MyHeader. This is the header with the value "111def."
	
	`http.res.header("MyHeader").substr("111")`

`http header.VALUE(<instance number>)`	An HTTP header can occur multiple times in a request or a response. VALUE(0) selects the value in the last instance, VALUE(1) selects the value in the next-to-last instance, and so on. The <instance number> argument cannot exceed 14.
	
	Following is an example of a request with two headers:
	
	`HTTP/1.1 200 OK\r\n`
	
	`MyHeader: abc\r\n`
	
	`Content-Length: 200\r\n`
	
	`MyHeader: def\r\n`
	
	`\r\n`
	
	The following returns "abc\r\n":
	
	`http.res.header("MyHeader").value(1)`

Prefixes for Cache-Control Headers

The following prefixes apply specifically to Cache-Control headers.

Table 3. Prefixes That Extract Cache-Control Headers

HTTP Header Prefix	Description
`HTTP.REQ.CACHE_CONTROL`	Returns a Cache-Control header in an HTTP request.
`HTTP.RES.CACHE_CONTROL`	Returns a Cache-Control header in an HTTP response.

Operations for Cache-Control Headers

You can apply any of the operations for HTTP headers to Cache-Control headers. For more information, see "Operations for HTTP Headers."

In addition, the following operations identify specific types of Cache-Control headers. See RFC 2616 for information about these header types.

Table 4. Operations That Evaluate Cache-Control Headers

HTTP Header Operation	Description
`Cache-Control header.NAME(<integer>)`	Returns as a text value the name of the Cache-Control header that corresponds to the nth component in a name-value list, as specified by <integer>. The index of the name-value component is 0-based. If the <integer> that is specified by the integer argument is greater than the number of components in the list, a zero-length text object is returned. Following is an example: `http.req.cache_control.name(3).contains("some_text")`
`Cache-Control header.IS_INVALID`	Returns a Boolean TRUE if the Cache-Control header is not present in the request or response. Following is an example: `http.req.cache_control.is_invalid`
`Cache-Control header.IS_PRIVATE`	Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: `http.req.cache_control.is_private`
`Cache-Control header.IS_PUBLIC`	Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: `http.req.cache_control.is_public`
`Cache-Control header.IS_NO_STORE`	Returns a Boolean TRUE if the Cache-Control header has the value No-Store. Following is an example: `http.req.cache_control.is_no_store`

`Cache-Control header.IS_NO_CACHE`	Returns a Boolean TRUE if the Cache-Control header has the value No-Cache. Following is an example: `http.req.cache_control.is_no_cache`
`Cache-Control header.IS_MAX_AGE`	Returns a Boolean TRUE if the Cache-Control header has the value Max-Age. Following is an example: `http.req.cache_control.is_max_age`
`Cache-Control header.IS_MIN_FRESH`	Returns a Boolean TRUE if the Cache-Control header has the value Min-Fresh. Following is an example: `http.req.cache_control.is_min_fresh`
`Cache-Control header.IS_MAX_STALE`	Returns a Boolean TRUE if the Cache-Control header has the value Max-Stale. Following is an example: `http.req.cache_control.is_max_stale`
`Cache-Control header.IS_MUST_REVALIDATE`	Returns a Boolean TRUE if the Cache-Control header has the value Must-Revalidate. Following is an example: `http.req.cache_control.is_must_revalidate`
`Cache-Control header.IS_NO_TRANSFORM`	Returns a Boolean TRUE if the Cache-Control header has the value No-Transform. Following is an example: `http.req.cache_control.is_no_transform`
`Cache-Control header.IS_ONLY_IF_CACHED`	Returns a Boolean TRUE if the Cache-Control header has the value Only-If-Cached. Following is an example: `http.req.cache_control.is_only_if_cached`
`Cache-Control header.IS_PROXY_REVALIDATE`	Returns a Boolean TRUE if the Cache-Control header has the value Proxy-Revalidate. Following is an example: `http.req.cache_control.is_proxy_revalidate`

`Cache-Control header.IS_S_MAXAGE`	Returns a Boolean TRUE if the Cache-Control header has the value S-Maxage. Following is an example: `http.req.cache_control.is_s_maxage`
`Cache-Control header.IS_UNKNOWN`	Returns a Boolean TRUE if the Cache-Control header is of an unknown type. Following is an example: `http.req.cache_control.is_unknown`
`Cache-Control header.MAX_AGE`	Returns the value of the Cache-Control header Max-Age. If this header is absent or invalid, 0 is returned. Following is an example: `http.req.cache_control.max_age.le(3)`
`Cache-Control header.MAX_STALE`	Returns the value of the Cache-Control header Max-Stale. If this header is absent or invalid, 0 is returned. Following is an example: `http.req.cache_control.max_stale.le(3)`
`Cache-Control header.MIN_FRESH`	Returns the value of the Cache-Control header Min-Fresh. If this header is absent or invalid, 0 is returned. Following is an example: `http.req.cache_control.min_fresh.le(3)`
`Cache-Control header.S_MAXAGE`	Returns the value of the Cache-Control header S-Maxage. If this header is absent or invalid, 0 is returned. Following is an example: `http.req.cache_control.s_maxage.eq(2)`

Expressions for Extracting Segments of URLs

You can extract URLs and portions of URLs, such as the host name, or a segment of the URL path. For example, the following expression identifies HTTP requests for image files by extracting image file suffixes from the URL:

```
http.req.url.suffix.eq("jpeg") || http.req.url.suffix.eq("gif")
```

Most expressions for URLs operate on text and are described in "Expression Prefixes for Text in HTTP Requests and Responses." This section discusses the GET operation. The GET operation extracts text when used with the following prefixes:

- `HTTP.REQ.URL.PATH`
- `VPN.BASEURL.PATH`
- `VPN.CLIENTLESS_BASEURL.PATH`

The following table describes prefixes for HTTP URLs.

Table 1. Prefixes That Extract URLs

URL Prefix	Description

`HTTP.REQ.URL.PATH.GET(<n>)`	Returns a slash- (“/”) separated list from the URL path. For example, consider the following URL:
	
	`http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1`
	
	The following expression returns dir1 from this URL:
	
	`http.req.url.path.get(1)`
	
	The following expression returns dir2:
	
	`http.req.url.path.get(2)`

`HTTP.REQ.URL.PATH.GET_REVERSE(<n>)`	Returns a slash- (“/”) separated list from the URL path, starting from the end of the path. For example, consider the following URL:
	
	`http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1`
	
	The following expression returns index.html from this URL:
	
	`http.req.url.path.get_reverse(0)`
	
	The following expression returns dir3:
	
	`http.req.url.path.get_reverse(1)`

Expressions for HTTP Status Codes and Numeric HTTP Payload Data Other Than Dates

The following table describes prefixes for numeric values in HTTP data other than dates.

Table 1. Prefixes That Evaluate HTTP Request or Response Length

Prefix	Description
`HTTP.REQ.CONTENT_LENGTH`	Returns the length of an HTTP request as a number. Following is an example: `http.req.content_length < 500`
`HTTP.RES.CONTENT_LENGTH`	Returns the length of the HTTP response as a number. Following is an example: `http.res.content_length <= 1000`
`HTTP.RES.STATUS`	Returns the response status code

HTTP.RES.IS_REDIRECT	Returns a Boolean TRUE if the response code is associated with a redirect. Following are the redirect response codes:
	· 300 (Multiple Choices)
	· 301 (Moved Permanently)
	· 302 (Found)
	· 303 (See Other)
	· 305 (Use Proxy)
	· 307 (Temporary Redirect)
	Note: Status code 304 is not considered a redirect HTTP response status code. Status code 306 is unused.
	In the following example, the rewrite action replaces http in the Location header of an HTTP response with https if the response is associated with an HTTP redirect.
	`add rewrite action redloc replace 'http.res.header("Location").before_regex(re#://#)' '"https"'`
	`add rewrite policy pol1 HTTP.RES.IS_REDIRECT red_location`
	`bind rewrite global pol1 100`

SIP Expressions

Introduction

The NetScaler default expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for any supported protocol that operates on a request/response basis. (These expressions can be bound only to `sip_udp` virtual servers and global bind points.) These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

Certain limitations apply to SIP expressions used with responder policies. The NetScaler operating system currently supports only SIP over UDP. Only the DROP, NOOP or RESPONDWITH actions are allowed on a SIP load balancing virtual server. Responder policies can be bound to a load balancing virtual server, an override global bind point, a default global bind point, or a `sip_udp` policy label.

The header format used by the SIP protocol is similar to that used by the HTTP protocol, so many of the new expressions look and function much like their HTTP analogs. Each SIP header consists of a line that includes the SIP method, the URL, and the version, followed by a series of name-value pairs that look like HTTP headers.

Following is a sample SIP header that is referred to in the expressions tables beneath it:

```
INVITE sip:16@www.sip.com:5060;transport=udp SIP/2.0
Record-Route: <sip:200.200.100.22;lr=on>
Via: SIP/2.0/UDP 200.200.100.22;branch=z9hG4bK444b.c8e103d1.0;rport=5060;
   received=10.102.84.18
Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;
   received=10.102.84.160
From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180
Max-Forwards: 69CSeq: 101 INVITE
User-Agent: Cisco-CP7940G/8.0
Contact: <sip:12@10.102.84.180:5060;transport=udp>
Expires: 180
Accept: application/sdp
Allow: ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,UPDATE
Supported: replaces,join,norefersub
Content-Length: 277
Content-Type: application/sdp
Content-Disposition: session;handling=optiona
```

SIP Reference Tables

The following tables contain lists of expressions that operate on SIP headers. The first table contains expressions that apply to request headers. Most response-based expressions are nearly the same as the corresponding request-based expressions. To create a response expression from the corresponding request expression, you change the first two sections of the expression from `SIP.REQ` to `SIP.RES`, and make other obvious adjustments. The second table contains those response expressions that are unique to responses and have no request equivalents. You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

Table 1. SIP Request Expressions

	Description
	Operates on the method of the SIP request. The supported SIP request me MESSAGE, NOTIFY, OPTIONS, PRACK, PUBLISH, REFER, REGISTER, SUBSCRIB the text class, so all operations that are applicable to text are applicable `INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0`, t
	Operates on the SIP request URL. This expression is a derivative of the tex are applicable to this method. For example, for a SIP request of `INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0`, this expre `sip:16@10.102.84.181:5060;transport=udp`.
	Returns the URL protocol. For example, for a SIP URL of `sip:16@www.si` returns `sip`.
	Returns the hostname portion of the SIP URL. For example, for a SIP URL o this expression returns `www.sip.com:5060`.
	Returns the port portion of the SIP URL hostname. If no port is specified, t For example, for a SIP hostname of `www.sip.com:5060`, this expression
	Returns the domain name portion of the SIP URL hostname. If the host is a incorrect result. For example, for a SIP hostname of `www.sip.com:5060` hostname of `192.168.43.15:5060`, this expression returns an error.
	Returns the server portion of the host. For example, for a SIP hostname of
	Returns the username that precedes the @ character. For example, for a S sip:16@www.sip.com:5060;transport=udp, this expression returns 16.
	Returns the SIP version number in the request. For example, for a SIP requ `sip:16@10.102.84.181:5060;transport=udp SIP/2.0`, this expre
	Returns the major version number (the number to the left of the period). this expression returns 2.
	Returns the minor version number (the number to the right of the period). `SIP/2.0`, this expression returns `0`.
	Returns the contents of the Content-Length header. This expression is a de operations that are available for SIP headers can be used. For example, fo `Content-Length: 277`, this expression returns 277.
	Returns the contents of the To header. For example, for a SIP To header o `<sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53` `<sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53`

	Returns the SIP URI, which is found in the sip_url object. All operations tha example, for a SIP To header of `To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53 sip:16@sip_example.com`.
	Returns the display name portion of the To header. For example, for a SIP `<sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53`
	Returns the “tag” vale from the “tag” name value pair in the TO header. F `<sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53 00127f54ec85a6d90cc14f45-53cc0185`.
	Returns the contents of the From header. For example, for a SIP From hea `<sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53 sip:12@sip_example.com`.
	Returns the SIP URI, which is found in the sip_url object. All operations tha example, for a SIP From header of `From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53 sip:12@sip_example.com`.
	Returns the display name portion of the To header. For example, for a SIP `<sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53`
	Returns the “tag” value from the “tag” name/value pair in the TO header. `"12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f 00127f54ec85a6d90cc14f45-53cc0185`.
	Returns the complete Via header. If there are multiple Via headers in the for the two Via headers in the sample SIP header, this expression returns `10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec`
	Returns the address that sent the request. For example, for the Via heade `10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec 10.102.84.180`.
	Returns the port that sent the request. For example, for the Via header `Vi 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec 5060`.
	Returns the value from the rport name/value pair. For example, for the Vi `10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec 5060`.
	Returns the value from the branch name/value pair. For example, for the `10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec z9hG4bK03e76d0b`.
	Returns the value from the received name/value pair. For example, for th `10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec 10.102.84.160`.
	Returns the contents of the Callid header. This expression is a derivative c are available for SIP headers can be used. For example, for a SIP Callid hea `00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180`, this exp `00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180`.
	Returns the CSEQ number from the CSEQ, as an integer. For example, for a expression returns `101`.
)	Returns the specified SIP header. For `<header_name>`, substitute the nam return the SIP From header, you would type `SIP.REQ.HEADER("From")`.

.INSTANCE(<line_number>)	Returns the specified instance of the specified SIP header. Multiple instanc want a specific instance of such a SIP header (for example, a specific Via h number as the <line_number>. Header instances are matched from last SIP.REQ.HEADER("Via").INSTANCE(0) returns the last instance of th SIP.REQ.HEADER("Via").INSTANCE(1) returns the last instance but For example, if used on the example SIP header, SIP.REQ.HEADER("Via 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.
.VALUE(<line_number>)	Returns the contents of the specified instance of the specified SIP header. expression. For example, if used on the SIP header example in the precedi SIP.REQ.HEADER("Via").VALUE(1) returns SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.
.COUNT	Returns the number of instances of a particular header as an integer. For e SIP.REQ.HEADER("Via").COUNT returns 2.
.EXISTS	Returns a boolean value of true or false, depending upon whether the spec the SIP header example above, SIP.REQ.HEADER("Expires").EXISTS SIP.REQ.HEADER("Caller-ID").EXISTS returns false.
.LIST	Returns the comma-separated parameter list in the specified header. For e SIP.REQ.HEADER("Allow").LIST returns ACK,BYE,CANCEL,INVITE,NOTIFY,OP You can append the string .GET(<list_item_number>) to select a specific li from the above list, you would type SIP.REQ.HEADER("Allow").LIST.GET(0) SIP.REQ.HEADER("Allow").LIST.GET(1). **Note:** If the specified header contains a list of name/value pairs, the ent
.TYPECAST_SIP_HEADER_T("<in_header_name>")	Typecasts <header_name> to <in_header_name>. Any text can be typ all header-based operations can be used. After you perform this operation <in_header_name>. For example, the expression SIP.REQ.CONTENT_LENGTH.TYPECAST_SI Content-Length header. After you perform this operation, you can apply a header.
.CONTAINS("<string>").	Returns boolean true if the specified text string is present in any instance instances of the specified header. Header instances are matched from last
.EQUALS_ANY(<patset>)	Returns boolean true if any pattern associated with <patset> matches a Operates on all the instances of the specified header. Header instances ar
.CONTAINS_ANY(<patset>)	Returns Boolean true if any pattern associated with <patset> matches a Operates on all the instances of the specified header. Header instances ar
.CONTAINS_INDEX(<patset>)	Returns the index of the matching pattern associated with <patset> if th the specified header. Operates on all the instances of the specified heade first.
.EQUALS_INDEX(<patset>)	Returns the index of the matching pattern associated with <patset> if that header. Operates on all the instances of the specified header. Header inst
.SUBSTR("<string>")	If the specified string is present in any instance of the specified header, th the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec SIP.REQ.HEADER("Via").SUBSTR("rport=5060") returns "rport= SIP.REQ.HEADER("Via").SUBSTR("rport=5061") returns an empty

.AFTER_STR("<string>")	If the specified string is present in any instance of the specified header, th that string. For example, for the SIP header `Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec` `SIP.REQ.HEADER("Via").AFTER_STR("rport=")` returns `5060`.
.REGEX_MATCH(<regex>)	Returns boolean true if the specified regular expression (*regex*) matches a specify the regular expression in the following format: re<delimiter>regular expression<same delimiter> The regular expression cannot be larger than 1499 characters in length. It library. See http://www.pcre.org/pcre.txt for documentation on PCRE reg page also has useful information on specifying patterns by using PCRE regu The regular expression syntax supported in this expression has some differ You should avoid recursive regular expressions; although some work, many newlines. Unicode is not supported. `SET_TEXT_MODE(IGNORECASE)` ove regular expression.
.REGEX_SELECT(<regex>)	If the specified regex matches any text in any instance of the specified he for the SIP header `Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec` `SIP.REQ.HEADER("Via").REGEX_SELECT("received=[0-9]{1,3}\` returns `received=10.102.84.160`.
.AFTER_REGEX(<regex>)	If the specified regex matches any text in any instance of the specified he after that text. For example, for the SIP header `Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec` `SIP.REQ.HEADER("Via").AFTER_REGEX("received=")` returns `10.`
.BEFORE_REGEX(<regex>)	If the specified regex matches any text in any instance of the specified he before that text. For example, for the SIP header `Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;rec` `SIP.REQ.HEADER("Via").BEFORE_REGEX("[0-9]{1,3}\.[0-9]{1,` `received=`.
	Returns the entire SIP header, including the terminating CR/LF.
	Returns boolean `true` if the request format is valid.
	Returns the request body, up to the specified length. If the specified lengt this expression returns the entire request body.
	Returns the name of the load balancing virtual server (*LB vserver*) that is s
	Returns the name of the content switching virtual server (*CS vserver*) that

Table 2. SIP Response Expressions

Expression	Description
`SIP.RES.STATUS`	Returns the SIP response status code. For example, if the first line of the response is `SIP/2.0 100 Trying`, this expression returns `100`.
`SIP.RES.STATUS_MSG`	Returns the SIP response status message. For example, if the first line of the response is `SIP/2.0 100 Trying`, this expression returns `Trying`.

SIP.RES.IS_REDIRECT	Returns boolean `true` if the response code is a redirect.
SIP.RES.METHOD	Returns the response method extracted from the request method string in the CSeq header.

Operations for HTTP, HTML, and XML Encoding and “Safe” Characters

The following operations work with the encoding of HTML data in a request or response and XML data in a POST body.

Table 1. Operations That Evaluate HTML and XML Encoding

peration	Description
_XML_SAFE	Transforms special characters into XML safe format, examples: · A left-pointing angle bracket (<) is converted to · A right-pointing angle bracket (>) is converted to · An ampersand (&) is converted to & This operation safeguards against cross-site scripting of the transformed text is 2048 bytes. This is a read- After applying the transformation, additional operat expression are applied to the selected text. Followin `http.req.url.query.html_xml_safe. conta`
_HEADER_SAFE	Converts all new line ('\n') characters in the input te input to be used safely in HTTP headers. This operation safeguards against response-splitting The maximum length of the transformed text is 2048 operation.

_URL_SAFE	Converts unsafe URL characters to '%xx' values, wher representation of the input character. For example, represented as %26 in URL-safe encoding. The maxin transformed text is 2048 bytes. This is a read-only o Following are URL safe characters. All others are uns · Alpha-numeric characters: a-z, A-Z, 0-9 · Asterix: "*" · Ampersand: "&" · At-sign: "@" · Colon: ":" · Dollar: "$" · Dot: "." · Equals: "=" · Exclamation mark: "!" · Hyphen: "-" · Open and close parentheses: "(", ")" · Plus: "+" · Semicolon: ";" · Single quote: "'" · Slash: "/" · Tilde: "~" · Underscore: "_"
_SAFE	Marks the text as safe without applying any type of

TEXT_MODE(URLENCODED|NOURLENCODED)	Transforms all %HH encoding in the byte stream. Thi characters (not bytes). By default, a single byte repr ASCII encoding. However, if you specify URLENCODE represent a character.
	
	In the following example, a PREFIX(3) operation sele in a target.
	
	`http.req.url.hostname.prefix(3)`
	
	In the following example, the NetScaler can select u target:
	
	`http.req.url.hostname.set_text_mode(url`

TEXT_MODE(PLUS_AS_SPACE|NO_PLUS_AS_SPACE)	Specifies how to treat the plus character (+). The PL replaces a plus character with white space. For exar “hello+world” becomes “hello world.” The NO_PLUS plus characters as they are.
TEXT_MODE(BACKSLASH_ENCODED|NO_BACKSLASH_ENCODED)	Specifies whether or not backslash decoding is perfo represented by <text>. If BACKSLASH_ENCODED is specified, the SET_TEX performs the following operations on the text object · All occurrences of “\XXX” will be replaced with t XXX represents a number in the octal system and equivalent of XXX). The valid range of octal valu encoding is 0 to 377. For example, the encoded "http\072//" will both be decoded to "http://", w ASCII equivalent of the octal value “72”. · All occurrences of “\xHH” will be replaced with represents a number in the hexadecimal system equivalent of HH. For example, the encoded tex decoded to "http://", where the colon (:) is the hexadecimal value “3a“. · All occurrences of “\\uWWXX” will be replaced w sequence “YZ” (Where WW and XX represent tw values and Y and Z represent their ASCII equivale respectively. For example, the encoded text "ht "http%u003a//" will both be decoded to "http:// are two hexadecimal values and the colon (:) an represent their ASCII equivalents respectively. · All occurrences of "\b", "\n", "\t", "\f", and "\r" are corresponding ASCII characters. If NO_BACKSLASH_ENCODED is specified, backslash performed on the text object.

TEXT_MODE(BAD_ENCODE_RAISE_UNDEF|NO_BAD_ENCODE_RAISE_UNDEF)	Performs the associated undefined action if either th BACKSLASH_ENCODED mode is set and bad encodin specified encoding mode is encountered in the text <text>. If NO_BAD_ENCODE_RAISE_UNDEF is specified, the action will not be performed when bad encoding is e object represented by<text>.

Expressions for TCP, UDP, and VLAN Data

TCP and UDP data take the form of a string or a number. For expression prefixes that return string values for TCP and UDP data, you can apply any text-based operations. For more information, see "Default Syntax Expressions: Evaluating Text."

For expression prefixes that return numeric value, such as a source port, you can apply an arithmetic operation. For more information, see "Basic Operations on Expression Prefixes" and "Compound Operations for Numbers."

The following table describes prefixes that extract TCP and UDP data.

Table 1. Prefixes That Extract TCP and UDP Data

GET Operation	Description
`CLIENT.TCP.PAYLOAD(<integer>)`	Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the <integer> argument. You can apply any text-based operation to this prefix.
`CLIENT.TCP.SRCPORT`	Returns the ID of the current packet's source port as a number.
`CLIENT.TCP.DSTPORT`	Returns the ID of the current packet's destination port as a number.
`CLIENT.TCP.OPTIONS`	Returns the TCP options set by the client. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The `COUNT`, `TYPE(<type>)`, and `TYPE_NAME(<m>)` operators can be used with this prefix. For the TCP options set by the server, see the `SERVER.TCP.OPTIONS` prefix.
`CLIENT.TCP.OPTIONS.COUNT`	Returns the number of TCP options that the client has set.

`CLIENT.TCP.OPTIONS.TYPE(<type>)`	Returns the value of the TCP option whose type (or *option kind*) is specified as the argument. The value is returned as a string of bytes in big endian format (or *network byte order*). **Parameters:** `type` - Type value
`CLIENT.TCP.OPTIONS.TYPE_NAME(<m>)`	Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use `CLIENT.TCP.OPTIONS.TYPE(<type>)`. For other TCP options, you must use `CLIENT.TCP.OPTIONS.TYPE(<type>)`. **Parameters:** `m` - TCP option enumeration constant
`CLIENT.TCP.REPEATER_OPTION.EXISTS`	Returns a Boolean TRUE if Repeater TCP options exist.
`CLIENT.TCP.REPEATER_OPTION.IP`	Returns the branch repeater's IPv4 address from the Repeater TCP options.
`CLIENT.TCP.REPEATER_OPTION.MAC`	Returns the branch repeater's MAC address from the Repeater TCP options.
`CLIENT.UDP.DNS.DOMAIN`	Returns the DNS domain name.
`CLIENT.UDP.DNS.DOMAIN.EQ("<hostname>")`	Returns a Boolean TRUE if the domain name matches the <hostname> argument. The comparison is case insensitive. Following is an example: `client.udp.dns.domain.eq("www.mycompany.com")`
`CLIENT.UDP.DNS.IS_AAAAREC`	Returns a Boolean TRUE if the record type is AAAA. These types of records indicate an IPv6 address in forward lookups.
`CLIENT.UDP.DNS.IS_ANYREC`	Returns a Boolean TRUE if it is of any record type.
`CLIENT.UDP.DNS.IS_AREC`	Returns a Boolean TRUE if the record is type A. Type A records provide the host address.

CLIENT.UDP.DNS.IS_CNAMEREC	Returns a Boolean TRUE if the record is of type CNAME. In systems that use multiple names to identify a resource, there is one canonical name and a number of aliases. The CNAME provides the canonical name.
CLIENT.UDP.DNS.IS_MXREC	Returns a Boolean TRUE if the record is of type MX (mail exchanger). This DNS record describes a priority and a host name. The MX records for the same domain name specify the email servers in the domain and the priority for each server.
CLIENT.UDP.DNS.IS_NSREC	Returns a Boolean TRUE if the record is of type NS. This is a name server record that includes a host name with an associated A record. This enables locating the domain name that is associated with the NS record.
CLIENT.UDP.DNS.IS_PTRREC	Returns a Boolean TRUE if the record is of type PTR. This is a domain name pointer and is often used to associate a domain name with an IPv4 address.
CLIENT.UDP.DNS.IS_SOAREC	Returns a Boolean TRUE if the record is of type SOA. This is a start of authority record.
CLIENT.UDP.DNS.IS_SRVREC	Returns a Boolean TRUE if the record is of type SRV. This is a more general version of the MX record.
CLIENT.UDP.DSTPORT	Returns the numeric ID of the current packet's UDP destination port.
CLIENT.UDP.SRCPORT	Returns the numeric ID of the current packet's UDP source port.
CLIENT.UDP.RADIUS	Returns RADIUS data for the current packet.
CLIENT.UDP.RADIUS.ATTR_TYPE(<type>)	Returns the value for the attribute type specified as the argument.
CLIENT.UDP.RADIUS.USERNAME	Returns the RADIUS user name.
CLIENT.TCP.MSS	Returns the maximum segment size (MSS) for the current connection as a number.
CLIENT.VLAN.ID	Returns the numeric ID of the VLAN through which the current packet entered the NetScaler.
SERVER.TCP.DSTPORT	Returns the numeric ID of the current packet's destination port.
SERVER.TCP.SRCPORT	Returns the numeric ID of the current packet's source port.

SERVER.TCP.OPTIONS	Returns the TCP options set by the server. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(<type>), and TYPE_NAME(<m>) operators can be used with this prefix. For the TCP options set by the client, see the CLIENT.TCP.OPTIONS prefix.
SERVER.TCP.OPTIONS.COUNT	Returns the number of TCP options that the server has set.
SERVER.TCP.OPTIONS.TYPE(<type>)	Returns the value of the TCP option whose type (or *option kind*) is specified as the argument. The value is returned as a string of bytes in big endian format (or *network byte order*). **Parameters:** type - Type value
SERVER.TCP.OPTIONS.TYPE_NAME(<m>)	Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(<type>). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(<type>). **Parameters:** m - TCP option enumeration constant
SERVER.VLAN	Operates on the VLAN through which the current packet entered the NetScaler.
SERVER.VLAN.ID	Returns the numeric ID of the VLAN through which the current packet entered the NetScaler.

Expressions for Evaluating a DNS Message and Identifying Its Carrier Protocol

You can evaluate DNS requests and responses by using expressions that begin with `DNS.REQ` and `DNS.RES`, respectively. You can also identify the transport layer protocol that is being used to send the DNS messages.

The following functions return the contents of a DNS query.

Table 1. Functions that return the contents of a DNS query

Function	Description
`DNS.REQ.QUESTION.DOMAIN`	Return the domain name (the value of the `QNAME` field) in the question section of the DNS query. The domain name is returned as a text string, which can be passed to `EQ()`, `NE()`, and any other functions that work with text.

DNS.REQ.QUESTION.TYPE	Return the query type (the value of the QTYPE field) in the DNS query. The field indicates the type of resource record (for example, A, NS, or CNAME) for which the name server is being queried. The returned value can be compared to one of the following values by using the EQ() and NE() functions: · A · AAAA · NS · SRV · PTR · CNAME · SOA · MX · ANY **Note:** You can use only the EQ() and NE() functions with the TYPE function. **Example:** DNS.REQ.QUESTION.TYPE.EQ(MX)

The following functions return the contents of a DNS response.

Table 2. Functions that return the contents of a DNS response

Function	Description
DNS.RES.HEADER.RCODE	Return the response code (the value of the RCODE field) in the header section of the DNS response. You can use only the EQ() and NE() functions with the RCODE function. Following are the possible values: · NOERROR · FORMERR · SERVFAIL · NXDOMAIN · NOTIMP · REFUSED

DNS.RES.QUESTION.DOMAIN	Return the domain name (the value of the QNAME field) in the question section of the DNS response. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.
DNS.RES.QUESTION.TYPE	Return the query type (the value of the QTYPE field) in the question section of the DNS response. The field indicates the type of resource record (for example, A, NS, or CNAME) that is contained in the response. The returned value can be compared to one of the following values by using the EQ() and NE() functions: · A · AAAA · NS · SRV · PTR · CNAME · SOA · MX · ANY You can use only the EQ() and NE() functions with the TYPE function. **Example:** DNS.RES.QUESTION.TYPE.EQ(SOA)

The following functions return the transport layer protocol name.

Table 3. Functions that return the transport layer protocol name

Function	Description
DNS.REQ.TRANSPORT	Return the name of the transport layer protocol that was used to send the DNS query. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. **Example:** DNS.REQ.TRANSPORT.EQ(TCP)

DNS.RES.TRANSPORT	Return the name of the transport layer protocol that was used for the DNS response. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. **Example:** DNS.RES.TRANSPORT.EQ(TCP)

XPath and HTML, XML, or JSON Expressions

The default syntax expression engine supports expressions for evaluating and retrieving data from HTML, XML, and JavaScript Object Notation (JSON) files. This enables you to find specific nodes in an HTML, XML, or JSON document, determine if a node exists in the file, locate nodes in XML contexts (for example, nodes that have specific parents or a specific attribute with a given value), and return the contents of such nodes. Additionally, you can use XPath expressions in rewrite expressions.

The default syntax expression implementation for XPath comprises a default syntax expression prefix (such as "`HTTP.REQ.BODY`") that designates HTML or XML text, and the XPATH operator that takes the XPath expression as its argument.

HTML files are a largely free-form collection of tags and text elements. You can use the XPATH_HTML operator, which takes an XPath expression as its argument, to process HTML files. JSON files are either a collection of name/value pairs or an ordered list of values. You can use the XPATH_JSON operator, which takes an XPath expression as its argument, to process JSON files.

Table 1. XPath and JSON Expression Prefixes That Return Text

XPath Prefix	Description
`<text>.XPATH(xpathex)`	Operate on an XML file and return a Boolean value. For example, the following expression returns a Boolean TRUE if a node calle "creator" exists under the node "Book" within the first 1000 bytes of the XM `HTTP.REQ.BODY(1000).XPATH(xp%boolean(//Book/creator)%)` Parameters: xpathex - XPath Boolean expression
`<text>.XPATH(xpathex)`	Operate on an XML file and return a value of data type "double." For example, the following expression converts the string "36" (a price valu value of data type "double" if the string is in the first 1000 bytes of the XML `HTTP.REQ.BODY(1000).XPATH(xp%number(/Book/price)%)` Parameters: xpathex - XPath numeric expression

`<text>.XPATH(xpathex)`	Operate on an XML file and return a node-set or a string. Node-sets are conv to corresponding strings by using the standard XPath string conversion routin For example, the following expression selects all the nodes that are enclose “/Book/creator” (a node-set) in the first 1000 bytes of the body: `HTTP.REQ.BODY(1000).XPATH(xp%/Book/creator%)` Parameters: xpathex - XPath expression
`<text>.XPATH_HTML(xpathex)`	Operate on an HTML file and return a text value. For example, the following expression operates on an HTML file and returns text enclosed in <title></title> tags if the title HTML element is found in the 1000 bytes: `HTTP.REQ.BODY(1000).XPATH_HTML(xp%/html/head/title%)` Parameters: xpathex - XPath text expression
`<text>.XPATH_HTML_WITH_MARKUP(xpathex)`	Operate on an HTML file and return a string that contains the entire selecte portion of the document, including markup such as including the enclosing e tags. The following expression operates on the HTML file and selects all content w the <title> tag, including markup. `HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP( xp%/html/head/title%)` The portion of the HTML body that is selected by the expression is marked fo further processing. Parameters: xpathex - XPath expression
`<text>.XPATH_JSON(xpathex)`	Operate on a JSON file and return a Boolean value. For example, consider the following JSON file: { "Book":{ "creator":{ "person":{ "name":'<name>' } }, "title":'<title>' } } The following expression operates on the JSON file and returns a Boolean TR the JSON file contains a node named “creator,” whose parent node is “Book the first 1000 bytes: `HTTP.REQ.BODY(1000).XPATH_JSON(xp%boolean(/Book/creator)%` Parameters: xpathex - XPath Boolean expression

`<text>.XPATH_JSON(xpathex)`	Operate on a JSON file and return a value of data type “double.” For example, consider the following JSON file: { "Book":{ "creator":{ "person":{ "name":'<name>' } }, "title":'<title>', "price":"3 The following expression operates on the JSON file and converts the string “ a value of data type “double” if the string is present in the first 1000 bytes o JSON file. `HTTP.REQ.BODY(1000).XPATH_JSON(xp%number(/Book/price)%)` Parameters: xpathex - XPath numeric expression
`<text>.XPATH_JSON(xpathex)`	Operate on a JSON file and return a node-set or a string. Node-sets are conv to corresponding strings by using the standard XPath string conversion routin For example, consider the following JSON file: { "Book":{ "creator":{ "person":{ "name":'<name>' } }, "title":'<title>' } } The following expression selects all the nodes that are enclosed by “/Book" (node-set) in the first 1000 bytes of the body of the JSON file and returns the corresponding string value, which is "<name><title>": `HTTP.REQ.BODY(1000).XPATH_JSON(xp%/Book%)` Parameters: xpathex - XPath expression
`<text>.XPATH_JSON_WITH_MARKUP(xpathex)`	Operate on an XML file and return a string that contains the entire portion o document for the result node, including markup such as including the enclos element tags. For example, consider the following JSON file: {"Book":{ "creator":{ "person":{ "name":'<name>' } }, "title":'<title>' } } The following expression operates on the JSON file and selects all the nodes are enclosed by “/Book/creator" in the first 1000 bytes of the body, which is “creator:{ person:{ name:'<name>' } }.” `HTTP.REQ.BODY(1000).XPATH_JSON_WITH_MARKUP(xp%/Book/creat` The portion of the JSON body that is selected by the expression is marked fo further processing. Parameters: xpathex - XPath expression

`<text>.XPATH_WITH_MARKUP(xpathex)`	Operate on an XML file and return a string that contains the entire portion o document for the result node, including markup such as including the enclos element tags. For example, the following expression operates on an XML file and selects al nodes enclosed by “/Book/creator" in the first 1000 bytes of the body. `HTTP.REQ.BODY(1000).XPATH_WITH_MARKUP(xp%/Book/creator%)` The portion of the JSON body that is selected by the expression is marked fo further processing. Parameters: xpathex - XPath expression

Encrypting and Decrypting XML Payloads

You can use the XML_ENCRYPT() and XML_DECRYPT() functions in default syntax expressions to encrypt and decrypt, respectively, XML data. These functions conform to the W3C XML Encryption standard defined at "http://www.w3.org/TR/2001/PR-xmldsig-core-20010820/." XML_ENCRYPT() and XML_DECRYPT() support a subset of the XML Encryption specification. In the subset, data encryption uses a bulk cipher method (RC4, DES3, AES128, AES192, or AES256), and an RSA public key is used to encrypt the bulk cipher key.

Note: If you want to encrypt and decrypt text in a payload, you must use the ENCRYPT and DECRYPT functions. For more information about these functions, see "Encrypting and Decrypting Text."

The XML_ENCRYPT() and XML_DECRYPT() functions are not dependent on the encryption/decryption service that is used by the ENCRYPT and DECRYPT commands for text. The cipher method is specified explicitly as an argument to the XML_ENCRYPT() function. The XML_DECRYPT() function obtains the information about the specified cipher method from the <xenc:EncryptedData> element. Following are synopses of the XML encryption and decryption functions:

- **XML_ENCRYPT(<certKeyName>, <method> [, <flags>])**. Returns an <xenc:EncryptedData> element that contains the encrypted input text and the encryption key, which is itself encrypted by using RSA.
- **XML_DECRYPT(<certKeyName>)**. Returns the decrypted text from the input <xenc:EncryptedData> element, which includes the cipher method and the RSA-encrypted key.

Note: The <xenc:EncryptedData> element is defined in the W3C XML Encryption specification.

Following are descriptions of the arguments:

certKeyName

Selects an X.509 certificate with an RSA public key for XML_ENCRYPT() or an RSA private key for XML_DECRYPT(). The certificate key must have been previously created by an add ssl certKey command.

method

Specifies which cipher method to use for encrypting the XML data. Possible values: RC4, DES3, AES128, AES192, AES256.

flags

A bitmask specifying the following optional key information (<ds:KeyInfo>) to be included in the <xenc:EncryptedData> element that is generated by XML_ENCRYPT():

- **1** - Include a `KeyName` element with the `certKeyName`. The element is `<ds:KeyName>`.
- **2** - Include a `KeyValue` element with the RSA public key from the certificate. The element is `<ds:KeyValue>`.
- **4** - Include an `X509IssuerSerial` element with the certificate serial number and issuer DN. The element is `<ds:X509IssuserSerial>`.
- **8** - Include an `X509SubjectName` element with the certificate subject DN. The element is `<ds:X509SubjectName>`.
- **16** - Include an `X509Certificate` element with the entire certificate. The element is `<ds:X509Certificate>`.

Using the *XML_ENCRYPT( )* and *XML_DECRYPT( )* Functions in Expressions

The XML encryption feature uses SSL certificate-key pairs to provide X.509 certificates (with RSA public keys) for key encryption and RSA private keys for key decryption. Therefore, before you use the `XML_ENCRYPT( )` function in an expression, you must create an SSL certificate-key pair. The following command creates an SSL certificate-key pair, `my-certkey`, with the X.509 certificate, `my-cert.pem`, and the private key file, `my-key.pem`.

```
add ssl certKey my-certkey -cert my-cert.pem -key my-key.pem
-passcrypt kxPeMRYnitY=
```

The following CLI commands create rewrite actions and policies for encrypting and decrypting XML content.

```
add rewrite action my-xml-encrypt-action replace
"HTTP.RES.BODY(10000).XPATH_WITH_MARKUP(xp%/%)" "HTTP.RES.BODY(10000)
.XPATH_WITH_MARKUP(xp%/%).XML_ENCRYPT(\"my-certkey\", AES256, 31)"
-bypassSafetyCheck YES

add rewrite action my-xml-decrypt-action replace
"HTTP.REQ.BODY(10000).XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%)" "H
TTP.REQ.BODY(10000).XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%).XML_D
ECRYPT(\"my-certkey\")" -bypassSafetyCheck YES

add rewrite policy my-xml-encrypt-policy
"HTTP.REQ.URL.CONTAINS(\"xml-encrypt\")" my-xml-encrypt-action

add rewrite policy my-xml-decrypt-policy
"HTTP.REQ.BODY(10000).XPATH(xp%boolean(//xenc:EncryptedData)%)"
my-xml-decrypt-action

bind rewrite global my-xml-encrypt-policy 30

bind rewrite global my-xml-decrypt-policy 30
```

In the above example, the rewrite action `my-xml-encrypt-action` encrypts the entire XML document (`XPATH_WITH_MARKUP(xp%/%)`) in the request by using the AES-256 bulk encryption method and the RSA public key from `my-certkey` to encrypt the bulk encryption key. The action replaces the document with an `<xenc:EncryptedData>` element containing the encrypted data and an encrypted key. The flags represented by 31 include all of the optional `<ds:KeyInfo>` elements.

The action `my-xml-decrypt-action` decrypts the first `<xenc:EncryptedData>` element in the response (`XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%)`). This requires the prior addition of the `xenc` XML namespace by use of the following CLI command:

```
add ns xmlnamespace xenc http://www.w3.org/2001/04/xmlenc#
```

The `my-xml-decrypt-action` action uses the RSA private key in `my-certkey` to decrypt the encrypted key and then uses the bulk encryption method specified in the element to decrypt the encrypted contents. Finally, the action replaces the encrypted data element with the decrypted content.

The rewrite policy `my-xml-encrypt-policy` applies `my-xml-encrypt-action` to requests for URLs containing `xml-encrypt`. The action encrypts the entire response from a service configured on the NetScaler appliance.

The rewrite policy `my-xml-decrypt-policy` applies `my-xml-decrypt-action` to requests that contain an `<xenc:EncryptedData>` element (`(XPATH(xp%//xenc:EncryptedData%)` returns a non-empty string). The action decrypts the encrypted data in requests that are bound for a service configured on the NetScaler appliance.

Default Syntax Expressions: Parsing SSL Certificates

You can use default syntax expressions to evaluate X.509 Secure Sockets Layer (SSL) client certificates. A client certificate is an electronic document that can be used to authenticate a user's identity. A client certificate contains (at a minimum) version information, a serial number, a signature algorithm ID, an issuer name, a validity period, a subject (user) name, a public key, and signatures.

You can examine both SSL connections and data in client certificates. For example, you may want to send SSL requests that use low-strength ciphers to a particular load balancing virtual server farm. The following command is an example of a Content Switching policy that parses the cipher strength in a request and matches cipher strengths that are less than or equal to 40:

```
add cs policy p1 -rule "client.ssl.cipher_bits.le(40)"
```

As another example, you can configure a policy that determines whether a request contains a client certificate:

```
add cs policy p2 -rule "client.ssl.client_cert EXISTS"
```

Or, you might want to configure a policy that examines particular information in a client certificate. For example, the following policy verifies that the certificate has one or more days before expiration:

```
add cs policy p2 -rule "client.ssl.client_cert exists &&
client.ssl.client_cert.days_to_expire.ge(1)"
```

Note: For information on parsing dates and times in a certificate, see "Format of Dates and Times in an Expression" and "Expressions for SSL Certificate Dates."

Prefixes for Text-Based SSL and Certificate Data

The following table describes expression prefixes that identify text-based items in SSL transactions and client certificates.

Table 1. Prefixes That Return Text or Boolean Values for SSL and Client Certificate Data

Prefix	Description
`CLIENT.SSL.CLIENT_CERT`	Returns the SSL client certificate in the current SSL transaction.
`CLIENT.SSL.CLIENT_CERT.TO_PEM`	Returns the SSL client certificate in binary format.
`CLIENT.SSL.CIPHER_EXPORTABLE`	Returns a Boolean TRUE if the SSL cryptographic SSL cryptographic cipher is exportable.
`CLIENT.SSL.CIPHER_NAME`	Returns the name of the SSL Cipher if invoked from an SSL connection, and a NULL string if invoked from a non-SSL connection.
`CLIENT.SSL.IS_SSL`	Returns a Boolean TRUE if the current connection is SSL-based.

Prefixes for Numeric Data in SSL Certificates

The following table describes prefixes that evaluate numeric data other than dates in SSL certificates. These prefixes can be used with the operations that are described in "Basic Operations on Expression Prefixes" and "Compound Operations for Numbers."

Table 1. Prefixes That Evaluate Numeric Data Other Than Dates in SSL Certificates

Prefix	Description
`CLIENT.SSL.CLIENT_CERT.DAYS_TO_EXPIRE`	Returns the number of days that the certificate is valid, or returns -1 for expired certificates.
`CLIENT.SSL.CLIENT_CERT.PK_SIZE`	Returns the size of the public key used in the certificate.
`CLIENT.SSL.CLIENT_CERT.VERSION`	Returns the version number of the certificate. If the connection is not SSL-based, returns zero (0).
`CLIENT.SSL.CIPHER_BITS`	Returns the number of bits in the cryptograhic key. Returns 0 if the connection is not SSL-based.
`CLIENT.SSL.VERSION`	Returns a number that represents the SSL protocol version, as follows: · 0. The transaction is not SSL-based. · 0x002. The transaction is SSLv2. · 0x300. The transaction is SSLv3. · 0x301. The transaction is TLSv1.

Note: For expressions related to expiration dates in a certificate, see "Expressions for SSL Certificate Dates."

Expressions for SSL Certificates

You can parse SSL certificates by configuring expressions that use the following prefix:

```
CLIENT.SSL.CLIENT_CERT
```

This section discusses the expressions that you can configure for certificates, with the exception of expressions that examine certificate expiration. Time-based operations are described in "Default Syntax Expressions: Working with Dates, Times, and Numbers."

The following table describes operations that you can specify for the `CLIENT.SSL.CLIENT_CERT prefix`.

Table 1. Operations That Can Be Specified with the CLIENT.SSL.CLIENT_CERT Prefix

SSL Certificate Operation	Description
`<certificate>.EXISTS`	Returns a Boolean TRUE if the client has an SSL certificate.
`<certificate>.ISSUER`	Returns the Distinguished Name (DN) of the Issuer in the certificate as a name-value list. An equals sign (“=”) is the delimiter for the name and the value, and the slash (“/”) is the delimiter that separates the name-value pairs. Following is an example of the returned DN: `/C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com`

<certificate>.ISSUER. IGNORE_EMPTY_ELEMENTS	Returns the Issuer and ignores the empty elements in a name-value list. For example, consider the following: Cert-Issuer: /c=in/st=kar//l=bangelore //o=mycompany/ou=sales/ /emailAddress=myuserid@mycompany.com The following Rewrite action returns a count of 6 based on the preceding Issuer definition: sh rewrite action insert_ssl_header Name: insert_ssl Operation: insert_http_header Target:Cert-Issuer Value:CLIENT.SSL.CLIENT_CERT.ISSUER.COUNT However, if you change the value to the following, the returned count is 9: CLIENT.SSL.CLIENT_CERT.ISSUER.IGNORE_EMPTY_ELEMENTS.COUNT
<certificate>.AUTH_KEYID	Returns a string that contains the Authority Key Identifier extension of the X.509 V3 certificate.
<certificate>.AUTH_KEYID.CERT_SERIALNUMBER	Returns the SerialNumber field of the Authority Key Identifier as a blob.
<certificate>.AUTH_KEYID.EXISTS	Returns a Boolean TRUE if the certificate contains an Authority Key Identifier extension.
<certificate>.AUTH_KEYID.ISSUER_NAME	Returns the Issuer Distinguished Name in the certificate as a name-value list. An equals sign (“=”) is the delimiter for the name and the value, and the slash (“/”) is the delimiter that separates the name-value pairs. Following is an example: /C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com
<certificate>.AUTH_KEYID.ISSUER_NAME.IGNORE_EMPTY_ELEMENTS	Returns the Issuer Distinguished Name in the certificate as a name-value list and ignores the empty elements in the list. For example, the following name-value list has an empty element following “a=10”: a=10;;b=11; ;c=89 The element following b=11 is not considered an empty element.

`<certificate>.AUTH_KEYID.KEYID`	Returns the keyIdentifier field of the Authority Key Identifier as a blob.
`<certificate>.CERT_POLICY`	Returns a string that contains the client certificate policy. Note that this represents a sequence of certificate policies.
`<certificate>.KEY_USAGE(string)`	Returns a Boolean value to indicate whether the specified key usage extension bit value in the X.509 certificate is set. The string argument specifies which bit is checked. Following are valid arguments: · `DIGITAL_SIGNATURE.` Returns TRUE if the digital signature bit is set; otherwise, it returns FALSE. · `NONREPUDIATION.` Returns TRUE if the nonrepudiation bit is set; otherwise, it returns FALSE. · `KEYENCIPHERMENT.` Returns TRUE if the key encipherment bit is set; otherwise, it returns FALSE. · `DATAENCIPHERMENT.` Returns TRUE if the data encipherment bit is set; otherwise, it returns FALSE. · `KEYAGREEMENT.` Returns TRUE if the key agreement bit is set; otherwise, it returns FALSE. · `KEYCERTSIGN.` Returns TRUE if the key cert sign bit is set; otherwise, it returns FALSE. · `CRLSIGN.` Returns TRUE if the CRL bit is set; otherwise, it returns FALSE. · `ENCIPHERONLY.` Returns TRUE if the encipher only bit is set; otherwise, it returns FALSE. · `DECIPHERONLY.` Returns TRUE if the decipher only bit is set; otherwise, it returns FALSE.
`<certificate>.PK_ALGORITHM`	Returns the name of the public key algorithm used by the certificate.
`<certificate>.PK_SIZE`	Returns the size of the public key used in the certificate.
`<certificate>.SERIALNUMBER`	Returns the serial number of the client certificate. If this is a non-SSL transaction or there is an error in the certificate, this operation returns an empty string.
`<certificate>.SIGNATURE_ALGORITHM`	Returns the name of the cryptographic algorithm used by the CA to sign this certificate.

<certificate>.SUBJECT	Returns the Distinguished Name of the Subject as a name-value. An equals sign (“=”) separates names and values and a slash (“/”) delimits name-value pairs. Following is an example: /C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com
<certificate>.SUBJECT.IGNORE_EMPTY_ELEMENTS	Returns the Subject as a name-value list, but ignores the empty elements in the list. For example, consider the following: Cert-Issuer: /c=in/st=kar//l=bangelore //o=mycompany/ou=sales/ /emailAddress=myuserid@mycompany.com The following Rewrite action returns a count of 6 based on the preceding Issuer definition: sh rewrite action insert_ssl_header Name: insert_ssl Operation: insert_http_header Target:Cert-Issuer Value:CLIENT.SSL.CLIENT_CERT.ISSUER.COUNT However, if you change the value to the following, the returned count is 9: CLIENT.SSL.CLIENT_CERT.ISSUER.IGNORE_EMPTY_ELEMENTS.COUNT
<certificate>.SUBJECT_KEYID	Returns the Subject KeyID of the client certificate. If there is no Subject KeyID, this operation returns a zero-length text object.

Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs

You can use default syntax expression prefixes that return IPv4 and IPv6 addresses, MAC addresses, IP subnets, useful client and server data such as the throughput rates at the interface ports (Rx, Tx, and RxTx), and the IDs of the VLANs through which packets are received. You can then use various operators to evaluate the data that is returned by these expression prefixes.

Expressions for IP Addresses and IP Subnets

You can use default syntax expressions to evaluate addresses and subnets that are in Internet Protocol version 4 (IPv4) or Internet Protocol version 6 (IPv6) format. Expression prefixes for IPv6 addresses and subnets include IPv6 in the prefix. Expression prefixes for IPv4 addresses and subnets include IP in the prefix. Following is an example of an expression that identifies whether a request has originated from a particular IPv4 subnet.

client.ip.src.in_subnet(147.1.0.0/16)

Following are two examples of Rewrite policies that examine the subnet from which the packet is received and perform a rewrite action on the Host header. With these two policies configured, the rewrite action that is performed depends on the subnet in the request. These two policies evaluate IP addresses that are in the IPv4 address format.

```
add rewrite action URL1-rewrite-action replace "http.req.header(\"Host\")" "\"www.mycompany1.com\""
add rewrite policy URL1-rewrite-policy "http.req.header(\"Host\").contains(\"www.test1.com\") && client.ip.
add rewrite action URL2-rewrite-action replace "http.req.header(\"Host\")" "\"www.mycompany2.com\""
add rewrite policy URL2-rewrite-policy "http.req.header(\"Host\").contains(\"www.test2.com\") && client.ip.
```

Note: The preceding examples are commands that you type at the NetScaler command-line interface (CLI) and, therefore, each quotation mark must be preceded by a backslash (\). For more information, see "Configuring Default Syntax Expressions in a Policy."

Prefixes for IPV4 Addresses and IP Subnets

The following table describes prefixes that return IPv4 addresses and subnets, and segments of IPv4 addresses. You can use numeric operators and operators that are specific to IPv4 addresses with these prefixes. For more information about numeric operations, see "Basic Operations on Expression Prefixes" and "Compound Operations for Numbers."

Table 1. Prefixes That Evaluate IP and MAC Addresses

Prefix	Description
`CLIENT.IP.SRC`	Returns the source IP of the current packet as an IP address or as a number.
`CLIENT.IP.DST`	Returns the destination IP of the current packet as an IP address or as a number.
`SERVER.IP.SRC`	Returns the source IP of the current packet as an IP address or as a number.
`SERVER.IP.DST`	Returns the destination IP of the current packet as an IP address or as a number.

Operations for IPV4 Addresses

The following table describes the operators that can be used with prefixes that return an IPv4 address.

Table 1. Operations on IPV4 Addresses

Prefix	Description
`<ip address>.EQ(<address>)`	Returns a Boolean TRUE if the IP address value is same as the <address> argument. The following example checks whether the client's destination IP address is equal to 10.100.10.100: `client.ip.dst.eq(10.100.10.100)`

`<ip address>.GET1. . .GET4`	Returns a portion of an IP address as a numeric value. For example, if the IP address value is 10.100.200.1, the following is returned:
	
	`client.ip.src.get1 Returns 10`
	
	`client.ip.src.get2 returns 100`
	
	`client.ip.src.get3 returns 200`

`<ip address>.IN_SUBNET(<subnet>)`	Returns a Boolean TRUE if the <subnet> argument matches the subnet of the address value. For example, the following determines whether the client's destination IP address subnet is 10.100.10.100/18: `client.ip.dst.eq(10.100.10.100/18)`
`<ip address>.SUBNET(<n>)`	Returns the IP address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 32. For example: `CLIENT.IP.SRC.SUBNET(24) returns 192.168.1.0 if the IP address represented by the prefix is 192.168.1.[0-255].`
`<ip address>.IS_IPV6`	Returns a Boolean TRUE if this is an Internet Protocol version 6 (IPv6) host for the client or server. Following is an example: `client.ip.src.is_ipv6`
`<ip address>.MATCHES(<hostname>)`	Returns a Boolean TRUE if the IP address for the host specified in <hostname> matches the current IP address. The <hostname> cannot exceed 255 charac

`<ip address>.MATCHES_LOCATION(<location>)`	Returns a Boolean TRUE if the location of the IP address matches the <locat argument. The Location string can take the following form: *qual1.qual2.qual3.qual4.qual5.qual6*, for example: NorthAmeria.CA.* Following is an example: `client.ip.src.matches_location(\"Europe.GB.17.London.*.*\`

About IPv6 Expressions

The IPv6 address format allows more flexibility than the older IPv4 format. IPv6 addresses are in the hexadecimal format (RFC 2373). In the following examples, Example 1 is an IPv6 address, Example 2 is a URL that includes the IPv6 address, and Example 3 includes the IPv6 address and a port number.

Example 1:

9901:0ab1:22a2:88a3:3333:4a4b:5555:6666

Example 2:

http://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]/

Example 3:

https://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]:8080/

In Example 3, the brackets separate the IP address from the port number (8080).

Note that you can only use the '+' operator to combine IPv6 expressions with other expressions. The output is a concatenation of the string values that are returned from the individual expressions. You cannot use any other arithmetic operator with an IPv6 expression. The following syntax is an example:

client.ipv6.src + server.ip.dst

For example, if the client source IPv6 address is ABCD:1234::ABCD, and the server destination IPv4 address is 10.100.10.100, the preceding expression returns "ABCD:1234::ABCD10.100.10.100".

Note that when the NetScaler appliance receives an IPv6 packet, it assigns a temporary IPv4 address from an unused IPv4 address range and changes the source address of the packet to this temporary address. At response time, the outgoing packet's source address is replaced with the original IPv6 address.

Note: You can combine an IPv6 expression with any other expression except an expression that produces a Boolean result.

Expression Prefixes for IPv6 Addresses

The IPv6 addresses that are returned by the expression prefixes in the following table can be treated as text data. For example, the prefix client.ipv6.dst returns the destination IPv6 address as a string that can be evaluated as text.

The following table describes expression prefixes that return an IPv6 address.

Table 1. IPv6 Expression Prefixes That Return Text

Prefix	Description
`CLIENT.IPV6`	Operates on the IPv6 address in with the current packet.
`CLIENT.IPV6.DST`	Returns the IPv6 address in the destination field of the IP header.

`CLIENT.IPV6.SRC`	Returns the IPv6 address in the source field of the IP header. Following are examples:
	
	`client.ipv6.src.in_subnet(2007::2008/64)`
	
	`client.ipv6.src.get1.le(2008)`

`SERVER.IPV6`	Operates on the IPv6 address in with the current packet.
`SERVER.IPV6.DST`	Returns the IPv6 address in the destination field of the IP header.

`SERVER.IPV6.SRC`	Returns the IPv6 address in the source field of the IP header. Following are examples:
	
	`server.ipv6.src.in_subnet(2007::2008/64)`
	
	`server.ipv6.src.get1.le(2008)`

Operations for IPV6 Prefixes

The following table describes the operators that can be used with prefixes that return an IPv6 address:

Table 1. Operations That Evaluate IPv6 Addresses

IPv6 Operation	Description
`<ipv6>.EQ(<IPv6_address> )`	Returns a Boolean TRUE if the IP address value is same as the <IPv6_address> argument. Following is an example: `client.ipv6.dst.eq(ABCD:1234::ABCD)`
`<ipv6>.GET1. . .GET8`	Returns a segment of an IPv6 address as a number. The following example expressions retrieve segments from the ipv6 address 1000:1001:CD10:0000:0000:89AB:4567:CDEF: · `client.ipv6.dst.get5` extracts 0000, which is the fifth set of bits in the address. · `client.ipv6.dst.get6 extracts 89AB.` · `client.ipv6.dst.get7` extracts 4567. You can perform numeric operations on these segments. Note that you cannot perform numeric operations when you retrieve an entire IPv6 address. This is because expressions that return an entire IPv6 address, such as `CLIENT.IPV6.SRC`, return the address in text format.
`<ipv6>.IN_SUBNET(<subnet>)`	Returns a Boolean TRUE if the IPv6 address value is in the subnet specified by the <subnet> argument. Following is an example: `client.ipv6.dst.eq(1000:1001:CD10:0000:0000:89AB:4567:CDEF/60)`
`<ipv6>.IS_IPV4`	Returns a Boolean TRUE if this is an IPv4 client, and returns a Boolean FALSE if it is not.
`<ipv6>.SUBNET(<n>)`	Returns the IPv6 address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 128. For example: `CLIENT.IPV6.SRC.SUBNET(24)`

Expressions for MAC Addresses

A MAC address consists of colon-delimited hexadecimal values in the format ##:##:##:##:##:##, where each “#” represents either a number from 0 through 9 or a letter from A through F. Default syntax expression prefixes and operators are available for evaluating source and destination MAC addresses.

Prefixes for MAC Addresses

The following table describes prefixes that return MAC addresses.

Table 1. Prefixes That Evaluate MAC Addresses

Prefix	Description
`client.ether.dstmac`	Returns the MAC address in the destination field of the Ethernet header.
`client.ether.srcmac`	Returns the MAC address in the source field of the Ethernet header.

Operations for MAC Addresses

The following table describes the operators that can be used with prefixes that return a MAC address.

Table 1. Operations on MAC Addresses

Prefix	Description
`<mac address>.EQ(<address>)`	Returns a Boolean TRUE if the MAC address value is same as the <address> argument.
`<mac address>.GET1. . .GET4`	Returns a numeric value extracted from the segment of the MAC address that is specified in the GET operation. For example, if the MAC address is 12:34:56:78:9a:bc, the following returns 34: `client.ether.dstmac.get2`

Expressions for Numeric Client and Server Data

The following table describes prefixes for working with numeric client and server data, including throughput, port numbers, and VLAN IDs.

Table 1. Prefixes That Evaluate Numeric Client and Server Data

Prefix	Description
`client.interface.rxthroughput`	Returns an integer representing the raw received traffic throughput in kilobytes per second (KBps) for the previous seven seconds.
`client.interface.txthroughput`	Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.
`client.interface.rxtxthroughput`	Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.
`server.interface.rxthroughput`	Returns an integer representing the raw received traffic throughput in KBps for the previous seven seconds.
`server.interface.txthroughput`	Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.
`server.interface.rxtxthroughput`	Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.
`server.vlan.id`	Returns a numeric ID of the VLAN through which the current packet entered the NetScaler.
`client.vlan.id`	Returns a numeric ID for the VLAN through which the current packet entered the NetScaler.

Default Syntax Expressions: Stream Analytics Functions

Stream Analytics expressions begin with the `ANALYTICS.STREAM(<identifier_name>)` prefix. The following list describes the functions that can be used with this prefix.

`COLLECT_STATS`

Collect statistical data from the requests that are evaluated against the policy and create a record for each request.

`REQUESTS`

Return the number of requests that exist for the specified record grouping. The value returned is of type unsigned long.

`BANDWIDTH`

Return the bandwidth statistic for the specified record grouping. The value returned is of type unsigned long.

`RESPTIME`

Return the response time statistic for the specified record grouping. The value returned is of type unsigned long.

`CONNECTIONS`

Return the number of concurrent connections that exist for the specified record grouping. The value returned is of type unsigned long.

`IS_TOP(n)`

Return a Boolean `TRUE` if the statistical value for the specified record grouping is one among the top `n` groups. Otherwise, return a Boolean `FALSE`.

`CHECK_LIMIT`

Return a Boolean `TRUE` if the statistic for the specified record grouping has hit the preconfigured limit. Otherwise, return a Boolean `FALSE`.

Default Syntax Expressions: DataStream

The policy infrastructure on the Citrix NetScaler appliance includes expressions that you can use to evaluate and process database server traffic when the appliance is deployed between a farm of application servers and their associated database servers.

Expressions for the MySQL Protocol

The following expressions evaluate traffic associated with MySQL database servers. You can use the request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors.

- **`MYSQL.CLIENT`.** Operates on the client properties of a MySQL connection.
- **`MYSQL.CLIENT.CAPABILITIES`.** Returns the set of flags that the client has set in the capabilities field of the handshake initialization packet during authentication. Examples of the flags that are set are `CLIENT_FOUND_ROWS`, `CLIENT_COMPRESS`, and `CLIENT_SSL`.
- **`MYSQL.CLIENT.CHAR_SET`.** Returns the enumeration constant assigned to the character set that the client uses. The `EQ(<m>)` and `NE(<m>)` operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the character set enumeration constants:
  - `LATIN2_CZECH_CS`
  - `DEC8_SWEDISH_CI`
  - `CP850_GENERAL_CI`
  - `GREEK_GENERAL_CI`
  - `LATIN1_GERMAN1_CI`
  - `HP8_ENGLISH_CI`
  - `KOI8R_GENERAL_CI`
  - `LATIN1_SWEDISH_CI`
  - `LATIN2_GENERAL_CI`
  - `SWE7_SWEDISH_CI`
  - `ASCII_GENERAL_CI`
  - `CP1251_BULGARIAN_CI`
  - `LATIN1_DANISH_CI`
  - `HEBREW_GENERAL_CI`
  - `LATIN7_ESTONIAN_CS`
  - `LATIN2_HUNGARIAN_CI`

- KOI8U_GENERAL_CI
- CP1251_UKRAINIAN_CI
- CP1250_GENERAL_CI
- LATIN2_CROATIAN_CI
- CP1257_LITHUANIAN_CI
- LATIN5_TURKISH_CI
- LATIN1_GERMAN2_CI
- ARMSCII8_GENERAL_CI
- UTF8_GENERAL_CI
- CP1250_CZECH_CS
- CP866_GENERAL_CI
- KEYBCS2_GENERAL_CI
- MACCE_GENERAL_CI
- MACROMAN_GENERAL_CI
- CP852_GENERAL_CI
- LATIN7_GENERAL_CI
- LATIN7_GENERAL_CS
- MACCE_BIN
- CP1250_CROATIAN_CI
- LATIN1_BIN
- LATIN1_GENERAL_CI
- LATIN1_GENERAL_CS
- CP1251_BIN
- CP1251_GENERAL_CI
- CP1251_GENERAL_CS
- MACROMAN_BIN
- CP1256_GENERAL_CI
- CP1257_BIN

- CP1257_GENERAL_CI
- ARMSCII8_BIN
- ASCII_BIN
- CP1250_BIN
- CP1256_BIN
- CP866_BIN
- DEC8_BIN
- GREEK_BIN
- HEBREW_BIN
- HP8_BIN
- KEYBCS2_BIN
- KOI8R_BIN
- KOI8U_BIN
- LATIN2_BIN
- LATIN5_BIN
- LATIN7_BIN
- CP850_BIN
- CP852_BIN
- SWE7_BIN
- UTF8_BIN
- GEOSTD8_GENERAL_CI
- GEOSTD8_BIN
- LATIN1_SPANISH_CI
- UTF8_UNICODE_CI
- UTF8_ICELANDIC_CI
- UTF8_LATVIAN_CI
- UTF8_ROMANIAN_CI
- UTF8_SLOVENIAN_CI

- UTF8_POLISH_CI
- UTF8_ESTONIAN_CI
- UTF8_SPANISH_CI
- UTF8_SWEDISH_CI
- UTF8_TURKISH_CI
- UTF8_CZECH_CI
- UTF8_DANISH_CI
- UTF8_LITHUANIAN_CI
- UTF8_SLOVAK_CI
- UTF8_SPANISH2_CI
- UTF8_ROMAN_CI
- UTF8_PERSIAN_CI
- UTF8_ESPERANTO_CI
- UTF8_HUNGARIAN_CI
- INVAL_CHARSET

- **MYSQL.CLIENT.DATABASE.** Returns the name of the database specified in the authentication packet that the client sends to the database server. This is the `databasename` attribute.
- `MYSQL.CLIENT.USER.` Returns the user name (in the authentication packet) with which the client is attempting to connect to the database. This is the `user` attribute.
- **MYSQL.REQ.** Operates on a MySQL request.
- **MYSQL.REQ.COMMAND.** Identifies the enumeration constant assigned to the type of command in the request. The `EQ(<m>)` and `NE(<m>)` operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the enumeration constant values:
  - SLEEP
  - QUIT
  - INIT_DB
  - QUERY
  - FIELD_LIST
  - CREATE_DB

    - DROP_DB
    - REFRESH
    - SHUTDOWN
    - STATISTICS
    - PROCESS_INFO
    - CONNECT
    - PROCESS_KILL
    - DEBUG
    - PING
    - TIME
    - DELAYED_INSERT
    - CHANGE_USER
    - BINLOG_DUMP
    - TABLE_DUMP
    - CONNECT_OUT
    - REGISTER_SLAVE
    - STMT_PREPARE
    - STMT_EXECUTE
    - STMT_SEND_LONG_DATA
    - STMT_CLOSE
    - STMT_RESET
    - SET_OPTION
    - STMT_FETCH
- **MYSQL.REQ.QUERY.** Identifies the query in the MySQL request.
- **MYSQL.REQ.QUERY.COMMAND.** Returns the first keyword in the MySQL query.
- **MYSQL.REQ.QUERY.SIZE.** Returns the size of the request query in integer format. The SIZE method is similar to the CONTENT_LENGTH method that returns the length of an HTTP request or response.
- **MYSQL.REQ.QUERY.TEXT.** Returns a string covering the entire query.

- **MYSQL.REQ.QUERY.TEXT(<n>).** Returns the first `n` bytes of the MySQL query as a string. This is similar to `HTTP.BODY(<n>)`.

  Parameters:

  `n` - Number of bytes to be returned

- **MYSQL.RES.** Operates on a MySQL response.

- **MYSQL.RES.ATLEAST_ROWS_COUNT(<i>).** Checks whether the response has at least `i` number of rows and returns a Boolean `TRUE` or `FALSE` to indicate the result.

  Parameters:

  `i` - Number of rows

- **MYSQL.RES.ERROR.** Identifies the MySQL error object. The error object includes the error number and the error message.

- **MYSQL.RES.ERROR.MESSAGE.** Returns the error message that is retrieved from the server's error response.

- **MYSQL.RES.ERROR.NUM.** Returns the error number that is retrieved from the server's error response.

- **MYSQL.RES.ERROR.SQLSTATE.** Returns the value of the `SQLSTATE` field in the server's error response. The MySQL server translates error number values to `SQLSTATE` values.

- **MYSQL.RES.FIELD(<i>).** Identifies the packet that corresponds to the i^{th} individual field in the server's response. Each field packet describes the properties of the associated column. The packet count (`i`) begins at 0.

  Parameters:

  `i` - Packet number

- **MYSQL.RES.FIELD(<i>).CATALOG.** Returns the `catalog` property of the field packet.

- **MYSQL.RES.FIELD(<i>).CHAR_SET.** Returns the character set of the column. The `EQ(<m>)` and `NE(<m>)` operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.

- **MYSQL.RES.FIELD(<i>).DATATYPE.** Returns an enumeration constant that represents the data type of the column. This is the `type` (also called `enum_field_type`) attribute of the column. The `EQ(<m>)` and `NE(<m>)` operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. The possible values for the various data types are:

  - `DECIMAL`
  - `TINY`
  - `SHORT`

- LONG
- FLOAT
- DOUBLE
- NULL
- TIMESTAMP
- LONGLONG
- INT24
- DATE
- TIME
- DATETIME
- YEAR
- NEWDATE
- VARCHAR (new in MySQL 5.0)
- BIT (new in MySQL 5.0)
- NEWDECIMAL (new in MySQL 5.0)
- ENUM
- SET
- TINY_BLOB
- MEDIUM_BLOB
- LONG_BLOB
- BLOB
- VAR_STRING
- STRING
- GEOMETRY

- **MYSQL.RES.FIELD(<i>).DB.** Returns the database identifier (db) attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).DECIMALS.** Returns the number of positions after the decimal point if the type is DECIMAL or NUMERIC. This is the decimals attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).FLAGS.** Returns the `flags` property of the field packet. Following are the possible hexadecimal flag values:
  - `0001`: `NOT_NULL_FLAG`
  - `0002`: `PRI_KEY_FLAG`
  - `0004`: `UNIQUE_KEY_FLAG`
  - `0008`: `MULTIPLE_KEY_FLAG`
  - `0010`: `BLOB_FLAG`
  - `0020`: `UNSIGNED_FLAG`
  - `0040`: `ZEROFILL_FLAG`
  - `0080`: `BINARY_FLAG`
  - `0100`: `ENUM_FLAG`
  - `0200`: `AUTO_INCREMENT_FLAG`
  - `0400`: `TIMESTAMP_FLAG`
  - `0800`: `SET_FLAG`
- **MYSQL.RES.FIELD(<i>).LENGTH.** Returns the length of the column. This is the value of the `length` attribute of the field packet. The value that is returned might be larger than the actual value. For example, an instance of a `VARCHAR(2)` column might return a value of `2` even when it contains only one character.
- **MYSQL.RES.FIELD(<i>).NAME.** Returns the column identifier (the name after the `AS` clause, if any). This is the `name` attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).ORIGINAL_NAME.** Returns the original column identifier (before the `AS` clause, if any). This is the `org_name` attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).ORIGINAL_TABLE.** Returns the original table identifier of the column (before the `AS` clause, if any). This is the `org_table` attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).TABLE.** Returns the table identifier of the column (after the `AS` clause, if any). This is the `table` attribute of the field packet.
- **MYSQL.RES.FIELDS_COUNT.** Returns the number of field packets in the response (the `field_count` attribute of the `OK` packet).
- **MYSQL.RES.OK.** Identifies the `OK` packet sent by the database server.
- **MYSQL.RES.OK.AFFECTED_ROWS.** Returns the number of rows affected by an `INSERT`, `UPDATE`, or `DELETE` query. This is the value of the `affected_rows` attribute of the `OK` packet.
- **MYSQL.RES.OK.INSERT_ID.** Identifies the `unique_id` attribute of the `OK` packet. If an auto-increment identity is not generated by the current MySQL statement or query, the value of `unique_id`, and hence the value returned by the expression, is `0`.

- **MYSQL.RES.OK.MESSAGE.** Returns the `message` property of the `OK` packet.
- **MYSQL.RES.OK.STATUS.** Identifies the bit string in the `server_status` attribute of the `OK` packet. Clients can use the server status to check whether the current command is a part of a running transaction. The bits in the `server_status` bit string correspond to the following fields (in the given order):
  - `IN TRANSACTION`
  - `AUTO_COMMIT`
  - `MORE RESULTS`
  - `MULTI QUERY`
  - `BAD INDEX USED`
  - `NO INDEX USED`
  - `CURSOR EXISTS`
  - `LAST ROW SEEN`
  - `DATABASE DROPPED`
  - `NO BACKSLASH ESCAPES`
- **MYSQL.RES.OK.WARNING_COUNT.** Returns the `warning_count` attribute of the `OK` packet.
- **MYSQL.RES.ROW(<i>).** Identifies the packet that corresponds to the i^{th} individual row in the database server's response.

  Parameters:

  `i` - Row number
- **MYSQL.RES.ROW(<i>).DOUBLE_ELEM(<j>).** Checks whether the j^{th} column of the i^{th} row of the table is `NULL`. Following C conventions, both indexes `i` and `j` start from 0. Therefore, row `i` and column `j` are actually the $(i+1)^{th}$ row and the $(j+1)^{th}$ column, respectively.

  Parameters:

  `i` - Row number

  `j` - Column number
- **MYSQL.RES.ROW(<i>).IS_NULL_ELEM(j).** Checks whether the j^{th} column of the i^{th} row of the table is `NULL`. Following C conventions, both indexes `i` and `j` start from 0. Therefore, row `i` and column `j` are actually the $(i+1)^{th}$ row and the $(j+1)^{th}$ column, respectively.

  Parameters:

  `i` - Row number

`j` - Column number

- **`MYSQL.RES.ROW(<i>).NUM_ELEM(<j>).`** Returns an integer value from the j^{th} column of the i^{th} row of the table. Following C conventions, both indexes `i` and `j` start from 0. Therefore, row `i` and column `j` are actually the $(i+1)^{th}$ row and the $(j+1)^{th}$ column, respectively.

  Parameters:

  `i` - Row number

  `j` - Column number

- **`MYSQL.RES.ROW(<i>).TEXT_ELEM(j).`** Returns a string from the j^{th} column of the i^{th} row of the table. Following C conventions, both indexes `i` and `j` start from 0. Therefore, row `i` and column `j` are actually the $(i+1)^{th}$ row and the $(j+1)^{th}$ column, respectively.

  Parameters:

  `i` - Row number

  `j` - Column number

- **`MYSQL.RES.TYPE.`** Returns an enumeration constant for the response type. Its values can be `ERROR`, `OK`, and `RESULT_SET`. The `EQ(<m>)` and `NE(<m>)` operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.

Expressions for Evaluating Microsoft SQL Server Connections

The following expressions evaluate traffic associated with Microsoft SQL Server database servers. You can use the request-based expressions (expressions that begin with MSSQL.CLIENT and MSSQL.REQ) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with MSSQL.RES) to evaluate server responses to user-configured health monitors.

Table 1. Expressions for Evaluating Microsoft SQL Server Connections

Expression	Description
MSSQL.CLIENT.CAPABILITIES	Returns the OptionFlags1, OptionFlags2, OptionFlags3, and TypeFlags fields of the LOGIN7 authentication packet, in that order, as a 4-byte integer. Each field is 1 byte long and specifies a set of client capabilities.
MSSQL.CLIENT.DATABASE	Returns the name of the client database. The value returned is of type text.
MSSQL.CLIENT.USER	Returns the user name with which the client authenticated. The value returned is of type text.
MSSQL.REQ.COMMAND	Returns an enumeration constant that identifies the type of command in the request sent to a Microsoft SQL Server database server. The value returned is of type text. Examples of the values of the enumeration constant are QUERY, RESPONSE, RPC, and ATTENTION. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.
MSSQL.REQ.QUERY.COMMAND	Returns the first keyword in the SQL query. The value returned is of type text.
MSSQL.REQ.QUERY.SIZE	Returns the size of the SQL query in the request. The value returned is a number.
MSSQL.REQ.QUERY.TEXT	Returns the entire SQL query as a string. The value returned is of type text.
MSSQL.REQ.QUERY.TEXT(<n>)	Returns the first n bytes of the SQL query. The value returned is of type text. **Parameters:** n - Number of bytes
MSSQL.REQ.RPC.NAME	Returns the name of the procedure that is being called in a remote procedure call (RPC) request. The name is returned as a string.

MSSQL.REQ.RPC.IS_PROCID	Returns a Boolean value that indicates whether the remote procedure call (RPC) request contains a procedure ID or an RPC name. A return value of TRUE indicates that the request contains a procedure ID and a return value of FALSE indicates that the request contains an RPC name.
MSSQL.REQ.RPC.PROCID	Returns the procedure ID of the remote procedure call (RPC) request as an integer.
MSSQL.REQ.RPC.BODY **Note:** Not available for releases before 10.1.	Returns the body of the SQL request as a string in the form of parameters represented as "a=b" clauses separated by commas, where "a" is the RPC parameter name and "b" is its value.
MSSQL.REQ.RPC.BODY(n) **Note:** Not available for releases before 10.1.	Returns part of the body of the SQL request as a string in the form of parameters represented as "a=b" clauses separated by commas, where "a" is the RPC parameter name and "b" is its value. Parameters are returned from only the first "n" bytes of the request, skipping the SQL header. Only complete name-value pairs are returned.
MSSQL.RES.ATLEAST_ROWS_COUNT(i)	Checks whether the response has at least i number of rows. The value returned is a Boolean TRUE or FALSE value. **Parameters:** i - Number of rows
MSSQL.RES.DONE.ROWCOUNT	Returns a count of the number of rows affected by an INSERT, UPDATE, or DELETE query. The value returned is of type unsigned long.
MSSQL.RES.DONE.STATUS	Returns the status field from the DONE token sent by a Microsoft SQL Server database server. The value returned is a number.
MSSQL.RES.ERROR.MESSAGE	Returns the error message from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the MsgText field in the ERROR token. The value returned is of type text.
MSSQL.RES.ERROR.NUM	Returns the error number from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the Number field in the ERROR token. The value returned is a number.
MSSQL.RES.ERROR.STATE	Returns the error state from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the State field in the ERROR token. The value returned is a number.

MSSQL.RES.FIELD(<i>).DATATYPE	Returns the data type of the i^{th} field in the server response. The EQ(<m>) and NE(<m>) functions, which return Boolean values to indicate the result of a comparison, are used with this prefix. For example, the following expression returns a Boolean TRUE if the DATATYPE function returns a value of datetime for the third field in the response: MSSQL.RES.FIELD(<2>).DATATYPE.EQ(datetime) **Parameters:** i - Row number
MSSQL.RES.FIELD(<i>).LENGTH	Returns the maximum possible length of the i^{th} field in the server response. The value returned is a number. **Parameters:** i - Row number
MSSQL.RES.FIELD(<i>).NAME	Returns the name of the i^{th} field in the server response. The value returned is of type text. **Parameters:** i - Row number
MSSQL.RES.ROW(<i>).DOUBLE_ELEM(<j>)	Returns a value of type double from the j^{th} column of the i^{th} row of the table. If the value is not a double value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the $(i + 1)^{th}$ row and the $(j + 1)^{th}$ column, respectively. **Parameters:** i - Row number j - Column number
MSSQL.RES.ROW(<i>).NUM_ELEM(j)	Returns an integer value from the j^{th} column of i^{th} row of the table. If the value is not an integer value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the $(i + 1)^{th}$ row and the $(j + 1)^{th}$ column, respectively. **Parameters:** i - Row number j - Column number

MSSQL.RES.ROW(<i>).IS_NULL_ELEM(j)	Checks whether the j^{th} column of the i^{th} row of the table is NULL and returns a Boolean TRUE or FALSE to indicate the result. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the $(i + 1)^{th}$ row and the $(j + 1)^{th}$ column, respectively. **Parameters:** i - Row number j - Column number
MSSQL.RES.ROW(<i>).TEXT_ELEM(j)	Returns a text string from the j^{th} column of i^{th} row of the table. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the $(i + 1)^{th}$ row and the $(j + 1)^{th}$ column, respectively. **Parameters:** i - Row number j - Column number
MSSQL.RES.TYPE	Returns an enumeration constant that identifies the response type. Following are the possible return values: · ERROR · OK · RESULT_SET The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.

Typecasting Data

You can extract data of one type (for example, text or an integer) from requests and responses and transform it to data of another type. For example, you can extract a string and transform the string to time format. You can also extract a string from an HTTP request body and treat it like an HTTP header or extract a value from one type of request header and insert it in a response header of a different type.

After typecasting the data, you can apply any operation that is appropriate for the new data type. For example, if you typecast text to an HTTP header, you can apply any operation that is applicable to HTTP headers to the returned value.

The following table describes various typecasting operations.

Table 1. Typecasting Functions

	Description

TYPECAST_LIST_T(<separator>)	Treats the text in an HTTP request or response body as a list whose elem by the character in the <separator> argument. Index values in the list th with zero (0). Text mode settings have no effect on the separator. For example, even i mode to IGNORECASE, and the separator is the letter “p,” an uppercase a separator. The following example creates a Rewrite action that constructs a list fro body and extracts the fourth item in the list: add rewrite action myreplace_action REPLACE 'http.req.body(100)' 'http.req.body(100).typecast_list_t('?').get(4)' set rewrite policy myreplace_policy -action myreplace_action This policy returns the string “fourth item” from the following request: GET?first item?second item?third item?fourth item? The following example extracts the fourth-from-last item from the list. add rewrite action myreplace_action1 REPLACE 'http.req.body(100)' 'http.req.body(100).typecast_list_t('?').get_reverse(4)' set rewrite policy myreplace_policy1 -action myreplace_action1 This policy returns the string “first item” from the following request: GET?first item?second item?third item?fourth item.

TYPECAST_ NVLIST_T(<separator>, <delimiter>) PECAST_ NVLIST_T(<separator>, <delimiter>,)	Treats the text as a name-value list. The <separator> argument identifie separates the name and the value. The <delimiter> argument identifies separates each name-value pair. The <quote> character is required whe into a name-value list that supports quoted strings. Any delimiters that a quoted string are ignored. The text mode has no effect on the delimiters. For example, if the curre IGNORECASE and you specify “p” as the delimiter, an uppercase “P” is n delimiter. For example, the following policy counts the number of name-value pair result in a header named name-value-count: add rewrite action mycount_action insert_http_header name-value-coun 'http.req.header("Cookie").typecast_nvlist_t('=',';').count' set rewrite policy mycount_policy -action mycount_action This policy can extract a count of arguments in Cookie headers and inser name-value-count header: `Cookie: name=name1; rank=rank1`
TYPECAST_TIME_T	Treats the designated text as a date string. The following formats are su · RFC822: Sun, 06 Nov 1994 08:49:37 GMT · RFC850: Sunday, 06-Nov-94 08:49:37 GMT · ASCII TIME: Sun Nov 6 08:49:37 1994 · HTTP Set-Cookie Expiry date: Sun, 06-Nov-1994 08:49:37 GMT For example, the following policy converts the string to a time value and day. This policy matches all requests that have a day value lesser than o Add rewrite policy mytime_policy "http.req.body(100) .typecast_time_t.day.le(10)" mytime_action bind rewrite global mytime_policy 100

c string>.TYPECAST_IP_ ADDRESS_T	Treats a numeric string as an IP address. For example, the following policy matches HTTP requests that contains C a value of: 12.34.56.78\r\n. set rewrite policy ip_check_policy -rule 'http.req.cookie .value("ip").typecast_ip_address_t.eq(12.34.56.78)' bind rewrite global ip_check_policy 200 -type req_default
c string>.TYPECAST_IPV6_ADDRESS_T	Treats a string as an IPv6 address in the following format: 0000:0000:CD00:0000:0000:00AB:0000:CDEF
TYPECAST_HTTP_ URL_T	Treats the designated text as the URL in the first line of an HTTP reques supported format is [<protocol>://<hostname>]<path>?<query> is set to URLENCODED by default. For example, the following policy replaces a URL-encoded part of a strin named Test. add rewrite action replace_header_string replace "http.req.header(\"Test\").typecast_http_url_t.path .before_str(\"123\").after_str(\"ABC\")" "\"string\"" add rewrite policy rewrite_test_header_policy true replace_header_strin bind rewrite global rewrite_test_header_policy 1 END -type res_override Consider the following header: Test: ABC%12123\r\n This policy would replace the preceding header with the value ABC%str
TYPECAST_HTTP_ HOSTNAME_T	Provides operations for parsing an HTTP host name as it appears in HTTP for a host name is abc.def.com:8080.
TYPECAST_HTTP_ METHOD_T	Converts text to an HTTP method. For example, the following policy matches any HTTP request that contai with a value equal to POST: Add rewrite policy method_policy "http.req.header(\"Host\") .typecast_http_method_t.eq(POST)" act1
TYPECAST_DNS_ DOMAIN_T	Enables the designated text to be parsed like a DNS domain name in the

TYPECAST_HTTP_ HEADER_T("<name>")	Converts the designated text to a multi-line HTTP header that you specif argument. For example, the following expression converts “MyHeader” to “InHeade http.req.header("MyHeader").typcast_http_header_t("InHeader") Typically, text operations that you specify in this type of expression app line of this header, with some exceptions. For example, the CONTAINS o values in all the lines in instances of this header type.
TYPECAST_COOKIE_T	Treats the designated text as an HTTP cookie as it appears in a Set-Cook header. You can apply name-value list operations as well as text operati designated text. For example, you can designate equals (=) as the name- the semicolon (;) as the list element delimiter. If you apply name-value list operations, the list is parsed as if IGNORE_E were in effect. Each cookie begins with a `cookie-name=cookie-value` pair, optiona attribute-value pairs that are separated by a semicolon, as follows: `cookie1=value1;version=n.n;value;domain=value;path=valu` If the same attribute appears more than once in a cookie, the value for t the attribute is returned.
>.TYPECAST_DOUBLE_AT	Transforms the number to a value of data type double.
>.TYPECAST_IP_ADDRESS_AT	Converts the number to an IP address.
>.TYPECAST_TIME_AT	Converts the number to time format.

>.TYPECAST_TIME_AT.BETWEEN(<time1>, <time2>)	Returns a Boolean value (TRUE or FALSE) that indicates whether the time by <number> is between the lower and upper time value arguments <tim The following are prerequisites for this function: · Both the lower and upper time arguments must be fully specified. Fo 1995 Jan is fully specified. But GMT Jan, GMT 1995 20 and GMT Jan / specified. · Both arguments must be either GMT or Local. · The day of the week must not be present in either argument. Howev month can be specified as the first, second, third, or fourth weekday (example Wed_3 is the third Wednesday of the month). · The upper time argument, <time2>, must be bigger than the lower t <time1>. The following examples assume that the current time value is GMT 2005 and that the day is the first Sunday of the month of May in 2005. The res is given after each example. BETWEEN(GMT 2004, GMT 2006): TRUE BETWEEN(GMT 2004 Jan, GMT 2006 Nov): TRUE BETWEEN(GMT 2004 Jan, GMT 2006): TRUE BETWEEN(GMT 2005 May Sun_1, GMT 2005 May Sun_3): TRUE BETWEEN(GMT 2005 May 1, GMT May 2005 1): TRUE BETWEEN(LOCAL 2005 May 1, LOCAL May 2005 1): The result depends on the NetScaler system's timezone. Parameters: <time1> - Lower time value <time2> - Upper time value
>.TYPECAST_TIME_AT.DAY	Extracts the day of the month from the current system time and returns number that corresponds to the day of the month. The returned value ra

>.TYPECAST_TIME_AT.EQ(<t>)	Returns a Boolean value (TRUE or FALSE) that indicates whether the tim by <number> is equal to the time value argument <t>. The following examples assume that the current time value is GMT 2005 and that the day is the 1st Sunday of the month of May in 2005. The resu is given after each example. EQ(GMT 2005): TRUE EQ(GMT 2005 Dec): FALSE EQ(Local 2005 May): TRUE or FALSE, depending on the time zone. EQ(GMT 10h): TRUE EQ(GMT 10h 30s): TRUE EQ(GMT May 10h): TRUE EQ(GMT Sun): TRUE EQ(GMT May Sun_1): TRUE Parameters: <t> - Time
>.TYPECAST_TIME_AT.GE(<t>)	Returns a Boolean value (TRUE or FALSE) that indicates whether the tim by <number> is greater than or equal to the time value argument <t>. The following examples assume that the current time value is GMT 2005 and that the day is the 1st Sunday of the month of May in 2005. The resu is given after each example. GE(GMT 2004): TRUE GE(GMT 2005 Jan): TRUE GE(Local 2005 May): TRUE or FALSE, depending on the time zone. GE(GMT 8h): TRUE GE(GMT 30m): FALSE GE(GMT May 10h): TRUE GE(GMT May 10h 0m): TRUE GE(GMT Sun): TRUE GE(GMT May Sun_1): TRUE Parameters: <t> - Time

>.TYPECAST_TIME_AT.GT(<t>)	Returns a Boolean value (TRUE or FALSE) that indicates whether the tim by <number> is greater than the time value argument <t>. The following examples assume that the current time value is GMT 2005 and that the day is the 1st Sunday of the month of May in 2005. The resu is given after each example. GT(GMT 2004): TRUE GT(GMT 2005 Jan): TRUE GT(Local 2005 May): TRUE or FALSE, depending on the time zone. GT(GMT 8h): TRUE GT(GMT 30m): FALSE GT(GMT May 10h): FALSE GT(GMT May 10h 0m): TRUE GT(GMT Sun): FALSE GT(GMT May Sun_1): FALSE Parameters: <t> - Time
>.TYPECAST_TIME_AT.HOURS	Extracts the hour from the current system time and returns the correspo integer that can range from 0 to 23.
>.TYPECAST_TIME_AT.LE(<t>)	Returns a Boolean value (TRUE or FALSE) that indicates whether the tim by <number> is lesser than or equal to the time value argument <t>. The following examples assume that the current time value is GMT 2005 and that the day is the 1st Sunday of the month of May in 2005. The resu is given after each example. LE(GMT 2006): TRUE LE(GMT 2005 Dec): TRUE LE(Local 2005 May): TRUE or FALSE, depending on the time zone. LE(GMT 8h): FALSE LE(GMT 30m): TRUE LE(GMT May 10h): TRUE LE(GMT Jun 11h): TRUE LE(GMT Wed): TRUE LE(GMT May Sun_1): TRUE Parameters: <t> - Time

>.TYPECAST_TIME_AT.LT(<t>)	Returns a Boolean value (TRUE or FALSE) that indicates whether the time by <number> is lesser than the time value argument <t>. The following examples assume that the current time value is GMT 2005 and that the day is the 1st Sunday of the month of May in 2005. The resu is given after each example. LT(GMT 2006): TRUE LT(GMT 2005 Dec): TRUE LT(Local 2005 May): TRUE or FALSE, depending on the time zone. LT(GMT 8h): FALSE LT(GMT 30m): TRUE LT(GMT May 10h): FALSE LT(GMT Jun 11h): TRUE LT(GMT Wed): TRUE LT(GMT May Sun_1): FALSE Parameters: <t> - Time
>.TYPECAST_TIME_AT.MINUTES	Extracts the minute from the current system time and returns the value can range from 0 to 59.
>.TYPECAST_TIME_AT.MONTH	Extracts the month from the current system time and returns the value a can range from 1 (January) to 12 (December).
>.TYPECAST_TIME_AT.RELATIVE_BOOT	Calculates the number of seconds that have elapsed after the most recen number of seconds to the next scheduled reboot, depending on which is time, and returns an integer. If the closest boot time is in the past, the If the closest boot time is in the future (scheduled reboot time), the inte
>.TYPECAST_TIME_AT.RELATIVE_NOW	Calculates the number of seconds between the current system time and and returns the value as an integer. If the designated time is in the past negative. If it is in the future, the integer is positive.
>.TYPECAST_TIME_AT.SECONDS	Extracts the seconds from the current system time and returns the value can range from 0 to 59.
>.TYPECAST_TIME_AT.WEEKDAY	Returns an integer that corresponds to the day of the week; 0 for Sunday

>.TYPECAST_TIME_AT.WITHIN(<time1>, <time2>)	Returns a Boolean value (TRUE or FALSE) that indicates whether the tim by <number> lies within all the ranges defined by lower and upper time <time1> and <time2>. If an element of time such as the day or the hour is left unspecified in th <time1>, then it is assumed to have the lowest value possible for its rang If an element is left unspecified in the upper argument , <time2>, then i the highest value possible for its range. If the year is specified in one of the arguments, then it must be specifie argument as well. Following are the ranges for different elements of time: · month: 1-12 · day: 1-31 · weekday: 0-6 · hour: 0-23 · minutes: 0-59 · seconds: 0-59. Each element of time in the lower time value argument defines a range the corresponding element in the upper time value argument. For the re each element of time in the time value designated by <number> must lie corresponding range specified by the lower and upper arguments. The following examples assume that the current time value is GMT 2005 30s.and that the day is the second Tuesday of the month. The result of t given after each example. WITHIN(GMT 2004, GMT 2006): TRUE WITHIN(GMT 2004 Jan, GMT 2006 Mar): FALSE (May doesn't fall in the Jan WITHIN(GMT Feb, GMT): TRUE (May falls in the Feb-Dec range.) WITHIN(GMT Sun_1, GMT Sun_3): TRUE (2nd Tuesday lies within 1st Sund and the 3rd Sunday.) WITHIN(GMT 2005 May 1 10h, GMT May 2005 1 17h): TRUE WITHIN(LOCAL 2005 May 1, LOCAL May 2005 1): The result depends on the NetScaler system's timezone. Parameters: <time1> - Lower time value <time2> - Upper time value
>.TYPECAST_TIME_AT.YEAR	Extracts the year from the current system time and returns the value as

>.TYPECAST_NUM_T(<type>)	Casts numeric string data to a signed 32-bit number. The argument <typ the following: · DECIMAL. Treat the string as a decimal number and cast to a signed · HEX. Treat the string as a hexadecimal number and cast to a signed · DECIMAL_PREFIX. Consider the part of the string up to the first occ character that is not a valid decimal character and cast to a signed 3 · HEX_PREFIX. Consider the part of the string up to the first occurrer that is not a valid hexadecimal character and cast to a signed 32-bit For example, the following policy extracts a numeric portion of a query s number, and inserts an HTTP header named Company with the resulting add rewrite action myadd_action insert_http_header Company "http.req.url.query.typecast_num_t(decimal).add(4)" add rewrite policy myadd_policy true myadd_action bind rewrite global myadd_policy 300 END -type RES_DEFAULT For example, this policy would extract "4444" from the following URL st /test/file.html?4444 The action that is associated with the policy would insert the following H header: Company: 4448\r\n
>.TYPECAST_NUM_AT	Casts a number of any data type to a number of data type integer.
>.TYPECAST_DOUBLE_AT	Casts a number of any data type to a number of data type double.
>.TYPECAST_UNSIGNED_LONG_AT	Casts a number of any data type to a number of data type unsigned long
>.TYPECAST_NUM_T(<type>,<default>)	Casts string data to a signed 32-bit number. If the typecasting operation (UNDEF) condition, the function returns the value specified for default. takes the values specified for TYPECAST_NUM_T(<type>).
>.TYPECAST_UNSIGNED_LONG_T(<type>)	Casts string data to data of type unsigned long. The argument can be on · DECIMAL. Treat the string as a decimal number and cast to unsigned · HEX. Treat the string as a hexadecimal number and cast to unsigned · DECIMAL_PREFIX. Consider the part of the string up to the first occ character that is not a valid decimal character and cast to unsigned · HEX_PREFIX. Consider the part of the string up to the first occurrer that is not a valid hexadecimal character and cast to unsigned long.

>.TYPECAST_UNSIGNED_LONG_T(<type>,<default>)	Casts string data to data of type unsigned long. If the typecasting operat undefined (UNDEF) condition, the function returns the value specified fo argument takes the values specified for TYPECAST_UNSIGNED_LONG_T

Regular Expressions

When you want to perform string matching operations that are more complex than the operations that you perform with the CONTAINS(“<string>”) or EQ(“<string>“) operators, you use regular expressions. The policy infrastructure on the Citrix® NetScaler® appliance includes operators to which you can pass regular expressions as arguments for text matching. The names of the operators that work with regular expressions include the string REGEX. The regular expressions that you pass as arguments must conform to the regular expression syntax that is described in "http://www.pcre.org/pcre.txt." You can learn more about regular expressions at "http://www.regular-expressions.info/quickstart.html" and at "http://www.silverstones.com/thebat/Regex.html."

The target text for an operator that works with regular expressions can be either text or the value of an HTTP header. Following is the format of a default syntax expression that uses a regular expression operator to operate on text:

```
<text>.<regex_operator>(re<delimiter><regex_pattern><delimiter>)
```

The string <text> represents the default syntax expression prefix that identifies a text string in a packet (for example, HTTP.REQ.URL). The string <regex_operator> represents the regular expression operator. The regular expression always begins with the string re. A pair of matching delimiters, represented by <delimiter>, enclose the string <regex_pattern>, which represents the regular expression.

The following example expression checks whether the URL in an HTTP packet contains the string *.jpeg (where * is a wildcard) and returns a Boolean TRUE or FALSE to indicate the result. The regular expression is enclosed within a pair of slash marks (/), which act as delimiters.

```
http.req.url.regex_match(re/*.jpeg/)
```

Regular expression operators can be combined to define or refine the scope of a search. For example, `<text>.AFTER_REGEX(re/regex_pattern1/).BEFORE_REGEX(re/regex_pattern2/)` specifies that the target for string matching is the text between the patterns regex_pattern1 and regex_pattern2. You can use a text operator on the scope that is defined by the regular expression operators. For example, you can use the CONTAINS(“<string>”) operator to check whether the defined scope contains the string abc:

```
<text>.AFTER_REGEX(re/regex_pattern1/).BEFORE_REGEX(re/regex_pattern2
/).CONTAINS(“abc”)
```

Note: The process of evaluating a regular expression inherently takes more time than that for an operator such as CONTAINS(“<string>”) or EQ(“<string>”), which work with simple string arguments. You should use regular expressions only if your requirement is beyond the scope of other operators.

Basic Characteristics of Regular Expressions

Following are notable characteristics of regular expressions as defined on the NetScaler appliance:

- A regular expression always begins with the string “re” followed by a pair of delimiting characters (called delimiters) that enclose the regular expression that you want to use.

  For example, `re#<regex_pattern>#` uses the number sign (#) as a delimiter.

- A regular expression cannot exceed 1499 characters.
- Digit matching can be done by using the string \d (a backslash followed by d).
- White space can be represented by using \s (a backslash followed by s).
- A regular expression can contain white spaces.

Following are the differences between the NetScaler syntax and the PCRE syntax:

- The NetScaler does not allow back references in regular expressions.
- You should not use recursive regular expressions.
- The dot meta-character also matches the newline character.
- Unicode is not supported.
- The operation SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option in the regular expression.

Operations for Regular Expressions

The following table describes the operators that work with regular expressions. The operation performed by a regular expression operator in a given default syntax expression depends on whether the expression prefix identifies text or HTTP headers. Operations that evaluate headers override any text-based operations for all instances of the specified header type. When you use an operator, replace <text> with the default syntax expression prefix that you want to configure for identifying text.

Table 1. Default Syntax Expression Operators That Work with Regular Expressions

sion Operation	Description
RE_REGEX(<regular)	Selects the text that precedes the string that matches the <regular expression> argument. If the regular exp any data in the target, the expression returns a text object of length 0. The following expression selects the string "text" from "text/plain". `http.res.header("content-type").before_regex(re#/#)`
R_REGEX(<regular)	Selects the text that follows the string that matches the <regular expression> argument. If the regular expre text in the target, the expression returns a text object of length 0. The following expression extracts "Example" from "myExample": `http.req.header("etag").after_regex(re/my/)`
X_SELECT(<regular)	Selects a string that matches the <regular expression> argument. If the regular expression does not match t of length 0 is returned. The following example extracts the string "NS-CACHE-9.0: 90" from a Via header: `http.req.header("via").regex_select(re!NS-CACHE-\d\.\d:\s*\d{1,3}!)`

X_MATCH(<regular
)
	Returns TRUE if the target matches a <regular expression> argument of up to 1499 characters.
	
	The regular expression must be of the following format:
	
	`re<delimiter>regular expression< delimiter>`
	
	Both delimiters must be the same. Additionally, the regular expression must conform to the Perl-compatible expression library syntax. For more information, go tohttp://www.pcre.org/pcre.txt. In particular, see the However, note the following:
	
	· Back-references are not allowed.
	
	· Recursive regular expressions are not recommended.
	
	· The dot metacharacter also matches the newline character.
	
	· The Unicode character set is not supported.
	
	· SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.
	
	The following are examples:
	
	http.req.hostname.regex_match(re/[[:alpha:]]+(abc){2,3}/)
	http.req.url.set_text_mode(urlencoded).regex_match(re#(a*b+c*)#)
	
	The following example matches ab and aB:
	
	`http.req.url.regex_match(re/a(?i)b/)`
	
	The following example matches ab, aB, Ab and AB:
	
	`http.req.url.set_text_mode(ignorecase).regex_match(re/ab/)`
	
	The following example performs a case-insensitive, multiline match in which the dot meta-character also m character:
	
	`http.req.body.regex_match(re/(?ixm) (^ab (.*) cd$) /)`

Configuring Classic Policies and Expressions

Some NetScaler features use classic policies and classic expressions. As with default syntax policies, classic policies can be either global or specific to a virtual server. However, to a certain extent, the configuration method and bind points for classic policies are different from those of default syntax policies. As with default syntax expressions, you can configure named expressions and use a named expression in multiple classic policies.

Where Classic Policies Are Used

The following table summarizes NetScaler features that can be configured by using classic policies.

Table 1. Policy Type and Bind Points for Policies in Features That Use Classic Policies

ature	Virtual Servers	Supported Policies	Policy Bind Points	How Y Policie
stem features, thentication	None	Authentication policies	Global	For th Authe featur contai authe schem differ authe metho examp config certifi authe schem
L	None	SSL policies	· Global · Load Balancing virtual server	To de to app encryp and ac inform clear To pro end-to securi messa decryp featur clear SSL to comm back-e server

ntent itching an use either assic or default ntax policies, t not both)	Content Switching virtual server	Content Switching policies	· Content Switching virtual server · Cache Redirection virtual server	To de server server respon servin based charac an inc reque Reque charac includ type, cookie metho type a associ server
mpression	None	HTTP Compression policies	· Global · Content Switching virtual server · Load Balancing virtual server · SSL Offload virtual server · Service	To de type o traffic compr
otection atures, Filter	None	Content Filtering policies	· Global · Content Switching virtual server · Load Balancing virtual server · SSL Offload virtual server · Service	To co behav filter
otection atures, reConnect	None	SureConnect policies	· Load Balancing virtual server · SSL Offload virtual server · Service	To co behav SureC functi
otection atures, Priority ueuing	None	Priority Queuing policies	· Load Balancing virtual server · SSL Offload virtual server	To co behav Priorit functi
TML Injection	None	HTML Injection Policies	· Global · Load Balancing virtual server · Content Switching virtual server · SSL Offload virtual server	To ena NetSc text o an HT that it client

AA - Traffic anagement	None	Authentication, Authorization, Auditing, and Session policies	· Authentication virtual server (authentication, session, and auditing policies) · Load Balancing or Content Switching virtual server (authorization and auditing policies) · Global (session and audit policies) · AAA group or user (session, auditing, and authorization policies)	To co for us specif and au user a
che edirection	Cache Redirection virtual server	Cache Redirection policies Map policies	Cache Redirection virtual server	To de wheth respon served cache server

		TCP Compression policies	VPN Global	

Configuring a Classic Policy

You can configure classic policies and classic expressions by using either the configuration utility or the command-line interface. A policy rule cannot exceed 1,499 characters. When configuring the policy rule, you can use named classic expressions. For more information about named expressions, see "Creating Named Classic Expressions." After configuring the policy, you bind it either globally or to a virtual server.

Note that there are small variations in the policy configuration methods for various NetScaler features.

Note: You can embed a classic expression in a default syntax expression by using the syntax SYS.EVAL_CLASSIC_EXPR***(classic_expression)***, specifying the *classic_expression* as the argument.

To create a classic policy by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add cmp policy <name> -rule <expression> -action <action>
- show cmp policy [<policyName>]

Example

The following commands first create a compression action and then create a compression policy that applies the action:

```
> add cmp action cmp-act-compress compress
 Done
> show cmp action cmp-act-compress
1)      Name: cmp-act-compress  Compression Type: compress
 Done
> add cmp pol cmp-pol-compress -rule ExpCheckIp -resAction cmp-act-compress
 Done
> show cmp pol cmp-pol-compress
1)      Name: cmp-pol-compress  Rule: ExpCheckIp
        Response action: cmp-act-compress       Hits: 0
 Done
>
```

Parameters for configuring a classic policy

featureName

The feature for which you are creating the policy. For example, for Access Gateway policies, type `accessgw`. For application firewall policies, type `appfw`. For SSL policies, type `ssl`.

name

A name for the policy. You must begin a policy name with a letter or underscore. A policy name can consist of 1 to 31 characters, including letters, numbers, hyphen (-), period (.), pound sign (#), space ( ), and underscore (_).

expression

The expression, as described in "Configuring a Classic Expression."

action

The name of the action that you want to associate with this policy. For Access Gateway and application firewall policies, you substitute the appropriate profile instead of an action.

To create a policy with classic expressions by using the configuration utility

1. In the navigation pane, expand the feature for which you want to configure a policy and, depending on the feature, do the following:
   - For Content Switching, Cache Redirection, and the application firewall, click Policies.
   - For SSL, click Policies, and then in the details pane, click the Policies tab.
   - For System Authentication, click Authentication, and then in the details pane, click the Policies tab.
   - For Filter, SureConnect, and Priority Queuing, expand Protection Features, select the desired function, and then in the details pane, click the Policies tab.
   - For the Access Gateway, expand Access Gateway, expand Policies, select the desired function, and then in the details pane, click the Policies tab.
2. For most features, click the Add button.
3. In the Create <feature name> Policy dialog box, in the Name* text box, enter a name for the policy.

   Note: Note: You must begin a policy name with a letter or underscore. A policy name can consist of 1 to 31 characters, including letters, numbers, hyphen (-), period (.), pound sign (#), space ( ), and underscore (_).
4. For most features, you associate an action or a profile. For example, you may be required to select an action, or, in the case of an Access Gateway or application firewall policy, you select a profile to associate with the policy. A profile is a set of configuration options that operate as a set of actions that are applied when the data being analyzed matches the policy rule.
5. Create an expression that describes the type of data that you want this policy to match.

   Depending on the type of policy you want to create, you can choose a predefined expression, or you can create a new expression. For instructions on how to create an expression for most types of classic policies, see "Configuring a Classic Expression."

   Named expressions are predefined expressions that you can reference by name in a policy rule. For more information about named expressions, see "Creating Named Classic Expressions." For a list of all the default named expressions and a definition of each, see "Expressions Reference."
6. Click Create to create your new policy.
7. Click Close to return to the Policies screen for the type of policy you were creating.

Configuring a Classic Expression

Classic expressions consist of the following expression elements, listed in hierarchical order:

- **Flow Type.** Specifies whether the connection is incoming or outgoing. The flow type is REQ for incoming connections and RES for outgoing connections.
- **Protocol.** Specifies the protocol, the choices for which are HTTP, SSL, TCP, and IP.
- **Qualifier.** The protocol attribute, which depends on the selected protocol.
- **Operator.** The type of test you want to perform on the connection data. Your choice of operator depends upon the connection information you are testing. If the connection information you are testing is text, you use text operators. If it is a number, you use standard numeric operators.
- **Value.** The string or number against which the connection data element—defined by the flow type, protocol, and qualifier—is tested. The value can be either a literal or an expression. The literal or expression must match the data type of the connection data element.

In a policy, classic expressions can be combined to create more complex expressions using Boolean and comparative operators.

Expression elements are parsed from left to right. The leftmost element is either REQ or RES and designates a request or a response, respectively. Successive terms define a specific connection type and a specific attribute for that connection type. Each term is separated from any preceding or following term by a period. Arguments appear in parentheses and follow the expression element to which they are passed.

The following classic expression fragment returns the client source IP for an incoming connection.

```
REQ.IP.SOURCEIP
```

The example identifies an IP address in a request. The expression element SOURCEIP designates the source IP address. This expression fragment may not be useful by itself. You can use an additional expression element, an operator, to determine whether the returned value meets specific criteria. The following expression tests whether the client IP is in the subnet 200.0.0.0/8 and returns a Boolean TRUE or FALSE:

```
REQ.IP.SOURCEIP == 200.0.0.0 -netmask 255.0.0.0
```

To create a classic policy expression by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- set appfw policy <name> -rule <expression> -action <action>
- show appfw policy <name>

Example

```
> set appfw policy GenericApplicationSSL_ 'HTTP.REQ.METHOD.EQ("get")' APPFW_DROP
 Done
> show appfw policy GenericApplicationSSL_
       Name: GenericApplicationSSL_    Rule: HTTP.REQ.METHOD.EQ("get")
       Profile: APPFW_DROP     Hits: 0
       Undef Hits: 0
       Policy is bound to following entities
       1) REQ VSERVER app_u_GenericApplicationSSLPortalPages   PRIORITY : 100
 Done
```

To add an expression for a classic policy by using the configuration utility

This procedure documents the Add Expression dialog box. Depending on the feature for which you are configuring a policy, the route by which you arrive at this dialog box may be different.

1. Perform steps 1-4 in "To create a policy with classic expressions by using the configuration utility."
2. In the Add Expression dialog box, in Expression Type, click the type of expression you want to create.
3. Under Flow Type, click the down arrow and choose a flow type.

   The flow type is typically REQ or RES. The REQ option specifies that the policy applies to all incoming connections or requests. The RES option applies the policy to all outgoing connections or responses.

   For Application Firewall policies, you should leave the expression type set to General Expression, and the flow type set to REQ. The Application Firewall treats each request and response as a single paired entity, so all Application Firewall policies begin with REQ.
4. Under Protocol, click the down arrow and choose the protocol you want for your policy expression. Your choices are:

- HTTP. Evaluates HTTP requests that are sent to a Web server. For classic expressions, HTTP includes HTTPS requests.
- SSL. Evaluates SSL data associated with the current connection.
- TCP. Evaluates the TCP data associated with the current connection.
- IP. Evaluates the IP addresses associated with the current connection.

5. Under Qualifier, click the down arrow and choose a qualifier for your policy.

   The qualifier defines the type of data to be evaluated. The list of qualifiers that appears depends on which protocol you selected in step 4.

   The following list describes the qualifier choices for the HTTP protocol. For a complete list of protocols and qualifiers, see "Classic Expressions."

   The following choices appear for the HTTP protocol:

   - METHOD. Filters HTTP requests that use a particular HTTP method.
   - URL. Filters HTTP requests for a specific Web page.
   - URLQUERY. Filters HTTP requests that contain a particular query string.
   - VERSION. Filters HTTP requests on the basis of the specified HTTP protocol version.
   - HEADER. Filters on the basis of a particular HTTP header.
   - URLLEN. Filters on the basis of the length of the URL.
   - URLQUERY. Filters on the basis of the query portion of the URL.
   - URLQUERYLEN. Filters on the basis of the length of the query portion of the URL only.

6. Under Operator, click the down arrow and choose the operator for your policy expression. For a complete list of choices see the “Operators” table in "Classic Expressions." Some common operators are:

Operator	Description
==	Matches the specified value exactly or is exactly equal to the specified value.
!=	Does not match the specified value.
>	Is greater than the specified value.
<	Is less than the specified value.
>=	Is greater than or equal to the specified value.
<=	Is less than or equal to the specified value.
CONTAINS	Contains the specified value.

CONTENTS	Returns the contents of the designated header, URL, or URL query.
EXISTS	The specified header or query exists.
NOTCONTAINS	Does not contain the specified value.
NOTEXISTS	The specified header or query does not exist.

7. If a Value text box appears, type a string or numeric value, as appropriate. For example, chose REQ as the Flow Type, HTTP as the Protocol, and HEADER as the qualifier, and then type the value of the header string in the Value field and the header type for which you want to match the string in the Header Name text box.

8. Click OK.

9. To create a compound expression, click Add. Note that the type of compounding that is done depends on the following choices in the Create Policy dialog box:

   - **Match Any Expression.** The expressions are in a logical OR relationship.

   - **Match All Expressions.** The expressions are in a logical AND relationship.

   - **Tabular Expressions.** Click the AND, OR, and parentheses buttons to control evaluation.

   - **Advanced Free-Form.** Enter the expressions components directly into the Expression field, and click the AND, OR, and parentheses buttons to control evaluation.

Binding a Classic Policy

Depending on the policy type, you can bind a classic policy either globally or to a virtual server. Policy bind points are described in the table, "Policy Type and Bind Points for Policies in Features That Use Classic Policies."

Note: You can bind a classic policy to multiple bind points.

To bind a classic policy globally by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- bind cmp global <policyName> [-priority <positive_integer>]
- show cmp global

Example

```
> bind cmp global cmp-pol-compress -priority 2
 Done
> show cmp global
1)      Policy Name: cmp-pol-compress   Priority: 2
2)      Policy Name: ns_nocmp_xml_ie    Priority: 8700
3)      Policy Name: ns_nocmp_mozilla_47        Priority: 8800
4)      Policy Name: ns_cmp_mscss       Priority: 8900
5)      Policy Name: ns_cmp_msapp       Priority: 9000
6)      Policy Name: ns_cmp_content_type        Priority: 10000
 Done
>
```

To bind a classic policy to a virtual server by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- bind lb vserver <name> [<targetVserver>] [-policyName <string> [-priority <positive_integer>]
- show lb vserver<name>

Example

```
> bind lb vserver lbtemp -policyName cmp-pol-compress -priority 1
 Done
> show lb vserver lbtemp
        lbtemp (10.102.29.101:80) - HTTP        Type: ADDRESS
        State: UP
        Last state change was at Tue Oct 27 06:40:38 2009 (+557 ms)
        Time since last state change: 0 days, 02:00:40.330
        Effective State: UP
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  1 (Total)       1 (Active)
        Configured Method: LEASTCONNECTION
        Current Method: Round Robin, Reason: Bound service's state changed to UP
        Group: vserver-grp
        Mode: IP
        Persistence: COOKIEINSERT (version 0)   Persistence Backup: SOURCEIP   Persistence Mask: 255.255.255
        Persistence Timeout: 2 min      Backup Persistence Timeout: 2 min
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none
1) http-one (10.102.29.252: 80) - HTTP State: UP        Weight: 1
        Persistence Cookie Value : NSC_wtfswfs-hsq=ffffffff096e03ed45525d5f4f58455e445a4a423660
1)      Policy : cmp-pol-compress Priority:1
 Done
>
```

Parameters for binding a classic policy

featureName

The name of the feature for which you are creating a policy. For application firewall policies, type `appfw`. For Access Gateway policies, type `accessgw`. For SSL policies, type `ssl`.

policyName

The name of the policy that you want to bind.

name

The name of the virtual server to which you bind the policy.

priority

The priority that you want to assign to the policy.

To bind a classic policy globally by using the configuration utility

Note: This procedure documents the Global Bindings dialog box. Depending on the feature for which you want to globally bind a policy, the route by which you arrive at this dialog box may be different.

1. In the navigation pane, expand the feature for which you want to globally bind a classic policy, and then locate the policy that you want to bind globally.

   Note: You cannot globally bind policies for Content Switching, Cache Redirection, SureConnect, Priority Queuing, or Access Gateway Authorization.

2. In the details pane, click Global Bindings.

3. In the Bind/Unbind <feature name> Policy(s) to Global dialog box, click Insert Policy.

4. In the Policy Name column, click the name of an existing policy that you want to globally bind, or click New Policy to open the Create <feature name> Policy dialog box.

5. After you have selected the policy or created a new policy, in the Priority column, type the priority value.

   The lower the number, the sooner this policy is applied relative to other policies. For example, a policy assigned a priority of 10 is applied before a policy with a priority of 100. You can use the same priority for different policies. All features that use classic policies implement only the first policy that a connection matches, so policy priority is important for getting the results you intend.

   As a best practice, leave room to add policies by setting priorities with intervals of 50 (or 100) between each policy.

6. Click OK.

To bind a classic policy to a virtual server by using the configuration utility

1. In the navigation pane, expand the feature that contains the virtual server to which you want to bind a classic policy (for example, if you want to bind a classic policy to a content switching virtual server, expand Content Switching), and then click Virtual Servers.

2. In the details pane, select the virtual server, and then click Open.

3. In the Configure <Feature> Virtual Server dialog box, on the Policies tab, click the feature icon for the type policy that you want, and then click Insert Policy.

4. In the Policy Name column, click the name of an existing policy that you want to bind to a virtual server, or click A to open the Create <feature name> Policy dialog box.

5. After you have selected the policy or created a new policy, in the Priority column, set the priority.

   If you are binding a policy to a content switching virtual server, in the Target column, select a load balancing virtual server to which traffic that matches the policy should be sent.

6. Click OK.

Viewing Classic Policies

You can view classic policies by using either the configuration utility or the command line. You can view details such as the policy's name, expression, and bindings.

To view a classic policy and its binding information by using the command line interface

At the command prompt, type the following commands to view a classic policy and its binding information:

show <featureName> policy [policyName]

Example

```
> show appfw policy GenericApplicationSSL_
      Name: GenericApplicationSSL_    Rule: ns_only_get_adv
      Profile: GenericApplicationSSL_Prof1    Hits: 0
      Undef Hits: 0
      Policy is bound to following entities
      1) REQ VSERVER app_u_GenericApplicationSSLPortalPages   PRIORITY : 100
 Done
```

Note: If you omit the policy name, all policies are listed without the binding details.

Parameters for viewing a classic policy

featureName

The name of the feature with which the policy is associated.

policyName

The name of the policy that you want to view.

To view classic policies and policy bindings by using the configuration utility

1. In the navigation pane, expand the feature whose policies you want to view, (for example, if you want to view application firewall policies, expand Application Firewall), and then click Policies.

2. In the details pane, do one or more of the following:

   - To view details for a specific policy, click the policy. Details appear in the Details area of the configuration pane.

   - To view bindings for a specific policy, click the policy, and then click Show Bindings.

   - To view global bindings, click the policy, and then click Global Bindings. Note that you cannot bind a Content Switching, Cache Redirection, SureConnect, Priority Queuing, or Access Gateway Authorization policy globally.

Creating Named Classic Expressions

A named classic expression is a classic expression that can be referenced through an assigned name. Often, you need to configure classic expressions that are large or complex and form a part of a larger compound expression. You might also configure classic expressions that you need to use frequently and in multiple compound expressions or classic policies. In these scenarios, you can create the classic expression you want, save it with a name of your choice, and then reference the expression from compound expressions or policies through its name. This saves configuration time and improves the readability of complex compound expressions. Additionally, any modifications to a named classic expression need to be made only once.

Some named expressions are built-in, and a subset of these are read-only. Built-in named expressions are divided into four categories: General, Anti-Virus, Personal Firewall, and Internet Security. General named expressions have a wide variety of uses. For example, from the General category, you can use the expressions `ns_true` and `ns_false` to specify a value of TRUE or FALSE, respectively, to be returned for all traffic. You can also identify data of a particular type (for example, HTM, DOC, or GIF files), determine whether caching headers are present, or determine whether the round trip time for packets between a client and the NetScaler is high (over 80 milliseconds).

Anti-Virus, Personal Firewall, and Internet Security named expressions test clients for the presence of a particular program and version and are used primarily in Access Gateway policies.

For descriptions of the built-in named expressions, see "Classic Expressions."

Note: You cannot modify or delete built-in named expressions.

To create a named classic expression by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add expression <name> <value> [-comment <string>] [-clientSecurityMessage <string>]
- show expression [<name> | -type CLASSIC

Example

```
> add expression classic_ne "REQ.HTTP.URL CONTAINS www.example1.com" -comment "Checking the URL for
 Done
> show expression classic_ne
1)     Name: classic_ne  Expr: REQ.HTTP.URL CONTAINS www.example1.com  Hits: 0 Type : CLASSIC
       Comment: "Checking the URL for www.example1.com"
 Done
```

>

Parameters for creating a named classic expression

name

The name of the expression that will be created. This is a required argument. The maximum length of the expression is 63 characters.

value

The expression string. This is a required argument. The maximum length is 1499 characters.

comment

Any comments that you may want to associate with the expression. The maximum length is 255 characters.

clientSecurityMessage

The client security message that must be displayed if the expression evaluates to false. This parameter is valid for expressions that perform endpoint checks only. The maximum length is 127 characters.

To create a named classic expression by using the configuration utility

1. In the navigation pane, expand AppExpert, expand Expressions, and then click Classic Expressions.
2. In the details pane, click Add.

   Note: Some of the built-in expressions in the Expressions list are read-only.
3. In the Create Policy Expression dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for creating a named classic expression" as shown:

   - Expression Name*—name
   - Client Security Message—clientSecurityMessage
   - Comments—comment

   * A required parameter
4. To create the expression, do one of the following:

   - You can choose inputs to this expression from the Named Expressions drop-down list.
   - You can create a new expression, as described in "To add an expression for a classic policy by using the configuration utility."
5. When you are done, click Close. Verify that your new expression was created by scrolling to the bottom of the Classic Expressions list to view it.

Expressions Reference

The following tables list expressions and expression elements that you can use to identify specific types of data. The first table applies to default syntax expressions, in alphabetic order. The remaining tables cover the different types of classic expressions.

Default Syntax Expressions

The following table is a listing of default syntax expression prefixes, with cross-references to descriptions of these prefixes and the operators that you can specify for them. Note that some prefixes can work with multiple types of operators. For example, a cookie can be parsed by using operators for text or operators for HTTP headers.

You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

Note: The Description column in the following table contains cross-references to additional information about prefix usage and applicable operators for the prefix.

Expression Prefix	Links to Relevant Information, with Applicable Notes and Operator Descriptions
`CLIENT.ETHER`	"Prefixes for MAC Addresses." "Operations for MAC Addresses."
`CLIENT.ETHER.[DSTMAC | SRCMAC]`	"Prefixes for MAC Addresses." "Operations for MAC Addresses."
`CLIENT.INTERFACE`	Designates an expression that refers to the ID of the network interface through which the current packet entered the Application Switch. See the other `CLIENT.INTERFACE` prefix descriptions in this table.
`CLIENT.INTERFACE.ID`	Extracts the ID of the network interface that received the current packet of data. See the other `CLIENT.INTERFACE` prefix descriptions in this table.
`CLIENT.INTERFACE.ID.EQ("id")`	Returns Boolean TRUE if the interface's ID matches the ID that is passed as the argument. For example: `CLIENT.INTERFACE.ID.EQ("1/1")` See "Booleans in Compound Expressions."
`CLIENT.INTERFACE.[RXTHROU GHPUT | RXTXTHROUGHPUT | TXTHROUGHPUT]`	"Expressions for Numeric Client and Server Data." "Compound Operations for Numbers."
`CLIENT.IP`	Operates on the IP protocol data associated with the current packet. See the other `CLIENT.IP` prefixes in this table.

`CLIENT.IP.DST`	"Prefixes for IPV4 Addresses and IP Subnets." "Operations for IPV4 Addresses." "Compound Operations for Numbers."
`CLIENT.IP.SRC`	"Prefixes for IPV4 Addresses and IP Subnets." "Operations for IPV4 Addresses." "Compound Operations for Numbers."
`CLIENT.IPV6`	Operates on IPv6 protocol data. See the other `CLIENT.IPV6` prefixes in this table.
`CLIENT.IPV6.DST`	"Expression Prefixes for IPv6 Addresses." "Operations for IPV6 Prefixes."
`CLIENT.IPV6.SRC`	"Expression Prefixes for IPv6 Addresses." "Operations for IPV6 Prefixes."
`CLIENT.SSL`	Operates on the SSL protocol data for the current packet. See the other `CLIENT.SSL` prefixes in this table.
`CLIENT.SSL.CIPHER_BITS`	"Prefixes for Numeric Data in SSL Certificates." "Compound Operations for Numbers."
`CLIENT.SSL.CIPHER_EXPORTA BLE`	"Prefixes for Text-Based SSL and Certificate Data." "Booleans in Compound Expressions.
`CLIENT.SSL.CLIENT_CERT`	"Expressions for SSL Certificates." "Expressions for SSL Certificate Dates."
`CLIENT.SSL.IS_SSL`	"Prefixes for Text-Based SSL and Certificate Data." "Booleans in Compound Expressions."
`CLIENT.SSL.VERSION`	"Prefixes for Numeric Data in SSL Certificates." "Compound Operations for Numbers."
`CLIENT.TCP`	Operates on TCP protocol data. See the other `CLIENT.TCP` prefixes in this table.
`CLIENT.TCP.[DSTPORT | MSS | SRCPORT]`	"Expressions for TCP, UDP, and VLAN Data." "Compound Operations for Numbers."
`CLIENT.TCP.PAYLOAD( integer )`	"Expressions for TCP, UDP, and VLAN Data." "Default Syntax Expressions: Evaluating Text."

`CLIENT.UDP`	Operates on the UDP protocol data associated with the current packet. See the other `CLIENT.UDP` prefixes in this table.
`CLIENT.UDP.DNS.DOMAIN`	"Expressions for TCP, UDP, and VLAN Data." "Default Syntax Expressions: Evaluating Text."
`CLIENT.UDP.DNS.DOMAIN.EQ("`*`hostname`*`")`	"Expressions for TCP, UDP, and VLAN Data." "Booleans in Compound Expressions."
`CLIENT.UDP.DNS. [IS_AAAAREC | IS_ANYREC | IS_AREC | IS_CNAMEREC | IS_MXREC | IS_NSREC | IS_PTRREC | IS_SOAREC | IS_SRVREC]`	"Expressions for TCP, UDP, and VLAN Data." "Booleans in Compound Expressions."
`CLIENT.UDP.[DSTPORT | SRCPORT]`	"Expressions for TCP, UDP, and VLAN Data." "Compound Operations for Numbers."
`CLIENT.VLAN`	Operates on the VLAN through which the current packet entered the NetScaler. See the other `CLIENT.VLAN` prefixes in this table.
`CLIENT.VLAN.ID`	"Expressions for TCP, UDP, and VLAN Data." "Compound Operations for Numbers."
`HTTP.REQ`	Operates on HTTP requests. See the other `HTTP.REQ` prefixes in this table.
`HTTP.REQ.BODY(`*`integer`*`)`	"Expression Prefixes for Text in HTTP Requests and Responses." "Basic Operations on Text."
`HTTP.REQ.CACHE_CONTROL`	"Prefixes for Cache-Control Headers." "Operations for Cache-Control Headers."
`HTTP.REQ.CONTENT_LENGTH`	"Expressions for Numeric HTTP Payload Data Other Than Dates." "Compound Operations for Numbers."
`HTTP.REQ.COOKIE`	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."

`HTTP.REQ.DATE`	"Format of Dates and Times in an Expression." "Expressions for HTTP Request and Response Dates." "Default Syntax Expressions: Evaluating Text." "Compound Operations for Numbers." "Operations for HTTP Headers."
`HTTP.REQ.HEADER("`*`header_name`*`")`	"Expression Prefixes for Text in HTTP Requests and Responses." "Prefixes for HTTP Headers." "Operations for HTTP Headers."
`HTTP.REQ.FULL_HEADER("`*`header_name`*`")`	"Prefixes for HTTP Headers." "Operations for HTTP Headers."
`HTTP.REQ.HOSTNAME`	"Expression Prefixes for Text in HTTP Requests and Responses."
`HTTP.REQ.HOSTNAME.[DOMAIN | Server]`	"Expression Prefixes for Text in HTTP Requests and Responses." "Basic Operations on Text."
`HTTP.REQ.HOSTNAME.EQ("`*`hostname`*`")`	"Expression Prefixes for Text in HTTP Requests and Responses." "Booleans in Compound Expressions." "“Basic Operations on Expression Prefixes”."
`HTTP.REQ.HOSTNAME.PORT`	"Expression Prefixes for Text in HTTP Requests and Responses." "Compound Operations for Numbers."
`HTTP.REQ.IS_VALID`	Returns TRUE if the HTTP request is properly formed. See "Booleans in Compound Expressions."
`HTTP.REQ.METHOD`	"Expression Prefixes for Text in HTTP Requests and Responses." "Basic Operations on Text." "Complex Operations on Text."
`HTTP.REQ.TRACKING`	Returns the HTTP body tracking mechanism. See the descriptions of other `HTTP.REQ.TRACKING` prefixes in this table.

HTTP.REQ.TRACKING.EQ("*tracking_ method name*")	Returns TRUE or FALSE. See "Booleans in Compound Expressions."
HTTP.REQ.URL	Obtains the HTTP URL object from the request and sets the text mode to URLENCODED by default. See "Expression Prefixes for Text in HTTP Requests and Responses."
HTTP.REQ.URL.[CVPN_ENCODE | HOSTNAME | HOSTNAME.DOMAIN | SERVER | PATH | PATH_AND_QUERY | PROTOCOL | QUERY | SUFFIX | VERSION]	"Expression Prefixes for Text in HTTP Requests and Responses." "Basic Operations on Text." "Complex Operations on Text."
HTTP.REQ.URL.HOSTNAME.EQ("*hostn ame*")	"Expression Prefixes for Text in HTTP Requests and Responses. "Booleans in Compound Expressions."
HTTP.REQ.URL.HOSTNAME.PORT	"Expression Prefixes for Text in HTTP Requests and Responses. "Compound Operations for Numbers."
HTTP.REQ.URL.PATH.IGNORE_ EMPTY_ELEMENTS	Ignores spaces in the data. See the table "HTTP Expression Prefixes that Return Text."
HTTP.REQ.URL.QUERY.IGNORE _EMPTY_ELEMENTS	Ignores spaces in the data. See the table "HTTP Expression Prefixes that Return Text."
HTTP.REQ.USER.IS_MEMBER_OF	"HTTP Expression Prefixes that Return Text."
HTTP.REQ.USER.NAME	"HTTP Expression Prefixes that Return Text."
HTTP.REQ.VERSION	"Expression Prefixes for Text in HTTP Requests and Responses."
HTTP.REQ.VERSION.[MAJOR | MINOR]	Operates on the major or minor HTTP version string. See "Expression Prefixes for Text in HTTP Requests and Responses" and "Compound Operations for Numbers."
HTTP.RES	Operates on HTTP responses.
HTTP.RES.BODY(*integer*)	"Expression Prefixes for Text in HTTP Requests and Responses." "Basic Operations on Text." "Complex Operations on Text."
HTTP.RES.CACHE_CONTROL	"Prefixes for Cache-Control Headers." "Operations for Cache-Control Headers."

HTTP.RES.CONTENT_LENGTH	"Expression Prefixes for Text in HTTP Requests and Responses." "Operations for HTTP Headers." "Compound Operations for Numbers."
HTTP.RES.DATE	"Format of Dates and Times in an Expression." "Expressions for HTTP Request and Response Dates." "Expression Prefixes for Text in HTTP Requests and Responses." "Compound Operations for Numbers." "Operations for HTTP Headers."
HTTP.RES.HEADER("*header_name*")	"Expression Prefixes for Text in HTTP Requests and Responses." "Prefixes for HTTP Headers." "Operations for HTTP Headers."
HTTP.REQ.FULL_HEADER("*header_name*")	"Prefixes for HTTP Headers." "Operations for HTTP Headers."
HTTP.REQ.TXID	"Prefixes for HTTP Headers." "Operations for HTTP Headers."
HTTP.RES.IS_VALID	Returns TRUE if the HTTP response is properly formed. See "Booleans in Compound Expressions."
HTTP.RES.SET_COOKIE	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."
HTTP.RES.SET_COOKIE.COOKIE("*name*")	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."
HTTP.RES.SET_COOKIE.COOKIE.[DOMAIN | PATH | PORT]	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."

HTTP.RES.SET_COOKIE.COOKIE.EXPIRES	Obtains the Expires field of the cookie as a date string. The value of the Expires attribute can be operated upon as a time object. If multiple Expires fields are present, this expression operates on the first one. If the Expires attribute is absent, a string of length zero is returned. Also see: "Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text." "Compound Operations for Numbers."
HTTP.RES.SET_COOKIE.COOKIE.PATH.IGNORE_EMPTY_ELEMENTS	Ignores spaces in the data. For an example, see the table "Expression Prefixes for Text in HTTP Requests and Responses."
HTTP.RES.SET_COOKIE.COOKIE.PORT.IGNORE_EMPTY_ELEMENTS	Ignores spaces in the data. For an example, see the table "HTTP Expression Prefixes that Return Text."
HTTP.RES.SET_COOKIE.COOKIE.VERSION	"Prefixes for HTTP Headers." "Compound Operations for Numbers."
HTTP.RES.SET_COOKIE.COOKIE("*name*"[,*integer*])[.PORT | .PATH | DOMAIN | VERSION | EXPIRES]	"Prefixes for HTTP Headers." "Default Syntax Expressions: Evaluating Text."
HTTP.RES.SET_COOKIE.COOKIE.EXPIRES	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text." "Compound Operations for Numbers."
HTTP.RES.SET_COOKIE.EXISTS("*name*")	"Prefixes for HTTP Headers." "Booleans in Compound Expressions."
HTTP.RES.SET_COOKIE2	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."

HTTP.RES.SET_COOKIE2.COOKIE("*name*")	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."
HTTP.RES.SET_COOKIE2.COOKIE.[DOMAIN | PATH | PORT]	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."
HTTP.RES.SET_COOKIE2.COOKIE.EXPIRES	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text." "Compound Operations for Numbers."
HTTP.RES.SET_COOKIE2.COOKIE.PATH.IGNORE_EMPTY_ ELEMENTS	Ignores spaces in the data. For an example, see the table HTTP Expression Prefixes that Return Text."
HTTP.RES.SET_COOKIE2.COOKIE.PORT.IGNORE_EMPTY_ ELEMENTS	Ignores spaces in the data. For an example, see the table "HTTP Expression Prefixes that Return Text." See also "Default Syntax Expressions: Evaluating Text" and "Compound Operations for Numbers."
HTTP.RES.SET_COOKIE2.COOKIE("*name*")[.integer].[PORT | PATH | DOMAIN | VERSION | EXPIRES]	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."
HTTP.RES.SET_COOKIE2.COOKIE.DOMAIN	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text."
HTTP.RES.SET_COOKIE2.COOKIE.EXPIRES	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text." "Compound Operations for Numbers."

HTTP.RES.SET_COOKIE2.COOKIE.VERSION	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Default Syntax Expressions: Evaluating Text." "Compound Operations for Numbers."
HTTP.RES.SET_COOKIE2.EXISTS("*name*")	"Prefixes for HTTP Headers." "Operations for HTTP Headers." "Booleans in Compound Expressions."
HTTP.RES.STATUS	"Expression Prefixes for Text in HTTP Requests and Responses." "Compound Operations for Numbers."
HTTP.RES.STATUS_MSG	"Expression Prefixes for Text in HTTP Requests and Responses."
HTTP.RES.TRACKING	Returns the HTTP body tracking mechanism. See the descriptions of other HTTP.REQ.TRACKING prefixes in this table.
HTTP.RES.TRACKING.EQ("*tracking_method*")	Returns TRUE or FALSE. See "Booleans in Compound Expressions."
HTTP.RES.TXID	" Prefixes for HTTP Headers." "Operations for HTTP Headers."
HTTP.RES.VERSION	"Expression Prefixes for Text in HTTP Requests and Responses."
HTTP.RES.VERSION.[MAJOR | MINOR]	Operates on the major or minor HTTP version string. See "Expression Prefixes for Text in HTTP Requests and Responses" and "Compound Operations for Numbers."
SERVER	Designates an expression that refers to the server. This is the starting point for access into parameters such as Ether and SSL. See the other SERVER prefixes in this table.
SERVER.ETHER	Operates on the ethernet protocol data associated with the current packet. See the other SERVER prefixes in this table.
SERVER.ETHER.DSTMAC	"Prefixes for MAC Addresses." "Prefixes for MAC Addresses."
SERVER.INTERFACE	Designates an expression that refers to the ID of the network interface that received the current packet of data. See the other SERVER.INTERFACE prefixes in this table.

SERVER.INTERFACE.ID.EQ("*id*")	Returns Boolean TRUE if the interface's ID matches the ID that is passed as the argument. For example: SERVER.INTERFACE.ID.EQ("LA/1") See "Booleans in Compound Expressions."
SERVER.INTERFACE.[RXTHROUGHPUT | RXTXTHROUGHPUT | TXTHROUGHPUT]	"Expressions for Numeric Client and Server Data." "Compound Operations for Numbers."
SERVER.IP	Operates on the IP protocol data associated with the current packet. See the other SERVER.IP prefixes in this table.
SERVER.IP.[DST | SRC]	"Prefixes for IPV4 Addresses and IP Subnets." "Operations for IPV4 Addresses." "Compound Operations for Numbers."
SERVER.IPV6	Operates on IPv6 protocol data. See the other SERVER.IPV6 prefixes in this table.
SERVER.IPV6.DST	"Expression Prefixes for IPv6 Addresses." "Operations for IPV6 Prefixes."
SERVER.IPV6.SRC	"Expression Prefixes for IPv6 Addresses." "Operations for IPV6 Prefixes."
SERVER.TCP	Operates on TCP protocol data. See the other CLIENT.TCP prefixes in this table.
SERVER.TCP.[DSTPORT | MSS | SRCPORT]	"Expressions for TCP, UDP, and VLAN Data." "Compound Operations for Numbers."
SERVER.VLAN	Operates on the VLAN through which the current packet entered the NetScaler. See the other SERVER.VLAN prefixes in this table.
SERVER.VLAN.ID	"Expressions for TCP, UDP, and VLAN Data." "Compound Operations for Numbers."
SYS	Designates an expression that refers to the NetScaler itself, not to the client or server.. See the other SYS prefixes in this table.
SYS.EVAL_CLASSIC_EXPR(*classic_expression*)	"Classic Expressions in Default Syntax Expressions." "Booleans in Compound Expressions."
SYS.HTTP_CALLOUT(*http_callout*)	"HTTP Callouts."
SYS.CHECK_LIMIT	"Rate Limiting."

SYS.TIME	"Expressions for the NetScaler System Time." "Compound Operations for Numbers."
SYS.TIME.[BETWEEN(*time1, time2*) | EQ(*time*) | GE(*time*) | GT(*time*) | LE(*time*) | LT(*time*) | WITHIN(*time1, time2*)]	"Expressions for the NetScaler System Time." "Booleans in Compound Expressions." "Compound Operations for Numbers."
SYS.TIME.[DAY | HOURS | MINUTES | MONTH | RELATIVE_BOOT | RELATIVE_NOW SECONDS | WEEKDAY | YEAR]	"Expressions for the NetScaler System Time." "Compound Operations for Numbers."
SYS.RANDOM	Returns a random number between 0 and 1, inclusive of 0 but exclusive of 1.
VPN.BASEURL.[CVPN_DECODE | CVPN_ENCODE | HOSTNAME | HOSTNAME.DOMAIN | HOSTNAME.SERVER | PATH | PATH_AND_QUERY | PROTOCOL | QUERY | SUFFIX]	"Expression Prefixes for VPNs and Clientless VPNs."
VPN.BASEURL.HOSTNAME.EQ("*hostna me*")	"Expression Prefixes for VPNs and Clientless VPNs." "Booleans in Compound Expressions."
VPN.BASEURL.HOSTNAME.PORT	"Expression Prefixes for VPNs and Clientless VPNs." "Compound Operations for Numbers."
VPN.BASEURL.PATH.IGNORE_EMPTY_ELEMENTS	Ignores spaces in the data. For an example, see the table "HTTP Expression Prefixes that Return Text."
VPN.BASEURL.QUERY.IGNORE_EMPTY_ELEMENTS	Ignores spaces in the data. For an example, see the table "HTTP Expression Prefixes that Return Text."
VPN.CLIENTLESS_BASEURL	" Expression Prefixes for VPNs and Clientless VPNs."
VPN.CLIENTLESS_BASEURL.[CVPN_DECODE | CVPN_ENCODE | HOSTNAME | HOSTNAME.DOMAIN | HOSTNAME.SERVER | PATH | PATH_AND_QUERY | PROTOCOL | QUERY | SUFFIX]	"Expression Prefixes for VPNs and Clientless VPNs."
VPN.CLIENTLESS_BASEURL.HOSTNAME.EQ("*hostname*")	"Expression Prefixes for VPNs and Clientless VPNs." "Booleans in Compound Expressions."

VPN.CLIENTLESS_BASEURL.HOSTNAME .PORT	"Expression Prefixes for VPNs and Clientless VPNs." "Compound Operations for Numbers."
VPN.CLIENTLESS_BASEURL.PATH.IGN ORE_EMPTY_ELEMENTS	Ignores spaces in the data. For an example, see the table "HTTP Expression Prefixes that Return Text."
VPN.CLIENTLESS_BASEURL.QUERY.IG NORE_EMPTY_ELEMENTS	Ignores spaces in the data. For an example, see the table "HTTP Expression Prefixes that Return Text."
VPN.CLIENTLESS_HOSTURL	" Expression Prefixes for VPNs and Clientless VPNs."
VPN.CLIENTLESS_HOSTURL.[CVPN_DE CODE | CVPN_ENCODE | HOSTNAME | HOSTNAME.DOMAIN | HOSTNAME.SERVER | PATH | PATH_AND_QUERY | PROTOCOL | QUERY | SUFFIX]	"Expression Prefixes for VPNs and Clientless VPNs."
VPN.CLIENTLESS_HOSTURL.HOSTNAME .EQ("*hostname*")	"Expression Prefixes for VPNs and Clientless VPNs." "Booleans in Compound Expressions.
VPN.CLIENTLESS_HOSTURL.HOSTNAME .PORT	"Expression Prefixes for VPNs and Clientless VPNs." "Compound Operations for Numbers."
VPN.CLIENTLESS_HOSTURL.PATH.IGN ORE_EMPTY_ELEMENTS	Ignores spaces in the data. For an example, see the table "HTTP Expression Prefixes that Return Text."
VPN.CLIENTLESS_HOSTURL.QUERY.IG NORE_EMPTY_ELEMENTS	Ignores spaces in the data. For an example, see the table "HTTP Expression Prefixes that Return Text."
VPN.HOST	" Expression Prefixes for VPNs and Clientless VPNs."
VPN.HOST.[DOMAIN | Server]	"Expression Prefixes for VPNs and Clientless VPNs."
VPN.HOST.EQ("*hostname*")	"Expression Prefixes for VPNs and Clientless VPNs." "Booleans in Compound Expressions.
VPN.HOST.PORT	"Expression Prefixes for VPNs and Clientless VPNs." "Default Syntax Expressions: Evaluating Text." "Compound Operations for Numbers."

Classic Expressions

The subtopics listed in the table of contents on the left side of your screen contain tables listing the NetScaler classic expressions.

In the table of operators, the result type of each operator is shown at the beginning of the description. In the other tables, the level of each expression is shown at the beginning of the description. For named expressions, each expression is shown as a whole.

Operators

Expression Element	Definition
==	Boolean. Returns TRUE if the current expression equals the argument. For text operations, the items being compared must exactly match one another. For numeric operations, the items must evaluate to the same number.
!=	Boolean. Returns TRUE if the current expression does not equal the argument. For text operations, the items being compared must not exactly match one another. For numeric operations, the items must not evaluate to the same number.
CONTAINS	Boolean. Returns TRUE if the current expression contains the string that is designated in the argument.
NOTCONTAINS	Boolean. Returns TRUE if the current expression does not contain the string that is designated in the argument.
CONTENTS	Text. Returns the contents of the current expression.
EXISTS	Boolean. Returns TRUE if the item designated by the current expression exists.
NOTEXISTS	Boolean. Returns TRUE if the item designated by the current expression does not exist.
>	Boolean. Returns TRUE if the current expression evaluates to a number that is greater than the argument.

<	Boolean. Returns TRUE if the current expression evaluates to a number that is less than the argument.
>=	Boolean. Returns TRUE if the current expression evaluates to a number that is greater than or equal to the argument.
<=	Boolean. Returns TRUE if the current expression evaluates to a number that is less than or equal to the argument.

General Expressions

Expression Element	Definition
REQ	Flow Type. Operates on incoming (or request) packets.
REQ.HTTP	Protocol Operates on HTTP requests.
REQ.HTTP.METHOD	Qualifier Designates the HTTP method.
REQ.HTTP.URL	Qualifier Designates the URL.
REQ.HTTP.URLTOKENS	Qualifier Designates the URL token.
REQ.HTTP.VERSION	Qualifier Designates the HTTP version.
REQ.HTTP.HEADER	Qualifier Designates the HTTP header.
REQ.HTTP.URLLEN	Qualifier Designates the number of characters in the URL.
REQ.HTTP.URLQUERY	Qualifier Designates the query portion of the URL.
REQ.HTTP.URLQUERYLEN	Qualifier Designates the length of the query portion of the URL.
REQ.SSL	Protocol Operates on SSL requests.
REQ.SSL.CLIENT.CERT	Qualifier Designates the entire client certificate.

REQ.SSL.CLIENT.CERT.SUBJECT	Qualifier Designates the client certificate subject.
REQ.SSL.CLIENT.CERT.ISSUER	Qualifier Designates the issuer of the client certificate.
REQ.SSL.CLIENT.CERT.SIGALGO	Qualifier Designates the validation algorithm used by the client certificate.
REQ.SSL.CLIENT.CERT.VERSION	Qualifier Designates the client certificate version.
REQ.SSL.CLIENT.CERT.VALIDFROM	Qualifier Designates the date before which the client certificate is not valid.
REQ.SSL.CLIENT.CERT.VALIDTO	Qualifier Designates the date after which the client certificate is not valid.
REQ.SSL.CLIENT.CERT.SERIALNUMBER	Qualifier Designates the serial number of the client certificate.
REQ.SSL.CLIENT.CIPHER.TYPE	Qualifier Designates the encryption protocol used by the client.
REQ.SSL.CLIENT.CIPHER.BITS	Qualifier Designates the number of bits used by the client's SSL key.
REQ.SSL.CLIENT.SSL.VERSION	Qualifier Designates the SSL version that the client is using.
REQ.TCP	Protocol Operates on incoming TCP packets.
REQ.TCP.SOURCEPORT	Qualifier Designates the source port of the incoming packet.
REQ.TCP.DESTPORT	Qualifier Designates the destination port of the incoming packet.

REQ.IP	Protocol Operates on incoming IP packets.
REQ.IP.SOURCEIP	Qualifier Designates the source IP of the incoming packet.
REQ.IP.DESTIP	Qualifier Designates the destination IP of the incoming packet.
RES	Flow Type Operates on outgoing (or response) packets.
RES.HTTP	Protocol Operates on HTTP responses.
RES.HTTP.VERSION	Qualifier Designates the HTTP version.
RES.HTTP.HEADER	Qualifier Designates the HTTP header.
RES.HTTP.STATUSCODE	Qualifier Designates the status code of the HTTP response.
RES.TCP	Protocol Operates on incoming TCP packets.
RES.TCP.SOURCEPORT	Qualifier Designates the source port of the outgoing packet.
RES.TCP.DESTPORT	Qualifier Designates the destination port of the outgoing packet.
RES.IP	Protocol Operates on outgoing IP packets.

RES.IP.SOURCEIP	Qualifier Designates the source IP of the outgoing packet. This can be in IPv4 or IPv6 format. For example: `add expr exp3 “sourceip == 10.102.32.123 –netmask 255.255.255.0 && destip == 2001::23/120”.`
RES.IP.DESTIP	Qualifier Designates the destination IP of the outgoing packet.

Client Security Expressions

The expressions to configure client settings on the Access Gateway with the following software:

- Antivirus
- Personal firewall
- Antispam
- Internet Security

For example usage, see http://support.citrix.com/article/CTX112599.

Actual Expression	Definition
`CLIENT.APPLICATION.AV(<NAME>.VERSION == <VERSION>)`	Checks whether the client is running the designated anti-virus program and version.
`CLIENT.APPLICATION.AV(<NAME>.VERSION != <VERSION>)`	Checks whether the client is not running the designated anti-virus program and version.
`CLIENT.APPLICATION.PF(<NAME>.VERSION == <VERSION>)`	Checks whether the client is running the designated personal firewall program and version.
`CLIENT.APPLICATION.PF(<NAME>.VERSION != <VERSION>)`	Checks whether the client is not running the designated personal firewall program and version.
`CLIENT.APPLICATION.IS(<NAME>.VERSION == <VERSION>)`	Checks whether the client is running the designated internet security program and version.
`CLIENT.APPLICATION.IS(<NAME>.VERSION != <VERSION>)`	Checks whether the client is not running the designated internet security program and version.
`CLIENT.APPLICATION.AS(<NAME>.VERSION == <VERSION>)`	Checks whether the client is running the designated anti-spam program and version.
`CLIENT.APPLICATION.AS(<NAME>.VERSION != <VERSION>)`	Checks whether the client is not running the designated anti-spam program and version.

Network-Based Expressions

Expression	Definition
REQ	Flow Type. Operates on incoming, or request, packets.
REQ.VLANID	Qualifier. Operates on the virtual LAN (VLAN) ID.
REQ.INTERFACE.ID	Qualifier. Operates on the ID of the designated NetScaler interface.
REQ.INTERFACE.RXTHROUGHPUT	Qualifier. Operates on the raw received packet throughput of the designated NetScaler interface.
REQ.INTERFACE.TXTHROUGHPUT	Qualifier. Operates on the raw transmitted packet throughput of the designated NetScaler interface.
REQ.INTERFACE.RXTXTHROUGHPUT	Qualifier. Operates on the raw received and transmitted packet throughput of the designated NetScaler interface.
REQ.ETHER.SOURCEMAC	Qualifier. Operates on the source MAC address.
REQ.ETHER.DESTMAC	Qualifier. Operates on the destination MAC address.
RES	Flow Type. Operates on outgoing (or response) packets.
RES.VLANID	Qualifier. Operates on the virtual LAN (VLAN) ID.
RES.INTERFACE.ID	Qualifier. Operates on the ID of the designated NetScaler interface.

RES.INTERFACE.RXTHROUGHPUT	Qualifier. Operates on the raw received packet throughput of the designated NetScaler interface.
RES.INTERFACE.TXTHROUGHPUT	Qualifier. Operates on the raw transmitted packet throughput of the designated NetScaler interface.
RES.INTERFACE.RXTXTHROUGHPUT	Qualifier. Operates on the raw received and transmitted packet throughput of the designated NetScaler interface.
RES.ETHER.SOURCEMAC	Qualifier. Operates on the source MAC address.
RES.ETHER.DESTMAC	Qualifier. Operates on the destination MAC address.

Date/Time Expressions

Expression	Definition
TIME	Qualifier. Operates on the date and time of day, GMT.
DATE	Qualifier. Operates on the date, GMT.
DAYOFWEEK	Operates on the specified day in the week, GMT.

File System Expressions

You can specify file system expressions in authorization policies for users and groups who access file sharing through the Access Gateway file transfer utility (the VPN portal). These expressions work with the Access Gateway file transfer authorization feature to control user access to file servers, folders, and files. For example, you can use these expressions in authorization policies to control access based on file type and size.

Expression	Definition
`FS.COMMAND`	Qualifier. Operates on a file system command. The user can issue multiple commands on a file transfer portal. (For example, ls to list files or mkdir to create a directory). This expression returns the current action that the user is taking. Possible values: Neighbor, login, ls, get, put, rename, mkdir, rmdir, del, logout, any. Following is an example: `Add authorization policy pol1 “fs.command eq login && (fs.user eq administrator || fs.serverip eq 10.102.88.221 –netmask 255.255.255.252)” allow`
`FS.USER`	Returns the user who is logged on to the file system.
`FS.SERVER`	Returns the host name of the target server. In the following example, the string `win2k3-88-22` is the server name: `fs.server eq win2k3-88-221`
`FS.SERVERIP`	Returns the IP address of the target server.

FS.SERVICE	Returns a shared root directory on the file server. If a particular folder is exposed as shared, a user can directly log on to the specified first level folder. This first level folder is called a service. For example, in the path \\hostname\SERVICEX\ETC, SERVICEX is the service. As another example, if a user accesses the file \\hostname\service1\dir1\file1.doc, FS.SERVICE will return service1. Following is an example: `fs.service notcontains New`
FS.DOMAIN	Returns the domain name of the target server.
FS.PATH	Returns the complete path of the file being accessed. For example, if a user accesses the file \\hostname\service1\dir1\file1.doc, FS.PATH will return \service\dir1\file1.doc. Following is an example: `fs.path notcontains SSL`
FS.FILE	Returns the name of the file being accessed. For example, if a user accesses the file \\hostname\service1\dir1\file1.doc, FS.FILE will return file1.doc.
FS.DIR	Returns the directory being accessed. For example, if a user accesses the file \\hostname\service1\dir1\file1.doc, FS.DIR will return \service\dir1.
FS.FILE.ACCESSTIME	Returns the time at which the file was last accessed. This is one of several options that provide you with granular control over actions that the user performs. (See the following entries in this table.)
FS.FILE.CREATETIME	Returns the time at which the file was created.
FS.FILE.MODIFYTIME	Returns the time at which the file was edited.
FS.FILE.WRITETIME	Returns the time of the most recent change in the status of the file.
FS.FILE.SIZE	Returns the file size.
FS.DIR.ACCESSTIME	Returns the time at which the directory was last accessed.
FS.DIR.CREATETIME	Returns the time at which the directory was created.

FS.DIR.MODIFYTIME	Returns the time at which the directory was last modified.
FS.DIR.WRITETIME	Returns the time at which the directory status last changed.

Note: File system expressions do not support regular expressions.

Built-In Named Expressions (General)

Expression	Definition
ns_all_apps_ncomp	Tests for connections with destination ports between 0 and 65535. In other words, tests for all applications.
ns_cachecontrol_nocache	Tests for connections with an HTTP Cache-Control header that contains the value “no-cache”.
ns_cachecontrol_nostore	Tests for connections with an HTTP Cache-Control header that contains the value “no-store”.
ns_cmpclient	Tests the client to determine if it accepts compressed content.
ns_content_type	Tests for connections with an HTTP Content-Type header that contains “text”.
ns_css	Tests for connections with an HTTP Content-Type header that contains “text/css”.
ns_ext_asp	Tests for HTTP connections to any URL that contains the string .asp—in other words, any connection to an active server page (ASP).
ns_ext_cfm	Tests for HTTP connections to any URL that contains the string .cfm
ns_ext_cgi	Tests for HTTP connections to any URL that contains the string .cgi—in other words, any connection to a common gateway interface (CGI) script.
ns_ext_ex	Tests for HTTP connections to any URL that contains the string .ex
ns_ext_exe	Tests for HTTP connections to any URL that contains the string .exe—in other words, any connection to a executable file.
ns_ext_htx	Tests for HTTP connections to any URL that contains the string .htx
ns_ext_not_gif	Tests for HTTP connections to any URL that does not contain the string .gif—in other words, any connection to a URL that is not a GIF image.
ns_ext_not_jpeg	Tests for HTTP connections to any URL that does not contain the string .jpeg—in other words, any connection to a URL that is not a JPEG image.

ns_ext_shtml	Tests for HTTP connections to any URL that contains the string .shtml—in other words, any connection to a server-parsed HTML page.
ns_false	Always returns a value of FALSE.
ns_farclient	Client is in a different geographical region from the NetScaler, as determined by the geographical region in the client's IP address. The following regions are predefined: 192.0.0.0 – 193.255.255.255: Multi-regional 194.0.0.0 – 195.255.255.255: European Union 196.0.0.0 – 197.255.255.255: Other1 198.0.0.0 – 199.255.255.255: North America 200.0.0.0 – 201.255.255.255: Central and South America 202.0.0.0 – 203.255.255.255: Pacific Rim 204.0.0.0 – 205.255.255.255: Other2 206.0.0.0 – 207.255.255.255: Other3
ns_header_cookie	Tests for HTTP connections that contain a Cookie header
ns_header_pragma	Tests for HTTP connections that contain a Pragma: no-cache header.
ns_mozilla_47	Tests for HTTP connections whose User-Agent header contains the string Mozilla/4.7—in other words, any connection from a client using the Mozilla 4.7 Web browser.
ns_msexcel	Tests for HTTP connections whose Content-Type header contains the string application/vnd.msexcel—in other words, any connection transmitting a Microsoft Excel spreadsheet.
ns_msie	Tests for HTTP connections whose User-Agent header contains the string MSIE—in other words, any connection from a client using any version of the Internet Explorer Web browser.

ns_msppt	Tests for HTTP connections whose Content-Type header contains the string application/vnd.ms-powerpoint—in other words, any connection transmitting a Microsoft PowerPoint file.
ns_msword	Tests for HTTP connections whose Content-Type header contains the string application/vnd.msword—in other words, any connection transmitting a Microsoft Word file.
ns_non_get	Tests for HTTP connections that use any HTTP method except for GET.
ns_slowclient	Returns TRUE if the average round trip time between the client and the NetScaler is more than 80 milliseconds.
ns_true	Returns TRUE for all traffic.
ns_url_path_bin	Tests the URL path to see if it points to the /bin/ directory.
ns_url_path_cgibin	Tests the URL path to see if it points to the CGI-BIN directory.
ns_url_path_exec	Tests the URL path to see if it points to the /exec/ directory.
ns_url_tokens	Tests for the presence of URL tokens.
ns_xmldata	Tests for the presence of XML data.

Built-In Named Expressions (Anti-Virus)

Expression	Definition
McAfee Virus Scan 11	Tests to determine whether the client is running the latest version of McAfee VirusScan.
McAfee Antivirus	Tests to determine whether the client is running any version of McAfee Antivirus.
Symantec AntiVirus 10 (with Updated Definition File)	Tests to determine whether the client is running the most current version of Symantec AntiVirus.
Symantec AntiVirus 6.0	Tests to determine whether the client is running Symantec AntiVirus 6.0.
Symantec AntiVirus 7.5	Tests to determine whether the client is running Symantec AntiVirus 7.5.
TrendMicro OfficeScan 7.3	Tests to determine whether the client is running Trend Microsystems' OfficeScan, version 7.3.
TrendMicro AntiVirus 11.25	Tests to determine whether the client is running Trend Microsystems' AntiVirus, version 11.25.
Sophos Antivirus 4	Tests to determine whether the client is running Sophos Antivirus, version 4.
Sophos Antivirus 5	Tests to determine whether the client is running Sophos Antivirus, version 5.
Sophos Antivirus 6	Tests to determine whether the client is running Sophos Antivirus, version 6.

Built-In Named Expressions (Personal Firewall)

Expression	Definition
TrendMicro OfficeScan 7.3	Tests to determine whether the client is running Trend Microsystems' OfficeScan, version 7.3.
Sygate Personal Firewall 5.6	Tests to determine whether the client is running the Sygate Personal Firewall, version 5.6.
ZoneAlarm Personal Firewall 6.5	Tests to determine whether the client is running the ZoneAlarm Personal Firewall, version 6.5.

Built-In Named Expressions (Client Security)

Expression	Definition
Norton Internet Security	Tests to determine whether the client is running any version of Norton Internet Security.

Summary Examples of Default Syntax Expressions and Policies

The following table provides examples of default syntax expressions that you can use as the basis for your own default syntax expressions.

Table 1. Examples of Default Syntax Expressions

Expression Type	Sample Expressions

Look at the method used in the HTTP request.	`http.req.method.eq(post)`
	
	`http.req.method.eq(get)`

Check the Cache-Control or Pragma header value in an HTTP request (`req`) or response (`res`).	`http.req.header("Cache-Control").contains("no-store")`
	
	`http.req.header("Cache-Control").contains("no-cache")`
	
	`http.req.header("Pragma").contains("no-cache")`
	
	`http.res.header("Cache-Control").contains("private")`
	
	`http.res.header("Cache-Control").contains("public")`
	
	`http.res.header("Cache-Control").contains("must-revalidate")`
	
	`http.res.header("Cache-Control").contains("proxy-revalidate")`
	
	`http.res.header("Cache-Control").contains("max-age")`

Check for the presence of a header in a request (`req`) or response (`res`).	`http.req.header("myHeader").exists`
	
	`http.res.header("myHeader").exists`

Look for a particular file type in an HTTP request based on the file extension.	`http.req.url.contains(".html")`
	
	`http.req.url.contains(".cgi")`
	
	`http.req.url.contains(".asp")`
	
	`http.req.url.contains(".exe")`
	
	`http.req.url.contains(".cfm")`
	
	`http.req.url.contains(".ex")`
	
	`http.req.url.contains(".shtml")`
	
	`http.req.url.contains(".htx")`
	
	`http.req.url.contains("/cgi-bin/")`
	
	`http.req.url.contains("/exec/")`
	
	`http.req.url.contains("/bin/")`

Look for anything that is other than a particular file type in an HTTP request.	`http.req.url.contains(".gif").not`
	
	`http.req.url.contains(".jpeg").not`

Check the type of file that is being sent in an HTTP response based on the Content-Type header.	`http.res.header("Content-Type").contains("text")`
	
	`http.res.header("Content-Type").contains("application/msword")`
	
	`http.res.header("Content-Type").contains("vnd.ms-excel")`
	
	`http.res.header("Content-Type").contains("application/vnd.ms-powerpoint")`
	
	`http.res.header("Content-Type").contains("text/css")`
	
	`http.res.header("Content-Type").contains("text/xml")`
	
	`http.res.header("Content-Type").contains("image/")`

Check whether this response contains an expiration header.	`http.res.header("Expires").exists`
Check for a Set-Cookie header in a response.	`http.res.header("Set-Cookie").exists`

Check the agent that sent the response.	`http.res.header("User-Agent").contains("Mozilla/4.7")`
	
	`http.res.header("User-Agent").contains("MSIE")`

Check if the first 1024 bytes of the body of a request starts with the string “some text”.	`http.req.body(1024).contains("some text")`

The following table shows examples of policy configurations and bindings for commonly used functions.

Table 2. Examples of Default Syntax Expressions and Policies

Purpose	Example

Use the rewrite feature to replace occurrences of `http:// with https://` in the body of an HTTP response.	`add rewrite action httpRewriteAction replace_all http.res.body(50000) "\"https://\"" -pattern http://`
	
	`add rewrite policy demo_rep34312 "http.res.body(50000).contains(\"http://\")" httpRewriteAction`

Replace all occurrences of “abcd” with “1234” in the first 1000 bytes of the HTTP body.	`add rewrite action abcdTo1234Action replace_all "http.req.body(1000)" "\"1234\"" -pattern abcd`
	
	`add rewrite policy abcdTo1234Policy "http.req.body(1000).contains(\"abcd\")" abcdTo1234Action`
	
	`bind rewrite global abcdTo1234Policy 100 END -type REQ_OVERRIDE`

Downgrade the HTTP version to 1.0 to prevent the server from chunking HTTP responses.	`add rewrite action downgradeTo1.0Action replace http.req.version.minor "\"0\""`
	
	`add rewrite policy downgradeTo1.0Policy "http.req.version.minor.eq(1)" downgradeTo1.0Action`
	
	`bind lb vserver myLBVserver -policyName downgradeTo1.0Policy -priority 100 -gotoPriorityExpression NEXT -type REQUEST`

Remove references to the HTTP or HTTPS protocol in all responses, so that if the user's connection is HTTP, the link is opened by using HTTP, and if the user's connection is HTTPS, the link is opened by using HTTPS.	`add rewrite action remove_http_https replace_all "http.res.body(1000000).set_text_mode(ignorecase)" "\"//\"" -pattern "re~https?://|HTTPS?://~"`
	
	`add rewrite policy remove_http_https true remove_http_https`
	
	`bind lb vserver test_vsvr -policyName remove_http_https -priority 20 -gotoPriorityExpression NEXT -type RESPONSE`

Rewrite instances of `http:// to https://` in all URLs.
 	
This policy uses the responder functionality.
	`add responder action httpToHttpsAction redirect "\"https://\" + http.req.hostname + http.req.url" -bypassSafetyCheck YES`
	
	`add responder policy httpToHttpsPolicy "!CLIENT.SSL.IS_SSL" httpToHttpsAction`
	
	`bind responder global httpToHttpsPolicy 1 END -type OVERRIDE`

Modify a URL to redirect from URL A to URL B. In this example, “file5.html” is appended to the path.
 	
This policy uses the responder functionality.
	`add responder action appendFile5Action redirect "\"http://\" + http.req.hostname + http.req.url + \"/file5.html\"" -bypassSafetyCheck YES`
	
	`add responder policy appendFile5Policy "http.req.url.eq(\"/testsite\")" appendFile5Action`
	
	`bind responder global appendFile5Policy 1 END -type OVERRIDE`

Redirect an external URL to an internal URL.	`add rewrite action act_external_to_internal REPLACE 'http.req.hostname.server' '"www.my.host.com"'`
	
	`add rewrite policy pol_external_to_internal 'http.req.hostname.server.eq("www.external.host.com")' act_external_to_internal`
	
	`bind rewrite global pol_external_to_internal 100 END -type REQ_OVERRIDE`

Redirect requests to www.example.com that have a query string to www.Web*n*.example.com. The value *n* is derived from a server parameter in the query string, for example, `server=5`.	`add rewrite action act_redirect_query REPLACE q#http.req.header("Host").before_str(".example.com")' '"Web" + http.req.url.query.value("server")#`
	
	`add rewrite policy pol_redirect_query q#http.req.header("Host").eq("www.example.com") && http.req.url.contains("?")' act_redirect_query#`

Limit the number of requests per second from a URL.	`add ns limitSelector ip_limit_selector http.req.url "client.ip.src"`
	
	`add ns limitIdentifier ip_limit_identifier -threshold 4 -timeSlice 3600 -mode request_rate -limitType smooth -selectorName ip_limit_selector`
	
	`add responder action my_Web_site_redirect_action redirect "\"http://www.mycompany.com/\""`
	
	`add responder policy ip_limit_responder_policy "http.req.url.contains(\"myasp.asp\") && sys.check_limit(\"ip_limit_identifier\")" my_Web_site_redirect_action`
	
	`bind responder global ip_limit_responder_policy 100 END -type default`

Check the client IP address but pass the request without modifying the request.	`add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS || HTTP.REQ.HEADER("client-ip").EXISTS' NOREWRITE`
	
	`bind rewrite global check_client_ip_policy 100 END`

Remove old headers from a request and insert an NS-Client header.	`add rewrite action del_x_forwarded_for delete_http_header x-forwarded-for`
	
	`add rewrite action del_client_ip delete_http_header client-ip`
	
	`add rewrite policy check_x_forwarded_for_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS' del_x_forwarded_for`
	
	`add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER("client-ip").EXISTS' del_client_ip`
	
	`add rewrite action insert_ns_client_header insert_http_header NS-Client 'CLIENT.IP.SRC'`
	
	`add rewrite policy insert_ns_client_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS || HTTP.REQ.HEADER("client-ip").EXISTS' insert_ns_client_header`
	
	`bind rewrite global check_x_forwarded_for_policy 100 200`
	
	`bind rewrite global check_client_ip_policy 200 300`
	
	`bind rewrite global insert_ns_client_policy 300 END`

Remove old headers from a request, insert an NS-Client header, and then modify the “insert header” action so that the value of the inserted header contains the client IP values from the old headers and the NetScaler appliance's connection IP address.
 	
Note that this example repeats the previous example, with the exception of the final set `rewrite action`.
	`add rewrite action del_x_forwarded_for delete_http_header x-forwarded-for`
	
	`add rewrite action del_client_ip delete_http_header client-ip`
	
	`add rewrite policy check_x_forwarded_for_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS' del_x_forwarded_for`
	
	`add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER("client-ip").EXISTS' del_client_ip`
	
	`add rewrite action insert_ns_client_header insert_http_header NS-Client 'CLIENT.IP.SRC'`
	
	`add rewrite policy insert_ns_client_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS || HTTP.REQ.HEADER("client-ip").EXISTS' insert_ns_client_header`
	
	`bind rewrite global check_x_forwarded_for_policy 100 200`
	
	`bind rewrite global check_client_ip_policy 200 300`
	
	`bind rewrite global insert_ns_client_policy 300 END`
	
	`set rewrite action insert_ns_client_header -stringBuilderExpr 'HTTP.REQ.HEADER("x-forwarded-for").VALUE(0) + " " + HTTP.REQ.HEADER("client-ip").VALUE(0) + " " + CLIENT.IP.SRC' -bypassSafetyCheck YES`

Tutorial Examples of Default Syntax Policies for Rewrite

With the rewrite feature, you can modify any part of an HTTP header, and, for responses, you can modify the HTTP body. You can use this feature to accomplish a number of useful tasks, such as removing unnecessary HTTP headers, masking internal URLs, redirecting Web pages, and redirecting queries or keywords.

In the examples listed in the table of contents on the left side of your screen, you first create a rewrite action and a rewrite policy. Then you bind the policy globally.

Redirecting an External URL to an Internal URL

This example describes how to create a rewrite action and rewrite policy that redirects an external URL to an internal URL. You create an action, called act_external_to_internal, that performs the rewrite. Then you create a policy called pol_external_to_internal.

To redirect an external URL to an internal URL by using the command line interface

- To create the rewrite action, at the command prompt, type:

  add rewrite action act_external_to_internal REPLACE 'http.req.hostname.server' '"host_name_of_internal_Web_server"

- To create the rewrite policy, at the NetScaler command prompt, type:

  add rewrite policy pol_external_to_internal 'http.req.hostname.server.eq("host_name_of_external_Web_server")' act_external_to_internal

- Bind the policy globally.

To redirect an external URL to an internal URL by using the configuration utility

1. In the navigation pane, expand Rewrite, and then click Actions.
2. In the details pane, click Add.
3. In the Create Rewrite Action dialog box, enter the name act_external_to_internal.
4. To replace the HTTP server host name with the internal server name, choose Replace from the Type list box.
5. In the Header Name field, type Host.
6. In the String expression for replacement text field, type the internal host name of your Web server.
7. Click Create and then click Close.
8. In the navigation pane, click Policies.
9. In the details pane, click Add.
10. In the Name field, type pol_external_to_internal. This policy will detect connections to the Web server.
11. In the Action drop-down menu, choose the action act_external_to_internal.
12. In the Expression editor, construct the following expression:

    HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com")

13. Bind your new policy globally.

Redirecting a Query

This example describes how to create a rewrite action and rewrite policy that redirects a query to the proper URL. The example assumes that the request contains a Host header set to **`www.example.com`** and a GET method with the **`string /query.cgi?server=5`**. The redirect extracts the domain name from the host header and the number from the query string, and redirects the user's query to the server **`Web5.example.com`**, where the rest of the user's query is processed.

Note: Although the following commands appears on multiple lines, you should enter them on a single line without line breaks.

To redirect a query to the appropriate URL using the command line

- To create a rewrite action named act_redirect_query that replaces the HTTP server host name with the internal server name, type:

  add rewrite action act_redirect_query REPLACE q#http.req.header("Host").before_str(".example.com")' '"Web" + http.req.url.query.value("server")#

- To create a rewrite policy named pol_redirect_query, type the following commands at the NetScaler command prompt.. This policy detects connections, to the Web server, that contain a query string. Do not apply this policy to connections that do not contain a query string:

  add rewrite policy pol_redirect_query q#http.req.header("Host").eq("www.example.com") && http.req.url.contains("?")' act_redirect_query#

- Bind your new policy globally.

Because this rewrite policy is highly specific and should be run before any other rewrite policies, it is advisable to assign it a high priority. If you assign it a priority of 1, it will be evaluated first.

Rewriting HTTP to HTTPS

This example describes how to rewrite Web server responses to find all URLs that begin with the string “http” and replace that string with “https.” You can use this to avoid having to update Web pages after moving a server from HTTP to HTTPS.

To redirect HTTP URLs to HTTPS by using the command line interface

- To create a rewrite action named act_replace_http_with_https that replaces all instances of the string “http” with the string “https,” enter the following command:

  add rewrite action act_replace_http_with_https replace_all 'http.res.body(100)' '"https"' -pattern http

- To create a rewrite policy named pol_replace_http_with_https that detects connections to the Web server, enter the following command:

  add rewrite policy pol_replace_http_with_https TRUE act_replace_http_with_https NOREWRITE

- Bind your new policy globally.

To troubleshoot this rewrite operation, see "Case Study: Rewrite Policy for Converting HTTP Links to HTTPS not Working."

Removing Unwanted Headers

This example explains how to use a Rewrite policy to remove unwanted headers. Specifically, the example shows how to remove the following headers:

- **Accept Encoding header.** Removing the Accept Encoding header from HTTP responses prevents compression of the response.
- **Content Location header.** Removing the Content Location header from HTTP responses prevents your server from providing a hacker with information that might allow a security breach.

To delete headers from HTTP responses, you create a rewrite action and a rewrite policy, and you bind the policy globally.

To create the appropriate Rewrite action by using the command line interface

At the command prompt, type one of the following commands to either remove the Accept Encoding header and prevent response compression or remove the Content Location header:

- add rewrite action "act_remove-ae" delete_http_header "Accept-Encoding"
- add rewrite action "act_remove-cl" delete_http_header "Content-Location"

To create the appropriate Rewrite policy by using the command line interface

At the command prompt, type one of the following commands to remove either the Accept Encoding header or the Content Location header:

- add rewrite policy "pol_remove-ae" true "act_remove-ae"
- add rewrite policy "pol_remove-cl" true "act_remove-cl"

To bind the policy globally by using the command line interface

At the command prompt, type one of the following commands, as appropriate, to globally bind the policy that you have created:

- bind rewrite global pol_remove_ae 100

- bind rewrite global pol_remove_cl 200

Reducing Web Server Redirects

This example explains how to use a Rewrite policy to modify connections to your home page and other URLs that end with a forward slash (/) to the default index page for your server, preventing redirects and reducing load on your server.

To modify directory-level HTTP requests to include the default home page by using the command line

- To create a Rewrite action named action-default-homepage that modifies URLs that end in a forward slash to include the default home page index.html, type:

  add rewrite action "action-default-homepage" replace q#http.req.url.path "/" "/index.html"#

- To create a Rewrite policy named policy-default-homepage that detects connections to your home page and applies your new action, type:

  add rewrite policy "policy-default-homepage" q#http.req.url.path.EQ("/") "action-default-homepage"#

- Globally bind your new policy to put it into effect.

Masking the Server Header

This example explains how to use a Rewrite policy to mask the information in the Server header in HTTP responses from your Web server. That header contains information that hackers can use to compromise your Web site. While masking the header will not prevent a skilled hacker from finding out information about your server, it will make hacking your Web server more difficult and encourage hackers to choose less well protected targets.

To mask the Server header in responses from the command line

1. To create a Rewrite action named act_mask-server that replaces the contents of the Server header with an uninformative string, type:

   add rewrite action "act_mask-server" replace "http.RES.HEADER(\"Server\")" "\"Web Server 1.0\""

2. To create a Rewrite policy named pol_mask-server that detects all connections, type:

   add rewrite policy "pol_mask-server" true "act_mask-server"

3. Globally bind your new policy to put it into effect.

Tutorial Examples of Classic Policies

The subtopics listed in the table of contents on the left side of your screen describe useful examples of classic policy configuration for certain NetScaler features such as Access Gateway, application firewall, and SSL.

Access Gateway Policy to Check for a Valid Client Certificate

The following policies enable the NetScaler to ensure that a client presents a valid certificate before establishing a connection to a company's SSL VPN.

To check for a valid client certificate by using the command line interface

- Add an action to perform client certificate authentication.

  add ssl action act1 -clientAuth DOCLIENTAUTH

- Create an SSL policy to evaluate the client requests.

  add ssl policy pol1 -rule "REQ.HTTP.METHOD == GET" -action act1

- Add a rewrite action to insert the certificate issuer details into the HTTP header of the requests being sent to web server.

  add rewrite action act2 insert_http_header "CertDN" CLIENT.SSL.CLIENT_CERT.SUBJECT

- Create a rewrite policy to insert the certificate issuer details, if the client certificate exists.

  add rewrite policy pol2 "CLIENT.SSL.CLIENT_CERT.EXISTS" act2

  Bind these new policies to the NetScaler VIP to put them into effect.

Application Firewall Policy to Protect a Shopping Cart Application

Shopping cart applications handle sensitive customer information, for example, credit card numbers and expiration dates, and they access back-end database servers. Many shopping cart applications also use legacy CGI scripts, which can contain security flaws that were unknown at the time they were written, but are now known to hackers and identity thieves.

A shopping cart application is particularly vulnerable to the following attacks:

- **Cookie tampering.** If a shopping cart application uses cookies, and does not perform the appropriate checks on the cookies that users return to the application, an attacker could modify a cookie and gain access to the shopping cart application under another user's credentials. Once logged on as that user, the attacker could obtain sensitive private information about the legitimate user or place orders using the legitimate user’s account.

- **SQL injection.** A shopping cart application normally accesses a back-end database server. Unless the application performs the appropriate safety checks on the data users return in the form fields of its Web forms before it passes that information on to the SQL database, an attacker can use a Web form to inject unauthorized SQL commands into the database server. Attackers normally use this type of attack to obtain sensitive private information from the database or modify information in the database.

The following configuration will protect a shopping cart application against these and other attacks.

To protect a shopping cart application by using the configuration utility

1. In the navigation pane, expand Application Firewall, click Profiles, and then click Add.
2. In the Create Application Firewall Profile dialog box, in the Profile Name field, enter shopping_cart.
3. In the Profile Type drop-down list, select Web Application.
4. In the Configure Select Advanced defaults.
5. Click Create and then click Close.
6. In the details view, double-click the new profile.
7. In the Configure Web Application Profile dialog box, configure your new profile as described below:

   a. Click the Checks tab, double-click the Start URL check, and in the Modify Start URL Check dialog box, click the General tab and disable blocking, and enable learning, logging, statistics, and URL closure. Click OK and then click Close.

      Note that if you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

      set appfw profile shopping_cart -startURLAction LEARN LOG STATS -startURLClosure ON

   b. For the Cookie Consistency check and Form Field Consistency checks, disable blocking, and enable learning, logging, statistics, using a similar method to the Modify Start URL Check configuration.

      If you are using the command line, you configure these settings by typing the following commands:

      set appfw profile shopping_cart -cookieConsistencyAction LEARN LOG STATS

      set appfw profile shopping_cart -fieldConsistencyAction LEARN LOG STATS

   c. For the SQL Injection check, disable blocking, and enable learning, logging, statistics, and transformation of special characters in the Modify SQL Injection Check dialog box, General tab, Check Actions section.

      If you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

      set appfw profile shopping_cart -SQLInjectionAction LEARN LOG STATS -SQLInjectionTransformSpecialChars ON

d. For the Credit Card check, disable blocking; enable logging, statistics, and masking of credit card numbers; and enable protection for those credit cards you accept as forms of payment.

- If you are using the configuration utility, you configure blocking, logging, statistics, and masking (or *x-out*) in the Modify Credit Card Check dialog box, General tab, Check Actions section. You configure protection for specific credit cards in the Settings tab of the same dialog box.

- If you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

set appfw profile shopping_cart -creditCardAction LOG STATS -creditCardXOut ON -creditCard <name> [<name>...]

For <name> you substitute the name of the credit card you want to protect. For Visa, you substitute VISA. For Master Card, you substitute MasterCard. For American Express, you substitute Amex. For Discover, you substitute Discover. For Diners Club, you substitute DinersClub. For JCB, you substitute JCB.

8. Create a policy named shopping_cart that detects connections to your shopping cart application and applies the shopping_cart profile to those connections.

To detect connections to the shopping cart, you examine the URL of incoming connections. If you host your shopping cart application on a separate host (a wise measure for security and other reasons), you can simply look for the presence of that host in the URL. If you host your shopping cart in a directory on a host that handles other traffic, as well, you must determine that the connection is going to the appropriate directory and/or HTML page.

The process for detecting either of these is the same; you create a policy based on the following expression, and substitute the proper host or URL for <string>.

REQ.HTTP.HEADER URL CONTAINS <string>

- If you are using the configuration utility, you navigate to the application firewall Policies page, click the Add... button to add a new policy, and follow the policy creation process described in “To create a policy with classic expressions using the configuration utility” beginning on page 201 and following.

- If you are using the command line, you type the following command at the prompt and press Enter:

  add appfw policy shopping_cart "REQ.HTTP.HEADER URL CONTAINS <string>" shopping_cart

9. Globally bind your new policy to put it into effect.

Because you want to ensure that this policy will match all connections to the shopping cart, and not be preempted by another more general policy, you should assign a high priority to it. If you assign one (1) as the priority, no other policy can preempt this one.

Application Firewall Policy to Protect Scripted Web Pages

Web pages with embedded scripts, especially legacy JavaScripts, often violate the “same origin rule,” which does not allow scripts to access or modify content on any server but the server where they are located. This security vulnerability is called *cross-site scripting*. The application firewall Cross-Site Scripting rule normally filters out requests that contain cross-site scripting.

Unfortunately, this can cause Web pages with older JavaScripts to stop functioning, even when your system administrator has checked those scripts and knows that they are safe. The example below explains how to configure the application firewall to allow cross-site scripting in Web pages from trusted sources without disabling this important filter for the rest of your Web sites.

To protect Web pages with cross-site scripting by using the command line interface

- At the command line, to create an advanced profile, type:

  add appfw profile pr_xssokay -defaults advanced

- To configure the profile, type:

  set appfw profile pr_xssokay -startURLAction NONE -startURLClosure OFF -cookieConsistencyAction LEARN LOG STATS -fieldConsistencyAction LEARN LOG STATS -crossSiteScriptingAction LEARN LOG STATS$"

- Create a policy that detects connections to your scripted Web pages and applies the pr_xssokay profile, type:

  add appfw policy pol_xssokay "REQ.HTTP.HEADER URL CONTAINS ^\.pl\?$ || REQ.HTTP.HEADER URL CONTAINS ^\.js$" pr_xssokay

- Globally bind the policy.

To protect Web pages with cross-site scripting by using the configuration utility

1. In the navigation pane, expand Application Firewall, and then click Profiles.
2. In the details view, click Add.
3. In the Create Application Firewall Profile dialog box, create a Web Application profile with advanced defaults and name it pr_xssokay. Click Create and then click Close.
4. In the details view, click the profile, click Open, and in the Configure Web Application Profile dialog box, configure the pr_xssokay profile as shown below.

   Start URL Check: Clear all actions.

   - Cookie Consistency Check: Disable blocking.
   - Form Field Consistency Check: Disable blocking.
   - Cross-Site Scripting Check: Disable blocking.

   This should prevent blocking of legitimate requests involving Web pages with cross-site scripting that you know are nonetheless safe.
5. Click Policies, and then click Add.
6. In the Create Application Firewall Policy dialog box, create a policy that detects connections to your scripted Web pages and applies the pr_xssokay profile:

   - Policy name: pol_xssokay
   - Associated profile: pr_xssokay

   Policy expression: `"REQ.HTTP.HEADER URL CONTAINS ^\.pl\?$ || REQ.HTTP.HEADER URL CONTAINS ^\.js$"`
7. Globally bind your new policy to put it into effect.

DNS Policy to Drop Packets from Specific IPs

The following example describes how to create a DNS action and DNS policy that detects connections from unwanted IPs or networks, such as those used in a DDOS attack, and drops all packets from those locations. The example shows networks within the IANA reserved IP block `192.168.0.0/16`. A hostile network will normally be on publicly routable IPs.

To drop packets from specific IPs by using the command line interface

- To create a DNS policy named pol_ddos_drop that detects connections from hostile networks and drops those packets, type:

  add dns policy pol_ddos_drop 'client.ip.src.in_subnet(192.168.253.128/25) || client.ip.src.in_subnet(192.168.254.32/27)' -drop YES'

  For the example networks in the `192.168.0.0/16` range, you substitute the IP and netmask in *###.###.###.###/##* format of each network you want to block. You can include as many networks as you want, separating each `CLIENT.IP.SRC.IN_SUBNET(###.###.###.###./##)` command with the OR operator.

- Globally bind your new policy to put it into effect.

SSL Policy to Require Valid Client Certificates

The following example shows an SSL policy that checks the user's client certificate validity before initiating an SSL connection with a client.

To block connections from users with expired client certificates

- Log on to the command line interface.

  If you are using the GUI, navigate to the SSL Policies page, then in the Data area, click the Actions tab.

- Create an SSL action named act_current_client_cert that requires that users have a current client certificate to establish an SSL connection with the NetScaler.

  add ssl action act_current_client_cert-clientAuth DOCLIENTAUTH -clientCert ENABLED -certHeader "clientCertificateHeader" -clientCertNotBefore ENABLED -certNotBeforeHeader "Mon, 01 Jan 2007 00:00:00 GMT"

- Create an SSL policy named pol_current_client_cert that detects connections to the Web server that contain a query string.

  add ssl policy pol_current_ client_cert 'REQ.SSL.CLIENT.CERT.VALIDFROM >= "Mon, 01 Jan 2007 00:00:00 GMT"' act_block_ssl

- Bind your new policy globally.

  Because this SSL policy should apply to any user’s SSL connection unless a more specific SSL policy applies, you may want to assign it a low priority. If you assign it a priority of one thousand (1000), that should ensure that other SSL policies are evaluated first, meaning that this policy will apply only to connections that do not match more specific policy criteria.

Migration of Apache mod_rewrite Rules to the Default Syntax

The Apache HTTP Server provides an engine known as mod_rewrite for rewriting HTTP request URLs. If you migrate the mod_rewrite rules from Apache to the NetScaler, you boost back-end server performance. In addition, because the NetScaler typically load balances multiple (sometimes thousands of) Web servers, after migrating the rules to the NetScaler you will have a single point of control for these rules.

The subtopic listed in the table of contents on the left side of your screen provide examples of mod_rewrite functions, and translations of these functions into Rewrite and Responder policies on the NetScaler.

Converting URL Variations into Canonical URLs

On some Web servers you can have multiple URLs for a resource. Although the canonical URLs should be used and distributed, other URLs can exist as shortcuts or internal URLs. You can make sure that users see the canonical URL regardless of the URL used to make an initial request.

In the following examples, the URL /~user is converted to /u/user.

Apache mod_rewrite solution for converting a URL

```
RewriteRule   ^/~([^/]+)/?(.*)    /u/$1/$2[R]
```

NetScaler solution for converting a URL

```
add responder action act1 redirect '"/u/"+HTTP.REQ.URL.AFTER_STR("/~")' -bypassSafetyCheck yes
add responder policy pol1 'HTTP.REQ.URL.STARTSWITH("/~") && HTTP.REQ.URL.LENGTH.GT(2)' act1
bind responder global pol1 100
```

Converting Host Name Variations to Canonical Host Names

You can enforce the use of a particular host name for reaching a site. For example, you can enforce the use of www.example.com instead of example.com.

Apache mod_rewrite solution for enforcing a particular host name for sites running on a port other than 80

```
RewriteCond %{HTTP_HOST}   !^www.example.com
RewriteCond %{HTTP_HOST}   !^$
RewriteCond %{SERVER_PORT} !^80$
RewriteRule ^/(.*)         http://www.example.com:%{SERVER_PORT}/$1 [L,R]
```

Apache mod_rewrite solution for enforcing a particular host name for sites running on port 80

```
RewriteCond %{HTTP_HOST}   !^www.example.com
RewriteCond %{HTTP_HOST}   !^$
RewriteRule ^/(.*)         http://www.example.com/$1 [L,R]
```

NetScaler solution for enforcing a particular host name for sites running on a port other than 80

```
add responder action act1 redirect '"http://www.example.com:"+CLIENT.TCP.DSTPORT+HTTP.REQ.URL' -byp
add responder policy pol1 '!HTTP.REQ.HOSTNAME.CONTAINS("www.example.com")&&!HTTP.REQ.HOSTNAME.
bind responder global pol1 100 END
```

NetScaler solution for enforcing a particular host name for sites running on port 80

```
add responder action act1 redirect '"http://www.example.com"+HTTP.REQ.URL' -bypassSafetyCheck yes
add responder policy pol1  '!HTTP.REQ.HOSTNAME.CONTAINS("www.example.com")&&!HTTP.REQ.HOSTNAME
bind responder global  pol1 100 END
```

Moving a Document Root

Usually the document root of a Web server is based on the URL “/”. However, the document root can be any directory. You can redirect traffic to the document root if it changes from the top-level “/” directory to another directory.

In the following examples, you change the document root from / to /e/www. The first two examples simply replace one string with another. The third example is more universal because, along with replacing the root directory, it preserves the rest of the URL (the path and query string), for example, redirecting /example/file.html to /e/www/example/file.html.

Apache mod_rewrite solution for moving the document root

```
RewriteEngine on
RewriteRule   ^/$  /e/www/  [R]
```

NetScaler solution for moving the document root

```
add responder action act1 redirect '"/e/www/"' -bypassSafetyCheck yes
add responder policy pol1 'HTTP.REQ.URL.EQ("/")' act1
bind responder global pol1 100
```

NetScaler solution for moving the document root and appending path information to the request

```
add responder action act1 redirect '"/e/www"+HTTP.REQ.URL' -bypassSafetyCheck yes
add responder policy pol1 '!HTTP.REQ.URL.STARTSWITH("/e/www/")' act1
bind responder global pol1 100 END
```

Moving Home Directories to a New Web Server

You may want to redirect requests that are sent to home directories on a Web server to a different Web server. For example, if a new Web server is replacing an old one over time, as you migrate home directories to the new location you need to redirect requests for the migrated home directories to the new Web server.

In the following examples, the host name for the new Web server is newserver.

Apache mod_rewrite solution for redirecting to another Web server

```
RewriteRule   ^/(.+)  http://newserver/$1     [R,L]
```

NetScaler solution for redirecting to another Web server (method 1)

```
add responder  action act1 redirect '"http://newserver"+HTTP.REQ.URL' -bypassSafetyCheck yes
add responder policy pol1 'HTTP.REQ.URL.REGEX_MATCH(re#^/(.+)#)'    act1
bind responder global pol1 100 END
```

NetScaler solution for redirecting to another Web server (method 2)

```
add responder  action act1 redirect '"http://newserver"+HTTP.REQ.URL' -bypassSafetyCheck yes
add responder policy pol1 'HTTP.REQ.URL.LENGTH.GT(1)' act1
bind responder global pol1 100 END
```

Working with Structured Home Directories

Typically, a site with thousands of users has a structured home directory layout. For example, each home directory may reside under a subdirectory that is named using the first character of the user name. For example, the home directory for jsmith (/~jsmith/anypath) might be /home/j/smith/.www/anypath, and the home directory for rvalveti (/~rvalveti/anypath) might be /home/r/rvalveti/.www/anypath.

The following examples redirect requests to the home directory.

Apache mod_rewrite solution for structured home directories

```
RewriteRule   ^/~(([a-z])[a-z0-9]+)(.*)  /home/$2/$1/.www$3
```

NetScaler solution for structured home directories

NetScaler solution for structured home directories

```
add rewrite action act1 replace 'HTTP.REQ.URL'  '"/home/"+ HTTP.REQ.URL.AFTER_STR("~").PREFIX(1)+"/"+ H
add rewrite policy pol1  'HTTP.REQ.URL.PATH.STARTSWITH("/~")' act1
bind rewrite global pol1 100
```

Redirecting Invalid URLs to Other Web Servers

If a URL is not valid, it should be redirected to another Web server. For example, you should redirect to another Web server if a file that is named in a URL does not exist on the server that is named in the URL.

On Apache, you can perform this check using mod_rewrite. On the NetScaler, an HTTP callout can check for a file on a server by running a script on the server. In the following NetScaler examples, a script named file_check.cgi processes the URL and uses this information to check for the presence of the target file on the server. The script returns TRUE or FALSE, and the NetScaler uses the value that the script returns to validate the policy.

In addition to performing the redirection, the NetScaler can add custom headers or, as in the second NetScaler example, it can add text in the response body.

Apache mod_rewrite solution for redirection if a URL is wrong

```
RewriteCond   /your/docroot/%{REQUEST_FILENAME} !-f
RewriteRule   ^(.+)      http://webserverB.com/$1 [R]
```

NetScaler solution for redirection if a URL is wrong (method 1)

```
add HTTPCallout Call
set policy httpCallout Call -IPAddress 10.102.59.101 -port 80 -hostExpr '"10.102.59.101"' -returnType BOOL -R
add responder action act1 redirect '"http://webserverB.com"+HTTP.REQ.URL' -bypassSafetyCheck yes
add responder policy pol1 '!HTTP.REQ.HEADER("Name").EXISTS  &&  !SYS.HTTP_CALLOUT(call)' act1
bind responder global pol1 100
```

NetScaler solution for redirection if a URL is wrong (method 2)

```
add HTTPCallout Call
set policy httpCallout Call -IPAddress 10.102.59.101 -port 80 -hostExpr '"10.102.59.101"' -returnType BOOL -R
add responder  action act1 respondwith  '"HTTP/1.1 302 Moved Temporarily\r\nLocation: http://webserverB.
add responder policy pol1 '!HTTP.REQ.HEADER("Name").EXISTS  &&  !SYS.HTTP_CALLOUT(call)' act1
bind responder global pol1 100
```

Rewriting a URL Based on Time

You can rewrite a URL based on the time. The following examples change a request for example.html to example.day.html or example.night.html, depending on the time of day.

Apache mod_rewrite solution for rewriting a URL based on the time

```
RewriteCond   %{TIME_HOUR}%{TIME_MIN} >0700
RewriteCond   %{TIME_HOUR}%{TIME_MIN} <1900
RewriteRule   ^example\.html$ example.day.html [L]
RewriteRule   ^example\.html$ example.night.html
```

NetScaler solution for rewriting a URL based on the time

```
add rewrite action act1 insert_before 'HTTP.REQ.URL.PATH.SUFFIX(\'.\',0)' '"day."'
add rewrite action act2  insert_before 'HTTP.REQ.URL.PATH.SUFFIX(\'.\',0)' '"night."'
add rewrite  policy pol1 'SYS.TIME.WITHIN(LOCAL 07h 00m,LOCAL 18h 59m)' act1
add rewrite policy pol2 'true'  act2
bind rewrite global pol1 101
bind rewrite global pol2 102
```

Redirecting to a New File Name (Invisible to the User)

If you rename a Web page, you can continue to support the old URL for backward compatibility while preventing users from recognizing that the page was renamed.

In the first two of the following examples, the base directory is /~quux/. The third example accommodates any base directory and the presence of query strings in the URL.

Apache mod_rewrite solution for managing a file name change in a fixed location

```
RewriteEngine  on
RewriteBase    /~quux/
RewriteRule    ^foo\.html$  bar.html
```

NetScaler solution for managing a file name change in a fixed location

```
add rewrite action act1 replace 'HTTP.REQ.URL.AFTER_STR("/~quux").SUBSTR("foo.html")' '"bar.html"'
add rewrite policy pol1 'HTTP.REQ.URL.ENDSWITH("/~quux/foo.html")' act1
bind rewrite global pol1 100
```

NetScaler solution for managing a file name change regardless of the base directory or query strings in the URL

```
add rewrite action act1 replace 'HTTP.REQ.URL.PATH.SUFFIX(\'/\',0)' '"bar.html"'
Add rewrite policy pol1 'HTTP.REQ.URL.PATH.CONTAINS("foo.html")' act1
Bind rewrite global pol1 100
```

Redirecting to New File Name (User-Visible URL)

If you rename a Web page, you may want to continue to support the old URL for backward compatibility and allow users to see that the page was renamed by changing the URL that is displayed in the browser.

In the first two of the following examples, redirection occurs when the base directory is /~quux/. The third example accommodates any base directory and the presence of query strings in the URL.

Apache mod_rewrite solution for changing the file name and the URL displayed in the browser

```
RewriteEngine on
RewriteBase    /~quux/
RewriteRule    ^old\.html$ new.html  [R]
```

NetScaler solution for changing the file name and the URL displayed in the browser

```
add responder action act1 redirect 'HTTP.REQ.URL.BEFORE_STR("foo.html")+"new.html"' -bypassSafetyCheck
add responder policy pol1 'HTTP.REQ.URL.ENDSWITH("/~quux/old.html")' act1
bind responder global pol1 100
```

NetScaler solution for changing the file name and the URL displayed in the browser regardless of the base directory or query strings in the URL

```
add responder action act1 redirect 'HTTP.REQ.URL.PATH.BEFORE_STR("old.html")+"new.html"+HTTP.REQ.URL
add responder policy pol1 'HTTP.REQ.URL.PATH.CONTAINS("old.html")' act1
bind responder global pol1 100
```

Accommodating Browser Dependent Content

To accommodate browser-specific limitations—at least for important top-level pages—it is sometimes necessary to set restrictions on the browser type and version. For example, you might want to set a maximum version for the latest Netscape variants, a minimum version for Lynx browsers, and an average feature version for all others.

The following examples act on the HTTP header "User-Agent", such that if this header begins with "Mozilla/3", the page MyPage.html is rewritten to MyPage.NS.html. If the browser is "Lynx" or "Mozilla" version 1 or 2, the URL becomes MyPage.20.html. All other browsers receive page MyPage.32.html.

Apache mod_rewrite solution for browser-specific settings

```
RewriteCond %{HTTP_USER_AGENT}  ^Mozilla/3.*
RewriteRule ^MyPage\.html$ MyPage.NS.html [L]
RewriteCond %{HTTP_USER_AGENT}  ^Lynx/.* [OR]
RewriteCond %{HTTP_USER_AGENT}  ^Mozilla/[12].*
RewriteRule ^MyPage\.html$ MyPage.20.html [L]
RewriteRule ^fMyPage\.html$ MyPage.32.html [L]
NetScaler solution for browser-specific settings
add patset pat1
bind patset pat1 Mozilla/1
bind Patset pat1 Mozilla/2
bind patset pat1 Lynx
bind Patset pat1 Mozilla/3
add rewrite action act1 insert_before 'HTTP.REQ.URL.SUFFIX' '".NS."'
add rewrite action act2 insert_before 'HTTP.REQ.URL.SUFFIX' '".20."'
add rewrite action act3 insert_before 'HTTP.REQ.URL.SUFFIX' '".32."'
add rewrite policy pol1 'HTTP.REQ.HEADER("User-Agent").STARTSWITH_INDEX("pat1").EQ(4)' act1
add rewrite policy pol2 'HTTP.REQ.HEADER("User-Agent").STARTSWITH_INDEX("pat1").BETWEEN(1,3)' act2
add rewrite policy pol3 '!HTTP.REQ.HEADER("User-Agent").STARTSWITH_ANY("pat1")' act3
bind rewrite global pol1 101 END
bind rewrite global pol2 102 END
bind rewrite global pol3 103 END
```

Blocking Access by Robots

You can block a robot from retrieving pages from a specific directory or a set of directories to ease up the traffic to and from these directories. You can restrict access based on the specific location or you can block requests based on information in User-Agent HTTP headers.

In the following examples, the Web location to be blocked is /~quux/foo/arc/, the IP addresses to be blocked are 123.45.67.8 and 123.45.67.9, and the robot's name is NameOfBadRobot.

Apache mod_rewrite solution for blocking a path and a User-Agent header

```
RewriteCond %{HTTP_USER_AGENT}   ^NameOfBadRobot.*
RewriteCond %{REMOTE_ADDR}       ^123\.45\.67\.[8-9]$
RewriteRule ^/~quux/foo/arc/.+   -   [F]
```

NetScaler solution for blocking a path and a User-Agent header

```
add responder action act1 respondwith "'HTTP/1.1 403 Forbidden\r\n\r\n'"
add responder policy pol1 'HTTP.REQ.HEADER("User_Agent").STARTSWITH("NameOfBadRobot")&&CLIENT.IP.S
bind responder global pol1 100
```

Blocking Access to Inline Images

If you find people frequently going to your server to copy inline graphics for their own use (and generating unnecessary traffic), you may want to restrict the browser's ability to send an HTTP Referer header.

In the following example, the graphics are located in http://www.quux-corp.de/~quux/.

Apache mod_rewrite solution for blocking access to an inline image

```
RewriteCond %{HTTP_REFERER} !^$
RewriteCond %{HTTP_REFERER} !^http://www.quux-corp.de/~quux/.*$
RewriteRule .*\.gif$ - [F]
```

NetScaler solution for blocking access to an inline image

```
add patset pat1
bind patset pat1 .gif
bind patset pat1 .jpeg
add responder action act1 respondwith "'HTTP/1.1 403 Forbidden\r\n\r\n'"
add responder policy pol1 '!HTTP.REQ.HEADER("Referer").EQ("") && !HTTP.REQ.HEADER("Referer").STARTSWI
bind responder global pol1 100
```

Creating Extensionless Links

To prevent users from knowing application or script details on the server side, you can hide file extensions from users. To do this, you may want to support extensionless links. You can achieve this behavior by using rewrite rules to add an extension to all requests, or to selectively add extensions to requests.

The first two of the following examples show adding an extension to all request URLs. In the last example, one of two file extensions is added. Note that in the last example, the mod_rewrite module can easily find the file extension because this module resides on the Web server. In contrast, the NetScaler must invoke an HTTP callout to check the extension of the requested file on the Web server. Based on the callout response, the NetScaler adds the .html or .php extension to the request URL.

Note: In the second NetScaler example, an HTTP callout is used to query a script named file_check.cgi hosted on the server. This script checks whether the argument that is provided in the callout is a valid file name.

Apache mod_rewrite solution for adding a .php extension to all requests

```
RewriteRule ^/?([a-z]+)$ $1.php [L]
```

NetScaler policy for adding a .php extension to all requests

```
add rewrite action act1 insert_after 'HTTP.REQ.URL' "".php""
add rewrite policy pol1 'HTTP.REQ.URL.PATH.REGEX_MATCH(re#^/([a-z]+)$#)' act1
bind rewrite global pol1 100
```

Apache mod_rewrite solution for adding either .html or .php extensions to requests

```
RewriteCond %{REQUEST_FILENAME}.php -f
RewriteRule ^/?([a-zA-Z0-9]+)$ $1.php [L]
RewriteCond %{REQUEST_FILENAME}.html –f
RewriteRule ^/?([a-zA-Z0-9]+)$ $1.html [L]
```

NetScaler policy for adding either .html or .php extensions to requests

```
add HTTPCallout Call_html
add HTTPCallout Call_php
set policy httpCallout Call_html -IPAddress 10.102.59.101 -port 80 -hostExpr ""10.102.59.101"" -returnType BO
set policy httpCallout Call_php -IPAddress 10.102.59.101 -port 80 -hostExpr ""10.102.59.101"" -returnType BO
add patset pat1
bind patset pat1 .html
bind patset pat1 .php
bind patset pat1 .asp
```

```
bind patset pat1 .cgi
add rewrite  action act1 insert_after 'HTTP.REQ.URL.PATH'  "".html""
add rewrite  action act2 insert_after "HTTP.REQ.URL.PATH"  "".php""
add rewrite policy pol1 '!HTTP.REQ.URL.CONTAINS_ANY("pat1") && SYS.HTTP_CALLOUT(Call_html)' act1
add rewrite policy pol2 '!HTTP.REQ.URL.CONTAINS_ANY("pat1") && SYS.HTTP_CALLOUT(Call_php)' act2
bind rewrite global pol1 100 END
bind rewrite global pol2 101 END
```

Redirecting a Working URI to a New Format

Suppose that you have a set of working URLs that resemble the following:

/index.php?id=nnnn

To change these URLs to /nnnn and make sure that search engines update their indexes to the new URI format, you need to do the following:

- Redirect the old URIs to the new ones so that search engines update their indexes.
- Rewrite the new URI back to the old one so that the index.php script runs correctly.

To accomplish this, you can insert marker code into the query string (making sure that the marker code is not seen by visitors), and then removing the marker code for the index.php script.

The following examples redirect from an old link to a new format only if a marker is not present in the query string. The link that uses the new format is re-written back to the old format, and a marker is added to the query string.

Apache mod_rewrite solution

```
RewriteCond %{QUERY_STRING} !marker
RewriteCond %{QUERY_STRING} id=([-a-zA-Z0-9_+]+)
RewriteRule ^/?index\.php$ %1? [R,L]
RewriteRule ^/?([-a-zA-Z0-9_+]+)$  index.php?marker&id=$1 [L]
NetScaler solution
add responder action act_redirect redirect 'HTTP.REQ.URL.PATH.BEFORE_STR("index.php")+HTTP.REQ.URL.C
add responder policy pol_redirect '!HTTP.REQ.URL.QUERY.CONTAINS("marker")&& HTTP.REQ.URL.QUERY.VA
bind responder global pol_redirect 100 END
add rewrite action act1 replace 'HTTP.REQ.URL.PATH.SUFFIX(\'/\',0)' '"index.phpmarker&id="+HTTP.REQ.URL
add rewrite policy pol1 '!HTTP.REQ.URL.QUERY.CONTAINS("marker")'  act1
bind rewrite global pol1 100 END
```

Ensuring That a Secure Server Is Used for Selected Pages

To make sure that only secure servers are used for selected Web pages, you can use the following Apache mod_rewrite code or NetScaler Responder policies.

Apache mod_rewrite solution

```
RewriteCond %{SERVER_PORT} !^443$
RewriteRule ^/?(page1|page2|page3|page4|page5)$  https://www.example.com/%1 [R,L]
```

NetScaler solution using regular expressions

```
add responder action res_redirect redirect  "'https://www.example.com"+HTTP.REQ.URL' -bypassSafetyChec
add responder policy pol_redirect '!CLIENT.TCP.DSTPORT.EQ(443)&&HTTP.REQ.URL.REGEX_MATCH(re/page[
bind responder global pol_redirect 100 END
```

NetScaler solution using pattern sets

```
add patset pat1
bind patset pat1 page1
bind patset pat1 page2
bind patset pat1 page3
bind patset pat1 page4
bind patset pat1 page5
add responder action res_redirect redirect  "'https://www.example.com"+HTTP.REQ.URL' -bypassSafetyChec
add responder policy pol_redirect '!CLIENT.TCP.DSTPORT.EQ(443)&&HTTP.REQ.URL.CONTAINS_ANY("pat1")'
bind responder global pol_redirect 100 END
```

Rate Limiting

The rate limiting feature enables you to define the maximum load for a given network entity or virtual entity on the Citrix NetScaler appliance. The feature enables you to configure the appliance to monitor the rate of traffic associated with the entity and take preventive action, in real time, based on the traffic rate. This feature is particularly useful when the network is under attack from a hostile client that is sending the appliance a flood of requests. You can mitigate the risks that affect the availability of resources to clients, and you can improve the reliability of the network and the resources that the appliance manages.

You can monitor and control the rate of traffic that is associated with virtual and user-defined entities, including virtual servers, URLs, domains, and combinations of URLs and domains. You can throttle the rate of traffic if it is too high, base information caching on the traffic rate, and redirect traffic to a given load balancing virtual server if the traffic rate exceeds a predefined limit. You can apply rate-based monitoring to HTTP, TCP, and DNS requests.

To monitor the rate of traffic for a given scenario, you configure a *rate limit identifier*. A rate limit identifier specifies numeric thresholds such as the maximum number of requests or connections (of a particular type) that are permitted in a specified time period called a *time slice*.

Optionally, you can configure filters, known as *stream selectors*, and associate them with rate limit identifiers when you configure the identifiers. After you configure the optional stream selector and the limit identifier, you must invoke the limit identifier from a default syntax policy. You can invoke identifiers from any feature in which the identifier may be useful, including rewrite, responder, DNS, and integrated caching.

You can globally enable and disable SNMP traps for rate limit identifiers. Each trap contains cumulative data for the rate limit identifier's configured data collection interval (time slice), unless you specified multiple traps to be generated per time slice. For more information about configuring SNMP traps and managers, see "SNMP."

Configuring a Stream Selector

A traffic stream selector is an optional filter for identifying an entity for which you want to throttle access. The selector is applied to a request or a response and selects data points (keys) that can be analyzed by a rate stream identifier. These data points can be based on almost any characteristic of the traffic, including IP addresses, subnets, domain names, TCP or UDP identifiers, and particular strings or extensions in URLs.

A stream selector consists of individual default syntax expressions called selectlets. Each selectlet is a non-compound default syntax expression. A traffic stream selector can contain up to five non-compound expressions called selectlets. Each selectlet is considered to be in an AND relationship with the other expressions. Following are some examples of selectlets:

http.req.url
http.res.body(1000>after_str(\"car_model\").before_str(\"made_in\")"
"client.ip.src.subnet(24)"

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

Note: If you modify an expression in a stream selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a stream selector named myStreamSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1. If you change the expression in myStreamSelector1, you might receive an error when binding dnsRateLimit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

To configure a traffic stream selector by using the command line interface

At the command prompt, type:

add stream selector <name> <rule> ...

Example

> add stream selector myStreamSel HTTP.REQ.URL CLIENT.IP.SRC

To configure a stream selector by using the configuration utility

Navigate to AppExpert > Rate Limiting > Selectors, click Add and specify the relevant details.

Configuring a Traffic Rate Limit Identifier

A rate limit identifier returns a Boolean TRUE if the amount of traffic exceeds a numeric limit within a particular time interval. The rate limit identifier definition can optionally include a stream selector. When you include a limit identifier in the compound default syntax expression in a policy rule, if you do not specify a stream selector, the limit identifier is applied to all the requests or responses that are identified by the compound expression.

Note: The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

To configure a traffic limit identifier from the command line interface

At the command prompt, type:

add ns limitIdentifier <limitIdentifier> -threshold <positive_integer> -timeSlice <positive_integer> -mode <mode> -limitType (BURSTY | SMOOTH) -selectorName <string> -maxBandwidth <positive_integer> -trapsInTimeSlice <positive_integer>

Example

Configuring traffic rate limit identifier in BURSTY mode:

```
> add ns limitIdentifier 100_request_limit -threshold 100 -timeSlice 1000 -mode REQUEST_RATE -limitType B
```

Configuring traffic rate limit identifier in SMOOTH mode:

```
> add ns limitidentifier limit_req -mode request_rate -limitType smooth -timeslice 1000 -Threshold 2000 -tra
```

To configure a traffic limit identifier by using the configuration utility

Navigate to AppExpert > Rate Limiting > Limit Identifiers, click Add and specify the relevant details.

Configuring and Binding a Traffic Rate Policy

You implement rate-based application behavior by configuring a policy in an appropriate NetScaler feature. The feature must support default syntax policies. The policy expression must contain the following expression prefix to enable the feature to analyze the traffic rate:

```
sys.check_limit(<limit_identifier>)
```

Where `limit_identifier` is the name of a limit identifier.

The policy expression must be a compound expression that contains at least two components:

- An expression that identifies traffic to which the rate limit identifier is applied. For example:

  ```
  http.req.url.contains("my_aspx.aspx").
  ```

- An expression that identifies a rate limit identifier, for example, `sys.check_limit("my_limit_identifier")`. This must be the last expression in the policy expression.

To configure a rate-based policy by using the command line interface

At the command prompt, type the following command to configure a rate-based policy and verify the configuration:

add cache|dns|rewrite|responder policy <policy_name> -rule expression && sys.check_limit("<LimitIdentifierName>") [<feature-specific information>]

Following is a complete example of a rate-based policy rule. Note that this example assumes that you have configured the responder action, send_direct_url, that is associated with the policy. Note that the sys.check_limit parameter must be the last element of the policy expression:

add responder policy responder_threshold_policy "http.req.url.contains(\"myindex.html\") && sys.check_limi

For information about binding a policy globally or to a virtual server, see "Binding Default Syntax Policies."

Rate Limiting Policy Parameters

Name

A name of up to 31 characters.

Expression

A default syntax expression that contains, at minimum, a component that identifies traffic to which the rate limit identifier should be applied and a sys.check_limit parameter.

Feature-specific information

Other required information for the policy definition, for example, actions or profiles to trigger if the policy evaluates to TRUE.

Note: You must specify sys.check_limit as the final expression element in the policy rule to ensure that the NetScaler updates the limit records only if the policy is true.

To configure a rate-based policy by using the configuration utility

1. In the navigation pane, expand the feature in which you want to configure a policy (for example, Integrated Caching, Rewrite, or Responder), and then click Policies.
2. In the details pane, click Add. In Name, enter a unique name for the policy.
3. Under Expression, enter the policy rule, and make sure that you include the `sys.check_limit` parameter as the final component of the expression. For example:

   ```
   http.req.url.contains("my_aspx.aspx") && sys.check_limit("my_limit_identifier")
   ```

4. Enter feature-specific information about the policy.

   For example, you may be required to associate the policy with an action or a profile. For more information, see the feature-specific documentation.
5. Click Create, and then click Close.
6. Click Save.

Viewing the Traffic Rate

If traffic through one or more virtual servers matches a rate-based policy, you can view the rate of this traffic. The rate statistics are maintained in the limit identifier that you named in the rule for the rate-based policy. If more than one policy uses the same limit identifier, you can view the traffic rate as defined by hits to all of the policies that use the particular limit identifier.

To view the traffic rate by using the command line interface

At the command prompt, type the following command to view the traffic rate:

show ns limitSessions <limitIdentifier>

Example

sh limitsession myLimitSession

Parameters for viewing the traffic rate

limitIdentifier

The name of the rate limit identifier. Maximum length: 31.

To view the traffic rate by using the configuration utility

1. Navigate to AppExpert > Rate Limiting > Limit Identifiers.
2. Select a limit identifier whose traffic rate you want to view.
3. Click the Show Sessions button. If traffic through one or more virtual servers has matched a rate limiting policy that uses this limit identifier (and the hits are within the configured time slice for this identifier), the Session Details dialog box appears. Otherwise, you receive a "`No session exists`" message.

Testing a Rate-Based Policy

To test a rate-based policy, you can send traffic to any virtual server to which a rate-based policy is bound.

Task overview: Testing a rate-based policy

1. Configure a stream selector (optional) and a rate limit identifier (required). For example:

   ```
   add stream selector sel_subnet Q.URL "CLIENT.IP.SRC.SUBNET(24)"
   add ns limitIdentifier k_subnet -Threshold 4 -timeSlice 3600 -mode REQUEST_RATE  -limittype smooth  -s
   ```

2. Configure the action that you want to associate with the policy that uses the rate limit identifier. For example:

   ```
   add responder action resp_redirect redirect "\"http://response_site.com/\""
   ```

3. Configure a policy that uses the sys.check_limit expression prefix to call the rate limit identifier. For example, the policy can apply a rate limit identifier to all requests arriving from a particular subnet, as follows:

   ```
   add responder policy resp_subnet "SYS.CHECK_LIMIT(\"k_subnet\")" resp_redirect
   ```

4. Bind the policy globally or to a virtual server. For example:

   ```
   bind responder global resp_subnet 6 END -type DEFAULT
   ```

5. In a browser address bar, send a test HTTP query to a virtual server. For example:

   ```
   http://<IP of a vserver>/testsite/test.txt
   ```

6. At the NetScaler command prompt, type:

   ```
   show ns limitSessions <limitIdentifier>
   ```

   Example

   ```
   > sh limitsession k_subnet
   1)      Time Remaining:       98 secs  Hits: 2                    Action Taken: 0
          Total Hash:    1718618  Hash String: /test.txt
          IPs gathered:
                 1) 10.217.253.0
          Active Transactions: 0
    Done
   >
   ```

7. Repeat the query and check the limit identifier statistics again to verify that the statistics are being updated correctly.

Examples of Rate-Based Policies

The following table shows examples of rate-based policies.

Table 1. Examples of Rate-Based Policies

Purpose	Example
Limit the number of requests per second from a URL	add stream selector ipStreamSelector http.req.url "client.ip.src" add ns limitIdentifier ipLimitIdentifier -threshold 4 -timeSlice 1000 -mode request_rate -limitType smooth -selectorName ipStreamSelecto add responder action myWebSiteRedirectAction redirect "\"http://www.mycompany.com/\"" add responder policy ipLimitResponderPolicy "http.req.url.contains(\"m && sys.check_limit(\"ipLimitIdentifier\")" myWebSiteRedirectAction bind responder global ipLimitResponderPolicy 100 END -type default
Cache a response if the request URL rate exceeds 5 per 20000 milliseconds	add stream selector cacheStreamSelector http.req.url add ns limitidentifier cacheRateLimitIdentifier -threshold 5 -timeSlice 2 -selectorName cacheStreamSelector add cache policy cacheRateLimitPolicy -rule "http.req.method.eq(get) && sys.check_limit(\"cacheRateLimitIdentifier\")" -action cache bind cache global cacheRateLimitPolicy -priority 10
Drop a connection on the basis of cookies received in requests from www.yourcompany.com if the requests exceed the rate limit	add stream selector reqCookieStreamSelector "http.req.cookie .value(\"mycookie\")" "client.ip.src.subnet(24)" add ns limitIdentifier myLimitIdentifier -Threshold 2 -timeSlice 3000 -selectorName reqCookieStreamSelector add responder action sendRedirectUrl redirect '\"http://www.mycompa + http.req.url' -bypassSafetyCheck YES add responder policy rateLimitCookiePolicy "http.req.url.contains(\"www.yourcompany.com\") && sys.check_limit(\"myLimitIdentifier\")" sendRedirectUrl

Drop a DNS packet if the requests from a particular client IP address and DNS domain exceed the rate limit	add stream selector dropDNSStreamSelector client.udp.dns.domain clie add ns limitIdentifier dropDNSRateIdentifier -timeslice 20000 -mode req -selectorName dropDNSStreamSelector -maxBandwidth 1 -trapsintimesl add dns policy dnsDropOnClientRatePolicy "sys.check_limit (\"dropDNSRateIdentifier\")" -drop yes
Limit the number of HTTP requests that arrive from the same subnet (with a subnet mask of 32) and that have the same destination IP address.	add stream selector ipv6_sel "CLIENT.IPv6.src.subnet(32)" CLIENT.IPv6.d add ns limitIdentifier ipv6_id -imeSlice 20000 -selectorName ipv6_sel add lb vserver ipv6_vip HTTP 3ffe::209 80 -persistenceType NONE -cltTi add responder action redirect_page redirect "\"http://redirectpage.com add responder policy ipv6_resp_pol "SYS.CHECK_LIMIT(\"ipv6_id\")" redir bind responder global ipv6_resp_pol 5 END -type DEFAULT

Sample Use Cases for Rate-Based Policies

The following scenarios describe two uses of rate-based policies in global server load balancing (GSLB):

- The first scenario describes the use of a rate-based policy that sends traffic to a new data center if the rate of DNS requests exceed 1000 per second.
- In the second scenario, if more than five DNS requests arrive for a local DNS (LDNS) client within a particular period, the additional requests are dropped.

Redirecting Traffic on the Basis of Traffic Rate

In this scenario, you configure a proximity-based load balancing method, and a rate-limiting policy that identifies DNS requests for a particular region. In the rate-limiting policy, you specify a threshold of 1000 DNS requests per second. A DNS policy applies the rate limiting policy to DNS requests for the region "Europe.GB.17.London.UK-East.ISP-UK." In the DNS policy, DNS requests that exceed the rate limiting threshold, starting with request 1001 and continuing to the end of the one-second interval, are to be forwarded to the IP addresses that are associated with the region "North America.US.TX.Dallas.US-East.ISP-US."

The following configuration demonstrates this scenario:

```
add stream selector DNSSelector1 client.udp.dns.domain
add ns limitIdentifier DNSLimitIdentifier1 -threshold 5 -timeSlice 1000 -selectorName DNSSelector1
add dns policy DNSLimitPolicy1 "client.ip.src.matches_location(\"Europe.GB.17.London.*.*\") &&
sys.check_limit(\"DNSLimitIdentifier1\")" -preferredLocation "North America.US.TX.Dallas.*.*"
bind dns global DNSLimitPolicy1 5
```

Dropping DNS Requests on the Basis of Traffic Rate

In the following example of global server load balancing, you configure a rate limiting policy that permits a maximum of five DNS requests in a particular interval, per domain, to be directed to an LDNS client for resolution. Any requests that exceed this rate are dropped. This type of policy can help protect the NetScaler from resource exploitation. For example, in this scenario, if the time to live (TTL) for a connection is five seconds, this policy prevents the LDNS from requerying a domain. Instead, it uses data that is cached on the NetScaler.

```
add stream selector LDNSSelector1 client.udp.dns.domain client.ip.src
add ns limitIdentifier LDNSLimitIdentifier1 -threshold 5 -timeSlice 1000 -selectorName LDNSSelector1
add dns policy LDNSPolicy1 "client.udp.dns.domain.contains(\".\") && sys.check_limit(\"LDNSLimitIdentifier1\
```

```
bind dns global LDNSPolicy1 6
show gslb vserver gvip

Responder

Today's complex Web configurations often require different responses to HTTP requests that appear, on the surface, to be similar. When users request a Web site's home page, you may want to provide a different home page depending on where each user is located, which browser the user is using, or which language(s) the browser accepts and the order of preference. You might want to break the connection immediately if the request is coming from an IP range that has been generating DDoS attacks or initiating hacking attempts.

With the Responder feature, responses can be based on who sends the request, where it is sent from, and other criteria with security and system management implications. The feature is simple and quick to use. By avoiding the invocation of more complex features, it reduces CPU cycles and time spent in handling requests that do not require complex processing.

For handling sensitive data such as financial information, if you want to ensure that the client uses a secure connection to browse a site, you can redirect the request to secure connection by using https:// instead of http://.

To use the Responder feature, do the following;

- Enable the Responder feature on the NetScaler.
- Configure responder actions. The action can be to generate a custom response, redirect a request to a different Web page, or reset a connection.
- Configure responder policies. The policy determines the requests (traffic) on which an action has to be taken.
- Bind each policy to a bind point put it into effect. A bind point refers to an entity at which NetScaler examines the traffic to see if it matches a policy. For example, a bind point can be a load balancing virtual server.

You can specify a default action for requests that do not match any policy, and you can bypass the safety check for actions that would otherwise generate error messages.

The Rewrite feature of NetScaler helps in rewriting some information in the requests or responses handled by NetScaler. The following section shows some differences between the two features.

Comparison between Rewrite and Responder options

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting a http request to new Web sites or Web pages
- Responding with some custom response

- Dropping or resetting a connection at request level

In case of a responder policy, the NetScaler examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

In case of a rewrite policy, the NetScaler examines the request from the client or response from the server, takes action according to the applicable policies, and forwards the traffic to the client or the server.

In general, it is recommended to use responder if you want the NetScaler to reset or drop a connection based on a client or request-based parameter. Use responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

Enabling the Responder Feature

To use the Responder feature, you must first enable it.

To enable the responder feature by using the command line interface

At the command prompt, type the following commands to enable the responder feature and verify the configuration:

- enable ns feature<feature>
- show ns feature

Example

```
enable ns feature Responder
 Done
> show ns feature

      Feature                 Acronym           Status
      -------                 -------           ------
 1)   Web Logging               WL                ON
 2)   Surge Protection          SP                ON
.
.
.
 22)  Responder                 RESPONDER         ON
 23)  HTML Injection            HTMLInjection     ON
 24)  NetScaler Push            push              OFF
Done
>
```

To enable the responder feature by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change advanced features.
3. In the Configure Advanced Features dialog box, select the Responder check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click YES. A message appears in the status bar, stating that the feature has been enabled.

Configuring a Responder Action

After enabling the responder feature, you must configure one or more actions for handling requests. The responder supports the following types of actions:

Respond with

Sends the response defined by the Target expression without forwarding the request to a web server. (The NetScaler appliance substitutes for and acts as a web server.) Use this type of action to manually define a simple HTML-based response. Normally the text for a Respond with action consists of a web server error code and brief HTML page.

Respond with SQL OK

Sends the designated SQL OK response defined by the Target expression. Use this type of action to send an SQL OK response to an SQL query.

Respond with SQL Error

Sends the designated SQL Error response defined by the Target expression. Use this type of action to send an SQL Error response to an SQL query.

Respond with HTML page

Sends the designated HTML page as the response. You can choose from a drop-down list of HTML pages that were previously uploaded, or upload a new HTML page. Use this type of action to send an imported HTML page as the response.

Redirect

Redirects the request to a different web page or web server. A Redirect action can redirect requests originally sent to a "dummy" web site that exists in DNS, but for which there is no actual web server, to an actual web site. It can also redirect search requests to an appropriate URL. Normally, the redirection target for a Redirect action consists of a complete URL.

To configure a responder action by using the command line interface

At the command prompt, type the following commands to configure a responder action and verify the configuration:

- add responder action <name> <type> <target> [-bypassSafetyCheck (YES | NO)]
- show responder action

Example

To create a responder action that displays a “Not Found” error page for URLs that do not exist:

```
add responder action act404Error respondWith "'HTTP/1.1 404 Not Found\r\n\r\n"+ "HTTP.REQ.URL.HTTP_URL
 Done
> show responder action

1)      Name: act404Error
        Operation: respondwith
        Target: "HTTP/1.1 404 Not Found

"+ "HTTP.REQ.URL.HTTP_URL_SAFE" + "does not exist on the web server."
        BypassSafetyCheck : NO
        Hits: 0
        Undef Hits: 0
        Action Reference Count: 0
 Done
```

To create a responder action that displays a “Not Found” error page for URLs that do not exist:

```
add responder action act404Error respondWith "'HTTP/1.1 404 Not Found\r\n\r\n"+ "HTTP.REQ.URL.HTTP_URL
 Done
> show responder action

1)      Name: act404Error
        Operation: respondwith
        Target: "HTTP/1.1 404 Not Found

"+ "HTTP.REQ.URL.HTTP_URL_SAFE" + "does not exist on the web server."
        BypassSafetyCheck : NO
        Hits: 0
        Undef Hits: 0
        Action Reference Count: 0
 Done
```

To modify an existing responder action by using the command line interface

At the command prompt, type the following command to modify an existing responder action and verify the configuration:

- set responder action <name> -target <string> [-bypassSafetyCheck (YES | NO)]
- show responder action

Example

```
set responder action act404Error  -target '"HTTP/1.1 404 Not Found\r\n\r\n"+ "HTTP.REQ.URL.HTTP_URL_SAF
 Done
> show responder action

1)      Name: act404Error
        Operation: respondwith
        Target: "HTTP/1.1 404 Not Found

"+ "HTTP.REQ.URL.HTTP_URL_SAFE" + "does not exist on the web server."
        BypassSafetyCheck : NO
        Hits: 0
        Undef Hits: 0
        Action Reference Count: 0
 Done
```

To remove a responder action by using the command line interface

At the command prompt, type the following command to remove a responder action and verify the configuration:

- rm responder action <name>
- show responder action

Example

```
rm responder action act404Error
 Done

> show responder action
 Done
```

Parameters for configuring a responder action

name

A name for your new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.

type

The type of responder action. Possible values:

- *respondWith*: Sends the response specified in the target expression.
- *sqlresponse_ok*: Sends an SQL OK response as specified in the target expression.

- *sqlresponse_error*: Sends an SQL Error response as specified in the target expression.
- *respondwithhtmlpage*: Sends the uploaded HTML page specified as the target.
- *redirect*: Redirects the request to the URL specified as the target expression.

target

The HTTP or SQL string to be sent as a response, the name of the uploaded HTML page to be sent as a response, or the URL to which the request is redirected. For `respondWith`, `sqlresponse_ok`, and `sqlresponse_error` response types, the target must consist of one or more strings enclosed in straight double quotes, with the entire response enclosed in straight single quotes. Within a response, type a plus sign (+) between separate double-quoted strings. Type \r\n to begin a new line.

bypassSafetyCheck

Bypass the appliance's built-in safety checks when adding or modifying this action. Possible values: YES, NO

To configure a responder action by using the configuration utility

1. Navigate to AppExpert > Responder > Actions.
2. In the details pane, do one of the following:
   - To create a new action, click Add.
   - To modify an existing action, select the action, and then click Open.
3. In the Add Responder Action or Configure Responder Action dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring a responder action" as follows (asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously configured action)
   - Type*—type
   - Target*—target
   - Bypass Safety Check—byPassSafetyCheck

   If you want help creating the target for a new action, while the cursor is in the Target text box you can either hold down the Control key and press the space bar, or you can use the Add Expression dialog box as described in “To add an expression by using the Add Expression dialog box” below.
4. Click Create or OK, depending on whether you are creating a new action or modifying an existing action.
5. Click Close. A message appears in the status bar, stating that the feature has been enabled.
6. To delete a responder action, select the action, and then click Remove. A message appears in the status bar, stating that the feature has been disabled.

To add an expression by using the Add Expression dialog box

1. In the Create Responder Action or Configure Responder Action dialog box, click Add.
2. In the Add Expression dialog box, in the first list box choose the first term for your expression.

   HTTP

   The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.

   SYS

   The protected web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

   CLIENT

   The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

   ANALYTICS

   The analytics data associated with the request. Choose this if you want to examine request metadata.

   SIP

   A SIP request. Choose this if you want to examine some aspect of a SIP request.

   When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.
3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

Configuring the Global HTTP Action

You can configure the global HTTP action to invoke a responder action when an HTTP request times out. To configure this feature, you must first create the responder action that you want to invoke. Then, you configure the global HTTP timeout action to respond to a timeout with that responder action.

To configure the global HTTP action by using the command line interface

At the command prompt, type the following command:

- set ns httpProfile -reqTimeoutAction <responder action name>
- save ns config

For <responder action name>, substitute the name of the responder action.

Configuring a Responder Policy

After you configure a responder action, you must next configure a responder policy to select the requests to which the NetScaler appliance should respond. A responder policy is based on a rule, which consists of one or more expressions. The rule is associated with an action, which is performed if a request matches the rule.

Note: For creating and managing responder policies, the configuration utility provides assistance that is not available at the NetScaler command prompt.

To configure a responder policy by using the command line interface

At the command prompt, type the following command to add a new responder policy and verify the configuration:

- add responder policy <name> <expression> <action> [<undefaction>]-appFlowaction<actionName>
- show responder policy <name>

Example

```
> add responder policy policyThree "CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)" RESET
 Done
> show responder policy policyThree

      Name: policyThree
      Rule: CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)
      Responder Action: RESET
      UndefAction: Use Global
      Hits: 0
      Undef Hits: 0
 Done
```

To modify an existing responder policy by using the command line interface

At the command prompt, type the following command to modify an existing responder policy and verify the configuration:

- set responder policy <name> [-rule <expression>] [-action <string>] [-undefAction <string>]

- show responder policy <name>

To remove a responder policy by using the command line interface

At the command prompt, type the following command to remove a responder policy and verify the configuration:

- rm responder policy <name>
- show responder policy

Example

```
>rm responder policy pol404Error
 Done

> show responder policy
 Done
```

Parameters for configuring a responder policy

name

A name for the policy, or the name of the existing policy you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that will make it easy for others to tell what type of request this policy was configured to match.

rule

The expression that defines the rule for this policy. The expression can be a simple expression or a complex expression that contains several expressions in structured relationship to one another. Expressions are written in the NetScaler Policy Infrastructure (PI) language. For more information about PI, see "AppExpert."

action

The name of the responder action associated with the policy. You can choose either the built-in ‘NOOP’ or ‘RESET’ actions, or a responder action you have configured.

appFlowaction

The name of the AppFlow action that sends the web-page performance data to the collectors in which you want to collect the web-page performance data.

undefaction

The action to use if the policy generates an UNDEF event. You can select either the NOOP, RESET, or DROP action, or configure the NetScaler appliance use the configured global undefined action.

Any responder-specific undefined action you configure will override the global undefined action.

To configure a responder policy by using the configuration utility

1. Navigate to Responder > Policies.
2. In the details pane, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the policy, and then click Open.
3. In the Create Responder Policy or Configure Responder Policy dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring a responder policy" as follows (asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously configured policy.)
   - Action*—action
   - Expression*—expression
   - Undefined-Result Action—undefaction
   - AppFlow Action—actionName

   If you want help creating an expression for a new policy, while your cursor is in the Expression text box you can either hold down the Control key and press the space bar, or you can use the Add Expression dialog box as described in “To add an expression by using the Add Expression dialog box.”
4. Click Create or OK, depending on whether you are creating a new policy or modifying an existing policy.
5. Click Close. A message appears in the status bar, stating that the feature has been configured.

Binding a Responder Policy

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the NetScaler, or to a specific virtual server, so that the policy applies only to requests whose destination IP address is the VIP of that virtual server.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The responder feature implements only the first policy that a request matches, not any additional policies that it might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler, see "Policies and Expressions."

Note: Responder policies cannot be bound to TCP-based virtual servers.

To globally bind a responder policy by using the command line interface

At the command prompt, type the following command to globally bind a responder policy and verify the configuration:

- bind responder global <policyName> <priority> [<gotoPriorityExpression [-type <type>] [-invoke (<labelType> <labelName>)]
- show responder global

Example

```
> bind responder global poliError 100
 Done
> show responder global
1)      Global bindpoint: REQ_DEFAULT
        Number of bound policies: 1

 Done
```

To bind responder policy to a specific virtual server by using the command line interface

At the command prompt, type the following command to bind responder policy to a specific virtual server and verify the configuration:

bind lb vserver <name> -policyname <policy_name> -priority <priority>

Example

```
> bind lb vserver vs-loadbal -policyName policyTwo -priority 100
 Done
> show lb vserver
1)      vs-loadbal (10.102.29.20:80) - HTTP      Type: ADDRESS
        State: OUT OF SERVICE
        Last state change was at Wed Aug 19 09:05:47 2009 (+211 ms)
        Time since last state change: 2 days, 00:58:03.260
        Effective State: DOWN
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none
2)      vs-cont-sw (0.0.0.0:0) - TCP     Type: ADDRESS
        State: DOWN
        Last state change was at Wed Aug 19 10:03:46 2009 (+213 ms)
        Time since last state change: 2 days, 00:00:04.260
        Effective State: DOWN
        Client Idle Timeout: 9000 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Connection Failover: DISABLED
 Done
```

Parameters for binding a responder policy

name

The name of the virtual server to which you want to bind this policy.

policyname

The name of the responder policy you want to bind.

priority

The priority assigned to this responder policy.

type

Bindpoint, specifying where to bind the policy.

invoke

Invoke flag.

labelType

Type of policy label invocation.

labelName

Name of the label to invoke if the current policy rule evaluates to TRUE.

To globally bind a responder policy by using the configuration utility

1. Navigate to Responder > Policies.
2. On the Responder Policies page, select a responder policy, and then click Policy Manager.
3. In the Responder Policy Manager dialog box Bind Points menu, select Default Global.
4. Click Insert Policy to insert a new row and display a drop-down list of all unbound responder policies.
5. Click one of the policies on the list. That policy is inserted into the list of globally bound responder policies.
6. Click Apply Changes.
7. Click Close. A message appears in the status bar, stating that the configuration has been successfully completed.

To bind a responder policy to a specific virtual server by using the configuration utility

1. Navigate to Load Balancing > Virtual Servers.
2. On the Load Balancing Virtual Servers page, select the virtual server to which you want to bind the responder policy, and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, select the Policies tab, which displays a list of all policies configured on your NetScaler appliance.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click OK. A message appears in the status bar, stating that the configuration has been successfully completed.

Setting the Responder Default Action

The NetScaler appliance generates an undefined event (UNDEF event) when a request does not match a responder policy, and then carries out the default action assigned to undefined events. By default, that action is to forward the request to the next feature without changing it. This default behavior is normally what you want; it ensures that requests that do not require special handling by a specific responder action are sent to your Web servers and clients receive access to the content that they requested.

If the Web site(s) your NetScaler appliance protects receive a significant number of invalid or malicious requests, however, you may want to change the default action to either reset the client connection or drop the request. In this type of configuration, you would write one or more responder policies that would match any legitimate requests, and simply redirect those requests to their original destinations. Your NetScaler appliance would then block any other requests as specified by the default action you configured.

You can assign any one of the following actions to an undefined event:

NOOP

The NOOP action aborts responder processing but does not alter the packet flow. This means that the appliance continues to process requests that do not match any responder policy, and eventually forwards them to the requested URL unless another feature intervenes and blocks or redirects the request. This action is appropriate for normal requests to your Web servers and is the default setting.

RESET

If the undefined action is set to RESET, the appliance resets the client connection, informing the client that it must re-establish its session with the Web server. This action is appropriate for repeat requests for Web pages that do not exist, or for connections that might be attempts to hack or probe your protected Web site(s).

DROP

If the undefined action is set to DROP, the appliance silently drops the request without responding to the client in any way. This action is appropriate for requests that appear to be part of a DDoS attack or other sustained attack on your servers.

Note: UNDEF events are triggered only for client requests. No UNDEF events are triggered for responses.

To set the undefined action by using the command line interface

At the command prompt, type the following command to set the undefined action and verify the configuration:

- set responder param -undefAction (RESET|DROP|NOOP)

- show responder param

Example

```
>set responder param -undefAction RESET
 Done
> show responder param
       Action Name: RESET
 Done
>
```

To set the undefined action by using the configuration utility

1. In the navigation pane, expand Responder, and then under Settings, click the Change Responder Settings link.
2. In the Set Responder Params dialog box, under Global Undefined-Result Action, select NOOP, RESET, or DROP.
3. Click OK. A message appears in the status bar, stating that the Responder Parameters have been configured.

Responder Action and Policy Examples

Responder actions and policies are powerful and complex, but you can get started with relatively simple applications. For typical examples, see "Example: Blocking Access from Specified IPs" and "Example: Redirecting a Client to a new URL."

Example: Blocking Access from Specified IPs

The following procedures block access to your protected Web site(s) by clients originating from the CIDR 222.222.0.0/16. The responder sends an error message stating that the client is not authorized to access the URL requested.

To block access by using the command line interface

At the command prompt, type the following commands to block access:

- add responder action act_unauthorized respondwith '"HTTP/1.1 200 OK\r\n\r\n" + "Client: " + CLIENT.IP.SRC + " is not authorized to access URL:" + "HTTP.REQ.URL.HTTP_URL_SAFE"'
- add responder policy pol_un "CLIENT.IP.SRC.IN_SUBNET (222.222.0.0/16)" act_unauthorized
- bind responder global pol_un 10

To block access by using the configuration utility

1. In the navigation pane, expand Responder, and then click Actions.
2. In the details pane, click Add.
3. In the Create Responder Action dialog box, do the following:
   a. In the Name text box, type `act_unauthorized`.
   b. Under Type, select Respond with.
   c. In the Target text area, type the following string:
   ```
   "HTTP/1.1 200 OK\r\n\r\n"
   + "Client: " + CLIENT.IP.SRC + " is not authorized to access
   URL:" + HTTP.REQ.URL.HTTP_URL_SAFE
   ```
   d. Click Create, and then click Close.
   The responder action you configured, named `act_unauthorized`, now appears in the Responder Actions page.
4. In the navigation pane, click Policies.
5. In the details pane, click Add.
6. In the Create Responder Policy dialog box, do the following:
   a. In the Name text box, type `pol_unauthorized`.
   b. Under Action, select act_unauthorized.
   c. In the Expression window, type the following rule:
   `CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)`
   d. Click Create, then click Close.
   The responder policy you configured, named pol_unauthorized, now appears in the Responder Policies page.
7. Globally bind your new policy, `pol_unauthorized`, as described in "Binding a Responder Policy."

Example: Redirecting a Client to a new URL

The following procedures redirect clients who access your protected Web site(s) from within the CIDR 222.222.0.0/16 to a specified URL.

To redirect clients by using the command line interface

At the command prompt, type the following commands to redirect clients and verify the configuration:

- add responder action act_redirect redirect '"http://www.example.com/404.html"'
- show responder action act_redirect

- add responder policy pol_redirect "CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)" act_redirect
- show responder policy pol_redirect
- bind responder global pol_redirect 10

Example

> add responder action act_redirect redirect '" http ://www.example.com/404.html '"

> add responder policy pol_redirect "CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)" act_redirect

To redirect clients by using the configuration utility

1. Navigate to Responder > Actions.
2. In the details pane, click Add.
3. In the Create Responder Action dialog box, do the following:
   a. In the Name text box, type `act_redirect`.
   b. Under Type, select Redirect.
   c. In the Target text area, type the following string:
      `"http://www.example.com/404.html"`
   d. Click Create, then click Close.

   The responder action you configured, named act_redirect, now appears in the Responder Actions page.
4. In the navigation pane, click Policies.
5. In the details pane, click Add.
6. In the Create Responder Policy dialog box, do the following:
   a. In the Name text box, type `pol_redirect`.
   b. Under Action, select act_redirect.
   c. In the Expression window, type the following rule:
      `CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)`
   d. Click Create, then click Close.

   The responder policy you configured, named pol_redirect, now appears in the Responder Policies page.
7. Globally bind your new policy, pol_redirect, as described in "Binding a Responder Policy."

Diameter Support for Responder

The Responder feature now supports the Diameter protocol. You can configure Responder to respond to Diameter requests as it does HTTP and TCP requests. For example, you could configure Responder to respond to requests from a specific Diameter origin with a redirect to a web page enhanced for mobile devices. A number of NetScaler expressions have been added that support examination of the Diameter header and the attribute-value pairs (AVPs). These expressions support lookup of specific AVPs by index, ID or name, examine the information in each AVP, and send an appropriate response.

To configure Responder to respond to a Diameter request

To configure the Responder feature to send a response to a diameter request, at the command prompt, type the following commands:

- add responder action <actname> RESPONDWITH "DIAMETER.NEW_REDIRECT(\"aaa://host.example.com\")"
  For <actname>, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For aaa://host.example.com, substitute the URL of the diameter host to which you want to redirect connections.

- add responder policy <polname> "diameter.req.avp(264).value.eq(\"host1.example.net\")" <actname>
  For <polname>, substitute a name for your new policy. As with <actname>, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For host1.example.net, substitute the name of the originating host of the requests that you want to redirect. For <actname>, substitute the name of the action that you just created.

- bind lb vserver <vservername> -policyName <polname> -priority <priority> -type REQUEST
  For <vservername>, substitute the name of the load balancing virtual server to which you want to bind the policy. For <polname>, substitute the name of the policy you just created. For <priority>, substitute a priority for the policy.

Example

To create a Responder action and policy to respond to Diameter requests that originate from "host1.example.net" with a redirect to "host.example.com", you could add the following action and policy, and bind the policy as shown.

```
> add responder action act_resp-dm-redirect RESPONDWITH "DIAMETER.NEW_REDIRECT(\"aaa://host.exampl
> add responder pol_resp-dm-redirect "diameter.req.avp(264).value.eq(\"host1.example.net\")" act_resp-dm
> bind lb vserver vs1 -policyName pol_resp-dm-redirect -priority 10 -type REQUEST

Done
```

Rewrite

Rewrite refers to the rewriting of some information in the requests or responses handled by the NetScaler appliance. Rewriting can help in providing access to the requested content without exposing unnecessary details about the Web site's actual configuration. A few situations in which the rewrite feature is useful are described below:

- To improve security, the NetScaler can rewrite all the http:// links to https:// in the response body.
- In the SSL offload deployment, the insecure links in the response have to be converted into secure links. Using the rewrite option, you can rewrite all the *http://* links to *https://* for making sure that the outgoing responses from NetScaler to the client have the secured links.
- If a Web site has to show an error page, you can show a custom error page instead of the default 404 Error page. For example, if you show the home page or site map of the Web site instead of an error page, the visitor remains on the site instead of moving away from the Web site.
- If you want to launch a new Web site, but use the old URL, you can use the Rewrite option.
- When a topic in a site has a complicated URL, you can rewrite it with a simple, easy-to-remember URL (also referred to as 'cool URL').
- You can append the default page name to the URL of a Web site. For example, if the default page of a company's Web site is '*http://www.abc.com/index.php*', when the user types '*abc.com*' in the address bar of the browser, you can rewrite the URL to '*abc.com/index.php*'.

When you enable the rewrite feature, NetScaler can modify the headers and body of HTTP requests and responses.

To rewrite HTTP requests and responses, you can use protocol-aware NetScaler policy expressions in the rewrite policies you configure. The virtual servers that manage the HTTP requests and responses must be of type HTTP or SSL. In HTTP traffic, you can take the following actions:

- Modify the URL of a request
- Add, modify or delete headers
- Add, replace, or delete any specific string within the body or headers.

To rewrite TCP payloads, consider the payload as a raw stream of bytes. Each of the virtual servers that managing the TCP connections must be of type TCP or SSL_TCP. The term *TCP rewrite* is used to refer to the rewrite of TCP payloads that are not HTTP data. In TCP traffic, you can add, modify, or delete any part of the TCP payload.

For examples to use the rewrite feature, see "Rewrite Action and Policy Examples."

Comparison between Rewrite and Responder options

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting a http request to new Web sites or Web pages
- Responding with some custom response
- Dropping or resetting a connection at request level

In case of a responder policy, the NetScaler examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

In case of a rewrite policy, the NetScaler examines the request from the client or response from the server, takes action according to the applicable policies, and forwards the traffic to the client or the server.

In general, it is recommended to use responder if you want the NetScaler to reset or drop a connection based on a client or request-based parameter. Use responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

How Rewrite Works

A rewrite policy consists of a rule and action. The rule determines the traffic on which rewrite is applied and the action determines the action to be taken by the NetScaler. You can define multiple rewrite policies. For each policy, specify the bind point and priority.

A *bind point* refers to a point in the traffic flow at which the NetScaler examines the traffic to verify whether any rewrite policy can be applied to it. You can bind a policy to a specific load balancing or content switching virtual server, or make the policy global if you want the policy to be applied to the entire traffic handled by the NetScaler. These policies are referred to as global policies.

In addition to the user-defined policies, the NetScaler has some default policies. You cannot modify or delete a default policy.

For evaluating the policies, NetScaler follows the order mentioned below:

- Global policies
- Policies bound to specific virtual servers
- Default policies

Note: NetScaler can apply a rewrite policy only when it is bound to a point.

NetScaler implements the rewrite feature in the following steps:

- The NetScaler appliance checks for global policies and then checks for policies at individual bind points.
- If multiple policies are bound to a bind point, the NetScaler evaluates the policies in the order of their priority. The policy with the highest priority is evaluated first. After evaluating each policy, if the policy is evaluated to TRUE (the traffic matches the rule), it adds the action associated with the policy to a list of actions to be performed. A match occurs when the characteristics specified in the policy rule match the characteristics of the request or response being evaluated.
- For any policy, in addition to the action, you can specify the policy that should be evaluated after the current policy is evaluated. This policy is referred to as the 'Go to Expression'. For any policy, if a Go to Expression (gotoPriorityExpr) is specified, the NetScaler evaluates the Go to Expression policy; it ignores policy with the next highest priority.

  You can specify the priority of the policy to indicate the Go to Expression policy; you cannot use the name of the policy. If you want the NetScaler to stop evaluating other policies after evaluating a particular policy, you can set the Go to Expression to 'END'.
- After all the policies are evaluated or when a policy has the Go to Expression set as END, the NetScaler starts performing the actions according to the list of actions.

For more information about configuring rewrite policies, see "Configuring a Rewrite Policy" and about binding rewrite policies, see "Binding a Rewrite Policy."

The following figure illustrates how NetScaler processes a request or response when the rewrite feature is used.

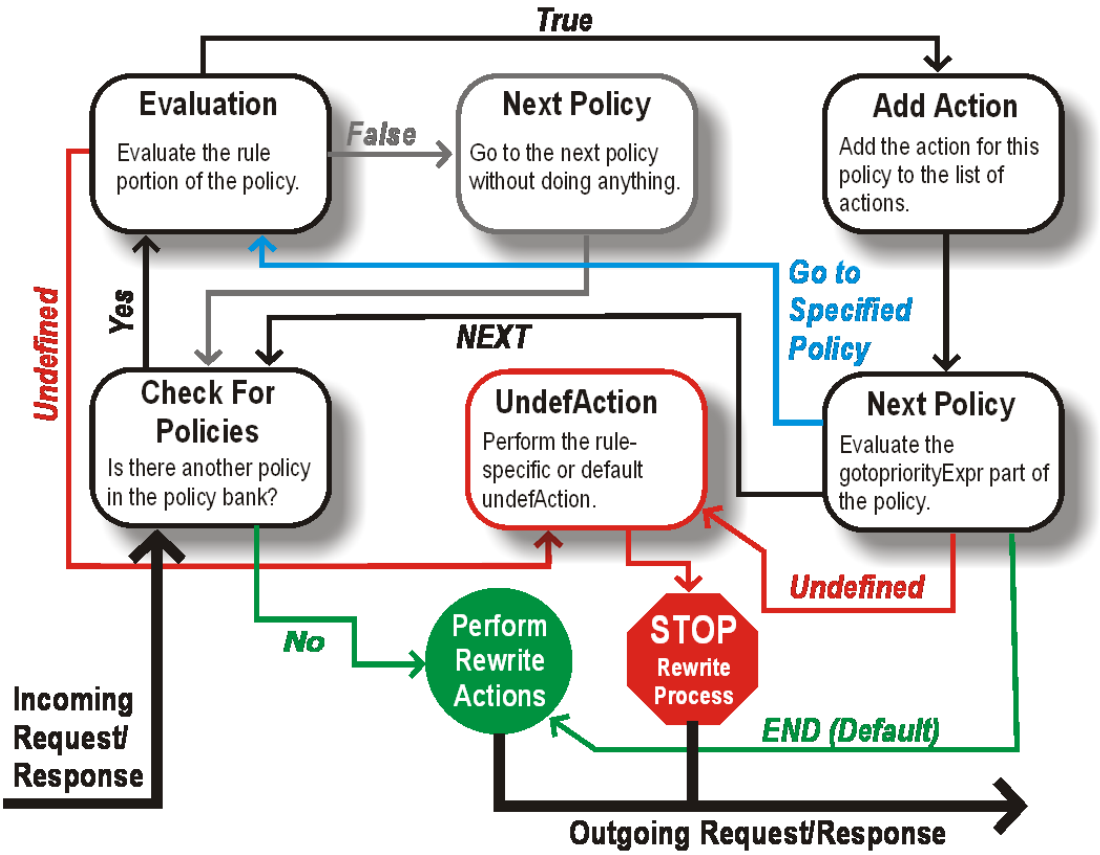

Figure 1. The Rewrite Process

Policy Evaluation

The policy with the highest priority is evaluated first. NetScaler does not stop the evaluation of rewrite policies when it finds a match; it evaluates all the rewrite policies configured on the NetScaler.

- If a policy evaluates to TRUE, the NetScaler follows the procedure below:
  - If the policy has the Go to Expression set to END, the NetScaler stops evaluating all the other policies and starts performing the rewrite.
  - The *gotoPriorityExpression* can be set to 'NEXT', 'END', some integer or 'INVOCATION_LIST'. The value determines the policy with the next priority. The following table shows the action taken by NetScaler for each value of the expression.

Value of the expression	Action
NEXT	Policy with the next priority gets evaluated.
END	Evaluation of policies stops.

<an integer>	Policy with specified priority gets evaluated.
INVOCATION_LIST	Goto NEXT or END is applied based on the result of the invocation list.

- If a policy evaluates to FALSE, the NetScaler continues the evaluation in the order of priority.
- If a policy evaluates to UNDEFINED (cannot be evaluated on the received traffic due to an error), the NetScaler performs the action assigned to the UNDEFINED condition (referred to as *undefAction*) and stops further evaluation of polices.

The NetScaler starts the actual rewriting only after the evaluation is complete. It refers to the list of actions identified by policies that are evaluated to TRUE, and starts the rewriting. After implementing all the actions in the list, the NetScaler forwards the traffic as required.

Note: Ensure that the policies do not specify conflicting or overlapping actions on the same part of the HTTP header or body, or TCP payload. When such a conflict occurs, the NetScaler encounters an undefined situation and aborts the rewrite.

Rewrite Actions

On the NetScaler appliance, specify the actions to be taken such as adding, replacing, or deleting text within the body, or adding, modifying or deleting headers, or any changes in the TCP payload as *rewrite actions*. For more information about rewrite actions, see "Configuring a Rewrite Action."

The following table describes the steps the NetScaler can take when a policy evaluates to TRUE.

Action	Result
Insert	The rewrite action specified for the policy is carried out.
NOREWRITE	The request or response is not rewritten. NetScaler forwards the traffic without rewriting any part of the message.
RESET	The connection is aborted at the TCP level.
DROP	The message is dropped.

Note: For any policy, you can configure the undefaction (action to be taken when the policy evaluates to UNDEFINED) as NOREWRITE, RESET, or DROP.

To use the Rewrite feature, take the following steps:

- Enable the feature on the NetScaler.
- Define rewrite actions.
- Define rewrite policies.
- Bind the policies to a bind point to bring a policy into effect.

Enabling the Rewrite Feature

Enable the rewrite feature on the NetScaler appliance if you want to rewrite the HTTP or TCP requests or responses. If the feature is enabled, NetScaler takes rewrite action according to the specified policies. For more information, see "How Rewrite Works."

To enable the rewrite feature by using the command line interface

At the command prompt, type the following commands to enable the rewrite feature and verify the configuration:

- enable ns feature REWRITE
- show ns feature

Example

```
> enable ns feature REWRITE
 Done
> show ns feature

      Feature                Acronym          Status
      -------                -------          ------
1)    Web Logging              WL               OFF
2)    Surge Protection         SP               ON
.
.
.
19)   Rewrite                  REWRITE          ON
.
.
24)   NetScaler Push           push             OFF
Done
```

To enable the rewrite feature by using the configuration utility

1. In the navigation pane, click System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure basic features.
3. In the Configure Basic Features dialog box, select the Rewrite check box, and then click OK.
4. In the Enable/Disable Feature(s) dialog box, click Yes. A message appears in the status bar, stating that the selected feature was enabled.

Configuring a Rewrite Action

After enabling the rewrite feature, you need to configure one or more actions unless a built-in rewrite action is sufficient. All of the built-in actions have names beginning with the string ns_cvpn, followed by a string of letters and underscore characters. Built-in actions perform useful and complex tasks such as decoding parts of a clientless VPN request or response or modifying JavaScript or XML data. The built-in actions can be viewed, enabled, and disabled, but cannot be modified or deleted.

Target expressions in actions for TCP rewrite must begin with one of the following expression prefixes:

- **`CLIENT.TCP.PAYLOAD`.** For rewriting TCP payloads in client requests. For example, `CLIENT.TCP.PAYLOAD(10000).AFTER_STR("string1")`.
- **`SERVER.TCP.PAYLOAD`.** For rewriting TCP payloads in server responses. For example, `SERVER.TCP.PAYLOAD(1000).B64DECODE.BETWEEN("string1","string2")`.

You can use all types of existing string manipulation functions with these prefixes to identify the strings that you want to rewrite. To configure a rewrite action, you assign it a name, specify an action type, and add one or more arguments specifying additional data. The following table describes the action types and the arguments you use with them.

Note: Action types that can be used only for HTTP rewrite are identified in the **Rewrite Action Type** column.

Table 1. Rewrite Action Types and Their Arguments

Rewrite Action Type	Argument 1	Argument 2
INSERT_HTTP_HEADER: Inserts the HTTP header you specify into the HTTP request or response. This is the default choice. This action type can be used only with HTTP requests and responses.	The HTTP header you want to insert. For example, if you want to insert the client IP from which a request is sent, type `Client-IP`.	A string expression that describes the contents of the header you want to insert. For example, if you want to insert the Client IP from which a request is sent, type `CLIENT.IP.SRC`.

INSERT_BEFORE: Inserts a new string before the designated string.	A string expression that describes the string before which you want to insert a new string. For example, if you want to find the hostname www.example.com and insert a string before the example.com portion, type the following: `HTTP.REQ.HOSTNAME.BEFORE_STR ("example.com")`	A string expression that describes the new string you want to insert. For example, if you want to insert the new string en. before the string example in the hostname, type en followed by a period.
INSERT_AFTER: Inserts a new string after the designated string.	A string expression that describes the string after which you want to insert a new string. For example, if you want to find the hostname www.example.com, and insert a string after the www. portion, type the following: `HTTP.REQ.HOSTNAME.AFTER_STR ("www.")`	A string expression that describes the new string you want to insert. For example, if you want to insert the new string en. after the string www. in the hostname, type en followed by a period.
REPLACE: Replaces the designated string with a different string.	A string expression that describes the string you want to replace with a new string. For example, if you want to replace the entire hostname in the Host header, type `HTTP.REQ.HOSTNAME.SERVER`.	A string expression that describes the new string you want to insert. For example, if you want to replace the current host header with the string web01.example.net, type `web01.example.net`.
DELETE: Deletes the designated string.	A string expression that describes the string you want to delete. For example, if you want to find and delete the string .en in the hostname of HTTP response headers, type the following: `HTTP.RES.HEADER("Host").SUBSTR("en.")`	

DELETE_HTTP_HEADER: Deletes the designated HTTP header, including all header contents. This action type can be used only with HTTP requests and responses.	The name of the HTTP header you want to delete. For example, if you want to delete the cache-control header from HTTP responses, type `HTTP.RES.HEADER ("Cache-Control").`	
CORRUPT_HTTP_HEADER: Replaces the name of the given HTTP header with a corrupted name so that it will not be recognized by the receiver. This action type can be used only with HTTP requests and responses.	The name of the HTTP header that you want to corrupt. If the specified header occurs more than once in a request, all the occurrences are corrupted. For example, if you want to corrupt the `Host` header in an HTTP request, you can use the following rewrite action command: `add rewrite action corrupt_header_act CORRUPT_HTTP_HEADER Host.`	
REPLACE_HTTP_RES: Replace the http response with the value specified in the target field. This action type can be used only with HTTP requests and responses.	A string expression that describes the string you want to replace the HTTP response with. For example, type `HTTP 200 OK` You are not authorized to view this page to replace the entire HTTP response with this warning.	
REPLACE_ALL: Will replace all occurrences of a pattern in the target text reference with the value specified in the string builder expression.	The part of either the HTTP request or response where you want to carry out the replacement.	A string expression that describes the new string you want to insert.
DELETE_ALL: Delete every occurrence of the pattern specified in the target text reference.	The part of either the HTTP request or response where you want the deletion to occur.	A string pattern after which the deletion should occur.

INSERT_AFTER_ALL: Inserts the value specified by string builder expression after each occurrence of a specified pattern in the target text reference.	The part of either the HTTP request or response where you want the insertion to occur.	A string expression that describes the new string you want to insert.
INSERT_BEFORE_ALL: Inserts the value you specify before each occurrence of the pattern you specify.	The part of either the HTTP request or response that you want to delete.	A string expression that describes the new string you want to insert.
CLIENTLESS_VPN_ENCODE: Encodes the URL you specify in clientless VPN format.	The URL you want to encode.	
CLIENTLESS_VPN_ENCODE_ALL: Encodes all of the URLs you specify in clientless VPN format.	A pattern that matches the URLs you want to encode.	
CLIENTLESS_VPN_DECODE: Decodes the URL you specify from clientless VPN format and returns it as unencoded text.	The URL you want to decode.	
CLIENTLESS_VPN_DECODE_ALL: Decodes all of the URLs you specify from clientless VPN format and returns them as unencoded text.	A pattern that matches all of the URLs you want to decode.	

To create a new rewrite action by using the command line interface

At the command prompt, type the following commands to create a new rewrite action and verify the configuration:

- add rewrite action <name> <type> <target> [<stringBuilderExpr>] [(-pattern <expression> | -patset <string>)] [-bypassSafetyCheck (YES|NO)]
- show rewrite action <name>

Example 1: Inserting an HTTP Header With the Client IP

```
> add rewrite action insertact INSERT_HTTP_HEADER "client-IP" CLIENT.IP.SRC
Done

> show rewrite action insertact

    Name: insertact
    Operation: insert_http_header   Target:Client-IP
    Value:CLIENT.IP.SRC
```

```
        BypassSafetyCheck : NO
        Hits: 0
        Undef Hits: 0
        Action Reference Count: 0
 Done
```

Example 2: Replacing Strings in a TCP Payload (TCP Rewrite)

```
> add rewrite action client_tcp_payload_replace_all REPLACE_ALL
  'client.tcp.payload(1000)' '"new-string"' -search text("old-string")
 Done
> show rewrite action client_tcp_payload_replace_all

        Name: client_tcp_payload_replace_all
        Operation: replace_all
        Target:client.tcp.payload(1000)
        Value:"new-string"
        Search: text("old-string")
        BypassSafetyCheck : NO
        Hits: 0
        Undef Hits: 0
        Action Reference Count: 0
 Done
>
```

To modify an existing rewrite action by using the command line interface

At the command prompt, type the following commands to modify an existing rewrite action and verify the configuration:

- set rewrite action <name> [-target <string>] [-stringBuilderExpr <string>] [(-pattern <expression> | -patset <string>)] [-bypassSafetyCheck (YES|NO)]
- show rewrite action <name>

Example

```
> set rewrite action insertact -target "Client-IP"
 Done
> show rewrite action insertact

        Name: insertact
        Operation: insert_http_header   Target:Client-IP
        Value:CLIENT.IP.SRC
        BypassSafetyCheck : NO
        Hits: 0
        Undef Hits: 0
        Action Reference Count: 0
```

Done

To remove a rewrite action by using the command line interface

At the command prompt, type the following commands to remove a rewrite action :

rm rewrite action <name>

Example

```
> rm rewrite action insertact
Done
```

Parameters for configuring a rewrite action

name

A name for your new action, or the name of the existing action you want to modify or remove. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that will make it easy for others to tell what this action is supposed to do. (Cannot be changed for an existing action.)

pattern

Pattern that is used to match multiple strings in the request or response. The pattern may be a string literal (without quotes) or a PCRE-format regular expression with a delimiter that consists of any printable ASCII non-alphanumeric character except for the underscore (_) and space ( ) that is not otherwise used in the expression. Example: re~https?://|HTTPS?://~ The preceding regular expression can use the tilde (~) as the delimiter because that character does not appear in the regular expression itself. Used in the INSERT_BEFORE_ALL, INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types.

bypassSafetyCheck

Whether to bypass the built-in safety checks when adding or modifying this action. Values: YES, NO. Default: NO. For more information, see "Bypassing the Safety Check."

target

A NetScaler default syntax expression that describes the text to be rewritten by the rewrite action. For TCP rewrite actions, the target expression must begin with either `CLIENT.TCP.PAYLOAD` or `SERVER.TCP.PAYLOAD`.

stringBuilderExpr

Expression specifying the new value of the rewritten packet. Maximum length of a string literal that can be used inside the expression is 255 characters. A string literal that contains more than 255 characters can be split into smaller chunks of 255 characters each. The chunks can then be concatenated with the + operator. Maximum length of the input expression is 8191.

search

Searches for the designated string or expression in the HTTP header or body. You can use a search expression with actions of the following types: delete_all, insert_after_all, insert_before_all, and replace_all. You can use any of the following argument types:

- **String (`-search text("<string>")`).** A literal text string. For example, the following expression searches an HTTP response for the string "Server: Apache", which indicates that the responding server is an Apache HTTPD server:

  -search text("Server: Apache")

- **Regular Expression (`-search regex(re/<regex>/)`).** A PCRE-format regular expression. For example, the following expression searches an HTTP response for a Location header, which indicates a redirect URL:

  -search regex(re/^Location:/)

- **XPath Expression (`-search xpath(xp%<xpathex>%)`).** An XPath expression that is used to search a standard XML file. For example, the following expression searches an XML request or response for the path "/a/b" :

  -search xpath(xp%/a/b%)

- **XPath JSON Expression (`-search xpath_json(xp%<xpathex>%)`).** An XPath expression that is used to search a JavaScript Object Notation (JSON) file. For example, the following expression searches a JSON request or response for the path "/a/b":

  -search xpath_json(xp%/a/b%)

- **Patset (`-search patset("<patset>")`).** A pattern set. For example, the following expression searches an HTTP request or response for a match with the `zipcodes` patset:

  -search patset("zipcodes")

refineSearch (-refineSearch "extend(#,#).<expression>)

A means of more efficiently searching and rewriting a lengthy response than with a simple search command. Instead of using the Search command to search for all occurrences of a regular expression and then rewriting the matched strings, refineSearch enables you to search for a simple string that appears within the text you want to rewrite, and then refine that search by including surrounding context, and then searching only the selected text and context for a regular expression match.

For example, assume that you want to search a response for all URLs at any host within the domain `example.net`. Instead of simply searching the entire response for the regular expression `#<https?://(^|[0-9A-Za-z][0-9A-Za-z]+\.example.net/[^>]*># `, you could use the following command:

```
add rewrite action <name> <type> 'http.res.body(10000)'
  -pattern "example.net" -refineSearch "extend(20,40).regex_select
   (re%<https?://(^|[0-9A-Za-z][0-9A-Za-z]+\.example.net/[^>]*>%)"
```

The refineSearch command does the same thing that the equivalent Search command would do, but is more efficient and runs faster. The difference may be negligible with a small response body, but can be significant when the response body is large.

To configure a rewrite action by using the configuration utility

1. Navigate to Rewrite > Actions.
2. In the details pane, do one of the following:
   - To create a new action, click Add.
   - To modify an existing action, select the action, and then click Open.
3. In the Add Rewrite Action or Configure Rewrite Action dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring a rewrite action" as follows (asterisk indicates a required parameter):
   - Name*—name
   - Type*—type (When you select a type of action from the Type list, the names of the remaining text boxes in the Create Rewrite Action or Configure Rewrite Action dialog box change to indicate the kind of additional information to be entered. For all Expression and String Expression text boxes, be sure to enclose strings in double quotation marks. Alternatively, you can use the Add Expression dialog box, as described in the procedure that follows this one.)
     - Expression (Argument 1)
     - Expression (Argument 2) (Several types do not take a second argument, in which case this text area will be greyed out.)
   - Pattern—target (Several types have implied targets, in which case this text area is greyed out.)
   - Bypass Safety Check—bypassSafetyCheck
4. Click Create or OK. A message appears in the status bar, stating that the Action has been configured successfully.
5. Repeat steps 2 through 4 to create or modify as many rewrite actions as you wish.
6. Click Close.

To add an expression by using the Add Expression dialog box

1. In the Create Rewrite Action or Configure Rewrite Action dialog box, under the text area for the type argument you want to enter, click Add.

2. In the Add Expression dialog box, in the first list box choose the first term for your expression.

   HTTP

   The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.

   SYS

   The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

   CLIENT

   The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

   When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.

4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

   For more information about the PI expressions language and creating expressions for responder policies, see "Policies and Expressions."

   If you want to test the effect of a rewrite action when used on sample HTTP data, you can use the Rewrite Expression Evaluator.

   Note: The Rewrite Expression Evaluator is only available in the configuration utility. There is no NetScaler command line version.

To evaluate a rewrite action by using the Rewrite Action Evaluator dialog box

1. In the Rewrite Actions details pane, select the rewrite action that you want to evaluate, and then click Evaluate.

2. In the Rewrite Expression Evaluator dialog box, specify values for the following parameters. (An asterisk indicates a required parameter.)

   - Rewrite Action*—If the rewrite action you want to evaluate is not already selected, select it from the drop-down list. After you select a Rewrite action, the Details section displays the details of the selected Rewrite action.

   - New*—Select New to open the Create Rewrite Action dialog box and create a new rewrite action.

   - Modify*—Select Modify to open the Configure Rewrite Action dialog box and modify the selected rewrite action.

   - Flow Type*—Specifies whether to test the selected rewrite action with HTTP Request data or HTTP Response data. The default is Request. If you want to test with Response data, select Response.

   - HTTP Request/Response Data*—Provides a space for you to provide the HTTP data that the Rewrite Action Evaluator will use for testing. You can paste the data directly into the window, or click Sample to insert some sample HTTP headers.

   - Show end-of-line—Specifies whether to show UNIX-style end-of-line characters (\n) at the end of each line of sample HTTP data.

   - Sample—Inserts sample HTTP data into the HTTP Request/Response Data window. You can choose either GET or POST data.

   - Browse—Opens a local browse window so that you can choose a file containing sample HTTP data from a local or network location.

   - Clear—Clears the current sample HTTP data from the HTTP Request/Response Data window.

3. Click Evaluate. The Rewrite Action Evaluator evaluates the effect of the Rewrite action on the sample data that you chose, and displays the results as modified by the selected Rewrite action in the Results window. Additions and deletions are highlighted as indicated in the legend in the lower left-hand corner of the dialog box.

4. Continue evaluating Rewrite actions until you have determined that all of your actions have the effect that you wanted.

   - You can modify the selected rewrite action and test the modified version by clicking Modify to open the Configure Rewrite Action dialog box, making and saving your changes, and then clicking Evaluate again.

   - You can evaluate a different rewrite action using the same request or response data by selecting it from the Rewrite Action drop-down list, and then clicking Evaluate again.

5. Click Close to close the Rewrite Expression Evaluator and return to the Rewrite Actions pane.

To delete a rewrite action, select the rewrite action you want to delete, then click Remove and, when prompted, confirm your choice by clicking OK.

Configuring a Rewrite Policy

After you create any needed rewrite action(s), you must create at least one rewrite policy to select the requests that you want the NetScaler appliance to rewrite.

A rewrite policy consists of a rule, which itself consists of one or more expressions, and an associated action that is performed if a request or response matches the rule. Policy rules for evaluating HTTP requests and responses can be based on almost any part of a request or response.

Even though you cannot use TCP rewrite actions to rewrite data other than the TCP payload, you can base the policy rules for TCP rewrite policies on the information in the transport layer and the layers below the transport layer.

If a configured rule matches a request or response, the corresponding policy is triggered and the action associated with it is carried out.

Note: You can use either the command line interface or the configuration utility to create and configure rewrite policies. Users who are not thoroughly familiar with the command line interface and the NetScaler Policy expression language will usually find using the configuration utility much easier.

To add a new rewrite policy by using the command line interface

At the command prompt, type the following commands to add a new rewrite policy and verify the configuration:

- add rewrite policy <name> <expression> <action> [<undefaction>]
- show rewrite policy <name>

Example 1: Rewriting HTTP Content

```
> add rewrite policy policyNew "HTTP.RES.IS_VALID" insertact NOREWRITE
 Done
> show rewrite policy policyNew
      Name: policyNew
      Rule: HTTP.RES.IS_VALID
      RewriteAction: insertact
      UndefAction: NOREWRITE
      Hits: 0
      Undef Hits: 0

 Done
```

Example 2: Rewriting a TCP Payload (TCP Rewrite)

```
> add rewrite policy client_tcp_payload_policy CLIENT.IP.SRC.EQ(172.168.12.232) client_tcp_payload_replac
 Done
> show rewrite policy client_tcp_payload_policy
      Name: client_tcp_payload_policy
      Rule: CLIENT.IP.SRC.EQ(172.168.12.232)
      RewriteAction: client_tcp_payload_replace_all
      UndefAction: Use Global
      LogAction: Use Global
      Hits: 0
      Undef Hits: 0

 Done
>
```

To modify an existing rewrite policy by using the command line interface

At the command prompt, type the following commands to modify an existing rewrite policy and verify the configuration:

- set rewrite policy <name> -rule <expression> -action <action> [<undefaction>]
- show rewrite policy <name>

Example

```
> set rewrite policy policyNew -rule "HTTP.RES.IS_VALID" -action insertaction
 Done

> show rewrite policy policyNew
      Name: policyNew
      Rule: HTTP.RES.IS_VALID
      RewriteAction: insertaction
      UndefAction: NOREWRITE
      Hits: 0
      Undef Hits: 0

 Done
```

To remove a rewrite policy by using the command line interface

At the command prompt, type the following command to remove a rewrite policy:

rm rewrite policy <name>

Example

```
> rm rewrite policy policyNew
Done
```

Parameters for configuring a rewrite policy

name

A name for the policy, or the name of the existing policy you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that will make it easy for others to tell what type of request this policy was created to match. (Cannot be changed for an existing policy.)

rule

The expression that defines the rule for this policy. The expression can be a simple expression or a complex expression that contains several expressions in structured relationship to one another. Expressions are written in the NetScaler default syntax.

Note: The rewrite feature does not support the use of stream selectors that include SIP-based expressions.

For more information about the default syntax, see "Policies and Expressions."

action

The name of the rewrite action associated with the policy. You can choose either one of the built-in rewrite actions, or a rewrite action you have configured. For a complete list of built-in rewrite actions, see "Policies and Expressions."

undefAction

The action to use if the policy generates an UNDEF event. You can select the NOREWRITE, RESET, or DROP action, or configure the NetScaler use the configured global undefined action.

Any rewrite-specific undefined action you configure will override the global undefined action.

To configure a rewrite policy by using the configuration utility

1. Navigate to Rewrite > Policies.
2. In the details pane, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the policy, and then click Open.
3. In the Create Rewrite Policy or Configure Rewrite Policy dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring a rewrite policy" as follows (asterisk indicates a required parameter):
   - Name*—name
   - Action*—action
   - Undefined-Result Action—undefAction
   - Expression*—expression (You can add the expression in any of three ways. First, you can click Add and choose an existing expression in the Frequently Used Expressions drop-down list. Second, you can type the expression directly into the supplied text box. For brief help and prompts, while the cursor is in the text box, hold down the CTRL key and then press the Space bar. Third, you can use the Add Expression dialog box, as described in “To add an expression by using the Add Expression dialog box.”)
4. Click Create or OK. A message appears in the status bar, stating that the Policy has been configured successfully.
5. Repeat steps 2 through 4 to create or modify as many rewrite actions as you wish.
6. Click Close. To delete a rewrite policy, select the rewrite policy you want to delete, then click Remove and, when prompted, confirm your choice by clicking OK.

Binding a Rewrite Policy

After creating a rewrite policy, you must bind it to put it into effect. You can bind your policy to Global if you want to apply it to all traffic that passes through your NetScaler, or you can bind your policy to a specific virtual server or bind point to direct only that virtual server or bind point's incoming traffic to that policy. If an incoming request matches a rewrite policy, the action associated with that policy is carried out.

Rewrite policies for evaluating HTTP requests and responses can be bound to virtual servers of type HTTP or SSL, or they can be bound to the REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, and RES_DEFAULT bind points. Rewrite policies for TCP rewrite can be bound only to virtual servers of type TCP or SSL_TCP, or to the OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, OTHERTCP_RES_OVERRIDE, and OTHERTCP_RES_DEFAULT bind points.

Note: The term OTHERTCP is used in the context of the NetScaler appliance to refer to all TCP or SSL_TCP requests and responses that you want to treat as a raw stream of bytes regardless of the protocols that the TCP packets encapsulate.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order - the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is applied first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000.

Unlike most other features in the NetScaler operating system, the rewrite feature continues to evaluate and implement policies after a request matches a policy. However, the effect of a particular action policy on a request or response will often be different depending on whether it is performed before or after another action. Priority is important to get the results you intended.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind it. If you do this, you can add additional policies at any time without having to reassign the priority of an existing policy.

When binding a rewrite policy, you also have the option of assigning a goto expression (gotoPriorityExpression) to the policy. A goto expression can be any positive integer that matches the priority assigned to a different policy that has a higher priority than the policy that contains the goto expression. If you assign a goto expression to a policy, and a request or response matches the policy, the NetScaler will immediately go to the policy whose priority matches the goto expression. It will skip over any policies with priority numbers that are lower than that of the current policy, but higher than the priority number of the goto expression, and not evaluate those policies.

For more information about binding policies on the NetScaler, see "Binding a Rewrite Policy."

To globally bind a rewrite policy by using the command line interface

At the command prompt, type the following commands to globally bind a rewrite policy and verify the configuration:

- bind rewrite global <policyName> <priority> [<gotoPriorityExpression>] [-type <type>] [-invoke (<labelType> <labelName>)]
- show rewrite global

Example

```
>bind rewrite global policyNew 10
 Done

> show rewrite global
1)      Global bindpoint: RES_DEFAULT
       Number of bound policies: 1

2)      Global bindpoint: REQ_OVERRIDE
       Number of bound policies: 1

 Done
```

To bind rewrite policy to a specific virtual server by using the command line interface

At the command prompt, type the following commands to bind rewrite policy to a specific virtual server and verify the configuration:

- bind lb vserver <name>@ (<serviceName>@ [-weight <positive_integer>]) | <serviceGroupName>@ | (-policyName <string>@ [-priority <positive_integer>] [-gotoPriorityExpression <expression>] [-type (REQUEST | RESPONSE)] [-invoke (<labelType> <labelName>)])
- show lb vserver <name>

Example

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50
 Done
>
> show lb vserver lbvip
      lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
      State: DOWN
      Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)
      Time since last state change: 28 days, 01:57:26.350
```

```
        Effective State: DOWN
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none

1)      Policy : ns_cmp_msapp Priority:50
2)      Policy : cf-pol Priority:1      Inherited
 Done
```

Parameters for binding a rewrite policy

name

If you are binding this rewrite policy to a specific virtual server, the name of that virtual server.

policyName

The name of the rewrite policy you want to bind. This parameter is mandatory.

priority

The priority assigned to this rewrite policy. The priority determines the order in which policies are evaluated, allowing the NetScaler to evaluate the most specific policy first, and more general policies in descending order, finishing with the most general policy. The lower the value for this parameter, the higher the priority. Assign the lowest priority value to the policy that is to be evaluated first. This parameter is mandatory.

gotoPriorityExpression

The priority of the next policy that should be evaluated if this policy matches. If set to END, this parameter halts the policy evaluation process after evaluation of the current policy. If you are careful to assign your policy priorities in the right order, you can use this parameter to skip over policies in the event that the current policy matches, and go directly to a specific policy.

type

Bindpoint, specifying where to bind the policy.

invoke

Type of policy label invocation.

labelType

Type of policy label invocation.

labelName

Name of the label to invoke if the current policy rule evaluates to TRUE.

weight

Weight for this service. This weight is used when the system performs load balancing, giving greater priority to a specific service. It is useful when the services bound to a virtual server are of different capacity.

To bind a rewrite policy to a bind point by using the configuration utility

1. Navigate to Rewrite > Policies.
2. In the details pane, select the rewrite policy you want to globally bind, and then click Policy Manager.
3. In the Rewrite Policy Manager dialog box, in the Bind Points menu, do one of the following:
   a. If you want to configure bindings for HTTP rewrite policies, click HTTP, and then click either Request or Response, depending on whether you want to configure request-based rewrite policies or response-based rewrite policies.
   b. If you want to configure bindings for TCP rewrite policies, click TCP, and then click either Client or Server, depending on whether you want to configure client-side TCP rewrite policies or server-side TCP rewrite policies.
4. Click the bind point to which you want to bind the rewrite policy. The Rewrite Policy Manager dialog box displays all the rewrite policies that are bound to the selected bind point.
5. Click Insert Policy to insert a new row and display a drop-down list with all available, unbound rewrite policies.
6. Click the policy you want to bind to the bind point. The policy is inserted into the list of rewrite policies bound to the bind point.
7. In the Priority column, you can change the priority to any positive integer. For more information about this parameter, see `priority` in "Parameters for binding a rewrite policy."
8. If you want to skip over policies and go directly to a specific policy in the event that the current policy is matched, change the value in the Goto Expression column to equal the priority of the next policy to be applied.. For more information about this parameter, see `gotoPriorityExpression` in "Parameters for binding a rewrite policy."
9. To modify a policy, click the policy, and then click Modify Policy.
10. To unbind a policy, click the policy, and then click Unbind Policy.
11. To modify an action, in the Action column, click the action you want to modify, and then click Modify Action.
12. To modify an invoke label, in the Invoke column, click the invoke label you want to modify, and then click Modify Invoke Label.
13. To regenerate the priorities of all the policies that are bound to the bind point you are currently configuring, click Regenerate Priorities. The policies retain their existing priorities relative to the other policies, but the priorities are renumbered in multiples of ten.
14. Click Apply Changes.

15. Click Close. A message appears in the status bar, stating that the Policy has been configured successfully.

To bind a rewrite policy to a specific virtual server by using the configuration utility

1. Navigate to Load Balancing > Virtual Servers.
2. In the details pane list of virtual servers, select the virtual server to which you want to bind the rewrite policy, and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, select the Policies tab. All policies configured on your NetScaler appear on the list.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click OK. A message appears in the status bar, stating that the Policy has been configured successfully.

Configuring Rewrite Policy Labels

If you want to build a more complex policy structure than is supported by single policies, you can create policy labels and then bind them as you would policies. A policy label is a user-defined point to which policies are bound. When a policy label is invoked, all the policies bound to it are evaluated in the order of the priority you configured. A policy label can include one or multiple policies, each of which can be assigned its own result. A match on one policy in the policy label can result in proceeding to the next policy, invoking a different policy label or appropriate resource, or an immediate end to policy evaluation and return of control to the policy that invoked the policy label.

A rewrite policy label consists of a name, a transform name that describes the type of policy included in the policy label, and a list of policies bound to the policy label. Each policy that is bound to the policy label contains all of the elements described in "Configuring a Rewrite Policy."

Note: You can use either the command line interface or the configuration utility to create and configure rewrite policy labels. Users who are not thoroughly familiar with the command line interface and the NetScaler Policy Infrastructure (PI) language will usually find using the configuration utility much easier.

To configure a rewrite policy label by using the command line interface

To add a new rewrite policy label, at the command prompt, type the following command:

```
add rewrite policylabel <labelName> <transform>
```

For example, to add a rewrite policy label named `polLabelHTTPResponses` to group all policies that work on HTTP responses, you would type the following:

```
add rewrite policylabel polLabelHTTPResponses http_res
```

To modify an existing rewrite policy label, at the NetScaler command prompt, type the following command:

```
set rewrite policy <name> <transform>
```

Note: The set rewrite policy command takes the same options as the add rewrite policy command.

To remove a rewrite policy label, at the NetScaler command prompt, type the following command:

```
rm rewrite policy<name>
```

For example, to remove a rewrite policy label named `polLabelHTTPResponses`, you would type the following:

```
rm rewrite policy polLabelHTTPResponses
```

Parameters for rewrite policy labels

name

A name for the policy label, or the name of the existing policy label that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that will make it easy for others to tell what type of policy this policy label was created to contain. (Cannot be changed for an existing policy label.)

transform

The type of policy that this policy label contains. Your choices are:

- http_req. Groups rewrite policies that process HTTP requests.
- http_res. Groups rewrite policies that process HTTP responses.
- URL. Groups rewrite policies that process HTTP URLs.
- text. Groups rewrite policies that process text.
- clientless_vpn_req. Groups rewrite policies that process clientless VPN requests.
- clientless_vpn_res. Groups rewrite policies that process clientless VPN responses.
- othertcp_req. Groups request-based TCP rewrite policies.
- othertcp_res. Groups response-based TCP rewrite policies.

The default is http_req.

To configure a rewrite policy label by using the configuration utility

1. Navigate to Rewrite > Policy Labels.
2. In the details pane, do one of the following:
   - To create a new policy label, click Add.
   - To modify an existing policy label, select the policy, and then click Open.
3. In the Create Rewrite Policy or Configure Rewrite Policy dialog box, specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in the table above.)
   - Name* (name)
   - Transform* (transform)
4. Add or remove policies from the list that is bound to the policy label.
   - To add a policy to the list, click Insert Policy, and choose a policy from the drop-down list. You can create a new policy and add it to the list by choosing New Policy in the list, and following the instructions in "Configuring a Rewrite Policy."
   - To remove a policy from the list, select that policy, and then click Unbind Policy.
5. Modify the priority of each policy by editing the number in the Priority column.

   You can also automatically renumber policies by clicking Regenerate Priorities.

6. Click Create or OK, and then click Close.

   To remove a policy label, select it, and then click Remove. To rename a policy label, select it and then click Rename. Edit the name of the policy, and then click OK to save your changes.

Configuring the Default Rewrite Action

An undefined event is triggered when the NetScaler cannot evaluate a policy, usually because it detects a logical or other error in the policy or an error condition on the NetScaler. When the rewrite policy evaluation results in an error, the specified undefined action is carried out. Undefined actions configured at the rewrite policy level are carried out before a globally configured undefined action.

The NetScaler supports following three types of undefined actions:

undefAction NOREWRITE

Aborts rewrite processing, but does not alter the packet flow. This means that the NetScaler continues to process requests and responses that do not match any rewrite policy, and eventually forwards them to the requested URL unless another feature intervenes and blocks or redirects the request. This action is appropriate for normal requests to your Web servers, and is the default setting.

undefAction RESET

Resets the client connection. This means that the NetScaler tells the client that it must re-establish its session with the Web server. This action is appropriate for repeat requests for Web pages that do not exist, or for connections that might be attempts to hack or probe your protected Web site(s).

undefAction DROP

Silently drops the request without responding to the client in any way. This means that the NetScaler simply discards the connection without responding to the client. This action is appropriate for requests that appear to be part of a DDoS attack or another sustained attack on your servers.

Note: Undefined events can be triggered for both request and response flow specific policies.

To configure the default action by using the command line interface

At the command prompt, type the following commands to configure the default action and verify the configuration:

- set rewrite param -undefAction (NOREWRITE | RESET | DROP)
- show rewrite param

Example

```
> set rewrite param -undefAction NOREWRITE
 Done
> show rewrite param
       Action Name: NOREWRITE
 Done
```

To configure the default action by using the configuration utility

1. In the navigation pane, expand Rewrite.
2. In the details pane, under Rewrite Overview, click the Change Rewrite Settings link. The Set Rewrite Params dialog box appears.
3. Under Global Undefined-Result Action, select an option as follows:
   - NoRewrite—NOREWRITE
   - Reset—RESET
   - Drop—DROP
4. Click OK. The global undefined action is set to the value you chose.

Bypassing the Safety Check

When you create a rewrite action, the NetScaler verifies that the expression you used to create the action is safe. Expressions created by the NetScaler from run-time data, such as URLs contained in HTTP requests, can cause unexpected errors. The NetScaler reports expressions that cause such errors as unsafe expressions.

In some cases, the expressions may be safe. For example, the NetScaler cannot validate an expression that contains a URL that does not resolve, even if the URL does not resolve because the Web server is temporarily unavailable. You can manually bypass the Safety Check to allow these expressions.

To bypass the safety check by using the command line interface

At the command prompt, type the following commands to bypass the safety check and verify the configuration:

- set rewrite action <name> -bypassSafetyCheck YES
- show rewrite action <name>

Example

```
> set rewrite action insertact -bypassSafetyCheck YES
 Done
> show rewrite action insertact

      Name: insertact
      Operation: insert_http_header   Target:Client-IP
      Value:CLIENT.IP.SRC
      BypassSafetyCheck : YES
      Hits: 0
      Undef Hits: 0
      Action Reference Count: 2
 Done
```

To bypass safety check by using the configuration utility

1. In the navigation pane, expand Rewrite > Actions.
2. In the details pane, select the rewrite action to be exempted from the safety check, and then click Open.
3. In the Configure Rewrite Action dialog box, select the Bypass Safety Check check box.
4. Click OK.

Rewrite Action and Policy Examples

The examples in this section demonstrate how to configure rewrite to perform various useful tasks. The examples occur in the server room of Example Manufacturing Inc., a mid-sized manufacturing company that uses its Web site to manage a considerable portion of its sales, deliveries, and customer support.

Example Manufacturing has two domains: example.com for its Web site and email to customers, and example.net for its intranet. Customers use the Example Web site to place orders, request quotes, research products, and contact customer service and technical support.

As an important part of Example's revenue stream, the Web site must respond quickly and keep customer data confidential. Example therefore has several Web servers and uses Citrix NetScaler appliances to balance the Web site load and manage traffic to and from its Web servers.

The Example system administrators use the rewrite features to perform the following tasks:

Example 1: Delete old X-Forwarded-For and Client-IP Headers.

Example Inc. removes old X-Forwarded-For and Client-IP HTTP headers from incoming requests.

Example 2: Adding a Local Client-IP Header.

Example Inc. adds a new, local Client-IP header to incoming requests.

Example 3: Tagging Secure and Insecure Connections.

Example Inc. tags incoming requests with a header that indicates whether the connection is a secure connection.

Example 4: Mask the HTTP Server Type.

Example Inc. modifies the HTTP Server: header so that unauthorized users and malicious code cannot use that header to determine the HTTP server software it uses.

Example 5: Redirect an External URL to an Internal URL.

Example Inc. hides information about the actual names of its Web servers and the configuration of its server room from users, to make URLs on its Web site shorter and easier to remember, and to improve security on its site.

Example 6: Migrating Apache Rewrite Module Rules.

Example Inc. moved its Apache rewrite rules to a NetScaler appliance, translating the Apache PERL-based script syntax to the NetScaler rewrite rule syntax.

Example 7: Marketing Keyword Redirection.

The marketing department at Example Inc. sets up simplified URLs for certain predefined keyword searches on the company's Web site.

Example 8: Redirect Queries to the Queried Server.

Example Inc. redirects certain query requests to the appropriate server.

Example 9: Home Page Redirection.

Example Inc. recently acquired a smaller competitor, and it now redirects requests for the acquired company's home page to a page on its own Web site.

Each of these tasks requires that the system administrators create rewrite actions and policies and bind them to a valid bind point on the NetScaler.

Example 1: Delete Old X-Forwarded-For and Client-IP Headers

Example Inc. wants to remove old X-Forwarded-For and Client-IP HTTP headers from incoming requests, so that the only X-Forwarded-For headers that appear are the ones added by the local server. This configuration can be done through the NetScaler command line or the configuration utility. The Example Inc. system administrator is an old-school networking engineer and prefers to use a CLI where possible, but wants to be sure he understands the configuration utility interface so that he can show new system administrators on the team how to use it.

The examples below demonstrate how to perform each configuration with both the CLI and the configuration utility. The procedures are abbreviated on the assumption that users will already know the basics of creating rewrite actions, creating rewrite policies, and binding policies.

- For more detailed information about creating rewrite actions, see "Configuring a Rewrite Action."
- For more detailed information about creating rewrite policies, see "Configuring a Rewrite Policy."
- For more detailed information about binding rewrite policies, see "Binding a Rewrite Policy."

To delete old X-Forwarded and Client-IP headers from a request by using the command line interface

At the command prompt, type the following commands in the order shown:

```
add rewrite action act_del_xfor delete_http_header x-forwarded-for
add rewrite action act_del_cip delete_http_header client-ip
add rewrite policy pol_check_xfor 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS' act_del_xfor
add rewrite policy pol_check_cip 'HTTP.REQ.HEADER("client-ip").EXISTS' act_del_cip
bind rewrite global pol_check_xfor 100 200
bind rewrite global pol_check_cip 200 300
```

To delete old X-Forwarded and Client-IP headers from a request by using the configuration utility

In the Create Rewrite Action dialog box, create two rewrite actions with the following descriptions.

Name	Type	Argument(s)
act_del_xfor	delete_http_header	x-forwarded-for
act_del_cip	delete_http_header	client-ip

In the Create Rewrite Policy dialog box, create two rewrite policies with the following descriptions.

Name	Expression	Action
pol_check_xfor	'HTTP.REQ.HEADER("x-forwarded-for").EXISTS'	act_del_xfor
pol_check_cip	'HTTP.REQ.HEADER("client-ip").EXISTS'	act_del_cip

Bind both policies to global, assigning the priorities and goto expression values shown below.

Name	Priority	Goto Expression
pol_check_xfor	100	200
pol_check_xfor	200	300

All old X-Forwarded-For and Client-IP HTTP headers are now deleted from incoming requests.

Example 2: Adding a Local Client-IP Header

Example Inc. wants to add a local Client-IP HTTP header to incoming requests. This example contains two slightly different versions of the same basic task.

To add a local Client-IP header by using the command line interface

At the command prompt, type the following commands in the order shown:

```
add rewrite action act_ins_client insert_http_header NS-Client 'CLIENT.IP.SRC'
add rewrite policy pol_ins_client 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS || HTTP.REQ.HEADER("client-
bind rewrite global pol_ins_client 300 END
```

To add a local Client-IP header by using the configuration utility

In the Create Rewrite Action dialog box, create a rewrite action with the following description.

Name	Type	Argument(s)
act_ins_client	insert_http_header	NS-Client 'CLIENT.IP.SRC'

In the Create Rewrite Policy dialog box, create a rewrite policy with the following description.

Name	Expression	Action
pol_ins_client	'HTTP.REQ.HEADER("x-forwarded-for").EXISTS || HTTP.REQ.HEADER("client-ip").EXISTS'	act_ins_client

Bind both policies to global, assigning the priorities and goto expression values shown below.

Name	Priority	Goto Expression
pol_check_xfor	100	200
pol_check_xfor	200	300

A local Client-IP HTTP header is now added to incoming requests. You can also modify the configuration above to append all IPs from X-Forwarded-For headers to the new Client-IP header, as shown below.

Example 3: Tagging Secure and Insecure Connections

Example Inc. wants to tag incoming requests with a header that indicates whether or not the connection is a secure connection. This helps the server keep track of secure connections after the NetScaler has decrypted the connections.

To implement this configuration, you would begin by creating rewrite actions with the values shown in the following tables. These actions label connections to port 80 as insecure connections, and connections to port 443 as secure connections.

Action Name	Type of Rewrite Action	Header Name	Value
Action-Rewrite-SSL_YES	INSERT_HTTP_HEADER	SSL	YES

Action Name	Type of Rewrite Action	Header Name	Value
Action-Rewrite-SSL_NO	INSERT_HTTP_HEADER	SSL	NO

You would then create a rewrite policy with the values shown in the following tables. These policies check incoming requests to determine which requests are directed to port 80 and which are directed to port 443. The policies then add the correct SSL header.

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-SSL_YES	Action-Rewrite-SSL_YES	NOREWRITE	CLIENT.TCP.DSTPORT.EQ(443)
Policy-Rewrite-SSL_NO	Action-Rewrite-SSL_NO	NOREWRITE	CLIENT.TCP.DSTPORT.EQ(80)

Finally, you would bind the rewrite policies to NetScaler, assigning the first policy a priority of 200, and the second a priority of 300, and setting the goto expression of both policies to END.

Each incoming connection to port 80 now has an SSL:NO HTTP header added to it and each incoming connection to port 443 has an SSL:YES HTTP header added to it.

Example 4: Mask the HTTP Server Type

Example Inc. wants to modify the HTTP Server: header so that unauthorized users and malicious code cannot use the header to identify the software that the HTTP server uses.

To modify the HTTP Server: header, you would create a rewrite action and a rewrite policy with the values in the following tables.

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Server_Mask	REPLACE	HTTP.RES.HEADER("Server")	"Web Server 1.0"

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-Server_Mask	Action-Rewrite-Server_Mask	NOREWRITE	HTTP.RES.IS_VALID

You would then globally bind the rewrite policy, assigning a priority of 100 and setting the Goto Priority Expression of the policy to END.

The HTTP Server: header is now modified to read “Web Server 1.0,” masking the actual HTTP server software used by the Example Inc. Web site.

Example 5: Redirect an External URL to an Internal URL

Example Inc. wants to hide its actual server room configuration from users to improve security on its Web servers.

To do this, you would create a rewrite action with the values as shown in the following tables. For request headers, the action in the table modifies `www.example.com` to web.hq.example.net. For response headers, the action does the opposite, translating `web.hq.example.net to www.example.com`.

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Request_Server_Replace	REPLACE	HTTP.REQ.HOSTNAME.SERVER	"Web.hq.example.net"
Action-Rewrite-Response_Server_Replace	REPLACE	HTTP.RES.HEADER("Server")	"www.example.com"

Next, you would create rewrite policies using the values shown in the following tables. The first policy checks incoming requests to see if they are valid, and if they are, it performs the Action-Rewrite-Request_Server_Replace action. The second policy checks responses to see if they originate at the server web.hq.example.net. If they do, it performs the Action-Rewrite-Response_Server_Replace action.

ne	Action Name	Undefined Action	Expression
vrite-Request_Server_Replace	Action-Rewrite-Request_Server_Replace	NOREWRITE	HTTP.REQ.HOSTNAME.SERVER.EQ("w
vrite-Response_Server_Replace	Action-Rewrite-Response_Server_Replace	NOREWRITE	HTTP.RES.HEADER("Server").EQ("web

Finally, you would bind the rewrite policies, assigning each a priority of 500 because they are in different policy banks and therefore will not conflict. You should set the goto expression to NEXT for both bindings.

All instances of `www.example.com` in the request headers are now changed to `web.hq.example.net`, and all instances of web.hq.example.net in response headers are now changed to `www.example.com`.

Example 6: Migrating Apache Rewrite Module Rules

Example Inc., is currently using the Apache rewrite module to process search requests sent to its Web servers and redirect those requests to the appropriate server on the basis of information in the request URL. Example Inc. wants to simplify its setup by migrating these rules onto the NetScaler platform.

Several Apache rewrite rules that Example currently uses are shown below. These rules redirect search requests to a special results page if they do not have a SiteID string or if they have a SiteID string equal to zero (0), or to the standard results page if these conditions do not apply.

The following are the current Apache rewrite rules:

- RewriteCond %{REQUEST_FILENAME} ^/search$ [NC]
- RewriteCond %{QUERY_STRING} !SiteId= [OR]
- RewriteCond %{QUERY_STRING} SiteId=0
- RewriteCond %{QUERY_STRING} CallName=DisplayResults [NC]
- RewriteRule ^.*$ /results2.html [P,L]
- RewriteCond %{REQUEST_FILENAME} ^/search$ [NC]
- RewriteCond %{QUERY_STRING} CallName=DisplayResults [NC]
- RewriteRule ^.*$ /results.html [P,L]

To implement these Apache rewrite rules on the NetScaler, you would create rewrite actions with the values in the following tables.

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Display_Results_NulSiteID	REPLACE	HTTP.REQ.URL	"/results2.html"
Action-Rewrite-Display_Results	REPLACE	HTTP.REQ.URL	"/results2.html"

You would then create rewrite policies with the values as shown in the tables below.

	Action Name	Undefined Action	Expression
ts_NulSiteID	Action-Rewrite-Display_Results_NulSiteID	NOREWRITE	HTTP.REQ.URL.PATH.SET_TEXT_MODE(IGNORECASE).EQ (!HTTP.REQ.URL.QUERY.CONTAINS("SiteId=") || HTTP.R HTTP.REQ.URL.QUERY.SET_TEXT_MODE(IGNORECASE).C

ts	Action-Rewrite-Display_Results	NOREWRITE	HTTP.REQ.URL.PATH.SET_TEXT_MODE(IGNORECASE).EQ HTTP.REQ.URL.QUERY.SET_TEXT_MODE(IGNORECASE).C

Finally, you would bind the rewrite policies, assigning the first a priority of 600 and the second a priority of 700, and then set the goto expression to NEXT for both bindings.

The NetScaler now handles these search requests exactly as the Web server did before the Apache rewrite module rules were migrated.

Example 7: Marketing Keyword Redirection

The marketing department at Example Inc. wants to set up simplified URLs for certain predefined keyword searches on the company's Web site. For these keywords, it wants to redefine the URL as shown below.

- External URL: `http://www.example.com/<marketingkeyword>`
- Internal URL: `http://www.example.com/go/kwsearch.asp?keyword=<marketingkeyword>`

To set up redirection for marketing keywords, you would create a rewrite action with the values in the following table.

Action Name	Type of Rewrite Action	Expression to choose target location	String expression for replacement text
Action-Rewrite-Modify_URL	INSERT_BEFORE	HTTP.REQ.URL.PATH.GET(1)	""go/kwsearch.aspkeyword="\"

You would then create a rewrite policy with the values in the following table.

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-Modify_URL	Action-Rewrite-Modify_URL	NOREWRITE	HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.c

Finally, you would bind the rewrite policy, assigning it a priority of 800. Unlike the previous rewrite policies, this policy should be the last to be applied to a request that matches its criteria. For this reason, NetScaler administrator sets its Goto Priority Expression to END.

Any request using a marketing keyword is redirected to the keyword search CGI page, whereupon a search is performed and all remaining policies are skipped.

Example 8: Redirect Queries to the Queried Server

Example Inc. wants to redirect query requests to the appropriate server, as shown here.

- Request: `GET /query.cgi?server=5HOST: www.example.com`
- Redirect URL: `http://web-5.example.com/`

To implement this redirection, you would first create a rewrite action with the values in the following table.

on Name	Type of Rewrite Action	Expression to choose target reference	String expression for re
on-Rewrite-Replace_Hostheader	REPLACE	HTTP.REQ.HEADER("Host").BEFORE_STR(".example.com")	"server-" + HTTP.REQ.URL.QUERY.

You would then create a rewrite policy with the values in the following table.

icy Name	Action Name	Undefined Action	Expression
icy-Rewrite-Replace_Hostheader	Action-Rewrite-Replace_Hostheader	NOREWRITE	HTTP.REQ.HEADER("Host").EQ("www.exa

Finally, you would bind the rewrite policy, assigning it a priority of 900. Because this policy should be the last policy applied to a request that matches its criteria, you set the goto expression to END.

Incoming requests to any URL that begins with `http://www.example.com/query.cgi?server=` are redirected to the server number in the query.

Example 9: Home Page Redirection

New Company, Inc. recently acquired a smaller competitor, Purchased Company, and wants to redirect the home page for Purchased Company to a new page on its own Web site, as shown here.

- Old URL: `http://www.purchasedcompany.com/*`
- New URL: `http://www.newcompany.com/products/page.htm`

To redirect requests to the Purchased Company home page, you would create rewrite actions with the values in the following table.

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Replace_URLr	REPLACE	HTTP.REQ.URL.PATH_AND_QUERY	"/products/page.htm"
Action-Rewrite-Replace_Host	REPLACE	HTTP.REQ.HOSTNAME	"www.newcompany.com"

You would then create rewrite policies with the values in the following table.

cy Name	Action Name	Undefined Action	Expression
cy-Rewrite-Replace-None	Action-Rewrite-Replace-None	NOREWRITE	!HTTP.REQ.HOSTNAME.SERVER.EQ("www.purchasedco
cy-Rewrite-Replace-Host	Action-Rewrite-Replace_Host	NOREWRITE	HTTP.REQ.HOSTNAME.SERVER.EQ("www.purchasedcon
cy-Rewrite-Replace-URL	Action-Rewrite-Replace_URL	NOREWRITE	HTTP.REQ.IS_VALID

Finally, you would bind the rewrite policies globally, assigning the first a priority of 100, the second a priority of 200, and the third a priority of 300. These policies should be the last policies applied to a request that matches the criteria. For this reason, set the goto expression to END for the first and third policies, and to 300 for the second policy. This ensures that all remaining requests are processed correctly.

Requests to the acquired company's old Web site are now redirected to the correct page on the New Company home page.

URL Transformation

The URL transformation feature provides a method for modifying all URLs in designated requests from an external version seen by outside users to an internal URL seen only by your Web servers and IT staff. You can redirect user requests seamlessly, without exposing your network structure to users. You can also modify complex internal URLs that users may find difficult to remember into simpler, more easily remembered external URLs.

Note: Before you can use the URL transformation feature, you must enable the Rewrite feature. To enable the Rewrite feature, see Enabling the Rewrite Feature.

To begin configuring URL transformation, you create profiles, each describing a specific transformation. Within each profile, you create one or more actions that describe the transformation in detail. Next, you create policies, each of which identifies a type of HTTP request to transform, and you associate each policy with an appropriate profile. Finally, you globally bind each policy to put it into effect.

Configuring URL Transformation Profiles

A profile describes a specific URL transformation as a series of actions. The profile functions primarily as a container for the actions, determining the order in which the actions are performed. Most transformations transform an external hostname and optional path into a different, internal hostname and path. Most useful transformations are simple and require only a single action, but you can use multiple actions to perform complex transformations.

You cannot create actions and then add them to a profile. You must create the profile first, and then add actions to it. In the CLI, creating an action and configuring the action are separate steps. Creating a profile and configuring the profile are separate steps in both the CLI and the configuration utility.

To create a URL transformation profile by using the NetScaler command line

At the NetScaler command prompt, type the following commands, in the order shown, to create a URL transformation profile and verify the configuration. You can then repeat the second and third commands to configure additional actions:

- add transform profile <profileName> -type URL [-onlyTransformAbsURLinBody (ON|OFF)] [-comment <comment>]
- add transform action <name> <profileName> <priority>
- set transform action <name> [-priority <priority>] [-reqUrlFrom <expression>] [-reqUrlInto <expression>] [-resUrlFrom <expression>] [-resUrlInto <expression>] [-cookieDomainFrom <expression>] [-cookieDomainInto <expression>] [-state (ENABLED|DISABLED)] [-comment "<string>"]
- show transform profile <name>

Example

```
> add transform profile shoppingcart -type URL
 Done
> add transform action actshopping shoppingcart 1000
 Done
> set transform action actshopping -priority 1000 -reqUrlFrom 'shopping.example.com' -reqUrlInto 'www.exar
 Done
> show transform profile shoppingcart
      Name: shoppingcart
            Type: URL       onlyTransformAbsURLinBody: OFF
      Comment:
      Actions:

1)            Priority 1000   Name: actshopping       ENABLED
```

Done

To modify an existing URL transformation profile or action by using the NetScaler command line

At the NetScaler command prompt, type the following commands to modify an existing URL transformation profile or action and verify the configuration:

Note: Use a set transform profile or set transform action command, respectively. The set transform profile command takes the same arguments as does the add transform profile command, and set transform action is the same command that was used for initial configuration.

- set transform action <name> [-priority <priority>] [-reqUrlFrom <expression>] [-reqUrlInto <expression>] [-resUrlFrom <expression>] [-resUrlInto <expression>] [-cookieDomainInto <expression>] [-state (ENABLED|DISABLED)] [-comment "<string>"]

- show transform profile <name>

Example

```
> set transform action actshopping -priority 1000 -reqUrlFrom 'searching.example.net' -reqUrlInto 'www.exar
 Done
> show transform profile shoppingcart
        Name: shoppingcart
              Type: URL       onlyTransformAbsURLinBody: OFF
        Comment:
        Actions:

1)              Priority 1000   Name: actshopping       ENABLED
 Done
```

To remove a URL transformation profile and actions by using the NetScaler command line

First remove all actions associated with that profile by typing the following command once for each action:

- rm transform action <name> After you have removed all actions associated with a profile, remove the profile as shown below.

- rm transform profile <name>

Parameters for configuring URL transformation profiles

profileName

A name for your new profile, or the name of the existing profile you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.

onlyTransformAbsURLinBody

Transform only absolute URLs, not relative URLs, in HTTP body text. Possible values: YES, NO. Default: NO.

name

A name for your new action, or the name of the existing action you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.

priority

The priority assigned to this URL transformation profile or action. Priorities assigned to profiles control the order in which matching URL transformation profiles are performed on a single request or response. Priorities assigned to actions control the order in which actions assigned to a single profile are performed.

reqUrlFrom

A PCRE-format regular expression that describes the request URL pattern to be transformed.

reqUrlInto

A PCRE-format regular expression that describes the transformation to be performed on the URLs in matching requests.

resUrlFrom

A PCRE-format regular expression that describes the response URL pattern to be transformed.

resUrlInto

A PCRE-format regular expression that describes the transformation to be performed on URLs in matching responses.

cookieDomainFrom

Pattern of the original domain in Set-Cookie headers.

cookieDomainInto

A PCRE-format regular expression that describes the transformation to be performed on cookies in matching requests and responses. The cookie domain to be transformed is extracted from the incoming request.

state

The state of a URL transformation action. (You can disable an action instead of removing it.) Possible values: ENABLED, DISABLED. Default: ENABLED.

comment

A text string, in quotation marks, that describes the purpose of this URL transformation action. This command is optional.

To create a URL transformation profile by using the configuration utility

1. In the navigation pane, expand Rewrite, expand URL Transformation, and then click Profiles.
2. In the details pane, click Add.
3. In the Create URL Transformation Profile dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring URL transformation profiles" as follows (asterisk indicates a required parameter):
   - Name*—name
   - Comment—comment
   - Only transform absolute URLs in response body—onlyTransformAbsURLinBody
4. Click Create, and then click Close. A message appears in the status bar, stating that the Profile has been configured successfully.

To configure a URL transformation profile and actions by using the configuration utility

1. In the navigation pane, expand Rewrite, expand URL Transformation, and then click Profiles.
2. In the details pane, select the profile you want to configure, and then click Open.
3. In the Configure URL Transformation Profile dialog box, do one of the following.
   - To create a new action, click Add.
   - To modify an existing action, select the action, and then click Open.
4. Fill in the Create URL Transformation Action or Modify URL Transformation Action dialog box by typing or selecting values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring URL transformation profiles" as follows (asterisk indicates a required parameter):
   - Action Name*—name
   - Comments—comment
   - Priority*—priority
   - Request URL from—reqUrlFrom
   - Request URL into—reqUrlInto
   - Response URL from—resUrlFrom
   - Response URL into—resUrlInto
   - Cookie Domain from—cookieDomainFrom
   - Cookie Domain into—cookieDomainInto
   - Enabled—state
5. Save your changes.
   - If you are creating a new action, click Create, and then Close.
   - If you are modifying an existing action, click OK.

   A message appears in the status bar, stating that the Profile has been configured successfully.
6. Repeat step 3 through step 5 to create or modify any additional actions.
7. To delete an action, select the action, and then click Remove. When prompted, click OK to confirm the deletion.
8. Click OK to save your changes and close the Modify URL Transformation Profile dialog box.

9. To delete a profile, in the details pane select the profile, and then click Remove. When prompted, click OK to confirm the deletion.

Configuring URL Transformation Policies

After you create a URL transformation profile, you next create a URL transformation policy to select the requests and responses that the NetScaler should transform by using the profile. URL transformation considers each request and the response to it as a single unit, so URL transformation policies are evaluated only when a request is received. If a policy matches, the NetScaler transforms both the request and the response.

Note: The URL transformation and rewrite features cannot both operate on the same HTTP header during request processing. Because of this, if you want to apply a URL transformation to a request, you must make sure that none of the HTTP headers it will modify are manipulated by any rewrite action.

To configure a URL transformation policy by using the NetScaler command line

You must create a new policy. On the command line, an existing policy can only be removed. At the NetScaler command prompt, type the following commands to configure a URL transformation policy and verify the configuration:

- add transform policy <name> <rule> <profileName>
- show transform policy <name>

Example

```
> add transform policy polsearch  HTTP.REQ.URL.SUFFIX.EQ("Searching") prosearching
 Done
> show transform policy polsearch
1)      Name: polsearch
        Rule: HTTP.REQ.URL.SUFFIX.EQ("Searching")
        Profile: prosearching
        Priority: 0
        Hits: 0
 Done
```

To remove a URL transformation policy by using the NetScaler command line

At the NetScaler command prompt, type the following command to remove a URL transformation policy:

rm transform policy <name>

Example

```
> rm transform policy polsearch
Done
```

Parameters for configuring URL transformation policies

name

A name for your new policy, or the name of the existing policy you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.

rule

A NetScaler advanced expression that defines the rule for this policy. The expression can be a simple expression, or a complex expression that contains several expressions in a structured relationship.

profileName

The name of the profile to execute when a request or response matches this policy.

To configure a URL transformation policy by using the configuration utility

1. In the navigation pane, expand Rewrite, expand URL Transformation, and then click Policies.

2. In the details pane, do one of the following:

   - To create a new policy, click Add.

   - To modify an existing policy, select the policy, and then click Open.

3. In the Create URL Transformation Policy or Configure URL Transformation Policy dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring URL transformation policies" as follows (asterisk indicates a required parameter):

   - Name*—name (Cannot be changed for a previously configured policy.)

   - Profile*—profileName

   - Expression—rule

   If you want help with creating an expression for a new policy, you can either hold down the `Control key` and press the `space bar` while your cursor is in the Expression text box. To create the expression, you can type it directly as described below, or you can use the Add Expression dialog box as described in To add an expression by using the Add Expression dialog box.

   a. Click Prefix, and choose the prefix for your expression.

      Your choices are:

      - HTTP—The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.

      - SYS—The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

      - CLIENT—The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

      - SERVER—The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

      - URL—The URL of the request. Choose this if you want to examine some aspect of the URL to which the request was sent.

      - TEXT—Any text string in the request. Choose this if you want to examine a text string in the request.

      - TARGET—The target of the request. Choose this if you want to examine some aspect of the request target.

        After you choose a prefix, the NetScaler displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of

what the selected choice means at the bottom. The choices depend on which prefix you chose.

b. Select your next term.

If you chose HTTP as your prefix, your choices are REQ, which specifies HTTP requests, and RES, which specifies HTTP responses. If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

When you are certain which choice you want, double-click it to insert it into the Expression window.

c. Type a period, and then continue selecting terms from the list boxes that appear to the right of the previous list box. You type the appropriate text strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

4. Click Create or OK, depending on whether you are creating a new policy or modifying an existing policy.

5. Click Close. A message appears in the status bar, stating that the Policy has been configured successfully.

To add an expression by using the Add Expression dialog box

1. In the Create Responder Action or Configure Responder Action dialog box, click Add.
2. In the Add Expression dialog box, in the first list box choose the first term for your expression.

   HTTP

   The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.

   SYS

   The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

   CLIENT

   The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

   SERVER

   The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

   URL

   The URL of the request. Choose this if you want to examine some aspect of the URL to which the request was sent.

   TEXT

   Any text string in the request. Choose this if you want to examine a text string in the request.

   TARGET

   The target of the request. Choose this if you want to examine some aspect of the request target.

   When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a

value, until your expression is finished.

Globally Binding URL Transformation Policies

After you have configured your URL transformation policies, you bind them to Global or a bind point to put them into effect. After binding, any a request or response that matches a URL transformation policy is transformed by the profile associated with that policy.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler OS, policy priorities work in reverse order - the higher the number, the lower the priority.

Because the URL transformation feature implements only the first policy that a request matches, not any additional policies that it might also match, policy priority is important for achieving the results that you intend. If you give your first policy a low priority (such as 1000), you tell the NetScaler to perform it only if other policies with a higher priority do not match a request. If you give your first policy a high priority (such as 1), you tell the NetScaler to perform it first, and skip any other policies that might also match. You can leave yourself plenty of room to add other policies in any order, without having to reassign priorities, by setting priorities with intervals of 50 or 100 between each policy when you globally bind your policies.

Note: URL transformation policies cannot be bound to TCP-based virtual servers.

To bind a URL transformation policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to globally bind a URL transformation policy and verify the configuration:

- bind transform global <policyName> <priority>
- show transform global

Example

```
> bind transform global polisearching 100
 Done
> show transform global
1)      Policy Name: polisearching
       Priority: 100

 Done
```

Parameters for binding URL transformation policies

policyName

The name of the URL transformation policy you want to bind.

priority

The priority assigned to this URL transformation policy. The priority determines the order in which policies are evaluated, allowing the NetScaler to evaluate the most specific policy first, and more general policies in descending order, finishing with the most general policy.

To bind a URL transformation policy by using the configuration utility

1. In the navigation pane, expand Rewrite, then expand URL Transformation, and then click Policies.
2. In the details pane, click Policy Manager.
3. In the Transform Policy Manager dialog box, choose the bind point to which you want to bind the policy. The choices are:
   - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance, and are applied before any other policies.
   - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
   - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
   - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance.
   - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
4. Select Insert Policy to insert a new row and display a drop-down list with all available, unbound URL transformation policies.
5. Select the policy you want to bind, or select New Policy to create a new policy. The policy that you selected or created is inserted into the list of globally bound URL transformation policies.
6. Make any additional adjustments to the binding.
   - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.
   - To modify the policy expression, double click that field to open the Configure Transform Policy dialog box, where you can edit the policy expression.
   - To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
   - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression
7. Repeat steps 3 through 6 to add any additional URL transformation policies you want to globally bind.

8. Click OK to save your changes. A message appears in the status bar, stating that the Policy has been configured successfully.

Diameter Support for Rewrite

The Rewrite feature now supports the Diameter protocol. You can configure Rewrite to modify Diameter requests and response as you would HTTP or TCP requests and responses, allowing you to use Rewrite to manage the flow of Diameter requests and make necessary modifications. For example, if the "Origin-Host" value in a Diameter request is inappropriate, you can use Rewrite to replace it with a value that is acceptable to the Diameter server.

To configure Rewrite to modify a Diameter request

To configure the Rewrite feature to replace the Origin-Host in a diameter request with a different value, at the command prompt, type the following commands:

- add rewrite action <actname> replace "DIAMETER.REQ.AVP(264,\"netscaler.example.net\")"
  For <actname>, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For netscaler.example.net, substitute the Host-Origin that you want to use instead of the original Host-Name.

- add rewrite policy <polname> "diameter.req.avp(264).value.eq(\"host.example.com\")" <actname>
  For <polname>, substitute a name for your new policy. As with <actname>, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For host.example.com, substitute the name of the Host-Origin that you want to change. For <actname>, substitute the name of the action that you just created.

- bind lb vserver <vservername> -policyName <polname> -priority <priority> -type REQUEST
  For <vservername>, substitute the name of the load balancing virtual server to which you want to bind the policy. For <polname>, substitute the name of the policy you just created. For <priority>, substitute a priority for the policy.

Example

To create a Rewrite action and policy to modify all Diameter Host-Origins of "host.example.com" to "netscaler.example.net", you could add the following action and policy, and bind the policy as shown.

```
> add rewrite action rw_act_replace_avp replace "diameter.req.avp(264)" "diameter.new.avp(264,\"netscale
> add rewrite policy rw_diam_pol "diameter.req.avp(264).value.eq(\"client.realm2.net\")" rw_act_replace_a
> bind lb vserver vs1 -policyName rw_diam_pol -priority 10 -type REQUEST

Done
```

String Maps

You can use string maps to perform pattern matching in all NetScaler features that use the default policy syntax. A string map is a NetScaler entity that consists of key-value pairs. The keys and values are strings in either ASCII or UTF-8 format. String comparison uses two new functions, `MAP_STRING(<string_map_name>)` and `IS_STRINGMAP_KEY(<string_map_name>)`.

A policy configuration that uses string maps performs better than one that does string matching through policy expressions, and you need fewer policies to perform string matching with a large number of key-value pairs. String maps are also intuitive, simple to configure, and result in a smaller configuration.

How String Maps Work

String maps are similar in structure to pattern sets (a pattern set defines a mapping of index values to strings; a string map defines a mapping of strings to strings) and the configuration commands for string maps (commands such as add, bind, unbind, remove, and show) are syntactically similar to configuration commands for pattern sets. Also, as with index values in a pattern set, each key in a string map must be unique across the map. The following table illustrates a string map called url_string_map, which contains URLs as keys and values.

Table 1. String Map "url_string_map"

Key	Value
/url_1.html	http://www.redirect_url_1.com/url_1.html
/url_2.html	http://www.redirect_url_2.com/url_2.html
/url_3.html	http://www.redirect_url_1.com/url_1.html

The following table describes the two functions that have been introduced to enable string matching with keys in a string map. String matching is always performed with the keys. Additionally, the following functions perform a comparison between the keys in the string map and the complete string that is returned by the expression prefix. The examples in the descriptions refer to the preceding example.

Table 2. String Map Functions

nction	Description
EXT>.MAP_STRING(<string_map_name>)	Checks whether the value returned by the expression prefix TEXT matches a in the string map, and returns the value that corresponds to the key. If no ke map matches the value returned by the expression prefix, the function return string. The IGNORECASE and NOIGNORECASE functions can be used for case and case-sensitive comparison, respectively. **Example 1:** HTTP.REQ.URL.MAP_STRING("url_string_map") checks wh string returned by HTTP.REQ.URL is a key in the string map url_string_map. of HTTP.REQ.URL is /url_1.html, the function returns http://www.redirect_url_1.com/url_1.html. **Example 2:** HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).MAP_STRING("url_str checks whether the string returned by HTTP.REQ.URL is a key in the string r url_string_map. The comparison does not consider case. If the string returned HTTP.REQ.URL is /URL_1.html, the function returns http://www.redirect_url_1.com/url_1.html. **Parameters:** string_map_name - The string map.

EXT>.IS_STRINGMAP_KEY(<string_map_name>)	Returns TRUE if the string returned by the expression prefix TEXT is a key in map. The IGNORECASE and NOIGNORECASE functions can be used for case- and case-sensitive string matching, respectively. **Example 1:** HTTP.REQ.URL.IS_STRINGMAP_KEY("url_string_map") returns TRUE HTTP.REQ.URL is one of the keys in url_string_map. **Example 2:** HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_string_map") returns TRUE if the value of HT is one of the keys in url_string_map. In this case, key lookup does not conside Therefore, the function returns TRUE even if the value of HTTP.REQ.URL is /URL_3.html. **Parameters:** string_map_name - The string map.

Configuring a String Map

You first create a string map and then bind key-value pairs to it. You can create a string map from the command line interface (CLI) or the configuration utility.

To configure a string map by using the command line interface

At the command prompt, do the following:

1. Create a string map.

   add policy stringmap <name> -comment <string>

2. Bind a key-value pair to the string map.

   bind policy stringmap <name> <key> <value>

   Example:

   > bind policy stringmap url_string_map1 "/url_1.html" "http://www.redirect_url_1.com/url_1.html"

To configure a string map by using the configuration utility

Create a string map and bind the key-value pair to the created entity.

Navigate to AppExpert > String Maps,click Add and specify the relevant details.

String Maps Use Cases

You can use string maps in all features that support the newer default policy syntax. For example, string maps can be used in responder redirects and rewrite actions. You can also reuse a given string map in multiple features.

Use Case: Responder Policy With a Redirect Action

The following use case involves a responder policy with a redirect action. In the example below, the first four commands create the string map `url_string_map` and bind the three key-value pairs used in the earlier example. After creating the map and binding the key-value pairs, you create a responder action (`act_url_redirects`) that redirects the client to the corresponding URL in the string map or to `www.default.com`. You also configure a responder policy (`pol_url_redirects`) that checks whether requested URLs match any of the keys in `url_string_map` and then performs the configured action. Finally, you bind the responder policy to the content switching virtual server that receives the client requests that are to be evaluated.

```
add stringmap url_string_map

bind stringmap url_string_map /url_1.html
http://www.redirect_url_1.com/url_1.html

bind stringmap url_string_map /url_2.html
http://www.redirect_url_2.com/url_2.html

bind stringmap url_string_map /url_3.html
http://www.redirect_url_1.com/url_1.html

add responder action act_url_redirects redirect
'HTTP.REQ.URL.MAP_STRING("url_string_map") ALT "www.default.com"'
-bypassSafetyCheck yes

add responder policy pol_url_redirects TRUE act_url_redirects

bind cs vserver csw_redirect -policyname pol_url_redirects -priority
1 -type request
```

Security

Contents

Security

The following topics cover configuration and installation information for NetScaler security features. Most of these features are policy based.

Authentication, Authorization, Auditing (AAA)	Keeps unauthorized users out of the network, denies users access to tasks for which they are not authorized, and tracks the resources used during user sessions.
Application Firewall	Prevents security breaches, data loss, and possible unauthorized modifications to web sites that access sensitive business or customer information.
Content Filtering	Blocks inappropriate HTML requests, preventing the requests from reaching the Web servers.
HTTP Denial-of-Service Protection	Prevents hackers from attacking your Web site with large numbers of HTTP requests.
Priority Queuing	Detects high-priority connections and allows those connections to proceed ahead of other connections, guaranteeing unimpeded access to those users.
SureConnect	Services all incoming connections with either the requested content or a custom Web page that displays information about a delay in the request being serviced.
Surge Protection	Detects any rapid rise in connection attempts and adjusts the rate at which connections are allowed to proceed to the server, preventing server overload.

AAA Application Traffic

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The AAA feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The AAA feature supports authentication, authorization, and auditing for all application traffic. To use AAA, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring AAA, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance.

AAA Application Traffic

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The AAA feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The AAA feature supports authentication, authorization, and auditing for all application traffic. To use AAA, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring AAA, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance.

How AAA Works

AAA provides security for a distributed Internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of authentication, authorization, and auditing. Authentication enables the NetScaler appliance to verify the client's credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the appliance to verify which content on a protected server it should allow each user to access. Auditing enables the appliance to keep a record of each user's activity on a protected server.

To understand how AAA works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the NetScaler appliance does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user's credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP.
- Verifies that the user is authorized to access specific intranet content before delivering the user's request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Authentication requires that several entities—the client, the NetScaler appliance, the external authentication server if one is used, and the application server—respond to each other when prompted by performing a complex series of tasks in the correct order. If you are using an external authentication server, this process can be broken down into the following fifteen steps.

- The client sends a GET request for a URL on the application server.
- The NetScaler appliance's traffic management virtual server redirects the request to the application server.
- The application server determines that the client has not been authenticated, and therefore sends an HTTP 200 OK response via the TM vserver to the client. The response contains a hidden script that causes the client to issue a POST request for /cgi/tm.
- The client sends a POST request for /cgi/tm.
- The NetScaler appliance's authentication virtual server redirects the request to the authentication server.

- The authentication server creates an authentication session, sets and caches a cookie that consists of the initial URL and the domain of the traffic management virtual server, and then sends an HTTP 302 response via the authentication virtual server, redirecting the client to /vpn/index.html.
- The client sends a GET request for /vpn/index.html.
- The authentication virtual server redirects the client to the authentication server login page.
- The client sends a GET request for the login page, enters credentials, and then sends a POST request with the credentials back to the login page.
- The authentication virtual server redirects the POST request to the authentication server.
- If the credentials are correct, the authentication server tells the authentication virtual server to log the client in and redirect the client to the URL that was in the initial GET request.
- The authentication virtual server logs the client in and sends an HTTP 302 response that redirects the client to the initially requested URL.
- The client sends a GET request for their initial URL.
- The traffic management virtual server redirects the GET request to the application server.
- The application server responds via the traffic management virtual server with the initial URL.

If you use local authentication, the process is similar, but the authentication virtual server handles all authentication tasks instead of forwarding connections to an external authentication server. The following figure illustrates the authentication process.

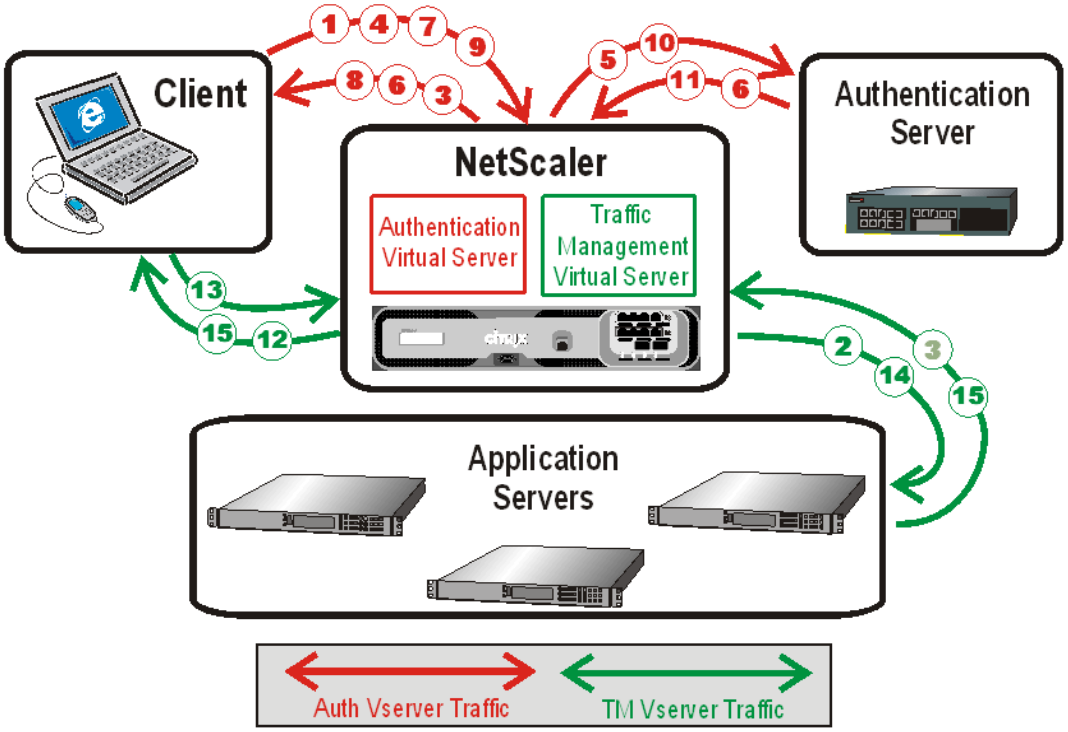

Figure 1. Authentication Process Traffic Flow

When an authenticated client requests a resource, the NetScaler appliance, before sending the request to the application server, checks the user and group policies associated with the client account, to verify that the client is authorized to access that resource. The appliance handles all authorization on protected application servers. You do not need to do any special configuration of your protected application servers.

AAA-TM handles password changes for users by using the protocol-specific method for the authentication server. For most protocols, neither the user nor the administrator needs to do anything different than they would without AAA-TM. Even when an LDAP authentication server is in use, and that server is part of a distributed network of LDAP servers with a single designated domain administration server, password changes are usually handled seamlessly. When an authenticated client of an LDAP server changes his or her password, the client sends a credential modify request to AAA-TM, which forwards it to the LDAP server. If the user's LDAP server is also the domain administration server, that server responds appropriately and AAA-TM then performs the requested password change. Otherwise, the LDAP server sends AAA-TM an LDAP_REFERRAL response to the domain administration server. AAA-TM follows the referral to the indicated domain administration server, authenticates to that server, and performs the password change on that server.

When configuring AAA-TM with an LDAP authentication server, the system administrator must keep the following conditions and limitations in mind:

- AAA-TM assumes that the domain administration server in the referral accepts the same bind credentials as the original server.
- AAA-TM only follows LDAP referrals for password change operations. In other cases AAA-TM refuses to follow the referral.
- AAA-TM only follows one level of LDAP referrals. If the second LDAP server also returns a referral, AAA-TM refuses to follow the second referral.

The NetScaler appliance supports auditing of all states and status information, so you can see the details of what each user did while logged on, in chronological order. To provide this information, the appliance logs each event, as it occurs, either to a designated audit log file on the appliance or to a syslog server. Auditing requires configuring the appliance and any syslog server that you use.

Enabling AAA

To use the AAA - Application Traffic feature, you must enable it. You can configure AAA entities—such as the authentication and traffic management virtual servers—before you enable the AAA feature, but the entities will not function until the feature is enabled.

To enable AAA by using the command line interface

At the command prompt, type the following commands to enable AAA and verify the configuration:

- enable ns feature AAA
- show ns feature

Example

```
> enable feature AAA
 Done

> show ns feature

      Feature                 Acronym           Status
      -------                 -------           ------
1)    Web Logging               WL                OFF
2)    Surge Protection          SP                ON
.
.
.
15)   AAA                     AAA               ON
.
.
.
23)   HTML Injection            HTMLInjection     ON
24)   NetScaler Push            push              OFF
Done
```

To enable AAA by using the configuration utility

1. Navigate to System > Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Authentication, Authorization and Auditing check box.
4. Click OK.

Setting up AAA Virtual Servers and DNS

You can configure AAA by using the built-in wizard, or manually. To use the wizard, in the main AAA pane of the configuration utility, you click AAA - Application Traffic wizard and follow the prompts.

To configure AAA manually, you first configure an authentication virtual server, which involves binding an SSL certificate-key pair. You then associate the authentication virtual server with a new or existing traffic management virtual server. (Either a load balancing virtual server or a content switching virtual server can serve as a traffic management virtual server.) To complete the initial configuration, you configure DNS to assign hostnames to both the authentication virtual server and the traffic management virtual server, and verify that your virtual servers are UP and configured correctly.

Caution: Both virtual servers must have hostnames in the same domain, or the AAA configuration will not work.

Configuring the Authentication Virtual Server

To configure AAA, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections. For additional information about configuring SSL and creating a certificate-key pair, see the *Citrix NetScaler Traffic Management Guide* at "http://support.citrix.com/article/CTX132359."

To configure an authentication virtual server by using the command line interface

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the order shown:

- add authentication vserver <name> ssl <ipaddress>
- show authentication vserver <name>
- bind ssl certkey <sslkeyname> <name>
- show authentication vserver <name>
- set authentication vserver <name> -authenticationDomain <FQDN>
- show authentication vserver <name>

Example

```
> add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443
 Done
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: DOWN[Certkey not bound]
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
 Done
> bind ssl certkey Auth-Vserver-2 Auth-Cert-1
 Done
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
      Client Idle Timeout: 180 sec
```

```
        Down state flush: DISABLED
        Disable Primary Vserver On Down : DISABLED
        Authentication : ON
        Current AAA Users: 0
        Authentication Domain: myCompany.employee.com
 Done
> set authentication vserver Auth-Vserver-2 -AuthenticationDomain myCompany.employee.com
 Done
> show authentication vserver Auth-Vserver-2
        Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
        State: DOWN[Certkey not bound]
        Client Idle Timeout: 180 sec
        Down state flush: DISABLED
        Disable Primary Vserver On Down : DISABLED
        Authentication : ON
        Current AAA Users: 0
        Authentication Domain: myCompany.employee.com
 Done
```

Parameters for configuring the authentication virtual server

name

A name for your new authentication virtual server, or the name of an existing authentication virtual server. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed after the virtual server is created.)

ipaddress

IP address assigned to the authentication virtual server in DNS.

sslkeyname

Name of the SSL certificate-key pair to associate with the virtual server.

authenticationDomain

The fully qualified domain name to be assigned to the authentication virtual server in your DNS. Must match the domain name in the SSL certificate-key pair.

To configure an authentication virtual server by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Virtual Servers.
2. In the details pane, do one of the following:
   - To create a new authentication virtual server, click Add.
   - To modify an existing authentication virtual server, select the virtual server, and then click Open.
3. In the Create Virtual Server (Authentication) or Configure Virtual Server (Authentication) dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the authentication virtual server" as follows (asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously created virtual server)
   - IP Address*—ipaddress
   - Domain*—authenticationDomain

   Note: The authentication virtual server uses only the SSL protocol and port 443, so those options are greyed out.
4. On the Certificates tab, in the Available list, select the SSL certificate you want to associate with this authentication virtual server, and click the Add button. If your configuration requires CA certs and you will use this SSL certificate as the CA server certificate, you click the Add as CA button instead. The certificate moves from the Available to the Configured list.
5. Click Create or OK, and then click Close. If you created a new authentication virtual server, it now appears in the Authentication Virtual Servers pane.

Configuring a Traffic Management Virtual Server

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual sever with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX132359Traffic Management.

Note: The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for AAA by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server at this time. If you do not configure this option, the NetScaler appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication vserver is `tm.xyz.bar.com`, the appliance assigns `xyz.bar.com`. as the authentication domain.

To configure a TM virtual server for AAA by using the command line interface

At the command prompt, type one of the following sets of commands to configure a TM virtual server and verify the configuration:

- set lb vserver <name> –authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]
- show lb vserver <name>
- set cs vserver <name> –authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]
- show cs vserver <name>

Example

```
> set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki.index.com
 Done
> show lb vserver vs-cont-sw
      vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS
```

```
        State: DOWN
        Last state change was at Wed Aug 19 10:03:15 2009 (+410 ms)
        Time since last state change: 5 days, 20:00:40.290
        Effective State: DOWN
        Client Idle Timeout: 9000 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Connection Failover: DISABLED
        Authentication: ON      Host: mywiki.index.com
Done
```

Parameters for configuring a traffic management virtual server

name

The name of the load balancing or content switching virtual server being configured as a traffic management virtual server.

authentication

Toggle authentication of application traffic on the traffic management virtual server. Possible values: ON, OFF. Default: OFF.

authenticationhost

FQDN assigned to the authentication virtual server.

authenticationdomain

The common domain in the FQDNs of both the authentication virtual server and the traffic management virtual server.

To configure a TM virtual server for AAA by using the configuration utility

1. In the navigation pane, do one of the following.
   - Expand Load Balancing, and then click Virtual Servers.
   - Expand Content Switching, and then click Virtual Servers.

   The AAA configuration process for either type of virtual server is identical.
2. In the details pane, select the virtual server on which you want to enable authentication, and then click Open.
3. In the Domain text box, type the authentication domain. See `authenticationdomain`, in "Parameters for configuring a traffic management virtual server," for information about this parameter.
4. On the Advanced tab, select the Authentication check box.
5. In the Authentication Host text box, type the fully qualified domain name of the authentication virtual server. See authenticationhost in the table above for information about this parameter.
6. Click OK. A message appears in the status bar, stating that the vserver has been configured successfully.

Configuring DNS

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to the configure DNS address records, see the *Citrix NetScalerTraffic Management Guide* at "http://support.citrix.com/article/CTX132359."

Verifying Your Setup for AAA

After you configure authentication and traffic management virtual servers and before you create user accounts, you should verify that both virtual servers are configured correctly and are in the UP state.

To verify authentication virtual server setup by using the command line interface

At the command prompt, type the following command:

show authentication vserver <name>

Example

```
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
      Authentication Domain: myCompany.employee.com
 Done
```

Parameters for Verifying your Setup for AAA

State

Current state of the service or virtual server. Possible values:

UP – The virtual server can respond to requests. Your authentication virtual server should be UP.

OUT OF SERVICE – The virtual server has been manually disabled. New requests received by this virtual server are dropped unless a backup virtual server or HTTP redirection is configured.

DOWN – The virtual server cannot respond to requests. An authentication virtual server is DOWN when a valid SSL certificate-key pair is not bound to it.

Client Idle Timeout

Idle time (in seconds) after which client connections are terminated. Default value for HTTP/SSL-based services: 180.

Down state flush

Perform delayed cleanup of connections on this virtual server. Possible values: ENABLED, DISABLED. Default: ENABLED.

Disable Primary Vserver On Down

Keep the primary virtual server secondary, when it comes back up, until manually forced to take over as primary. If enabled, preserves database updates on the backup, enabling you to synchronize the databases before restoring the primary. Possible values: ENABLED, DISABLED. Default: DISABLED.

Authentication

Authenticate application traffic for the traffic management virtual server. Possible values: ON, OFF. Default: OFF. This value must be ON for AAA to function.

Current AAA Users

Number of AAA users configured. This number should be zero if you have just started to create a AAA configuration.

Authentication Domain

Authentication domain configured for the authentication virtual server.

Beneath this information are listed any policies bound globally or to this authentication virtual server, and their priorities.

To verify your AAA virtual server setup by using the configuration utility

1. In the navigation pane, expand AAA - Application Traffic, and then click Virtual Servers.
2. Review the information in the AAA Virtual Servers pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

   Note: For descriptions of what the information signifies, see the list above.

Configuring Users and Groups

After configuring the AAA basic setup, you create users and groups. You first create a user account for each person who will authenticate via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the NetScaler appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create on the NetScaler. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the NetScaler appliance if, for example, you want to allow temporary users (such as visitors) to log in but do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts.

Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

To create a local AAA user account by using the command line interface

At the command prompt, type the following commands to create a local AAA user account and verify the configuration:

- add aaa user <username> [-password <password>]
- `show aaa user`

Example

```
> add aaa user user-2 -password emptybag
 Done
> show aaa user
1)      UserName: user-1
2)      UserName: user-2
 Done
```

To change the password for an existing AAA local user account by using the command line interface

At the command prompt, type the following command and, when prompted, type the new password:

set aaa user <username>

Example

```
> set aaa user user-2
Enter password:
Done
```

Parameters for Configuring AAA Local Users

username

A name for the user. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for an existing user.)

password

A password that the user uses to log in. This parameter is required for all user accounts if you are not using an external authentication server. If you are using an external authentication server, you provide a password only for local user accounts that do not exist on the authentication server.

To configure AAA local users by using the configuration utility

1. In the navigation pane, expand AAA - Application Traffic, and then click Users.
2. In the details pane, do one of the following:
   - To create a new user account, click Add.
   - To modify an existing user account, select the user account, and then click Open.
3. In the Create AAA User dialog box, in the User Name text box, type a name for the user. For rules for user names, see the list above.
4. If creating a locally authenticated user account, clear the External Authentication check box and provide a local password that the user will use to log on.
5. Click Create or OK, and then click Close. A message appears in the status bar, stating that the user has been configured successfully.

To create AAA local groups and add users to them by using the command line interface

At the command prompt, type the following commands. Type the first command one time, and type the second command once for each user:

- add aaa group <groupname>
- show aaa group

  Example

```
> add aaa group group-2
Done
> show aaa group
1)      GroupName: group-1
2)      GroupName: group-2
Done
```

- bind aaa group <groupname> -username <username>

  Example

```
> bind aaa group group-2 -username user-2
 Done
> show aaa group group-2
        GroupName: group-2

                UserName: user-2
 Done
```

To remove users from an AAA group by using the command line interface

At the command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:

unbind aaa group <groupname> -username <username>

Example

```
> unbind aaa group group-hr -username user-hr-1
 Done
```

To remove an AAA group by using the command line interface

First remove all users from the group. Then, at the command prompt, type the following command to remove an AAA group and verify the configuration:

- rm aaa group <groupname>
- show aaa group

Example

```
> rm aaa group group-hr
 Done
> show aaa group
1)      GroupName: group-1
2)      GroupName: group-finance
 Done
```

Parameters for Configuring AAA Local Groups

groupname

A name for the group you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing groups.)

username

The name of a user account to be added to the new group.

To configure AAA local groups and add users to them by using the configuration utility

1. In the navigation pane, expand AAA - Application Traffic, and then click Groups.
2. In the details pane, do one of the following:
   - To create a new group, click Add.
   - To modify an existing group, select the group, and then click Open.
3. If you are creating a new group, in the Create AAA Group dialog box, in the Group Name text box, type a name for the group. For information about group names, see the list above, under groupname.
4. On the Users tab, configure the users assigned to the group.
   a. To add a user to the group, in the Available Users list, select the user, and then click Add.
   b. To remove a user from the group, in the Configured Users list, select the user, and then click Remove.
   c. To create a new user account and add it to the group, click New, and then follow the instructions in “To configure AAA local users by using the configuration utility.”
5. Click Create or OK, and then click Close. The group that you created appears in the AAA Groups page.

Configuring AAA Policies

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail AAA will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The AAA feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler, see the *Citrix NetScaler Traffic Management Guide* at "http://support.citrix.com/article/CTX132359."

Authentication Policies

The NetScaler appliance can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

LOCAL

Authenticates to the NetScaler by using a password, without reference to an external authentication server. User data is stored locally on the NetScaler appliance.

RADIUS

Authenticate to an external Radius server.

LDAP

Authenticates to an external LDAP authentication server.

TACACS

Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

Note: When authenticating through a TACACS server, AAA-TM logs only successfully executed TACACS commands, to prevent the logs from showing TACACS commands that were entered by users who were not authorized to execute them.

CERT

Authenticates to the NetScaler appliance by using a client certificate, without reference to an external authentication server.

NEGOTIATE

Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, NetScaler uses NTLM authentication.

SAML

Authenticates to a server that supports the Security Assertion Markup Language (SAML).

An authentication policy is comprised of an expression and an action. Authentication policies use NetScaler expressions, which are described in detail in the *Citrix NetScaler Policy Configuration and Reference Guide* at "."

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies intended to handle authentication for any user accounts that do not meet the more specific criteria.

To add an authentication action by using the command line interface

If you do not use LOCAL authentication, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

add authentication tacacsAction <name> -serverip <IP> [-serverPort <port>] [-authTimeout <positive_integer>] [...]

Example

```
> add authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812
            -authtimeout 15 -tacacsSecret "minotaur" -authorization OFF -accounting ON
            -auditFailedCmds OFF -defaultAuthenticationGroup "users"
Done
```

To configure an authentication action by using the command line interface

To configure an existing authentication action, at the command prompt, type the following command:

set authentication tacacsAction <name> -serverip <IP> [-serverPort <port>] [-authTimeout <positive_integer>] [...]

Example

```
> set authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812
            -authtimeout 15 -tacacsSecret "minotaur" -authorization OFF -accounting ON
            -auditFailedCmds OFF -defaultAuthenticationGroup "users"
Done
```

To remove an authentication action by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

rm authentication radiusAction <name>

Example

```
> rm authentication tacacsaction Authn-Act-1
Done
```

Parameters for Configuring an Action

name

The name of the action. Called by the `-reqAction` option when configuring the matching policy.

-serverip <IP>

The IP the hosts the authentication server, in IPV4 or IPV6 format. The format is autodetected if configured at the command line.

-serverPort <port>

The port on which the authentication server accepts connections.

-authtimeout <timeout>

The timeout after which the authentication attempt will be deemed to have failed, and the user be notified.

In addition to the parameter listed above, each type of action has its own list of parameters that are specific to that action. For help with LDAP actions, see "LDAP Authentication Policies." For help with RADIUS actions, see "RADIUS Authentication Policies." For help with SAML actions, see "SAML Authentication Policies."

To configure an authentication server by using the configuration utility

Note: In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to AAA - Application Traffic > Policies > Authentication, and then click the type of authentication you want to configure.
2. In the details pane, on the Servers tab, do one of the following:
   - To create a new authentication server, click Add.
   - To modify an existing authentication server, select the server, and then click Open.
3. In the Create Authentication Server or Configure Authentication Server dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring an action" as follows (asterisk indicates a required parameter):
   - Name*—radiusActionName (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   - IP Address*—serverip <IP>
   - IPV6*—Select the checkbox if the server IP is an IPv6 IP. (No command line equivalent.)

- Port*—serverPort
- Time-out (seconds)*—authTimeout

4. Click Create or OK, and then click Close. The policy that you created appears in the Authentication Policies and Servers page.

To create and bind an authentication policy by using the command line interface

At the command prompt, type the following commands in the order shown to create and bind an authentication policy and verify the configuration:

- add authentication negotiatePolicy <name> <rule> <reqAction>
- show authentication localPolicy <name>
- bind authentication vserver <name> -policy <policyname> [-priority <priority>] [-secondary]]
- show authentication vserver <name>

Example

```
> add authentication localPolicy Authn-Pol-1 ns_true
 Done

> show authentication localPolicy
1)      Name: Authn-Pol-1       Rule: ns_true
       Request action: LOCAL
 Done
> bind authentication vserver Auth-Vserver-2 -policy Authn-Pol-1
 Done
> show authentication vserver Auth-Vserver-2
       Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
       State: UP
       Client Idle Timeout: 180 sec
       Down state flush: DISABLED
       Disable Primary Vserver On Down : DISABLED
       Authentication : ON
       Current AAA Users: 0
       Authentication Domain: myCompany.employee.com

1)             Primary authentication policy name: Authn-Pol-1 Priority: 0
 Done
```

To modify an existing authentication policy by using the command line interface

At the command prompt, type the following commands to modify an existing authentication policy:

set authentication localPolicy <name> <rule> [-reqaction <action>]

Example

```
> set authentication localPolicy Authn-Pol-1 'ns_true'
Done
```

To remove an authentication policy by using the command line interface

At the command prompt, type the following command to remove an authentication policy:

rm authentication localPolicy <name>

Example

```
> rm authentication localPolicy Authn-Pol-1
Done
```

Parameters for configuring authentication policies

authType

Type of authentication. Possible values: LOCAL, RADIUS, LDAP, TACACS, CERT, NEGOTIATE, SAML. Default value: LOCAL

Note: If you are creating an authentication policy for a RADIUS server, you must also create an authentication action. See To create and bind an authentication policy by using the command line interface for instructions.

name

A name for the policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

rule (expression)

An expression that defines the requests to be authenticated. For a complete description of NetScaler expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at "http://support.citrix.com/article/CTX132362."

reqAction

The action associated with your policy. Leave this blank unless you are using an external authentication server that requires an action. If you are enabling LDAP referral support, see "Authentication Policies" for instructions. If you are creating an authentication policy for a RADIUS server, see "RADIUS Authentication Policies" for instructions. If you are creating an authentication policy for a SAML server, see "SAML Authentication Policies" for instructions.

authVsName

The name of the authentication virtual server to which you are binding this policy.

priority

The priority assigned to this authentication policy.

secondary

Designate this policy as a secondary authentication policy.

To configure and bind authentication policies by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication, and then select the type of policy that you want to create.
2. In the details pane, on the Policies tab, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the action, and then click Open.
3. In the Create Authentication Policy or Configure Authentication Policy dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring authentication policies" as follows (asterisk indicates a required parameter):
   - Name*—policyname (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype
   - Server*—authVsName
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click Create or OK, and then click Close. The policy that you created appears in the Authentication Policies and Servers page.
5. Click the Servers tab, and in the details pane do one of the following:
   - To use an existing server, select it, and then click Open.
   - To create a new server, click Add, and follow the instructions in "Configuring the Authentication Virtual Server." If you are configuring a RADIUS authentication server, follow the instructions in "RADIUS Authentication Policies" If you are configuring a SAML authentication server, follow the instructions in "SAML Authentication Policies."
6. If you want to designate this policy as a secondary authentication policy, on the Authentication tab, click Secondary. If you want to designate this policy as a primary authentication policy, skip this step.
7. Click Insert Policy.
8. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
9. In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
10. Click OK. A message appears in the status bar, stating that the policy has been configured successfully.

Authorization Policies

After you create authentication policies, you next create any authorization policies you need. Authorization policies, like other policies, consist of an expression and action. There are only two actions for authorization policies: ALLOW and DENY. ALLOW permits users to access the specified resource; DENY blocks access. The default setting for authorization when no specific policy exists is to deny access to network resources. This means that a user or group can access a particular resource only if an authorization policy explicitly allows access. For optimum security, the best practice is not to change the default setting and to create specific authorization policies for users who need access to specific resources.

Authorization use both default syntax expressions and classic expressions. These expressions are described in detail in the *Citrix NetScaler Policy Configuration and Reference Guide* at "http://support.citrix.com/article/CTX132362."

After you create an authorization policy, you bind it to the appropriate user accounts or groups to put it into effect.

To create an authorization policy

At the NetScaler command prompt, type the following commands to create an authorization policy and verify the configuration:

- add authorization policy <policyname> <rule> -action <action>
- show authorization policy <name>

Example

```
> add authorization policy authz-pol-1 "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")" DENY
 Done
> show authorization policy authz-pol-1
1)      Name: authz-pol-1    Rule: HTTP.REQ.URL.SUFFIX.EQ("gif")
       Action: DENY
 Done
>
```

To modify an authorization policy

At the command prompt, type the following command to modify an authorization policy:

set authorization policy <policyname> [-rule <expression>] -action <action>

Example

```
> set authorization policy authz-pol-1 -rule "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")" -action ALLOW
 Done
> show authorization policy authz-pol-1
1)      Name: authz-pol-1    Rule: HTTP.REQ.URL.SUFFIX.EQ("gif")
       Action: ALLOW
 Done
>
```

To bind an authorization policy to a user account or group

At the command prompt, type one of the following commands to bind an authorization policy to a user account or group and verify the configuration:

- bind aaa user <userName> [-policy <policyname> [-priority <priority]] [-intranetApplication <appname>] [-urlName <urlname>] [-intranetIP <intranetip> [<netmask>]]
- show aaa user <name>
- bind aaa group <groupName> [-policy <policyname> [-priority <priority]] [-intranetApplication <appname>] [-urlName <urlname>] [-intranetIP <intranetip> [<netmask>]]
- show aaa group <name>

Example

```
> bind aaa user user-hr-1 -policy authz-pol-1
  Done
> show aaa user user-hr-1
       UserName: user-hr-1

              Policy: authz-pol-1, Priority: 0
 Done
> bind aaa group group-1 -policy authz-pol-1
 Done
> show aaa group group-1
       GroupName: group-1

              UserName: user-2
              UserName: user-1

              Policy: authz-pol-1, Priority: 0
 Done
```

To unbind an authorization policy from a user account or group

At the command prompt, type one of the following commands to unbind an authorization policy from a user account or group:

- unbind aaa user <userName> -policy <policyname>
- unbind aaa group <groupName> -policy <policyname>

Example

```
> unbind aaa user aaa-user-1 -policy auth-pol-1
Done
```

To remove an authorization policy

First unbind the policy from all user accounts and groups, and then, at the NetScaler command prompt, type the following command to remove an authorization policy:

rm authorization policy <policyname>

Parameters for configuring authorization policies

policyname

A name for the authorization policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

rule

A NetScaler default syntax or classic syntax expression that defines which requests to allow or deny. For a complete description of NetScaler default syntax and classic syntax expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at "http://support.citrix.com/article/CTX132362."

action

The action to perform when a connection matches the policy. Possible values: ALLOW, DENY. Default: ALLOW.

username or groupname

The name of the user account or the group to which you are binding the authorization policy.

priority

The priority you are assigning to the policy.

internetApplication

The name of the intranet application to which you are binding the authorization policy.

urlname

The URL of the intranet application to which you are binding the authorization policy.

intranetip

The intranet IP of the intranet application to which you are binding the authorization policy.

netmask

If the intranet application to which you are binding the authorization policy resides on an IP range, the subnet mask of that intranet range.

To configure and bind authorization policies by using the configuration utility

1. In the navigation pane, expand AAA - Application Traffic, and then click Authorization.
2. In the details pane, do one of the following:
   - To create a new authorization policy, click Add.
   - To modify an existing authorization policy, select the policy, and then click Open.
3. In the Create Authorization Policy or Configure Authorization Policy dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring authorization policies" as follows (asterisk indicates a required parameter):
   - Name*—policyname(Cannot be changed for a previously configured policy.)
   - Action*— action
   - Expression*—rule (By default, the Expression box accepts default syntax policies. To switch to the classic syntax view, click Switch to Classic Syntax.)
4. Click Create or OK, and then click Close. The policy that you created appears on the Authorization Policies page.
5. To bind an authorization policy to a user account or group, in the navigation pane, under AAA - Application Traffic, click either Users or Groups, as appropriate, and then add that policy to the user account list:
   a. In the details pane, select the appropriate user account, and then click Open.
   b. Click the Authorization tab.
   c. Click Insert Policy.
   d. Choose the policy you want to bind to the group from the drop-down list.
   e. In the Priority column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   f. Click OK.

   A message appears in the status bar, stating that the policy has been configured successfully.

Auditing Policies

After you create authentication policies, you next create any auditing policies you need. The NetScaler appliance allows auditing of all states and status information, so you can see the event history for any user in chronological order. When you configure auditing on the NetScaler appliance, you can choose to store the log files locally on the NetScaler appliance or to send them to a syslog server.

To put your auditing policies into effect, you bind them globally, to a specific authentication virtual server, or to specific user accounts or groups.

To create an auditing policy by using the command line interface

At the command prompt, type the following commands to create an auditing policy and verify the configuration:

- add audit nslogPolicy <name> [-rule <rule>] [-action <action>]
- show audit nslogPolicy

Example

```
> add audit nslogPolicy audit-1 ns_true audit_server
 Done
> show audit nslogPolicy
1)      Name: audit-pol Rule: ns_true
       Action: audit_server
2)      Name: audit-1   Rule: ns_true
       Action: audit_server
 Done
```

To modify an auditing policy by using the command line interface

At the command prompt, type the following commands to modify an auditing policy and verify the configuration:

- set audit nslogPolicy <name> [-rule <expression>] [-action <string>]
- show audit nslogPolicy

Example

```
> set audit nslogPolicy audit-1 ns_true audit_server
 Done
> show audit nslogPolicy
1)      Name: audit-pol Rule: ns_true
       Action: audit_server
2)      Name: audit-1    Rule: ns_true
       Action: audit_server
 Done
```

To globally bind an auditing policy by using the command line interface

At the command prompt, type the following commands to globally bind an auditing policy:

bind tm global [-policyName <string> [-priority <positive_integer>]]

Example

```
> bind tm global -policyName Audit-Pol-1 -priority 1000
Done
```

To bind an auditing policy to an authentication virtual server by using the command line interface

At the command prompt, type the following commands to bind an auditing policy to an authentication virtual server and verify the configuration:

- bind authentication vserver <name> [-policy <string> [-priority <positive_integer>] [-secondary] [-groupExtraction]]
- show authentication vserver [<name>]

Example

```
> bind authentication Vserver Auth-Vserver-2 -policy Authn-Pol-1
 Done
> show authentication Vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
      Authentication Domain: myCompany.employee.com
```

1) Primary authentication policy name: Authn-Pol-1 Priority: 0
Done

To bind an auditing policy to a user account or a group by using the command line interface

At the command prompt, type one of the following commands to bind an auditing policy to a user account or a group:

- bind audit <logtype> user <userName> -policy <policyname> [-priority <priority]
- bind audit <logtype> user <userName> -policy <policyname> [-priority <priority]

Example

> bind audit nslogPolicy user aaa-user-1 -policyName Audit-Pol-1 -priority 1000
Done

To unbind a globally bound auditing policy by using the command line interface

At the command prompt, type the following commands to unbind a globally-bound auditing policy:

unbind audit <logtype> global -policy <policyname>

Example

> unbind audit nslogPolicy global -policy Audit-Pol-1
Done

To unbind an auditing policy from an authentication virtual server by using the command line interface

At the command prompt, type the following commands to unbind an auditing policy from an authentication virtual server:

unbind authentication vserver <name> [-policy <string> [-secondary][-groupExtraction]]

Example

```
> unbind authentication vserver auth-vserver-1 -policyName Audit-Pol-1
Done
```

To unbind an auditing policy from a user account or a group by using the command line interface

At the command prompt, type one of the following commands to unbind an auditing policy from a user account or a group:

- unbind audit <logtype> user <userName> -policy <policyname>
- unbind audit <logtype> group <groupName> -policy <policyname>

Example

```
> unbind audit nslogPolicy group aaa-group-1 -policyName Audit-Pol-1
Done
```

To remove an auditing policy by using the command line interface

First unbind the policy from all users and groups, and then, at the command prompt, type the following command to remove an auditing policy:

rm audit <logtype> <policyname>

Parameters for configuring auditing policies

logtype

Which type of log your policy uses. If your policy logs to nslog, type nslogPolicy. If your policy logs to an external syslog server, type syslogPolicy.

policyname

A name for the policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

rule

A NetScaler classic expression that defines which requests to audit. If you do not specify a rule, audit policies default to ns_true, which logs all connections. For a complete description of NetScaler classic expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at "http://support.citrix.com/article/CTX132362."

action

The action associated with this policy. For auditing policies, the action is the name of the nslog or syslog server to which you want to direct connections that match the audit log policy. If you do not specify a server, the default nslog server or syslog server is used.

authvsname

The name of the authentication virtual server to which you are binding the policy.

username

The name of the user account to which you are binding the policy.

groupname

The name of the group to which you are binding the policy.

priority

The priority assigned to this auditing policy.

To configure and bind auditing policies by using the configuration utility

1. In the navigation pane, expand AAA - Application Traffic, expand Policies, and then click Auditing.
2. In the details pane, do one of the following:
   - To create a new auditing policy, click Add.
   - To modify an existing auditing policy, select the policy, and then click Open.
3. In the Create Auditing Policy or Configure Auditing Policy dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring auditing policies" as follows (asterisk indicates a required parameter):
   - Name*—policyname (Cannot be changed for a previously configured policy.)
   - Auditing type*—logtype (When creating auditing policies by using the configuration utility, you cannot specify a rule.)
   - Server*—action
4. Click Create, and then click Close. The policy that you created appears in the Auditing Policies and Servers page.
5. Click OK.
6. To globally bind an auditing policy, in the details pane, click Global Bindings and fill in the Bind/Unbind Audit Policies to Global dialog box.
   a. Select the name of the audit policy you want to globally bind.
   b. Click OK.

   A message appears in the status bar, stating that the policy has been configured successfully.
7. To bind an auditing policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the authentication policies list.
   a. In the details pane, select the appropriate virtual server, and then click Open.
   b. Click the Policies tab.
   c. Click Insert Policy.
   d. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
   e. In the Priority column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   f. Click OK.
8. To bind an auditing policy to a user account or group, in the navigation pane, click Users or Groups, and add that policy to the user account list.

a. In the details pane, select the appropriate user account, and then click Open.

b. Click the Policies tab.

c. Click Insert Policy.

d. Choose the policy you want to bind to the group from the drop-down list.

e. In the Priority column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.

f. Click OK.

A message appears in the status bar, stating that the policy has been configured successfully.

Session Settings

After you configure your authentication, authorization, and auditing profiles, you configure session settings to customize your user sessions. The session settings are:

The session timeout.

Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

The default authorization setting.

Determines whether the NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

The single sign-on setting.

Determines whether the NetScaler appliance will log users onto all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

The credential index setting.

Determines whether the NetScaler appliance will use primary or the secondary authentication credentials for single signon.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.

Session Profiles

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

Note: The terms “session profile” and “session action” mean the same thing.

To create a session profile by using the command line interface

At the command prompt, type the following commands to create a session profile and verify the configuration:

- add tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]
- show tm sessionAction <name>

Example

```
> add tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
 Done
> show tm sessionAction session-profile
1)      Name: session-profile
       Authorization action : ALLOW
       Session timeout: 30 minutes
 Done
```

To modify a session profile by using the command line interface

At the command prompt, type the following commands to modify a session profile and verify the configuration:

- set tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]
- show tm sessionAction

Example

```
> set tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
 Done
> show tm sessionAction session-profile
1)      Name: session-profile
       Authorization action : ALLOW
       Session timeout: 30 minutes
 Done
```

To remove a session profile by using the command line interface

At the command prompt, type the following command to remove a session profile:

rm tm sessionAction <name>

Parameters for configuring session profiles

actionname

A name for the session action, or the name of the existing session action you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing session actions.)

sesstimeout

The session timeout in minutes. Possible values: 1-65536. Default: 30.

defaultAuthorizationAction

Whether to allow or deny access to resources by default when no specific policy overrides this setting. Possible values: ALLOW, DENY. Default: DENY

sso

Whether to use single sign-on or not for all web applications. Possible values: YES, NO. Default: NO.

ssocredential

Whether to use the primary or secondary authentication server for single sign-on credentials. Possible values: PRIMARY, SECONDARY. Default: PRIMARY.

ssoDomain

The domain for single sign-on, as a string.

httpOnlyCookie

Whether to set the HTTPOnly flag on the sso cookie. Possible values: YES, NO. Default: NO.

persistentCookie

Whether to use a persistent sso cookie. Possible values: ENABLED, DISABLED. Default: DISABLED.

persistentCookieValidity

The number of minutes, as an integer, that the persistent cookie remains valid.

To configure session profiles by using the configuration utility

1. In the navigation pane, expand AAA - Application Traffic, and then click Session.
2. In the details pane, click the Profiles tab.
3. On the Profiles tab, do one of the following:
   - To create a new session profile, click Add.
   - To modify an existing session profile, select the profile, and then click Open.
4. In the Create TM Session Profile dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring session profiles" as follows (asterisk indicates a required parameter):
   - Name*—actionname (Cannot be changed for a previously configured session action.)
   - Session Time-out—sesstimeout
   - Default Authorization Action—defaultAuthorizationAction
   - Single Signon to Web Applications—sso
   - Credential Index—ssocredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity—persistentCookieValidity
5. Click Create or OK, and then click Close. The session profile that you created appears in the Session Policies and Profiles pane.

Session Policies

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

To create a session policy by using the command line interface

At the command prompt, type the following commands to create a session policy and verify the configuration:

- add tm sessionPolicy <policyname> <rule> <actionname>
- show tm sessionPolicy <name>

Example

```
> add tm sessionPolicy session-pol "URL == /*.gif" session-profile
 Done
> show tm sessionPolicy session-pol
1)      Name: session-pol       Rule: URL == '/*.gif'
       Action: session-profile
 Done
```

To modify a session policy by using the command line interface

At the command prompt, type the following commands to modify a session policy and verify the configuration:

- set tm sessionPolicy <policyname> [-rule <expression>] [-action <action>]
- show tm sessionPolicy <name>

Example

```
> set tm sessionPolicy session-pol "URL == /*.gif" session-profile
 Done
> show tm sessionPolicy session-pol
1)      Name: session-pol       Rule: URL == '/*.gif'
       Action: session-profile
 Done
```

To globally bind a session policy by using the command line interface

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:

bind tm global -policyName <policyname> [-priority <priority>]

Example

```
> bind tm global -policyName session-pol
 Done

> show tm sessionPolicy session-pol
1)      Name: session-pol       Rule: URL == '/*.gif'
       Action: session-profile
       Policy is bound to following entities
       1) TM GLOBAL    PRIORITY : 0
 Done
```

To bind a session policy to an authentication virtual server by using the command line interface

At the command prompt, type the following command to bind a session policy to an authentication virtual and verify the configuration:

bind authentication vserver <authvsname> -policy <policyname> [-priority <priority>]

Example

```
> bind authentication vserver auth-vserver-1 -policyName Session-Pol-1 -priority 1000
Done
```

To unbind a session policy from an authentication virtual server by using the command line interface

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:

unbind authentication vserver <authvsname> -policy <policyname>

Example

```
> unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1
Done
```

To unbind a globally bound session policy by using the command line interface

At the command prompt, type the following commands to unbind a globally-bound session policy:

unbind tm global -policyName <policyname>

Example

```
> unbind tm global -policyName Session-Pol-1
Done
```

To remove a session policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:

rm tm sessionPolicy <policyname>

Example

```
> rm tm sessionPolicy Session-Pol-1
Done
```

Parameters for configuring session policies

policyname

A name for the session policy, or the name of the existing session policy you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing session policies.)

rule

A NetScaler classic expression that defines the requests to select. If you do not specify a rule, session profiles default to ns_true, which selects all connections. For a complete description of NetScaler classic expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at "http://support.citrix.com/article/CTX132362."

actionname

The name of the session profile to apply to connections that match this policy.

priority

The priority assigned to this session policy.

authvsname

The name of the authentication virtual server to which you are binding this session policy.

To configure and bind session policies by using the configuration utility

1. In the navigation pane, expand AAA - Application Traffic, and then click Session.
2. In the details pane, on the Policies tab, do one of the following:
   - To create a new session policy, click Add.
   - To modify an existing session policy, select the policy, and then click Open.
3. In the Create Session Policy or Configure Session Policy dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring session policies" as follows (asterisk indicates a required parameter):
   - Name*—policyname (Cannot be changed for a previously configured session policy.)
   - Request Profile*—actionname
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click Create or OK, and then click Close. The policy that you created appears in the details pane of the Session Policies and Profiles page.
5. To globally bind an auditing policy, in the details pane, click Global Bindings and fill in the Bind/Unbind Session Policies to Global dialog box.
   a. Select the name of the session policy you want to globally bind.
   b. Click OK.
6. To bind a session policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the policies list.
   a. In the details pane, select the appropriate virtual server, and then click Open.
   b. Click the Policies tab.
   c. Click Insert Policy.
   d. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
   e. In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   f. Click OK.

A message appears in the status bar, stating that the policy has been configured successfully.

Global Session Settings

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

To configure the session settings by using the command line interface

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

set tm sessionParameter [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]

Example

```
> set tm sessionParameter -sessTimeout 30
  Done
> set tm sessionParameter -defaultAuthorizationAction DENY
  Done
> set tm sessionParameter -SSO ON
  Done
> set tm sessionParameter -ssoCredential PRIMARY
  Done
```

Parameters for configuring global session settings

sessTimeout

The timeout for user sessions, as an integer value representing a number of minutes.

defaultAuthorizationAction

The default authorization action for a user request, when no specific policy is available. Possible values: ALLOW, DENY. Default: DENY.

sso

Whether to allow a user to authenticate once and then have access to all web applications on your intranet, or to require authentication for each application. Possible values: ON, OFF. Default: OFF.

ssoCredential

If single signon is enabled, which group of credentials to use for authentication. Possible values: Primary, Secondary. Default: Primary.

ssoDomain

The domain for single sign-on, as a string.

httpOnlyCookie

Whether to set the HTTPOnly flag on the sso cookie. Possible values: YES, NO. Default: NO.

persistentCookie

Whether to use a persistent sso cookie. Possible values: ENABLED, DISABLED. Default: DISABLED.

persistentCookieValidity

The number of minutes, as an integer, that the persistent cookie remains valid.

To configure the session settings by using the configuration utility

1. Navigate to Security > AAA - Application Traffic
2. In the details pane, under Settings, click Change global settings.
3. In the Global Session Settings dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring global session settings" as follows
   - Session Time-out—sessTimeout
   - Default Authorization Action—defaultAuthorizationAction
   - Single Sign-on to Web Applications—sso
   - Credential Index—ssoCredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity—persistentCookieValidity
4. Click OK, and then click Close. A message appears in the status bar, stating that the settings have been configured successfully.

Traffic Settings

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put you company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one NetScaler appliance or virtual appliance instance to authenticate to another NetScaler appliance on behalf of users who have authenticated with the first appliance.

To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

Traffic Profiles

After creating at least one forms or SAML sso profile, you must next create a traffic profile.

Note: In this feature, the terms “profile” and “action” mean the same thing.

To create a traffic profile by using the command line interface

At the command prompt, type:

add tm trafficAction <name> [-appTimeout <mins>] [-SSO (ON | OFF) [-formSSOAction <string>]] [-persistentCookie (ENABLED | DISABLED)] [-InitiateLogout (ON | OFF)]

Example

add tm trafficAction Traffic-Prof-1 –appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1

To modify a session profile by using the command line interface

At the command prompt, type:

set tm trafficAction <name> [-appTimeout <mins>] [-SSO (ON | OFF) [-formSSOAction <string>]] [-persistentCookie (ENABLED | DISABLED)] [-InitiateLogout (ON | OFF)]

Example

set tm trafficAction Traffic-Prof-1 –appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1

To remove a session profile by using the command line interface

At the command prompt, type:

rm tm trafficAction <name>

Example

rm tm trafficAction Traffic-Prof-1

Parameters for configuring traffic profiles

name

A name for the traffic action, or the name of the existing traffic action you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing SSO actions.)

appTimeout

The application timeout in minutes. Possible values: 1-65536. Default: 30.

SSO

Whether to enable or disable SSO. Possible values: ON, OFF. Default: OFF.

formSSOAction

The name of the form SSO profile to use. (Use this only if you are configuring a traffic profile for forms SSO.)

samlSSOAction

The name of the SAML SSO profile to use. (Use this only if you are configuring a traffic profile for SAML SSO.)

persistentCookie

Whether to use a persistent SSO cookie. Possible values: ENABLED, DISABLED. Default: DISABLED.

InitiateLogout

Whether to initiate logout of the traffic management session. Possible values: ON, OFF. Default: OFF.

To configure traffic profiles by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Traffic.
2. In the details pane, click the Profiles tab.
3. On the Profiles tab, do one of the following:
   - To create a new traffic profile, click Add.
   - To modify an existing traffic profile, select the profile, and then click Open.
4. In the Create Traffic Profile or Configure Traffic Profile dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring form traffic profiles” as follows (an asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously configured session action.)
   - AppTimeout—appTimeout
   - Single Sign-On—SSO
   - Form SSO Action—formSSOAction
   - SAML SSO Action—samlSSOAction
   - Enable Persistent Cookie—persistentCookie
   - Initiate Logout—InitiateLogout
5. Click Create or OK, and then click Close. The traffic profile that you created appears in the Traffic Policies, Profiles, and either the Form SSO Profiles or SAML SSO Profiles pane, as appropriate.

Traffic Policies

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to an authentication virtual server, to put them into effect.

To create a traffic policy by using the command line interface

At the command prompt, type:

add tm trafficPolicy <name> <rule> <action>

Example

add tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1

To modify a traffic policy by using the command line interface

At the command prompt, type:

set tm trafficPolicy <name> <rule> <action>

Example

set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1

To globally bind a traffic policy by using the command line interface

At the command prompt, type:

bind tm global -policyName <string> [-priority <priority>]

Example

bind tm global -policyName Traffic-Pol-1

To bind a traffic policy to an authentication virtual server by using the command line interface

At the command prompt, type:

bind authentication vserver <name> -policy <policyName> [-priority <priority>]

Example

bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -priority 1000

To unbind a globally bound traffic policy by using the command line interface

At the command prompt, type:

unbind tm global -policyName <policyname>

Example

unbind tm global -policyName Traffic-Pol-1

To unbind a traffic policy from an authentication virtual server by using the command line interface

At the command prompt, type:

unbind authentication vserver <name> -policy <policyname>

Example

unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1

To remove a traffic policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type:

rm tm trafficPolicy <name>

Example

rm tm trafficPolicy Traffic-Pol-1

Parameters for configuring form traffic profiles

policyName

A name for the traffic policy, or the name of the existing traffic policy you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing SSO actions.)

rule

A NetScaler advanced expression that defines the requests to select. For a complete description of NetScaler advanced expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX132362.

actionname

The name of the traffic profile to apply to connections that match this policy.

priority

The priority assigned to this traffic policy.

authvsname

The name of the authentication virtual server to which you are binding this traffic policy.

To configure and bind traffic policies by using the configuration utility

1. In the navigation pane, expand AAA - Application Traffic, then expand Policies, and then click Traffic.

2. In the details pane, do one of the following:

   - To create a new session policy, click Add.

   - To modify an existing session policy, select the policy, and then click Open.

3. In the Create Traffic Policy or Configure Traffic Policy dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring form traffic profiles” as follows (an asterisk indicates a required parameter):

   - Name*—policyName (Cannot be changed for a previously configured session policy.)

   - Profile*—actionName

   - Expression—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)

4. Click Create or OK, and then click Close. The policy that you created appears in the details pane of the Session Policies and Profiles page.

5. To globally bind a traffic policy, in the details pane, click Global Bindings and fill in the Bind/Unbind Session Policies to Global dialog box.

   a. Select the name of the traffic policy you want to globally bind.

   b. Click OK.

6. To bind a traffic policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the policies list.

   a. In the details pane, select the appropriate virtual server, and then click Open.

   b. Click the Policies tab

   c. Click Insert Policy.

   d. Choose the policy you want to bind to the authentication virtual server from the drop-down list.

   e. In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.

   f. Click OK.

Form SSO Profiles

To enable and configure forms-based SSO, you first create an SSO profile.

Note: In this feature, the terms “profile” and “action” mean the same thing.

To create a form SSO profile by using the command line interface

At the command prompt, type:

add tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>] [-nvtype (STATIC | DYNAMIC)] [-submitMethod (GET | POST)

Example

add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
-userField "loginID" -passwdField "passwd"
-nameValuePair "loginID passwd" -responsesize "9096"
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
-nvtype STATIC -submitMethod GET
–sessTimeout 10 -defaultAuthorizationAction ALLOW

To modify a form SSO by using the command line interface

At the command prompt, type:

set tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>] [-nvtype (STATIC | DYNAMIC)] [-submitMethod (GET | POST)

Example

set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
-userField "loginID" -passwdField "passwd"
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
-nameValuePair "loginID passwd" -responsesize "9096"
-nvtype STATIC -submitMethod GET
–sessTimeout 10 -defaultAuthorizationAction ALLOW

To remove a form SSO profile by using the command line interface

At the command prompt, type:

rm tm formSSOAction <name>

Example

rm tm sessionAction SSO-Prof-1

Parameters for configuring form SSO profiles

name

A name for the SSO action, or the name of the existing SSO action you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing SSO actions.)

actionURL

The URL where the SSO logon form is located.

userField

The form field where the user types in the user ID or login.

passwdField

The form field where the user types in the password.

ssoSuccessRule

An expression that describes the action that this profile should take when invoked by a policy.

responsesize

The number of bytes to allow for the complete response size. Responses that exceed this value are blocked.

nameValuePair

The userField value, followed by a space, followed by the passwdField value. When typing this at the NetScaler command line, you should enclose the nameValuePair in straight double quotes.

nvtype

Whether the name/value pair is static or dynamic. Possible values: STATIC, DYNAMIC. Default: STATIC.

submitMethod

HTTP method used by the SSO logon form to send the logon credentials to the logon server. Possible values: GET, POST. Default: POST.

To configure form SSO profiles by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Policies > Traffic.
2. In the details pane, click the Form SSO Profiles tab.
3. On the Form SSO Profiles tab, do one of the following:
   - To create a new form SSO profile, click Add.
   - To modify an existing form SSO profile, select the profile, and then click Open.
4. In the Create Form SSO Profile dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring form SSO profiles” as follows (an asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously configured session action.)
   - Action URL*—actionURL
   - User Name Field*—userField
   - Password Field*—passField
   - SSO Success Rule*—ssoSuccessRule
   - Name Value Pair—nameValuePair
   - Response Size—responsesize
   - Extraction—nvtype
   - Submit Method—submitMethod
5. Click Create or OK, and then click Close. The form SSO profile that you created appears in the Traffic Policies, Profiles, and Form SSO Profiles pane.

Authenticating with Client Certificates

Web sites that contain sensitive content, such as online banking web sites or Web sites with employee personal information, sometimes require client certificates for authentication. To configure AAA to authenticate users on the basis of client-side certificate attributes, you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the NetScaler appliance must do to authenticate users on the basis of a client certificate. In either case, your authentication server must support CRLs. You configure the NetScaler appliance to extract the user name from the SubjectCN field or another specified field in the client certificate.

When the user tries to log in to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the NetScaler appliance presents a login page to the user.

The following procedures assume that you have already created a functioning AAA configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the NetScaler appliance in the /nsconfig/ssl directory.

To configure the AAA client certificate parameters by using the command line interface

At the command prompt, type the following commands in the order shown and verify the configuration:

- add ssl certKey <certkeyName> -cert <certFile> -key <keyFile> -password -inform <inform> -expiryMonitor <expiryMonitor> -notificationPeriod <notificationPeriod>
- bind ssl certKey <certkeyName> -vServer <certkeyName> -CA -crlCheck Mandatory
- set aaa parameter -defaultAuthType CERT
- set aaa certParams -userNameField "Subject:CN"

Parameters for authentication with client certificates

certkeyName

The name of the certificate-key pair.

certFile

The name of the file containing the certificate.

keyFile
