NetScaler 11.1

Contents

NetScaler Release Notes **3**

Getting started with Citrix ADC **4**

Where does a NetScaler appliance fit in the network? **7**

How a NetScaler appliance communicates with clients and servers **10**

Introduction to the NetScaler product line **17**

Install the hardware **18**

Access a NetScaler appliance **19**

Configure the ADC for the first time **23**

Secure your NetScaler deployment **24**

Configure high availability **24**

Change an RPC node password **29**

Configure a FIPS appliance for the first time **30**

Common network topologies **33**

System management settings **38**

System settings **38**

Packet forwarding modes **40**

Network interfaces **47**

Clock synchronization **48**

DNS configuration **49**

SNMP configuration **51**

Verify configuration **55**

Load balance traffic on a NetScaler appliance **58**

Load balancing **59**

Persistence settings **63**

Configure features to protect the load balancing configuration **69**

A typical load balancing scenario **72**

Accelerate load balanced traffic by using compression **76**

Secure load balanced traffic by using SSL **83**

Features at a glance **101**

Application switching and traffic management features **101**

Application acceleration features **106**

Application security and firewall features **107**

Application visibility feature **109**

Solutions for Telecom Service Providers **111**

Large Scale NAT **112**

Points to Consider before Configuring LSN **117**

Configuration Steps for LSN **119**

Sample LSN Configurations **137**

Configuring Static LSN Maps **147**

Configuring Application Layer Gateways **150**

Application Layer Gateway for FTP, ICMP, and TFTP Protocols **151**

Application Layer Gateway for PPTP Protocol **153**

Application Layer Gateway for SIP Protocol **155**

Application Layer Gateway for RTSP Protocol **169**

Logging and Monitoring LSN **174**

STUN Timeout **199**

TCP SYN Idle Timeout **201**

Overriding LSN configuration with Load Balancing Configuration **202**

Clearing LSN Sessions **204**

Load Balancing SYSLOG Servers **206**

Port Control Protocol **208**

Dual-Stack Lite **211**

Points to Consider before Configuring DS-Lite **215**

Configuring DS-Lite **216**

Configuring DS-Lite Static Maps **226**

Configuring Deterministic NAT Allocation for DS-Lite **228**

Configuring Application Layer Gateways for DS-Lite **230**

Application Layer Gateway for FTP, ICMP, and TFTP Protocols **231**

Application Layer Gateway for SIP Protocol **231**

Application Layer Gateway for RTSP Protocol **234**

Logging and Monitoring DS-Lite **236**

Port Control Protocol for DS-Lite **245**

Large Scale NAT64 **247**

Points to Consider for Configuring Large Scale NAT64 **252**

Configuring DNS64 **253**

Configuring Large Scaler NAT64 **255**

Configuring Application Layer Gateways for Large Scale NAT64 **261**

Application Layer Gateway for FTP, ICMP, and TFTP Protocols **261**

Application Layer Gateway for SIP Protocol **261**

Application Layer Gateway for RTSP Protocol **264**

Configuring Static Large Scale NAT64 Maps **266**

Logging and Monitoring Large Scale NAT64 268

Port Control Protocol for Large Scale NAT64 280

Telco subscriber management 282

Subscriber aware traffic steering 299

Subscriber aware service chaining 304

Policy based TCP profile selection 311

Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols 313

Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers 314

Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider 315

Bandwidth Utilization Using Cache Redirection Functionality 315

NetScaler TCP Optimization 316

Getting Started 316

Management Network 319

Licensing 319

High Availability 320

Gi-LAN Integration 321

TCP optimization configuration 327

Analytics and Reporting 333

Real-time Statistics 333

SNMP 335

Technical Recipes 338

Scalability 341

Optimizing TCP Performance using TCP Nile 347

Troubleshooting Guidelines **357**

Frequently Asked Questions **359**

NetScaler Solutions **363**

Setting up NetScaler for Citrix Virtual Apps and Desktops **363**

Global Server Load Balancing (GSLB) Powered Zone Preference **365**

NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI **366**

Creating a NetScaler Load Balancer in a Plan in the Service Management Portal (Admin Portal) **368**

Configuring a NetScaler Load Balancer by Using the Service Management Portal (Tenant Portal) **370**

Deleting a NetScaler Load Balancer from the Network **376**

Deploying Citrix NetScaler VPX **378**

Support matrix and usage guidelines **378**

Install a NetScaler VPX instance on XenServer **383**

Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces **386**

Install a NetScaler VPX instance on VMware ESX **388**

Configure a NetScaler VPX instance to use VMXNET3 network interface **393**

Configure a NetScaler VPX instance to use SR-IOV network interface **405**

Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces **423**

Configure a NetScaler VPX instance to use PCI passthrough network interface **424**

Install a NetScaler VPX instance on Microsoft Hyper-V server **427**

Install a NetScaler VPX instance on Linux-KVM platform **432**

Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform **433**

Provision the NetScaler VPX instance by using OpenStack **438**

Provisioning the NetScaler Virtual Appliance by using the Virtual Machine Manager **447**

Configure a NetScaler VPX instance to use SR-IOV network interfaces **455**

Configure a NetScaler VPX instance to use PCI passthrough network interfaces **465**

Provision the NetScaler VPX instance by using the virsh program **469**

Manage the NetScaler VPX guest VMs **473**

Deploy a NetScaler VPX instance on AWS **476**

Limitations and usage guidelines **480**

Deploy a NetScaler VPX standalone instance on AWS **482**

Download a NetScaler VPX license **487**

Load balancing servers in different availability zones **487**

Deploy a high availability pair on AWS **488**

Upgrade a NetScaler VPX instance on AWS **495**

Troubleshoot a VPX instance on AWS **500**

Deploying Citrix NetScaler VPX on Microsoft Azure **500**

Configure a NetScaler VPX standalone instance **509**

Configure multiple IP addresses for a NetScaler VPX standalone instance **521**

Configure GSLB on NetScaler VPX instances **528**

Configure address pools (IIP) for a Citrix Gateway appliance **536**

Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands **538**

PowerShell scripts for Azure deployment **546**

Azure terminology **560**

Deploy a NetScaler VPX instance on Oracle Public Cloud **563**

Prerequisites **565**

Configure a NetScaler VPX standalone instance on Oracle Public Cloud **566**

Scenario **570**

Deploy a NetScaler VPX Instance on Cisco CSP 2100 **578**

Jumbo frames on NetScaler VPX instances **580**

Hardware Installation **582**

Licensing **582**

NetScaler licensing overview **583**

NetScaler Pooled Capacity **590**

Upgrade and downgrade a NetScaler appliance **591**

Before you begin **591**

Upgrade considerations - SNMP configuration **592**

Upgrade a Citrix NetScaler standalone appliance **594**

Downgrade a Citrix NetScaler standalone appliance **600**

Upgrade a high availability pair **604**

Downgrade a high availability pair **610**

Troubleshooting **610**

FAQs **615**

New and Deprecated Commands, Parameters, and SNMP OIDs **615**

Deprecated features and functionalities **632**

AAA application traffic **634**

How AAA works **634**

Enabling AAA **637**

Setting up an authentication virtual server **638**

Configuring the authentication virtual server **640**

Configuring a traffic management virtual server **643**

Configuring DNS **645**

Verifying your setup for AAA **645**

Creating an authentication profile **646**

Configuring users and groups **647**

Configuring AAA policies **650**

Authentication policies **651**

LDAP authentication policies **656**

Negotiate authentication policies **658**

RADIUS authentication policies **659**

SAML authentication policies **663**

Web authentication policies **663**

Configuring advanced authentication policies **665**

Authorizing user access to application resources **666**

Auditing authenticated sessions **667**

Session settings **669**

Session profiles **670**

Session policies **672**

Global session settings **676**

Traffic Settings **677**

Traffic profiles **677**

Traffic policies **679**

Form SSO profiles **681**

SAML SSO profiles **683**

Session timeout for OWA 2010 **685**

Authenticating with client certificates **686**

Client certificate pass-through **688**

Configuring AAA with commonly used protocols **690**

Handling authentication, authorization and auditing with Kerberos/NTLM **690**

How NetScaler appliance implements Kerberos for client authentication **692**

Configuring kerberos authentication on the NetScaler appliance **695**

Configuring kerberos authentication on a client **698**

Offloading Kerberos authentication from physical servers **699**

NetScaler appliance kerberos single sign-on **703**

An overview of NetScaler appliance kerberos SSO **703**

Setting up NetScaler appliance SSO **706**

Prerequisites **706**

Configuring SSO **711**

Enabling integrated authentication on the web application server **711**

Setting up SSO by impersonation **712**

Configuring SSO by Delegation **713**

Generating the KCD keytab script **719**

SAML authentication **720**

NetScaler appliance as a SAML SP **722**

NetScaler appliance as a SAML IdP **725**

Configuring SAML single sign-on **728**

OAuth authentication **729**

Multi-Factor (nFactor) authentication **731**

How to configure nFactor authentication **732**

How nFactor authentication works **733**

Configuring nFactor authentication **734**

Configuration support for SameSite cookie attribute **736**

Admin Partitioning **739**

Supported NetScaler configurations **746**

Configure admin partitions **751**

VLAN configuration for admin partitions **760**

SNMP support for admin partitions **768**

AppExpert **770**

Action analytics **771**

Configure a selector **772**

Configure a stream identifier **774**

View statistics **776**

Grouping records on attribute values **779**

Clearing a stream session **782**

Configure policy for optimizing traffic **783**

How to limit bandwidth consumption for user or client device **784**

AppExpert applications and templates **787**

How AppExpert Application Works **789**

Get started with AppExpert **790**

Downloading an application template **791**

Importing an Application Template **791**

Verifying and Testing Application Configuration **792**

Customizing the configuration **794**

Configure public endpoints **794**

Configure services and service groups for an application unit **795**

Create application units **796**

Configuring application unit rules **796**

Configuring policies for application units **797**

Configuring Application Units **802**

Configuring public endpoints for an application **803**

Specifying the Order of Evaluation of Application Units **804**

Configuring Persistency Groups for Application Units **805**

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer **806**

Configuring User Authentication, Authorization, and Auditing **806**

Monitoring a NetScaler Application **807**

Deleting an Application **808**

Configure application authentication, authorization, and auditing **808**

Setting Up a Custom NetScaler Application **811**

Creating and managing template files **815**

Exporting an appExpert application to a template file **815**

Exporting a Content Switching Virtual Server Configuration to a Template File **816**

Creating Variables in Application Templates **818**

Uploading and downloading template files **819**

Understanding NetScaler application templates and deployment files **820**

Deleting a Template File **825**

NetScaler Gateway Applications **825**

Adding Intranet Subnets **827**

Adding Other Resources 828

Configuring Authorization Policies 828

Configuring Traffic Policies 829

Configuring Clientless Access Policies 830

Configuring TCP Compression Policies 831

Configure bookmarks 832

Customizing the configuration 832

Configure public endpoints 833

Configuring Endpoints for an Application Unit 833

Configure services and service groups for an application unit 834

Configuring services, service groups, and load balancing Parameters for an application unit 835

Create application units 836

Configuring application unit rules 836

Configuring policies for application units 837

Create application units 842

Configuring public endpoints for an application 843

Specifying the Order of Evaluation of Application Units 843

Configuring Persistency Groups for Application Units 844

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer 845

AppQoE 845

Enabling AppQoE 847

AppQOE actions 847

AppQoE parameters 852

AppQoE Policies 853

Entity templates **855**

Configuring an entity template **856**

Configuring variables in load balancing virtual server templates **857**

Modifying an entity template **859**

Deleting an entity template **860**

Creating an entity from a template **860**

Managing entity template folders **862**

Uploading and downloading entity templates **862**

Understanding load balancing entity templates and deployment files **863**

HTTP callouts **866**

How an HTTP callout works **867**

Notes on the format of HTTP requests and responses **868**

Configuring an HTTP callout **870**

Verifying the Configuration **873**

Invoking an HTTP Callout **874**

Avoiding HTTP callout recursion **876**

Caching HTTP Callout Responses **878**

Use Case: Filtering Clients by Using an IP Blacklist **879**

Use Case: ESI Support for Fetching and Updating Content Dynamically **881**

Use Case: Access control and authentication **884**

Use Case: OWA-Based Spam Filtering **886**

Use Case: Dynamic Content Switching **890**

Pattern sets and data sets **891**

How string matching works with pattern sets and data sets **892**

Configuring a Pattern Set **893**

Configuring a data set **895**

Using pattern sets and data sets **896**

Sample usage **896**

Variables **899**

Configuring and using Variables **900**

Use Case: Caching User Privileges **903**

Use Case: Limiting the Number of Sessions **904**

Policies and expressions **906**

Introduction to policies and expressions **911**

Classic and advanced policies **911**

Classic and advanced policy expressions **920**

Converting policy expressions using NSPEPI tool **922**

Before you proceed **926**

Configure advanced policy infrastructure **926**

Rules for names in identifiers used in policies **927**

Create or modify a policy **928**

Policy configuration examples **930**

Bind policies using advanced policy **931**

Bind a policy globally **939**

Bind a policy to a virtual server **943**

Display policy bindings **945**

Unbind a policy **946**

Create policy labels **949**

Configure a policy label or virtual server policy bank 953

Invoke or remove a policy label or virtual server policy bank 960

Configure and bind policies with the policy manager 965

Configuring advanced policy expression: getting started 968

Basic elements of an advanced policy expression 968

Compound advanced policy expressions 973

Specify the character set in expressions 986

Classic expressions in advanced policy expressions 989

Configure advanced policy expressions in a policy 990

Configure named advanced policy expressions 994

Configure advanced policy expressions outside the context of a policy 996

Advanced policy expressions: evaluating text 997

About text expressions 998

Expression prefixes for text in HTTP requests and responses 1000

Expression prefixes for VPNs and clientless VPNs 1001

Basic operations on text 1010

Complex operations on text 1015

Advanced policy expressions: working with dates, times, and numbers 1029

Format of dates and times in an expression 1029

Expressions for the NetScaler system time 1030

Expressions for SSL certificate dates 1034

Expressions for HTTP request and response dates 1042

Generate the day of the week, as a string, in short and long formats 1043

Expression prefixes for numeric data other than date and time 1044

Converting numbers to text **1045**

Virtual server based expressions **1046**

Advanced policy expressions: Parsing HTTP, TCP, and UDP data **1048**

About evaluating HTTP and TCP payload **1048**

Expressions for identifying the protocol in an incoming IP packet **1049**

Expressions for HTTP and cache-control headers **1051**

Expressions for extracting segments of URLs **1071**

Expressions for HTTP status codes and numeric HTTP payload data other than dates **1072**

SIP expressions **1073**

Operations for HTTP, HTML, and XML encoding and "safe" characters **1084**

Expressions for TCP, UDP, and VLAN data **1087**

Expressions for evaluating a DNS message and identifying its carrier protocol **1091**

XPath and HTML, XML, or JSON expressions **1093**

Encrypt and decrypt XML payloads **1096**

Advanced policy expressions: parsing SSL **1099**

Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs **1103**

Advanced policy expressions: stream analytics functions **1110**

Advanced policy expressions: DataStream **1111**

Typecasting data **1124**

Regular Expressions **1124**

Basic characteristics of regular expressions **1125**

Operations for regular expressions **1126**

Configuring classic policies and expressions **1128**

Configure a classic policy **1129**

Configure a classic expression **1131**

Bind a classic policy **1134**

View classic policies **1137**

Create named classic expressions **1138**

Expressions reference-advanced policy expressions **1140**

Expressions reference-classic expressions **1140**

Summary examples of default syntax expressions and policies **1151**

Tutorial examples of default syntax policies for rewrite **1159**

Tutorial Examples of Classic Policies **1163**

Migrate Apache mod_rewrite rules to default policy syntax **1169**

Rate limiting **1184**

Configuring a Stream Selector **1185**

Configuring a traffic rate limit identifier **1186**

Configuring and Binding a Traffic Rate Policy **1188**

Viewing the Traffic Rate **1189**

Testing a Rate-Based Policy **1190**

Examples of Rate-Based Policies **1191**

Sample Use Cases for Rate-Based Policies **1193**

Rate Limiting for Traffic Domains **1195**

Configure rate limit at packet level **1196**

Responder **1197**

Enabling the Responder Feature **1199**

Configuring a Responder Action **1200**

Configuring a Responder Policy **1204**

Binding a Responder Policy **1206**

Setting the default action for a responder policy **1208**

Responder action and policy examples **1210**

Diameter Support for Responder **1212**

RADIUS Support for Responder **1214**

DNS Support for the Responder Feature **1218**

Troubleshooting **1220**

Rewrite **1221**

How rewrite works **1223**

Enabling the rewrite feature **1226**

Configuring a Rewrite Action **1227**

Configuring a Rewrite Policy **1232**

Binding a Rewrite Policy **1235**

Configuring Rewrite Policy Labels **1239**

Configuring the Default Rewrite Action **1240**

Bypassing the Safety Check **1242**

Rewrite Action and Policy Examples **1243**

Example 1: Delete Old X-Forwarded-For and Client-IP Headers **1244**

Example 2: Adding a Local Client-IP Header **1246**

Example 3: Tagging Secure and Insecure Connections **1247**

Example 4: Mask the HTTP Server Type **1248**

Example 5: Redirect an External URL to an Internal URL **1249**

Example 6: Migrating Apache Rewrite Module Rules **1250**

Example 7: Marketing Keyword Redirection **1251**

Example 8: Redirect Queries to the Queried Server **1252**

Example 9: Home Page Redirection **1253**

URL Transformation **1254**

Configuring URL Transformation Profiles **1255**

Configuring URL Transformation Policies **1259**

Globally Binding URL Transformation Policies **1262**

Globally Binding URL Transformation Policies **1264**

Diameter Support for Rewrite **1266**

DNS Support for the Rewrite Feature **1268**

String maps **1270**

URL Sets **1272**

Getting Started **1273**

Advanced Policy Expressions for URL Evaluation **1274**

Configuring URL Set **1275**

URL Pattern Semantics **1278**

URL Categories **1279**

AppFlow **1285**

Configuring the AppFlow Feature **1289**

Exporting Performance Data of Web Pages to AppFlow Collector **1297**

Session reliability on NetScaler high availability pair **1300**

Application Firewall **1302**

FAQs and Deployment Guide **1306**

Introduction **1315**

Web application security **1315**

How App Firewall works **1319**

The App Firewall configuration interfaces **1322**

Configuring the App Firewall **1323**

Enabling App Firewall **1327**

The App Firewall wizard **1328**

Manual configuration **1334**

Manual configuration by using the GUI **1335**

Manual configuration By using the command line interface **1346**

Signatures **1348**

Manually configuring the signatures feature **1352**

Adding or removing a signatures object **1352**

Configuring or modifying a signatures object **1354**

Protecting JSON applications using signatures **1358**

Updating a signature object **1362**

Exporting a signatures object to a file **1365**

The Signatures editor **1365**

To add a signature rule category **1367**

Signature rule patterns **1368**

To Import and merge rules **1373**

Signature updates in high availability deployment and build upgrades **1374**

Overview of security checks **1375**

Top level protections **1377**

HTML cross-site scripting check **1378**

HTML SQL injection check **1389**

Buffer overflow check **1403**

Cookie consistency check **1409**

App Firewall support for Google web toolkit **1413**

Data leak prevention checks **1418**

Credit card check **1418**

Safe object check **1426**

Advanced form protection checks **1428**

Field formats check **1429**

Form field consistency check **1443**

CSRF form tagging check **1445**

Managing CSRF form tagging check relaxations **1448**

URL protection checks **1449**

Start URL check **1449**

Deny URL check **1454**

XML protection checks **1455**

XML format check **1455**

XML denial-of-service check **1456**

XML cross-site scripting check **1459**

XML SQL injection check **1466**

XML attachment check **1475**

Web services interoperability check **1476**

XML message validation check **1480**

XML SOAP fault filtering check **1481**

Managing content types **1482**

Profiles **1486**

Creating App Firewall profiles **1488**

Configuring App Firewall profiles **1490**

Changing an App Firewall profile type **1492**

Exporting and importing an App Firewall profile **1493**

Configuring and using the Learning feature **1498**

Supplemental Information about profiles **1504**

Policy labels **1510**

Policies **1512**

App Firewall Policies **1512**

Creating and configuring App Firewall policies **1514**

Binding App Firewall policies **1519**

Viewing a policy bindings **1521**

Supplemental information about App Firewall policies **1521**

Auditing policies **1522**

Imports **1527**

Importing and exporting files **1530**

Global configuration **1532**

Engine settings **1533**

Confidential fields **1536**

Field types **1541**

XML content types **1543**

JSON content types **1545**

Statistics and reports **1546**

App Firewall logs **1549**

Appendices **1559**

PCRE character encoding format **1559**

Whitehat WASC signature types for WAF use **1562**

Streaming support for request processing **1563**

Trace HTML requests with security logs **1566**

App Firewall support for cluster configurations **1569**

Debugging and troubleshooting **1571**

High CPU **1571**

Memory **1573**

Large file upload failure **1575**

Learning **1575**

Signatures **1577**

Trace Log **1578**

Miscellaneous **1579**

References **1580**

Cache Redirection **1581**

Cache redirection policies **1581**

Built-in cache redirection policies **1582**

Configure a cache redirection policy **1585**

Cache redirection configurations **1593**

Configure transparent redirection **1593**

Enable cache redirection and load balancing **1594**

Configure edge mode **1595**

Configure a cache redirection virtual server **1596**

Bind policies to the cache redirection virtual server **1598**

Unbind a policy from a cache redirection virtual server **1599**

Create a load balancing virtual server **1600**

Configure an HTTP service **1602**

Bind/unbind a service to/from a load balancing virtual server **1604**

Disable the use the proxy port setting for transparent caching **1605**

Assign a port range to the NetScaler appliance **1605**

Enable load balancing virtual servers to redirect requests to cache **1606**

Configure forward proxy redirection **1608**

Create a DNS service **1609**

Create a DNS load balancing virtual server **1610**

Bind the DNS service to the virtual server **1611**

Configure a client web browser to use a forward proxy **1613**

Configure reverse proxy redirection **1613**

Selective cache redirection **1617**

Enable content switching **1618**

Configure a load balancing virtual server for the cache **1619**

Configure policies for content switching **1620**

Configure precedence for policy evaluation **1624**

Administer a cache redirection virtual server **1625**

View cache redirection virtual server statistics **1625**

Enable or disable a cache redirection virtual server **1627**

Direct policy hits to the cache instead of the origin **1628**

Back up a cache redirection virtual server **1630**

Manage client connections for a virtual server **1631**

N-Tier cache redirection **1636**

Configure the upper-tier NetScaler appliances **1642**

Configure the lower-tier NetScaler appliances **1644**

Clustering **1645**

Supportability matrix for NetScaler cluster **1646**

Prerequisites for cluster nodes **1652**

Cluster overview **1654**

Synchronization across cluster nodes **1655**

Striped, partially striped, and spotted configurations **1657**

Communication in a cluster setup **1660**

Traffic distribution in a cluster setup **1663**

Cluster nodegroups **1665**

Cluster and node states **1666**

Routing in a cluster **1666**

Setting up a NetScaler cluster **1668**

Setting up inter-node communication **1668**

Creating a NetScaler cluster **1670**

Adding a node to the cluster **1674**

Viewing the details of a cluster **1677**

Distributing traffic across cluster nodes **1678**

Using Equal Cost Multiple Path (ECMP) **1678**

Use Case: ECMP with BGP routing **1682**

Using cluster link aggregation **1684**

Static cluster link aggregation **1687**

Dynamic cluster link aggregation **1688**

Link redundancy in a cluster with LACP **1690**

Managing the NetScaler cluster **1691**

Configuring linksets **1692**

Nodegroups for spotted and partially-striped configurations **1696**

Behavior of nodegroups **1697**

Configuring nodegroups for spotted and partially-striped configurations **1698**

Configuring redundancy for nodegroups **1700**

Disabling steering on the cluster backplane **1703**

Synchronizing cluster configurations **1704**

Synchronizing time across cluster nodes **1705**

Synchronizing cluster files **1705**

Viewing the statistics of a cluster **1707**

Discovering NetScaler appliances **1708**

Disabling a cluster node **1708**

Removing a cluster node **1709**

Removing a node from a cluster deployed using cluster link aggregation **1711**

Detecting jumbo probe on a cluster **1711**

Route monitoring for dynamic routes in cluster **1712**

Monitoring cluster setup using SNMP MIB with SNMP link **1713**

Monitoring command propagation failures in a cluster deployment **1714**

IPv6 ready logo support for clusters **1715**

Managing cluster heartbeat messages **1720**

Configuring owner node response status **1720**

Monitor static route (MSR) support for inactive nodes in a spotted cluster configuration **1721**

VRRP interface binding in a single node active cluster **1722**

Cluster setup and usage scenarios **1723**

Creating a two-node cluster **1723**

Migrating an HA setup to a cluster setup **1723**

Transitioning between a L2 and L3 Cluster **1727**

Setting up GSLB in a cluster **1728**

Using cache redirection in a cluster **1730**

Using L2 mode in a cluster setup **1730**

Using cluster LA channel with linksets **1731**

Backplane on LA channel **1732**

Common interfaces for client and server and dedicated interfaces for backplane **1734**

Common switch for client, server, and backplane **1737**

Common switch for client and server and dedicated switch for backplane **1739**

Different switch for every node **1742**

Sample cluster configurations **1743**

Monitoring services in a cluster using path monitoring **1747**

Upgrading or downgrading the NetScaler cluster **1750**

Operations supported on individual cluster nodes **1753**

FAQs **1754**

Troubleshooting the NetScaler cluster **1762**

Tracing the packets of a NetScaler cluster **1763**

Troubleshooting common issues **1767**

Content Switching **1770**

Configuring basic content switching **1773**

Enabling content switching **1774**

Creating content switching virtual servers **1775**

Configuring a load balancing setup for content switching **1775**

Configuring a content switching action **1776**

Configuring content switching policies **1779**

Configuring content switching policy labels **1781**

Binding policies to a content switching virtual server **1784**

Configuring policy based logging for content switching **1785**

Verifying the configuration **1787**

Customizing the basic content switching configuration **1792**

Content switching for diameter protocol **1797**

Protecting the content switching setup against failure **1799**

Managing a content switching setup **1805**

Managing client connections **1809**

Troubleshooting **1813**

DataStream **1815**

Configuring Database Users **1817**

Configuring a Database Profile **1819**

Configuring Load Balancing for DataStream **1820**

Configuring Content Switching for DataStream **1822**

Configuring Monitors for DataStream **1823**

Use Case 1: Configuring DataStream for a Master/Slave Database Architecture **1825**

Use Case 2: Configuring the Token Method of Load Balancing for DataStream **1828**

Use Case 3: Logging MSSQL Transactions in Transparent Mode **1830**

Use Case 4: Database Specific Load Balancing **1833**

DataStream Reference **1845**

Domain Name System **1848**

Configure DNS resource records **1851**

Create SRV records for a service **1853**

Creating AAAA Records for a Domain Name **1854**

Creating address records for a Domain Name **1855**

Create MX records for a mail exchange server **1856**

Create NS Records for an authoritative server **1857**

Create CNAME records for a subdomain **1858**

Create NAPTR records for telecommunications domain **1859**

Create PTR records for IPv4 and IPv6 addresses **1860**

Create SOA records for authoritative information **1861**

Create TXT records for holding descriptive text **1862**

Viewing DNS statistics **1863**

Configure a DNS zone **1865**

Configure the NetScaler as an authoritative domain name server **1866**

Configure the NetScaler appliance as a DNS proxy server **1871**

Configure the NetScaler as an end resolver **1876**

Configure the NetScaler appliance as a forwarder **1879**

Add a name server **1880**

Set DNS lookup priority **1882**

Disable and enable name servers **1883**

Configure DNS logging **1883**

Configuring DNS suffixes **1897**

DNS ANY query **1898**

Configure negative caching of DNS records **1899**

Domain name system security extensions **1901**

Configure DNSSEC **1902**

Configure DNSSEC when the NetScaler is authoritative for a zone **1910**

Configure DNSSEC for a zone for which the NetScaler is a DNS proxy server **1911**

Configure DNSSEC for GSLB domain names **1913**

Zone Maintenance **1913**

Offload DNSSEC operations to the NetScaler **1917**

Firewall Load Balancing **1918**

Sandwich Environment **1920**

Enterprise Environment **1937**

Multiple-Firewall Environment **1949**

Global Server Load Balancing **1960**

How GSLB Works **1961**

GSLB Deployment Types **1962**

Active-Active Site Deployment **1962**

Active-Passive Site Deployment **1964**

Parent-Child Topology Deployment using the MEP Protocol **1965**

GSLB Configuration Entities **1971**

Configuring Global Server Load Balancing (GSLB) **1974**

Configuring an Authoritative DNS Service **1975**

Configuring a Basic GSLB Site **1976**

Configuring a GSLB Service **1978**

Configuring a GSLB Virtual Server **1980**

Binding GSLB Services to a GSLB Virtual Server **1984**

Binding a Domain to a GSLB Virtual Server **1984**

Synchronizing a Configuration in a GSLB Setup **1988**

Testing the GSLB setup **1993**

Configuring the Metrics Exchange Protocol (MEP) **1994**

Configuring Site-to-Site Communication **1998**

Customize your GSLB configuration **2002**

Changing the GSLB methods **2007**

Configuring Static Proximity **2008**

Add a location file to create a static proximity database **2009**

Add custom entries to a static proximity database **2012**

Set location qualifiers **2014**

Specify proximity method **2015**

Synchronize GSLB static proximity database **2016**

Configuring the Dynamic Method (RTT) **2017**

How to configure persistence in GSLB **2019**

Override static proximity behavior by configuring preferred locations **2024**

Monitoring GSLB Services **2026**

Monitoring GSLB Sites **2030**

Protecting the GSLB Setup Against Failure **2030**

Managing Client Connections **2036**

Configuring GSLB for Disaster Recovery **2045**

Configuring GSLB for Proximity **2051**

Example of a Complete Parent-Child Configuration Using the Metrics Exchange Protocol **2052**

Configuring GSLB Service Selection Using Content Switching **2058**

Configuring Global Server Load Balancing for DNS Queries with NAPTR records **2060**

Using the EDNS0 Client Subnet Option for Global Server Load Balancing **2063**

Link load balancing **2068**

Configuring a Basic LLB Setup **2069**

Configuring RNAT with LLB **2079**

Configuring a Backup Route **2081**

Resilient LLB Deployment Scenario **2084**

Monitoring an LLB Setup **2086**

Load Balancing **2088**

How load balancing works **2089**

Set up basic load balancing **2099**

Load balance virtual server and service states **2112**

Support for load balancing profile **2115**

Load balancing algorithms **2118**

Least connection method **2121**

Round robin method **2126**

Least response time method **2128**

LRTM method **2134**

Hashing methods **2140**

Least bandwidth method **2147**

Least packets method **2151**

Custom load method **2155**

Static proximity method **2160**

Token method **2161**

Configure a load balancing method that does not include a policy **2164**

Persistence and persistent connections **2165**

About Persistence **2165**

Source IP address persistence **2168**

HTTP cookie persistence **2168**

SSL session ID persistence **2171**

Diameter AVP number persistence **2171**

Custom server ID persistence **2172**

IP address persistence **2174**

SIP Call ID persistence **2175**

RTSP session ID persistence **2175**

Configure URL passive persistence **2176**

Configure persistence based on user-defined rules **2177**

Configure persistence types that do not require a rule **2179**

Configure backup persistence **2180**

Configure persistence groups **2181**

Configure RADIUS load balancing with persistence **2183**

View persistence sessions **2186**

Clear persistence sessions **2187**

Override persistence settings for overloaded services **2188**

Troubleshooting **2190**

Insert cookie attributes to ADC generated cookies **2192**

Customize a load balancing configuration **2203**

Customize the hash algorithm for persistence across virtual servers **2204**

Configure the redirection mode **2207**

Configure per-VLAN wildcarded virtual servers **2208**

Assign weights to services **2209**

Configure the MySQL and Microsoft SQL server version setting **2211**

Configure diameter load balancing **2212**

Configure FIX load balancing **2218**

Protect a load balancing configuration against failure **2224**

Redirect client requests to an alternate URL **2224**

Configure a backup load balancing virtual server **2225**

Configure spillover **2226**

Connection failover **2234**

Flush the surge queue **2238**

Manage a load balancing setup **2240**

Manage server objects **2241**

Manage services **2242**

Manage a load balancing virtual server **2243**

Load balancing visualizer **2244**

Manage client traffic **2247**

Configure sessionless load balancing virtual servers **2248**

Redirect HTTP requests to a cache **2250**

Direct requests according to priority **2251**

Direct requests to a custom web page **2252**

Enable cleanup of virtual server connections **2253**

Rewrite ports and protocols for HTTP redirection **2255**

Insert IP address and port of a virtual server in the request header **2260**

Use a specified source IP for backend communication **2261**

Set a time-out value for idle client connections **2268**

Manage RTSP connections **2268**

Manage client traffic on the basis of traffic rate **2269**

Identify a connection with layer 2 parameters **2270**

Configure the prefer direct route option **2271**

Use a source port from a specified port range for backend communication **2271**

Configure source IP persistency for backend communication **2273**

Advanced load balancing settings **2274**

Gradually stepping up the load on a new service with virtual server–level slow start **2275**

The no-monitor option for services **2281**

Protect applications on protected servers against traffic surges **2284**

Enable cleanup of virtual server and service connections **2285**

Graceful shutdown of services **2287**

Direct requests to a custom web page **2291**

Enable access to services when down **2292**

Enable TCP buffering of responses **2293**

Enable compression **2293**

Maintain client connection for multiple client requests **2294**

Insert the IP address of the client in the request header **2295**

Use source IP address of the client when connecting to the server **2296**

Configure the source port for server-side connections **2296**

Set a limit on the number of client connections **2299**

Set a limit on number of requests per connection to the server **2300**

Set a threshold value for the monitors bound to a service **2300**

Set a timeout value for idle client connections **2301**

Set a timeout value for idle server connections **2302**

Set a limit on the bandwidth usage by clients **2303**

Redirect client requests to a cache **2303**

Retain the VLAN identifier for VLAN transparency **2304**

Configure automatic state transition based on percentage health of bound services **2305**

Built-in monitors **2306**

TCP-based application monitoring **2306**

SSL service monitoring **2308**

FTP service monitoring **2310**

Secure monitoring of servers by using SFTP **2311**

Set SSL parameters on a secure monitor **2312**

SIP service monitoring **2314**

RADIUS service monitoring **2314**

Monitor accounting information delivery from a RADIUS server **2315**

DNS and DNS-TCP service monitoring **2316**

LDAP service monitoring **2317**

MySQL service monitoring **2318**

SNMP service monitoring **2319**

NNTP service monitoring **2319**

POP3 service monitoring **2320**

SMTP service monitoring **2321**

RTSP service monitoring **2321**

XML broker service monitoring **2327**

ARP request monitoring **2327**

XenDesktop Delivery Controller service monitoring **2328**

Citrix StoreFront stores monitoring **2330**

Custom monitors **2331**

Configure HTTP-inline monitors **2331**

Understand user monitors **2332**

How to use a user monitor to check web sites **2338**

Understand the internal dispatcher **2339**

Configure a user monitor **2341**

Understand load monitors **2342**

Configure load monitors **2344**

Unbind metrics from a metrics table **2345**

Configure reverse monitoring for a service **2345**

Configure monitors in a load balancing setup **2348**

Create monitors **2349**

Bind monitors to services **2349**

Modify monitors **2350**

Enable and disable monitors **2351**

Unbind monitors **2352**

Remove monitors **2353**

View monitors **2353**

Close monitor connections **2354**

Ignore the upper limit on client connections for monitor probes **2356**

Manage a large scale deployment **2357**

Ranges of virtual servers and services **2357**

Configure service groups **2360**

Manage service groups **2363**

Configure automatic domain based service group scaling **2370**

Translate the IP address of a domain-based server **2373**

Mask a virtual server IP address **2374**

Configure load balancing for commonly used protocols **2376**

Load balance a group of FTP servers **2377**

Load balance DNS servers **2379**

Load balance domain-name based services **2382**

Load balance a group of SIP servers **2385**

Load balance RTSP servers **2395**

Load balance remote desktop protocol (RDP) servers **2398**

Use case 1: SMPP load balancing **2402**

Use case 2: Configure rule based persistence based on a name-value pair in a TCP byte stream **2412**

Use case 3: Configure load balancing in direct server return mode **2414**

Use case 4: Configure LINUX servers in DSR mode **2418**

Use case 5: Configure DSR mode when using TOS **2418**

Use case 6: Configure load balancing in DSR mode for IPv6 networks by using the TOS field **2424**

Use case 7: Configure load balancing in DSR mode by using IP Over IP **2427**

Use case 8: Configure load balancing in one-arm mode **2431**

Use case 9: Configure load balancing in the inline mode **2433**

Use case 10: Load balancing of intrusion detection system servers **2433**

Use case 11: Isolating network traffic using listen policies **2438**

Use case 12: Configure XenDesktop for load balancing **2444**

Use case 13: Configure XenApp for load balancing **2446**

Use case 14: ShareFile wizard for load balancing Citrix ShareFile **2449**

NetScaler Release Notes

July 19, 2021

Release notes describe how the software has changed in a particular build, and the issues known to exist in that build.

The release notes document includes all or some of the following sections:

- **What's New**: The enhancements and other changes released in the build.
- **Fixed Issues**: The issues that are fixed in the build.
- **Known Issues**: The issues that exist in the build.
- **Points to Note**: The important aspects to keep in mind while using the build.
- **Limitations**: The limitations that exist in the build.

Build 58.13	June 13, 2018	7.0

Getting started with Citrix ADC

September 21, 2020

This topic describes the basic features and configuration details of a Citrix ADC appliance. System and network administrators who install and configure network equipment can refer to the content.

Understanding Citrix ADC

The Citrix ADC appliance is an application switch which performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4–L7) network traffic for web applications. For example, a Citrix ADC appliance load balances decisions on individual HTTP requests instead of long-lived TCP connections. The load balancing feature helps slowing down the failure of a server with less disruption to clients. The ADC features can be broadly classified as:

1. Data switching
2. Firewall security
3. Optimization
4. Policy infrastructure
5. Packet flow
6. System limitation

Data switching

When deployed in front of application servers, a Citrix ADC ensures optimal distribution of traffic by how it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and based on L4–L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Firewall security

The Citrix ADC security and protection protect web applications from Application Layer attacks. An ADC appliance allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization

Optimization offloads resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. An ADC appliance supports several transparent TCP optimizations which mitigate problems caused by high latency and congested network links. Thereby accelerating the delivery of applications while requiring no configuration changes to clients or servers.

Policy infrastructure

A policy defines specific details of traffic filtering and management on a Citrix ADC. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the ADC appliance what to do when a request matches the expression. For example, the expression might be to match a specific URL pattern for a security attack with the configured to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.

When an ADC appliance receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

For all policy types except rewrite, the appliance implements only the first policy that has a request match. For Rewrite policies, the ADC appliance evaluates the policies in order and performs the associated actions in the same order. Policy priority is important for getting the results you want.

Packet flow

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the DataStream packet flow in the Citrix ADC appliance. DataStream is supported for MySQL and MS SQL databases.

> **Note:** If the traffic is for a content switching virtual server, the appliance evaluates policies in the following order:
>
> 1. bound to global override.
> 2. bound to load balancing virtual server.
> 3. bound to content switching virtual server.
> 4. bound to global default.
>
> This way, if a policy rule is true and gotopriorityexpression is END, we stop further policy evaluation.
> In content switching, if no load balancing virtual server is selected or bound to the content switching virtual server, then we evaluate responder policies bound only to the content switching virtual server.

System limitation

There are system limitations for each Citrix ADC feature when you install Citrix ADC software 9.2 or later. For more information, see Citrix article, CTX118716.

Where does a NetScaler appliance fit in the network?

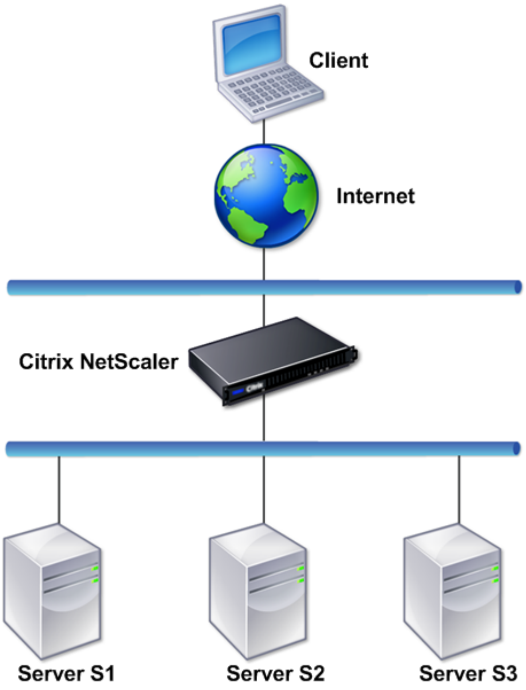
September 21, 2020

A NetScaler appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. In this case, the appliance owns public IP addresses that are associated with its virtual servers, while the real servers are isolated in a private network. It is also possible to operate the appliance in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

Physical deployment modes

A NetScaler appliance logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the appliance is placed between the clients and the servers. The appliance has a separate network interface to each client network and a separate network interface to each server network. The appliance and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment



In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see Understanding Common Network Topologies.

NetScaler as an L2 device

A NetScaler appliance functioning as an L2 device is said to operate in L2 mode. In L2 mode, the ADC appliance forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device's media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler appliance.

For information about how the L2 and L3 modes interact, see Packet forwarding modes.

For information about configuring L2 mode, see the "Enable and disable layer 2 mode" section in Packet forwarding modes.

NetScaler as a packet forwarding device

A NetScaler appliance can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the appliance forwards any received unicast packets that are destined for an IP address that does not belong to the appliance, if there is a route to the destination. The appliance can also route packets between VLANs.

In both modes of operation, L2 and L3, the appliance generally drops packets that are in:

- Multicast frames
- Unknown protocol frames destined for an appliance's MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see Packet forwarding modes.

For information about configuring the L3 mode, see Packet forwarding modes.

How a NetScaler appliance communicates with clients and servers

September 21, 2020

A NetScaler appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-owned IP addresses

To function as a proxy, a NetScaler appliance uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

- NetScaler IP (NSIP) address

  The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

- Virtual server IP (VIP) address

  A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.

- Subnet IP (SNIP) address

  A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

- IP Set

  An IP set is a set of IP addresses, which are configured on the appliance as SNIP . An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

- Net Profile

  A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

How Traffic flows are managed

Because a NetScaler appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the NetScaler appliance instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client’s request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

Figure 1. Virtual Server Based Connections

CIP: Client IP address
NS: Citrix NetScaler System
Svr: Server
DR: Default Router
VIP: Virtual IP address

In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

Traffic management building blocks

The configuration of a NetScaler appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 2. How traffic management building blocks work

connections to servers

A simple load balancing configuration

In the example shown in the following figure, the NetScaler appliance is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to connect to a NetScaler appliance. When the appliance receives client requests sent to the VIP address, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 3. Load balancing virtual server, services, and monitors

HTTP
Monitor
Default

In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

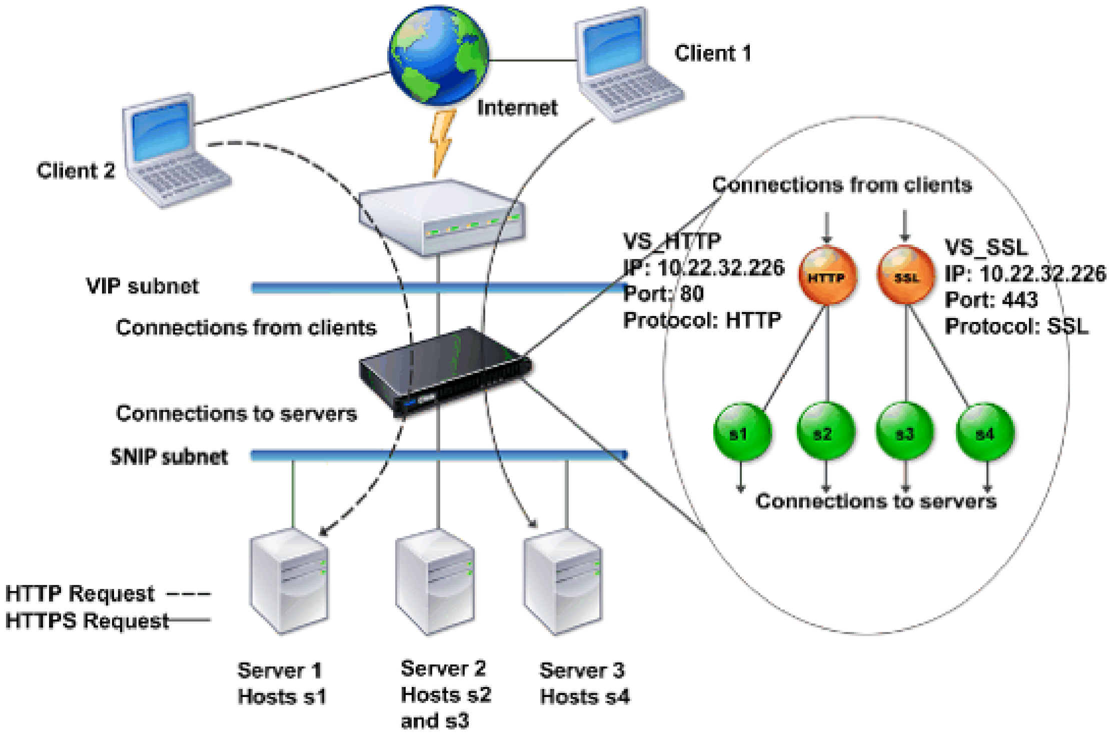
Understanding virtual servers

A virtual server is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP (VIP) address, port, and protocol. The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 4. Multiple Virtual Servers with a Single VIP Address



Client 1

Server 1
Hosts s1
Server 2
Hosts s2
and s3
Server 3
Hosts s4

The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP request at the VIP address, it processes the request as specified by the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

- Load balancing virtual server

  Receives and redirects requests to an appropriate server. Choice of the appropriate server is based on which of the various load balancing methods the user configures.

- Cache redirection virtual server

  Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.

- Content switching virtual server

  Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.

- Virtual private network (VPN) virtual server

  Decrypts tunneled traffic and sends it to intranet applications.

- SSL virtual server

  Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding services

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the source IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state. If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

Introduction to the NetScaler product line

September 21, 2020

The NetScaler product line optimizes delivery of applications over the internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You can install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A NetScaler appliance can be integrated into any network as a complement to existing load balancers, servers, caches, and firewalls. It requires no additional client or server side software, and can be configured using the NetScaler web-based GUI and CLI configuration utilities.

NetScaler Hardware Platforms

NetScaler hardware is available in a variety of platforms that have a range of hardware specifications:

NetScaler MPX hardware platform

NetScaler SDX hardware platform

NetScaler Editions

The NetScaler operating system is available in three editions:

- Standard
- Enterprise
- Platinum

The Standard and Advanced editions have limited features available. Feature licenses are required for all editions.

For more information about NetScaler software editions, see the NetScaler Editions datasheet.

For information about how to obtain and install licenses, see Licensing.

Supported releases on NetScaler hardware

See the following compatibility matrix tables for all NetScaler hardware platforms and the software releases supported on these platforms:

NetScaler MPX Hardware-Software Compatibility Matrix

NetScaler SDX Hardware-Software Compatibility Matrix

Supported browsers

To access the Citrix ADC GUI, your workstation must have a supported web browser.

The compatible browser versions for Citrix ADC 11.1 are as follows:

Operating System	Browser	Versions
Windows 7 & later	Internet Explorer	8,9,10, 11, Edge
Windows 7 & later	Mozilla Firefox	45 & later
Windows 7 & later	Chrome	60 & later
MAC	Mozilla Firefox	45 & later
MAC	Safari	10.1.1 & later

Install the hardware

September 21, 2020

Before installing a NetScaler appliance, review the pre-installation checklist.

To use the SDX appliance, you must complete the following tasks by following the instructions given in the resources provided in table. Complete the tasks in the sequence given.

Task

Description

1. Read safety, cautions, warnings, and other information

Read the caution and danger information you need to know, before installing the product.

2. Prepare for installation

Unpack your appliance and ensure all parts were delivered, prepare the site and rack, and follow basic electrical safety precautions before you install your new appliance.

3. Install the hardware

Rack mount the appliance, install transceivers (if available), and connect the appliance to the network and a power source.

4. Configure the appliance.

Configure the initial settings of the NetScaler appliance by using the GUI or the serial console.

Follow the steps given in the following documentations to complete these tasks:

- NetScaler MPX hardware documentation
- NetScaler SDX hardware documentation

Access a NetScaler appliance

September 23, 2020

A NetScaler appliance has both a command line interface (CLI) and a GUI. The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all appliances ship with the default NetScaler IP address (NSIP) of 192.168.100.1 and the default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.

If you encounter an IP address conflict when deploying multiple NetScaler units, check for the following possible causes:

- Did you select an NSIP that is an IP address already assigned to another device on your network?
- Did you assign the same NSIP to multiple NetScaler appliances?

- The NSIP is reachable on all physical ports. The ports on a NetScaler are host ports, not switch ports.

The following table summarizes the available access methods.

Access Method	Port	Default IP Address Required? (Y/N)
CLI	Console	N
CLI and GUI	Ethernet	Y

Command line interface

Access the CLI either locally, by connecting a workstation to the console port, or remotely, by connecting through the secure shell (SSH) from any workstation on the same network.

Log on to the Command Line Interface through the Console Port

The appliance has a console port for connecting to a computer workstation. To log on to the appliance, you need a serial crossover cable and a workstation with a terminal emulation program.

To log on to the CLI through the console port, follow these steps:

1. Connect the console port to a serial port on the workstation. For more information, see Connect the console cable.
2. On the workstation, start HyperTerminal or any other terminal emulation program. If the logon prompt does not appear, you might have to press ENTER one or more times to display it.
3. In User Name, type `nsroot`. In Password, type `nsroot` and if that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

Log on to the Command Line Interface by using SSH

The SSH protocol is the preferred remote access method for accessing an appliance remotely from any workstation on the same network. You can use either SSH version 1 (SSH1) or SSH version 2 (SSH2.)

If you do not have a working SSH client, you can download and install any of the following SSH client programs:

- PuTTY

  Open Source software supported on multiple platforms. Available at:

  "http://www.chiark.greenend.org.uk/~sgtatham/putty/"

- `Vandyke` Software SecureCRT

  Commercial software supported on the Windows platform. Available at:

  "http://www.vandyke.com/products/securecrt/"

These programs have been tested by the Citrix NetScaler team, which has verified that they work correctly with a NetScaler appliance. Other programs might also work correctly, but have not been tested.

To verify that the SSH client is installed properly, use it to connect to any device on your network that accepts SSH connections.

To log on to a NetScaler appliance by using an SSH client, follow these steps:

1. On your workstation, start the SSH client.
2. For initial configuration, use the default IP address (NSIP), which is 192.168.100.1. For subsequent access, use the NSIP that was assigned during initial configuration. Select either SSH1 or SSH2 as the protocol.
3. In User Name, type `nsroot`. In Password, type `nsroot` and if that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance. For example.

```
login as: nsroot

Using keyboard-interactive authentication.

Password:

Last login: Tue Jun 16 10:37:28 2009 from 10.102.29.9

Done

>

<!--NeedCopy-->
```

NetScaler GUI

> **Important**
>
> A certificate-key pair is required for HTTPS access to the Citric ADC GUI. On the ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Also, if a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes on a NetScaler for HTTPS access to the GUI. Also, install an appropriate license before starting the ADC.

The GUI includes a configuration utility and a statistical utility, called Dashboard, either of which you access through a workstation connected to an Ethernet port on the appliance.

The system requirements for the workstation running the GUI are as follows:

- For Windows-based workstations, a Pentium 166 MHz or faster processor.
- For Linux-based workstations, a Pentium platform running Linux kernel v2.2.12 or above, and `glibc` version 2.12–11 or later. A minimum of 32 MB RAM is required, and 48 MB RAM is recommended. The workstation must support 16-bit color mode, KDE, and KWM window managers used in conjunction, with displays set to local hosts.
- For Solaris-based workstations, a Sun running either Solaris 2.6, Solaris 7, or Solaris 8.

Your workstation must have a supported web browser to access the configuration utility and Dashboard.

The following browsers are supported.

Operating System:
Windows 7

Browser: Internet Explorer (version 9, 10, and 11), Mozilla Firefox (version 3.6.25 and above), Google Chrome (latest).

Operating System:
Windows 64 bit

Browser: Internet Explorer (version 8, 9, 10, and 11), Google Chrome (version latest)

Operating System:
MAC
Browser: Mozilla Firefox (version 3.6.25 and above), Safari (version 5.1.3 and above), Google Chrome (version latest)

Use the NetScaler GUI

Once you log on to the configuration utility, you can configure the appliance through a graphical interface that includes context-sensitive help.

To log on to the GUI, follow these steps:

1. Open your web browser and enter the NetScaler IP (NSIP) as an HTTP address. If you have not yet set up the initial configuration, enter the default NSIP (http://192.168.100.1). The Citrix Logon page appears.

   Note: If you have two NetScaler appliances in a high availability setup, do not access the GUI by entering the IP address of the secondary NetScaler appliance. If you do so and use the GUI to configure the secondary appliance, your configuration changes are not applied to the primary NetScaler appliance.

2. In the **User Name** text box, type `nsroot`.

3. In the **Password** text box, type the administrative password you assigned to the `nsroot` account during initial configuration and click **Login**. If that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

   To access the online help, select Help from the Help menu at the top right corner.

Use the Statistical Utility

Dashboard, the statistical utility, is a browser-based application that displays charts and tables on which you can monitor the performance of a NetScaler appliance.

To log on to Dashboard, follow these steps:

1. Open your web browser and enter the NSIP as an HTTP address. The Citrix Logon page appears.
2. In the User Name text box, type `nsroot`.
3. In the **Password** text box, type the administrative password you assigned to the `nsroot` account during initial configuration. If that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

Configure the ADC for the first time

September 21, 2020

For initial configuration of a NetScaler MPX appliance, see Initial Configuration of a Citrix MPX appliance.

For initial configuration of a Citrix SDX appliance, see Initial Configuration of a Citrix SDX appliance.

NITRO API

You can use the NITRO API to configure the NetScaler appliance. NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java or .NET or Python, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs). For more information, see NITRO API.

Secure your NetScaler deployment

September 21, 2020

To maintain security through the deployment life cycle of NetScaler appliance, Citrix recommends you to consider the following security aspects:

- Physical Security
- Appliance Security
- Network Security
- Administration and Management

Different deployments might require different security considerations. The NetScaler secure deployment guidelines provide general security guidance to help you decide on an appropriate secure deployment based on your specific security requirements.

For more information on guidelines for securely deploying the NetScaler appliance, see Citrix ADC secure deployment guidelines.

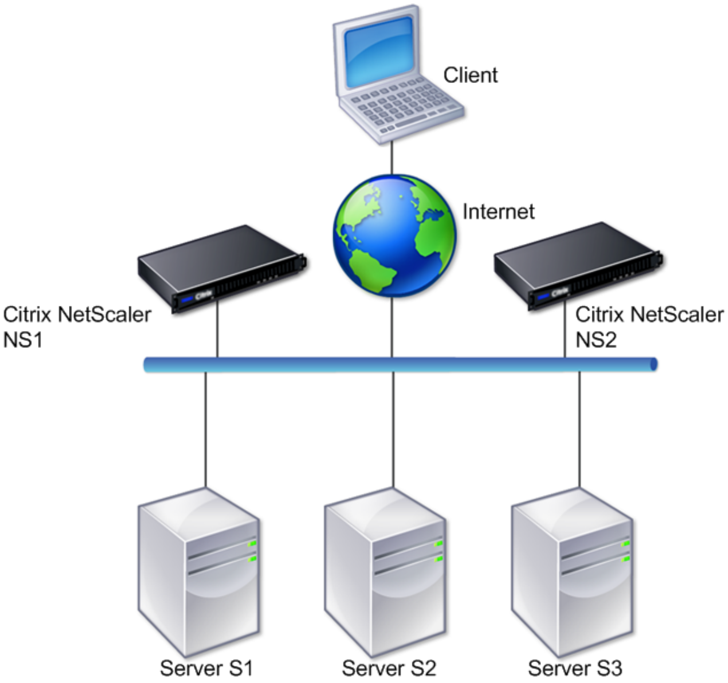
Configure high availability

September 21, 2020

You can deploy two NetScaler appliances in a high availability configuration, where one unit actively accepts connections and manages servers while the secondary unit monitors the first. The NetScaler appliance that is actively accepting connections and managing the servers is called a primary unit and the other one is called a secondary unit in a high availability configuration. If there is a failure in the primary unit, the secondary unit becomes the primary and begins actively accepting connections.

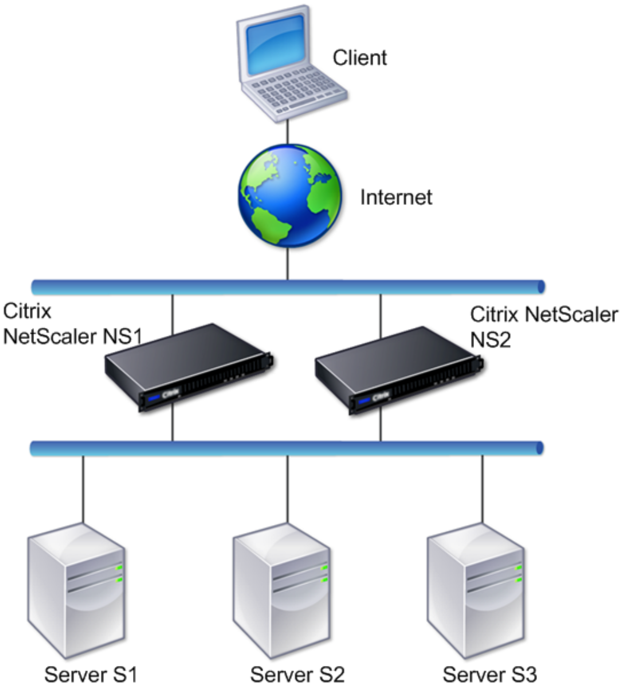
Each NetScaler appliance in a high availability pair monitors the other by sending periodic messages, called heartbeat messages or health checks, to determine the health or state of the peer node. If a health check for a primary unit fails, the secondary unit retries the connection for a specific time period. For more information about high availability, see High Availability. If a retry does not succeed by the end of the specified time period, the secondary unit takes over for the primary unit in a process called failover. The following figure shows two high availability configurations, one in one-arm mode and the other in two-arm mode.

Figure 1. High availability in one-arm mode



Client
Internet
Citrix NetScaler
NS1
Citrix NetScaler
NS2
Server S1
Server S2
Server S3

Figure 2. High availability in two-arm mode



In one-arm configuration, both NS1 and NS2 and servers S1, S2, and S3 are connected to the switch.

In two-arm configuration, both NS1 and NS2 are connected to two switches. The servers S1, S2, and S3 are connected to the second switch. The traffic between client and the servers passes through either NS1 or NS2.

To set up a high availability environment, configure one ADC appliance as primary and another as secondary. Perform the following tasks on each of the ADC appliances:

- Add a node.
- Disable high availability monitoring for unused interfaces.

Add a Node

A node is a logical representation of a peer NetScaler appliance. It identifies the peer unit by ID and NSIP. An appliance uses these parameters to communicate with the peer and track its state. When you add a node, the primary and secondary units exchange heartbeat messages asynchronously. The node ID is an integer that must not be greater than 64.

Through CLI

To add a node by using the command line interface, follow these steps:

At the command prompt, type the following commands to add a node and verify that the node has been added:

- add HA node <id> <IPAddress>
- show HA node <id>

  Example

  ```
  add HA node 0 10.102.29.170
   Done
  > show HA node 0
  1)      Node ID:      0
          IP:   10.102.29.200 (NS200)
          Node State: UP
          Master State: Primary
          SSL Card Status: UP
          Hello Interval: 200 msecs
          Dead Interval: 3 secs
          Node in this Master State for: 1:0:41:50 (days:hrs:min:
              sec)
  <!--NeedCopy-->
  ```

Through GUI

To add a node by using the GUI, follow these steps:

1. Navigate to **System** > **High Availability**.
2. Click **Add** on the **Nodes** tab.
3. On the **Create HA Node** page, in the **Remote Node IP Address** text box, type the NSIP Address (for example, 10.102.29.170) of the remote node.
4. Ensure that the **Configure remote system to participate in High Availability setup** check box is selected. Provide the login credentials of the remote node in the text boxes under **Remote System Login Credentials**.
5. Select the **Turn off HA monitor on interfaces/channels that are down** check box to disable the HA monitor on interfaces that are down.

Verify that the node you added appears in the list of nodes in the Nodes tab.

Disable high availability monitoring for unused interfaces

The high availability monitor is a virtual entity that monitors an interface. You must disable the monitor for interfaces that are not connected or being used for traffic. When the monitor is enabled on an interface whose status is DOWN, the state of the node becomes NOT UP. In a high availability configuration, a primary node entering a NOT UP state might cause a high availability failover. An interface is marked DOWN under the following conditions:

- The interface is not connected
- The interface is not working properly
- The cable connecting the interface is not working properly

Through CLI

To disable the high availability monitor for an unused interface by using the command line interface, follow these steps:

At the command prompt, type the following commands to disable the high availability monitor for an unused interface and verify that it is disabled:

- set interface <id> -haMonitor OFF
- show interface <id>

  Example

```
> set interface 1/8 -haMonitor OFF
 Done
> show interface 1/8
        Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
        flags=0x4000 <ENABLED, DOWN, down, autoneg, 802.1q>
        MTU=1514, native vlan=1, MAC=00:d0:68:15:fd:3d, downtime 238h55m44s
        Requested: media AUTO, speed AUTO, duplex AUTO, fctl OFF,
                 throughput 0

        RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
        Bandwidth thresholds are not set.
<!--NeedCopy-->
```

When the high availability monitor is disabled for an unused interface, the output of the show interface command for that interface does not include "HAMON."

Through GUI

To disable the high availability monitor for unused interfaces by using the GUI, follow these steps:

1. Navigate to System > Network > Interfaces.
2. Select the interface for which the monitor must be disabled.
3. Click Open. The Modify Interface dialog box appears.
4. In HA Monitoring, select the OFF option.
5. Click OK.
6. Verify that, when the interface is selected, "HA Monitoring: OFF" appears in the details at the bottom of the page.

Change an RPC node password

October 14, 2020

To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on NetScaler appliance. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each NetScaler appliance and stores information, such as the IP addresses of the other NetScaler appliance and the passwords used for authentication. The NetScaler appliance that contacts the other NetScaler appliance checks the password within the RPC node.

To change an RPC node password by using the GUI

1. Navigate to **System** > **Network** > **RPC**.
2. In the **RPC** pane, select the node and then click **Edit**.
3. In **Configure RPC Node**, type the new password.
4. In **Source IP Address**, type the existing node's IP address to be used to communicate with the peer system node.
5. Select **Secure** and then click **OK**.

   > **Note**
   >
   > When you enable the **Secure** option, the appliance encrypts all communication sent from the node to other RPC nodes thus securing the RPC communication.

To change an RPC node password by using the CLI

At the command line, type the following commands:

```
set ns rpcNode <IPAddress> {
 -password }
  [-secure ( YES | NO )]
show ns rpcNode
<!--NeedCopy-->
```

Example:

```
> set ns rpcNode 192.0.2.4 -password mypassword -secure YES
 Done
> show rpcNode
.
.
.
 IPAddress:  192.0.2.4 Password:  d336004164d4352ce39e
     SrcIP:  *             Secure:  ON
Done
>

<!--NeedCopy-->
```

Configure a FIPS appliance for the first time

September 21, 2020

A certificate-key pair is required for HTTPS access to the configuration utility and for secure remote procedure calls. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each appliance. This node stores the password, which is checked against the one provided by the contacting appliance. To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on the other appliance. RPC nodes maintain this information, which includes the IP addresses of the other NetScaler appliances and the passwords used to authenticate on each.

On a NetScaler MPX appliance virtual appliance, a certificate-key pair is automatically bound to the internal services. On a FIPS appliance, a certificate-key pair must be imported into the hardware security module (HSM) of a FIPS card. To do so, you must configure the FIPS card, create a certificate-key pair, and bind it to the internal services.

Configure secure HTTPS by using the CLI

To configure secure HTTPS by using the CLI, follow these steps

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.
2. If the appliance is part of a high availability setup, enable the SIM. For information about enabling the SIM on the primary and secondary appliances, see "Configure FIPS appliances in a high availability setup.
3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

   ```
   import ssl fipskey serverkey -key ns-server.key -inform PEM
   ```

4. Add a certificate-key pair. At the command prompt, type:

   ```
   add certkey server -cert ns-server.cert -fipskey serverkey
   ```

5. Bind the certificate-key created in the previous step to the following internal services. At the command prompt, type:

   ```
   bind ssl service nshttps-127.0.0.1-443 -certkeyname server
   ```

   ```
   bind ssl service nshttps-::11-443 -certkeyname server
   ```

Configure secure HTTPS by using the GUI

To configure secure HTTPS by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.
2. If the appliance is part of a high availability setup, enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see Configure FIPS appliances in a high availability setup.
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see the Import an existing FIPS key section.
4. Navigate to Traffic Management > SSL > Certificates.
5. <In the details pane, click Install.
6. In the Install Certificate dialog box, type the certificate details.
7. Click Create, and then click Close.
8. Navigate to Traffic Management > Load Balancing > Services.
9. In the details pane, on the Action tab, click Internal Services.
10. Select nshttps-127.0.0.1-443 from the list, and then click Open.

11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
12. Select nshttps-::11-443 from the list, and then click Open.
13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
14. Click OK.

Configure secure RPC by using the CLI

To configure secure RPC by using the CLI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see Csee Configure FIPS appliances in a high availability setup.
3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

   ```
   import ssl fipskey serverkey -key ns-server.key -inform PEM
   ```

4. Add a certificate-key pair. At the command prompt, type:

   ```
   add certkey server -cert ns-server.cert -fipskey serverkey
   ```

5. Bind the certificate-key pair to the following internal services. At the command prompt, type:

   ```
   bind ssl service nsrpcs-127.0.0.1-3008 -certkeyname server

   bind ssl service nskrpcs-127.0.0.1-3009 -certkeyname server

   bind ssl service nsrpcs-::1l-3008 -certkeyname server
   ```

6. Enable secure RPC mode. At the command prompt, type:

   ```
   set ns rpcnode <IP address> -secure YES
   ```

   For more information about changing an RPC node password, see Change an RPC node password.

Configure secure RPC by using the GUI

To configure secure RPC by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, Configure FIPS appliances in a high availability setup.
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, the Import an existing FIPS key section.
4. Navigate to Traffic Management > SSL > Certificates.
5. In the details pane, click Install.
6. In the Install Certificate dialog box, type the certificate details.
7. Click Create, and then click Close.
8. Navigate to Traffic Management > Load Balancing > Services.
9. In the details pane, on the Action tab, click Internal Services.
10. Select nsrpcs-127.0.0.1-3008 from the list, and then click Open.
11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
12. Select nskrpcs-127.0.0.1-3009 from the list, and then click Open.
13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
14. Select nsrpcs-::11-3008 from the list, and then click Open.
15. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
16. Click OK.
17. Navigate to System > Network > RPC.
18. In the details pane, select the IP address, and click Open.
19. In the Configure RPC Node dialog box, select Secure.
20. Click OK.

Common network topologies

September 21, 2020

As described in the “Physical deployment mode” section in Where does a NetScaler appliance fit in the network?, you can deploy the NetScaler appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

Set up a common two-arm topology

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the appliance. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the appliance on a public subnet and the servers on a private subnet, and transparent mode, with both the appliance and the servers on the public network.

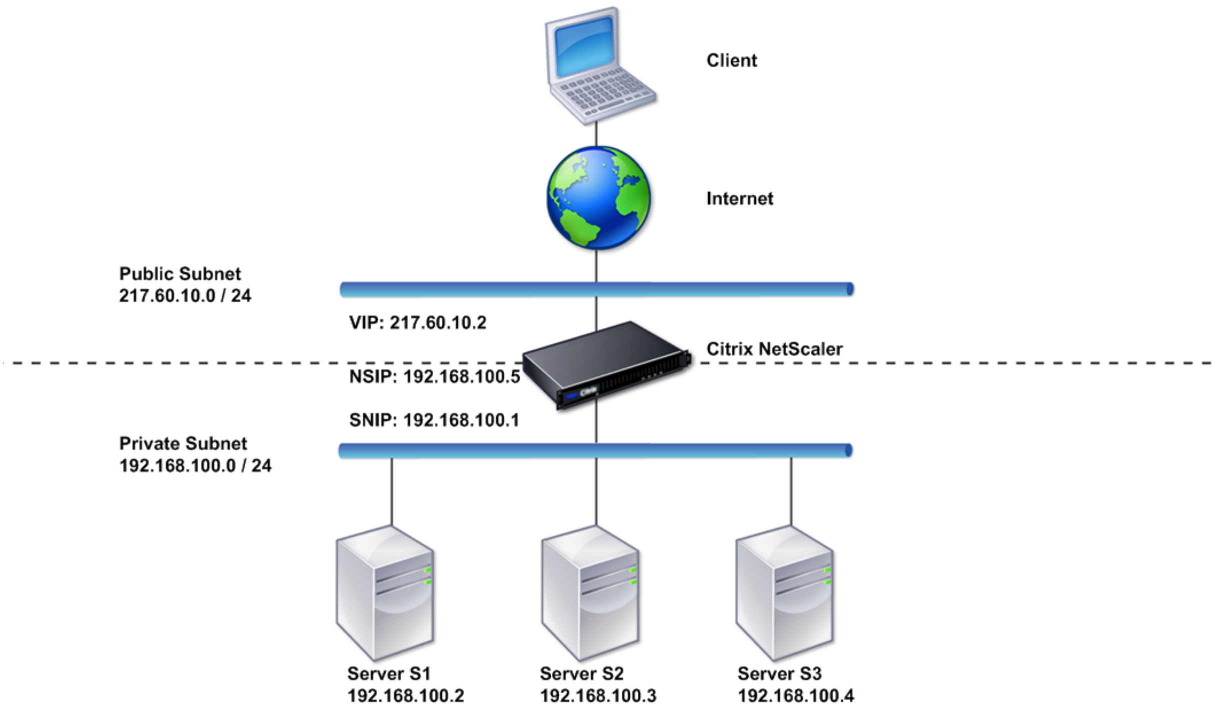
Set up a simple two-arm multiple subnet topology

One of the most commonly used topologies has the NetScaler appliance inline between the clients and the servers, with a virtual server configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider an appliance deployed in two-arm mode for managing servers S1, S2, and S3, with a virtual server of type HTTP configured on the appliance, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the appliance to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the appliance so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP is on public subnet 217.60.10.0, and the NSIP, the servers, and the SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets



Client
Internet
Public Subnet
217.60.10.0 / 24
VIP: 217.60.10.2
Citrix NetScaler
NSIP: 192.168.100.5
SNIP: 192.168.100.1
Private Subnet
192.168.100.0 / 24
Server S1
192.168.100.2
Server S2
192.168.100.3
Server S3
192.168.100.4

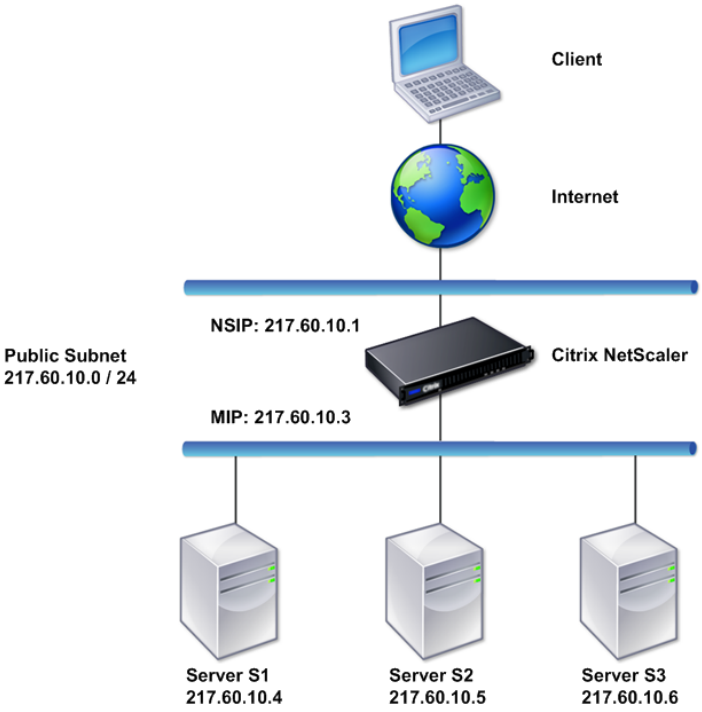
To deploy a NetScaler appliance in two-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Configure the SNIP, as described in Configuring Subnet IP Addresses.
3. Enable the USNIP option, as described in To enable or disable USNIP mode section.
4. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.
5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

Set up a simple two-arm transparent topology

Use transparent mode if the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 2. Topology Diagram for Two-Arm, Transparent Mode



Client
Internet
NSIP: 217.60.10.1
Public Subnet
217.60.10.0 / 24
Citrix NetScaler
MIP: 217.60.10.3
Server S1
217.60.10.4
Server S2
217.60.10.5
Server S3
217.60.10.6

To deploy a NetScaler appliance in two-arm, transparent mode, follow these steps

1. Configure the NSIP and default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Enable L2 mode, as described in Enabling and Disabling Layer 2 Mode.
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

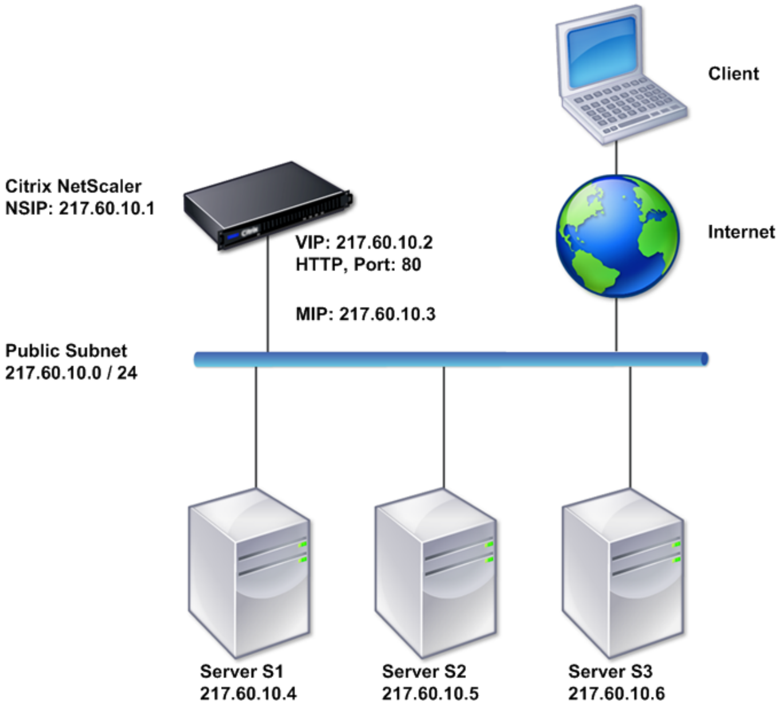
Set up common one-arm topologies

The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

Set up a simple one-arm single subnet topology

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3. A virtual server of type HTTP is configured on an ADC appliance, and HTTP services are running on the servers. As shown in the following figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 3. Topology Diagram for One-Arm Mode, Single Subnet



Client
Citrix NetScaler
NSIP: 217.60.10.1
VIP: 217.60.10.2
HTTP, Port: 80
Internet
MIP: 217.60.10.3
Public Subnet
217.60.10.0 / 24
Server S1
217.60.10.4
Server S2
217.60.10.5
Server S3
217.60.10.6

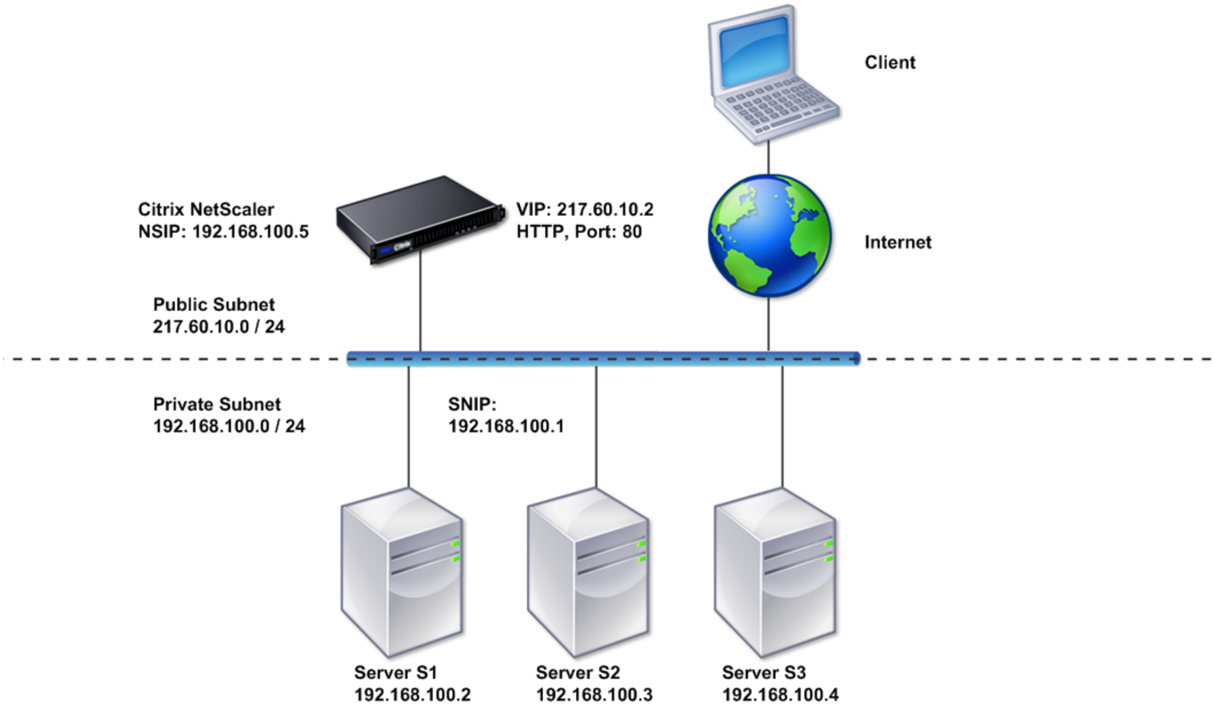
To deploy a NetScaler appliance in one-arm mode with a single subnet, follow these steps:

1. Configure the NSIP and the default gateway, as described in, as described in Configuring the NetScaler IP Address (NSIP).
2. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.
3. Connect one of the network interfaces to the switch.

Set up a simple one-arm multiple subnet topology

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A virtual server of type HTTP is configured on the appliance, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the appliance uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 4. Topology Diagram for One-Arm Mode, Multiple Subnets



Client
Citrix NetScaler
NSIP: 192.168.100.5
VIP: 217.60.10.2
HTTP, Port: 80
Internet
Public Subnet
217.60.10.0 / 24
Private Subnet
192.168.100.0 / 24
SNIP:
192.168.100.1
Server S1
192.168.100.2
Server S2
192.168.100.3
Server S3
192.168.100.4

To deploy a NetScaler appliance in one-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and the default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Configure the SNIP and enable the USNIP option, as described in Configuring Subnet IP Addresses.
3. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.
4. Connect one of the network interfaces to the switch.

System management settings

September 21, 2020

Once your initial configuration is in place, you can configure settings to define the behavior of the NetScaler appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler appliance. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the Citrix clock with a Network Time Protocol (NTP) server. The NetScaler appliance can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

System settings

September 21, 2020

Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a NetScaler appliance to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the NetScaler GUI.

You can modify the types of HTTP parameters described in the following table.

Parameter Type: HTTP Port Information

Specifies: The web server HTTP ports used by your managed servers. If you specify the ports, the appliance performs request switching for any client request that has a destination port matching a specified port.

> Note: If an incoming client request is not destined for a service or a virtual server that is specifically configured on the appliance, the destination port in the request must match one of the globally configured HTTP ports. This allows the appliance to perform connection keep-alive and server off-load.

Parameter Type: Limits

Specifies: The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if you set Max Connections to 500, and the appliance is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the appliance can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set Max Requests to 0.

> Note: If you are using the Apache HTTP server, you must set Max Connections equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.

Parameter Type: Client IP Insertion

Specifies: Enable/disable insertion of the client's IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a web server managed by an appliance receives a subnet IP address, the server identifies it as the client's IP address. Some applications need the client's IP address for logging purposes or to dynamically determine the content to be served by the web server.

You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the appliance. You can then access the inserted address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).

Parameter Type: Cookie Version

Specifies: The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.

Parameter Type: Requests/Responses

Specifies: Options for handling certain types of requests, and enable/disable logging of HTTP error responses.

Parameter Type: Server Header Insertion

Specifies: Insert a server header in NetScaler-generated HTTP responses.

To configure HTTP parameters by using the GUI, follow these steps:

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change HTTP parameters**.
3. In the **Configure HTTP parameters** dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click **OK**.

To set the FTP port range by using the GUI, follow these steps:

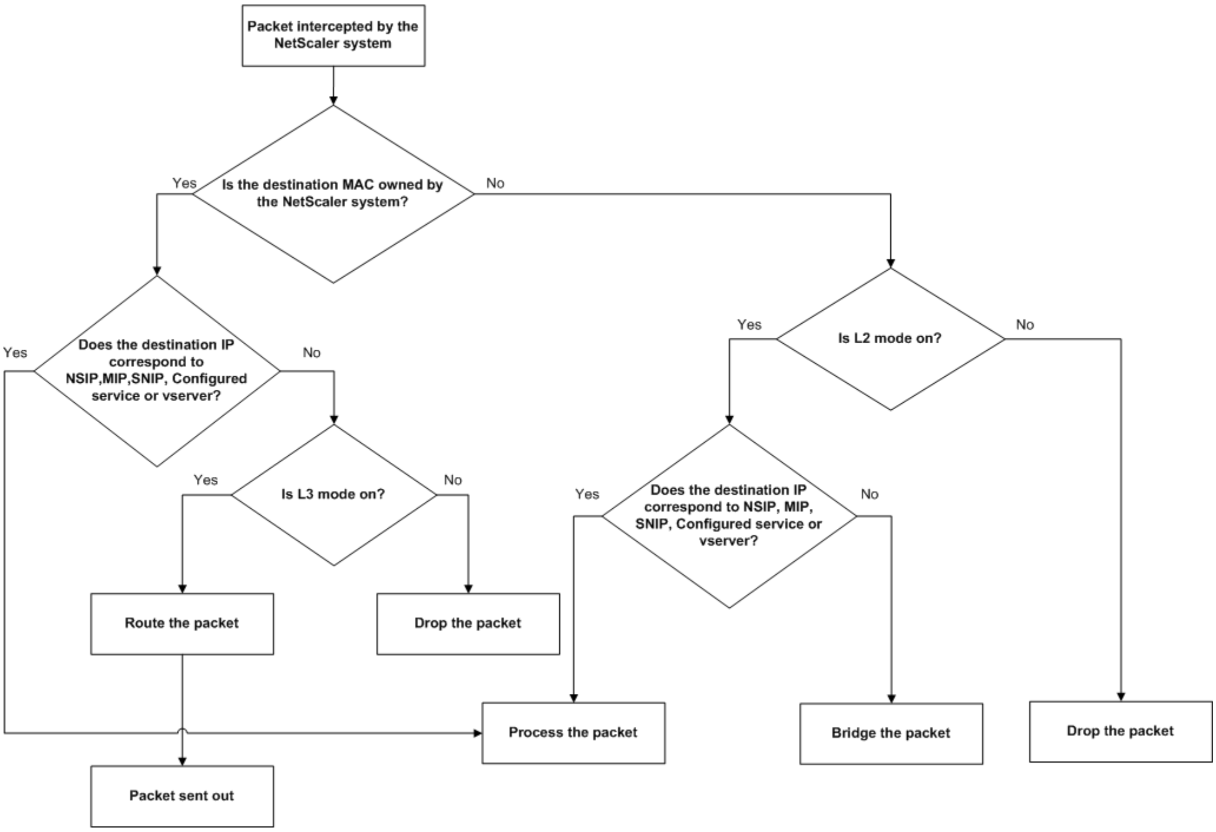
1. In the navigation pane, expand **System**, and then click **Settings**
2. In the details pane, under **Settings**, click **Change global system settings**.
3. Under **FTP Port Range,** in the **Start Port** and **End Port** text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click **OK**.

Packet forwarding modes

September 21, 2020

The NetScaler appliance can either route or bridge packets that are not destined for an IP address owned by the appliance (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured virtual server). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the appliance evaluates packets and either processes, routes, bridges, or drops them.

Figure 1. Interaction between Layer 2 and Layer 3 Modes



Packet intercepted by the NetScaler system
Is the destination MAC owned by the NetScaler system?
Yes
No
Does the destination IP correspond to NSIP,MIP,SNIP, Configured service or vserver?
Yes
No
Is L3 mode on?
Yes
No
Route the packet
Drop the packet
Process the packet
Packet sent out
Is L2 mode on?
Yes
No
Does the destination IP correspond to NSIP, MIP, SNIP, Configured service or vserver?
Yes
No
Bridge the packet
Drop the packet

An appliance can use the following modes to forward the packets it receives:

- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

Enable and disable layer 2 mode

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler appliance to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the appliance and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), the appliance drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with the appliance, Layer 2 mode must be disabled to prevent bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The appliance does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the appliance to the same broadcast domain.

To enable or disable Layer 2 mode by using the CLI

At the command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

  Examples

  ```
  > enable ns mode l2
  Done
  > show ns mode

  Mode Acronym Status
  ——- ——- ——
  1) Fast Ramp FR ON
  2) Layer 2 mode L2 ON
  .
  .
  .
  Done
  >

  > disable ns mode l2
  Done
  > show ns mode

  Mode Acronym Status
  ——- ——- ——
  1) Fast Ramp FR ON
  2) Layer 2 mode L2 OFF
  .
  .
  .
  Done
  >
  ```

To enable or disable Layer 2 mode by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes** and **Features**, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable Layer 2 mode, select the **Layer 2 Mode** check box. To disable Layer 2 mode, clear the check box.

4. Click **OK**. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click **Yes**.

Enable and disable layer 3 mode

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler appliance to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), the appliance performs route table lookups and forwards all packets that are not destined for any appliance-owned IP address. If you disable Layer 3 mode, the appliance drops these packets.

To enable or disable Layer 3 mode by using the CLI

At the command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

  Examples

  ```
  > enable ns mode l3
  Done
  > show ns mode

  Mode Acronym Status
  ——- ——- ——
  1) Fast Ramp FR ON
  2) Layer 2 mode L2 OFF
  .
  .
  .
  9) Layer 3 mode (ip forwarding) L3 ON
  .
  .
  .
  Done
  >

  > disable ns mode l3
  Done
  > show ns mode
  ```

```
Mode Acronym Status
——- ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
.
.
.
9) Layer 3 mode (ip forwarding) L3 OFF
.
.
.
Done
>
```

To enable or disable Layer 3 mode by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In the Configure Modes dialog box, to enable Layer 3 mode, select the Layer 3 Mode (IP Forwarding) check box. To disable Layer 3 mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

Enable and disable MAC based forwarding mode

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler appliance remembers the MAC address of the source. To avoid multiple lookups, the appliance caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the appliance ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

Figure 2. MAC-Based Forwarding Process

Request and
response flow

When MAC-based forwarding is enabled, the appliance caches the MAC address of:

- <The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- <The server that responds to the requests.

When a server responds through an appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when an appliance initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the appliance's default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

To enable or disable MAC-based forwarding by using the CLI

At the command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:

- <enable ns mode <Mode>
- <disable ns mode <Mode>
- <show ns mode
  Example

  "' pre codeblock

  > enable ns mode mbf
  > Done
  > show ns mode

  ```
  Mode                        Acronym            Status
  -------                     -------            ------   1)  Fast
      Ramp                  FR                 ON    2)  Layer 2

      MAC-based forwarding        MBF                ON    .    .    .
        Done   >
  ```

  > disable ns mode mbf
  > Done
  > show ns mode

  ```
  Mode                        Acronym            Status
  -------                     -------            ------   1)  Fast
      Ramp                  FR                 ON    2)  Layer 2
      mode               L2                OFF    .    .    .   6)
      MAC-based forwarding        MBF                OFF    .    .    .
         Done   >   <!--NeedCopy--> ```
  ```

To enable or disable MAC-based forwarding by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features** group, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable MAC-based forwarding mode, select the **MAC Based Forwarding** check box. To disable MAC-based forwarding mode, clear the check box.
4. Click **OK**. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click **Yes**.

Network interfaces

September 21, 2020

The NetScaler interfaces are numbered in slot/port notation. In addition to modifying the characteristics of individual interfaces, you can configure virtual LANs to restrict traffic to specific groups of hosts. You can also aggregate links into high-speed channels.

Virtual LANs

The NetScaler appliance supports (Layer 2) port and IEEE802.1Q tagged virtual LANs (VLANs). VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface to belong to multiple VLANs by using IEEE 802.1q tagging.

You can bind your configured VLANs to IP subnets. The ADC appliance (if it is configured as the default router for the hosts on the subnets) then performs IP forwarding between these VLANs.

The NetScaler appliance supports the following types of VLANs.

- Default VLAN

  By default, the network interfaces on a NetScaler appliance are included in a single, port-based VLAN as untagged network interfaces. This default VLAN has a VID of 1 and exists permanently. It cannot be deleted, and its VID cannot be changed.

- Port-Based VLANs

  A set of network interfaces that share a common, exclusive, Layer 2 broadcast domain define the membership of a port-based VLAN. You can configure multiple port-based VLANs. When you add an interface to a new VLAN as an untagged member, it is automatically removed from the default VLAN.

- Tagged VLAN

  A network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of only one VLAN (its native VLAN). The untagged network interface forwards the frames for the native VLAN as untagged frames. A tagged network interface can be a part of more than one VLAN. When you configure tagging, be sure that both ends of the link have matching VLAN settings. You can use the configuration utility to define a tagged VLAN (nsvlan) that can have any ports bound as tagged members of the VLAN. Configuring this VLAN requires a reboot of the ADC appliance and therefore must be done during initial network configuration.

Link aggregate channels

Link aggregation combines incoming data from multiple ports into a single high speed link. Configuring the link aggregate channel increases the capacity and availability of the communication channel between a NetScaler appliance and other connected devices. An aggregated link is also referred to as a channel.

When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to only one channel. Binding a network interface to a link aggregate channel changes the VLAN configuration. That is, binding network interfaces to a channel removes them from the VLANs that they originally belonged to and adds them to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you have bound network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then you bind them to link aggregate channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them to VLAN 2.

Note: You can also use Link Aggregation Control Protocol (LACP) to configure link aggregation. For more information, see Configuring Link Aggregation by Using the Link Aggregation Control Protocol.

Clock synchronization

September 21, 2020

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the appliance periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at http://www.ntp.org.

To configure clock synchronization on your appliance, follow these steps:

1. Log on to the command line and enter the shell command.
2. At the shell prompt, copy the ntp.conf file from the /etc directory to the /nsconfig directory. If the file already exists in the /nsconfig directory, make sure that you remove the following entries from the ntp.conf file:

   restrict localhost

   restrict 127.0.0.2

These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler appliance.

3. Edit /nsconfig/ntp.conf by typing the IP address for the desired NTP server under the file's server and restrict entries.
4. Create a file named rc.netscaler in the /nsconfig directory, if the file does not already exist in the directory.
5. Edit /nsconfig/rc.netscaler by adding the following entry: /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

   This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the /var/log directory.

   Note: If the time difference between the NetScaler appliance and the time server is more than 1000 sec, the ntpd service terminates with a message to the ADC log. To avoid this, you need to start ntpd with the
   -g option, which forcibly syncs the time. Add the following entry in
   /nsconfig/rc.netscaler:

   /usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

   If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start ntpd again. You can check the time difference between the appliance and the time server by running the following command in the shell:

   ```
   ntpdate -q <IP address or domain name of the NTP server>
   <!--NeedCopy-->
   ```

6. Reboot the appliance to enable clock synchronization.

   Note: If you want to start time synchronization before you restart the appliance, enter the following command (which you added to the rc.netscaler file in step 5) at the shell prompt:

   ```
   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ ntpd.log &
   <!--NeedCopy-->
   ```

DNS configuration

September 21, 2020

You can configure a NetScaler appliance to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records, AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the appliance can balance the load on external DNS servers.

A common practice is to configure an appliance as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing virtual server as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the appliance load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method.

Add a name server by using the CLI

At the command prompt, type the following commands to add a name server and verify the configuration:

- <add dns nameServer <IP>
- <show dns nameServer <IP>

  Example

  “‘ pre codeblock

  ```
  add dns nameServer 10.102.29.10
  Done
  show dns nameServer 10.102.29.10
  1) 10.102.29.10 - State: DOWN
  Done
  ```

  “‘

Add a name server by using the GUI

1. Navigate to **Traffic Management** > **DNS** > **Name Servers**.
2. In the details pane, click **Add**.
3. In the **Create Name Server** dialog box, select **IP Address**.
4. In the **IP Address** text box, type the IP address of the name server (for example, 10.102.29.10). If you are adding an external name server, clear the **Local** check box.
5. Click **Create**, and then click **Close**.
6. Verify that the name server you added appears in the **Name Servers** pane.

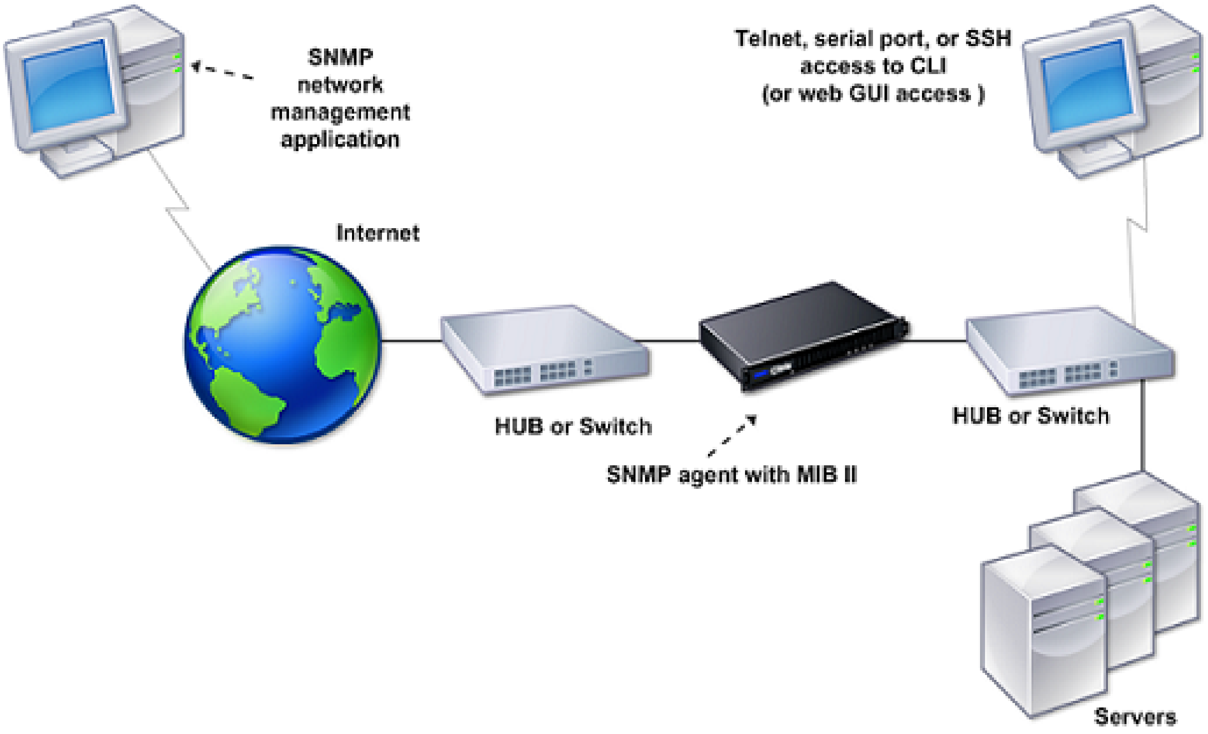
SNMP configuration

September 21, 2020

The Simple Network Management Protocol (SNMP) network management application, running on an external computer, queries the SNMP agent on the NetScaler appliance. The agent searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that condition. The following figure shows a network with a NetScaler appliance that has SNMP enabled and configured.

Figure 1. SNMP on the NetScaler appliance



The SNMP agent on a NetScaler appliance supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the ADC appliance) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler appliance supports the following enterprise-specific MIBs:

- A subset of standard MIB-2 groups. Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- A system enterprise MIB. Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

Add SNMP managers

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access an appliance. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the appliance, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks. To add an SNMP manager by using the CLI

At the command prompt, type the following commands to add an SNMP manager and verify the configuration:

```
add snmp manager <IPAddress> ... [-netmask <netmask>]
```

```
s********how snmp manager******** <IPAddress>
```

Example:

```
add snmp manager 10.102.29.5 -netmask 255.255.255.255`
Done
show snmp manager 10.102.29.5
10.102.29.5 255.255.255.255
Done
<!--NeedCopy-->
```

To add an SNMP manager by using the GUI:

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Managers**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Manager** dialog box, in the **IP Address** text box, type the IP address of the workstation running the management application (for example, 10.102.29.5).
4. Click **Create**, and then click **Close**.
5. Verify that the SNMP manager you added appears in the **Details** section at the bottom of the pane.

Add SNMP traps listeners

After configuring the alarms, you need to specify the trap listener to which the appliance will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

To add an SNMP trap listener by using the CLI

At the command prompt, type the following command to add an SNMP trap and verify that it has been added:

- `add snmp trap specific <IP>`
- `show snmp trap`

Example:

```
add snmp trap specific 10.102.29.3
Done
show snmp trap
Trap type: SPECIFIC
Destination IP: 10.102.29.3
TD: 0
Destination Port: 162
Source IP: NetScaler IP
Version: V2
Min-Severity: -
AllPartition: DISABLED
Community: public
<!--NeedCopy-->
```

To add an SNMP trap listener by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Traps.
2. In the details pane, click Add.
3. In the Create SNMP Trap Destination dialog box, in the Destination IP Address text box, type the IP address (for example, 10.102.29.3).
4. Click Create and then click Close.
5. Verify that the SNMP trap you added appears in the Details section at the bottom of the pane.

Configure SNMP alarms

You configure alarms so that the appliance generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the appliance will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the appliance will not generate a trap message when a login failure occurs.

To enable or disable an alarm by using the CLI

At the command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

- `set snmp alarm <trapName> [-state ENABLED | DISABLED]`
- `show snmp alarm <trapName>`

Example:

```
set snmp alarm LOGIN-FAILURE -state ENABLED
Done
show snmp alarm LOGIN-FAILURE
Alarm Alarm Threshold Normal Threshold Time State Severity Logging
\----- --------------- ---------------- ---- --------- ----------
   --------
1\) LOGIN-FAILURE N/A N/A N/A ENABLED - ENABLED
Done
<!--NeedCopy-->
```

To set the severity of the alarm by using the CLI

At the command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- `set snmp alarm <trapName> [-severity <severity>]`
- `show snmp alarm <trapName>`

Example:

```
set snmp alarm LOGIN-FAILURE -severity Major
Done
show snmp alarm LOGIN-FAILURE
```

```
Alarm Alarm Threshold Normal Threshold Time State Severity Logging
\----- ---------------- ----------------- ---- --------- ----------
    --------
\) LOGIN-FAILURE N/A N/A N/A ENABLED Major ENABLED
Done
<!--NeedCopy-->
```

To configure alarms by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Alarms.
2. In the details pane, select an alarm (for example, LOGIN-FAILURE), and then click Open.
3. In the Configure SNMP Alarm dialog box, to enable the alarm, select Enabled in the State drop-down list. To disable the alarm, select Disabled.
4. In the Severity drop-down list, select a severity option (for example, Major).
5. Click OK, and then click Close.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the Details section at the bottom of the pane.

Verify configuration

September 21, 2020

After you've finished configuring your system, complete the following checklists to verify your configuration.

Configuration checklist

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build's release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch's port.
- Enough SNIP IP addresses have been configured to support all server-side connections during peak times.
  - The number of configured SNIP IP addresses is:____
  - The expected number of simultaneous server connections is:
    [ ] 62,000 [ ] 124,000 [ ] Other____

Topology configuration checklist

The routes have been used to resolve servers on other subnets.

The routes entered are:

____

- If the NetScaler appliance is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the ADC appliance resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

____

- If the ADC appliance is placed behind an external load balancer, then the load balancing policy on the external load balancer is not "least connection."

  The load balancing policy configured on the external load balancer is:

  ____

- If the ADC appliance is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

  Note: The TCP idle connection timeout on a NetScaler appliance is 360 seconds. If the timeout on the firewall is also set to 300 seconds or more, then the appliance can perform TCP connection multiplexing effectively because connections will not be closed earlier.

  The value configured for the session time-out is: ___________________

Server configuration checklist

- "Keep-alive" has been enabled on all the servers.

  The value configured for the keep-alive time-out is: ___________________

- The default gateway has been set to the correct value. (The default gateway should either be a NetScaler appliance or upstream router.) The default gateway is:

  ____

- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.

  ____

- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.
- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler appliance.

The MaxConn (maximum number of connections) value that has been set is:

____

- If a Netscape Enterprise Server is used, the maximum requests per connection parameter is set on the NetScaler appliance. The maximum requests per connection value that has been set is:

  ____

Software features configuration checklist

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in parallel with a NetScaler appliance.)

  Reason for enabling or disabling:

  ____

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is different, it should be disabled.)

  Reason for enabling or disabling:

  ____

- <Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)

  Reason for enabling or disabling:

  ____

- Do the default settings of the surge protection feature need to be changed?

  Reason for changing or not changing:

  ____

Access checklist

- The system IPs can be pinged from the client-side network.
- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

> Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.

Firewall checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

Load balance traffic on a NetScaler appliance

September 21, 2020

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A NetScaler appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

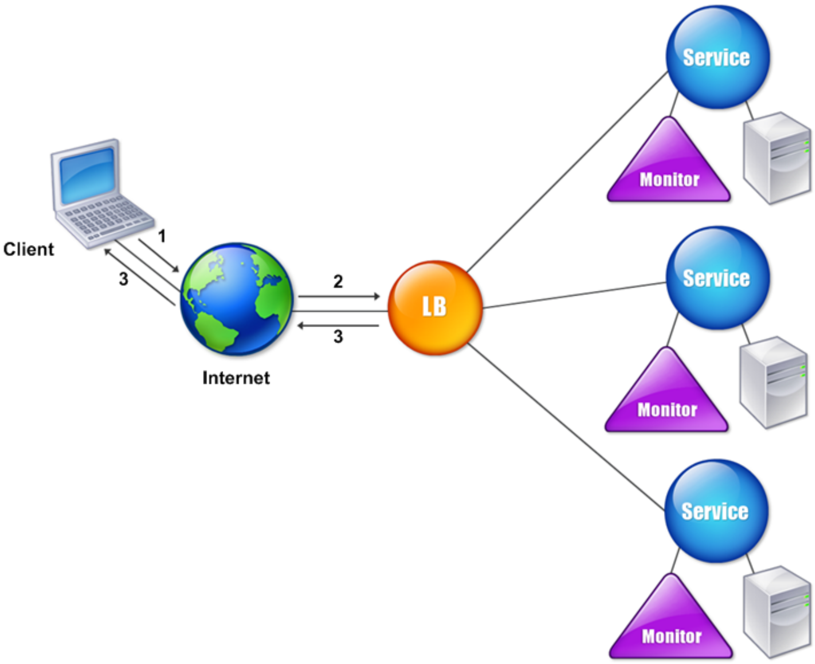
To configure load balancing, you define a virtual server to proxy multiple servers in a server farm and balance the load among them.

When a client initiates a connection to the server, a virtual server terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler appliance uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture



The entities function as follows:

- **Virtual server**. An entity that is represented by an IP address, a port, and a protocol. The virtual server IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The virtual server represents a bank of servers.
- **Service**. A logical representation of a server or an application running on a server. Identifies the server's IP address, a port, and a protocol. The services are bound to the virtual servers.
- **Server object**. An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create services by using the server object.
- **Monitor**. An entity that tracks the health of the services. The appliance periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The appliance then performs load balancing among the remaining services.

Load balancing

September 21, 2020

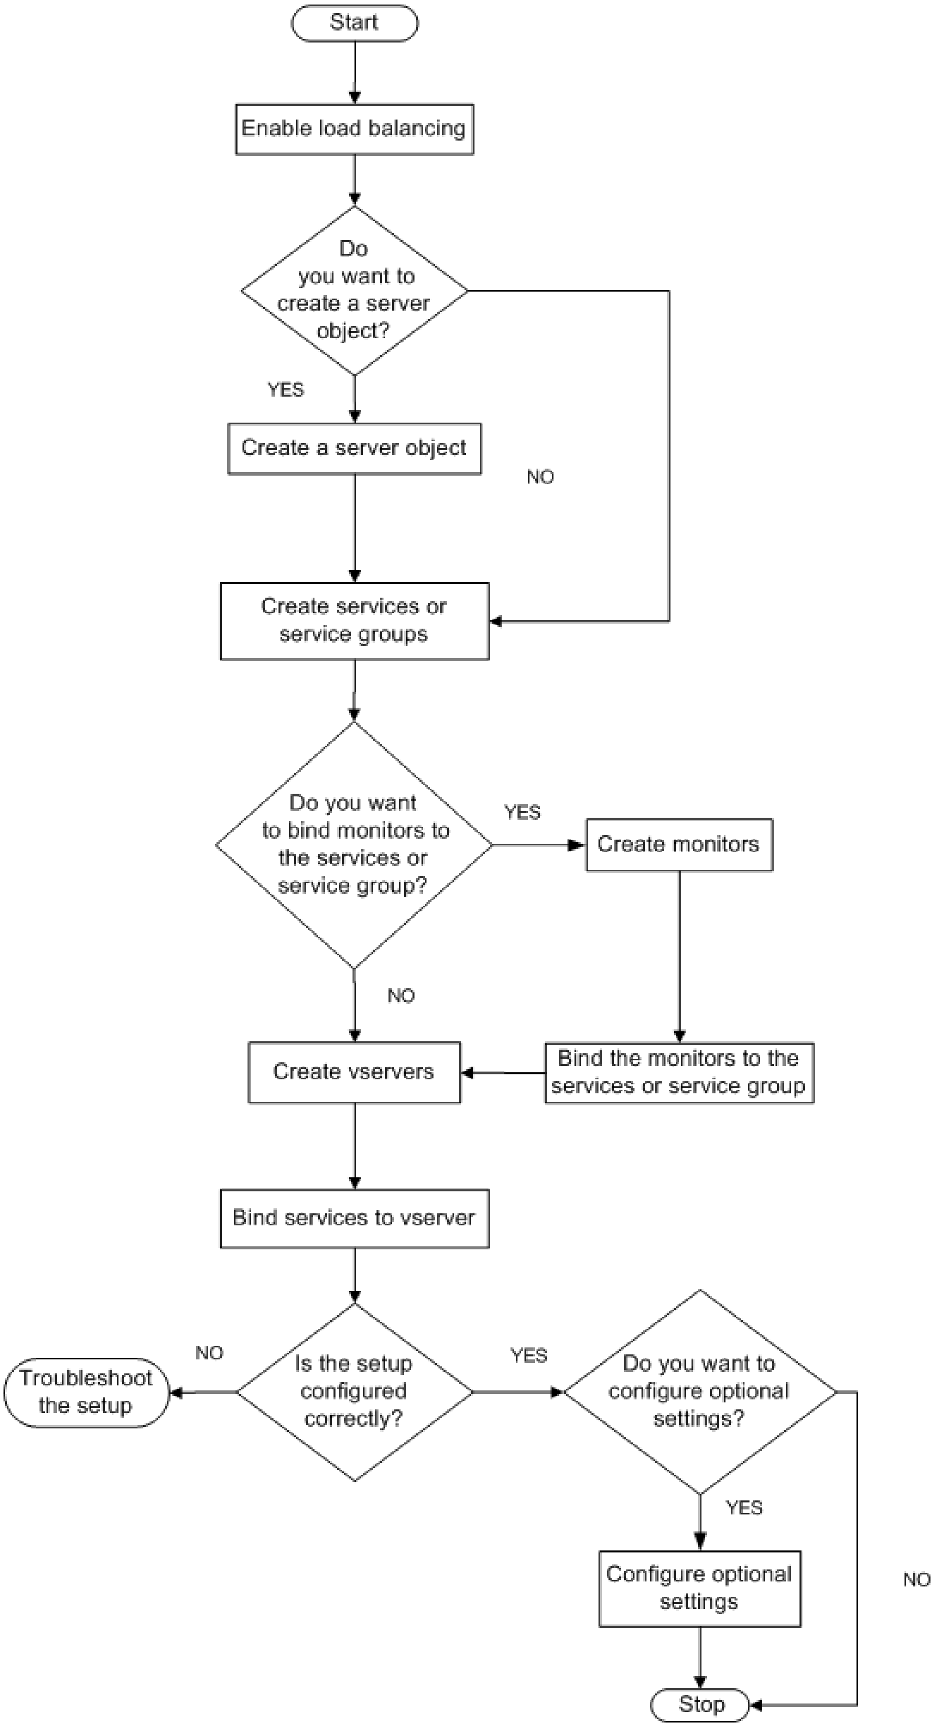
To configure load balancing, you must first create services. Then, you create virtual servers and bind the services to the virtual servers. By default, the NetScaler appliance binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

> Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the
> stat lb vserver <vserverName> command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.

The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing



Start
Enable load balancing
Do you want to create a server object?
YES
NO
Create a server object
Create services or service groups
Do you want to bind monitors to the services or service group?
YES
Create monitors
NO
Create vservers
Bind the monitors to the services or service group
Bind services to vserver
NO
Troubleshoot the setup
Is the setup configured correctly?
YES
Do you want to configure optional settings?
YES
NO
Configure optional settings
Stop

Enable load balancing

Before configuring load balancing, make sure that the load balancing feature is enabled.

To enable load balancing by using the CLI

At the command prompt, type the following commands to enable load balancing and verify that it is enabled:

- enable feature lb
- show feature

  Example

  “‘ pre codeblock

  > enable feature lb
  > Done
  > show feature

```
Feature                   Acronym          Status
-------                   -------          ------    1)  Web
    Logging                 WL               OFF   2)  Surge
    Protection            SP               OFF   3)  Load Balancing
              LB                ON    .   .   .   9)  SSL
    Offloading              SSL              ON    .   .   .  Done
    <!--NeedCopy--> ```
```

To enable load balancing by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Load Balancing check box, and then click OK.
4. In the Enable/Disable Feature(s)? message, click Yes.

Configure services and a virtual server

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing virtual server, and binding the service objects to the virtual server.

To implement the initial load balancing configuration by using the CLI

At the command prompt, type the following commands to implement and verify the initial configuration:

- <add service <name> <IPaddress> <serviceType> <port>
- <add lb vserver <vServerName> <serviceType> [<IPaddress> <port>]
- <bind lb vserver <name> <serviceName>
- <show service bindings <serviceName>

  Example

```
> add service service-HTTP-1 10.102.29.5 HTTP 80
 Done
> add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
 Done
> bind lb vserver vserver-LB-1 service-HTTP-1
 Done
> show service bindings service-HTTP-1
   service-HTTP-1 (10.102.29.5:80) - State : DOWN

     1)      vserver-LB-1 (10.102.29.60:80) - State : DOWN
 Done
<!--NeedCopy-->
```

To implement the initial load balancing configuration by using the GUI

1. Navigate to Traffic Management > Load Balancing.
2. In the details pane, under Getting Started, click Load Balancing wizard, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand Load Balancing, and then click Virtual Servers.
4. Select the virtual server that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click Open.
6. Verify that each service is bound to the virtual server by confirming that the Active check box is selected for each service on the Services tab.

Persistence settings

September 21, 2020

You must configure persistence on a virtual server if you want to maintain the states of connections on the servers represented by that virtual server (for example, connections used in e-commerce). The appliance then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the appliance uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

Persistence Type	Persistent Connections
Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP	250K
CookieInsert, URL passive, Custom Server ID	Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.

Table 1. Limitations on Number of Simultaneous Persistent Connections

If the configured persistence cannot be maintained because of a lack of resources on an appliance, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain virtual servers. The following table shows the relationship.

Persistence TypeHeader 1	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
Source IP	YES	YES	YES	YES	YES
CookieInsert	YES	YES	NO	NO	NO
SSL Session ID	NO	YES	NO	NO	YES
URL Passive	YES	YES	NO	NO	NO
Custom Server ID	YES	YES	NO	NO	NO
Rule	YES	YES	NO	NO	NO

Persistence TypeHeader 1	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
SRCIPDESTIP	N/A	N/A	YES	YES	N/A
DESTIP	N/A	N/A	YES	YES	N/A

Table 2. Persistence Types Available for Each Type of Virtual Server

You can also specify persistence for a group of virtual servers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which virtual server in the group receives the client request. When the configured time for persistence elapses, any virtual server in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs.

Configure persistence based on cookies

When you enable persistence based on cookies, the the NetScaler appliance adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the ADC uses it to select the service for those requests. You can use this type of persistence on virtual servers of type HTTP or HTTPS.

The NetScaler appliance inserts the cookie <NSC_XXXX>= <ServiceIP> <ServicePort>

where:

- <<NSC_XXXX> is the virtual server ID that is derived from the virtual server name.
- <<ServiceIP> is the hexadecimal value of the IP address of the service.
- <<ServicePort> is the hexadecimal value of the port of the service.

The ADC encrypts ServiceIP and ServicePort when it inserts a cookie, and decrypts them when it receives a cookie.

Note: If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the ADC appliance sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler appliance inserts the absolute Coordinated Universal Time (GMT) of the cookie's expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on an ADC appliance, and the timeout value.
- If an HTTP cookie version 1 is used, the ADC appliance inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the ADC appliance does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can change the HTTP cookie version.

To change the HTTP cookie version by using the CLI

At the command prompt, type;

```
set ns param [-cookieversion ( 0 | 1 )]
<!--NeedCopy-->
```

Example:

```
set ns param -cookieversion 1
<!--NeedCopy-->
```

To change the HTTP cookie version by using the GUI

1. Navigate to System > Settings.
2. <In the details pane, click Change HTTP Parameters.
3. <In the Configure HTTP Parameters dialog box, under Cookie, select Version 0 or Version 1.

Note: For information about the parameters, see
Configuring Persistence Based on Cookies.

To configure persistence based on cookies by using the CLI

At the command prompt, type the following commands to configure persistence based on cookies and verify the configuration:

```
set lb vserver <name> -persistenceType COOKIEINSERT

show lb vserver <name>
<!--NeedCopy-->
```

Example:

```
set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
Done
show lb vserver vserver-LB-1
    vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    .
    .
    .
    Persistence: COOKIEINSERT (version 0)
    Persistence Timeout: 2 min
    .
    .
    .
 Done
<!--NeedCopy-->
```

To configure persistence based on cookies by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select COOKIEINSERT.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. Click OK.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure persistence based on server IDs in URLs

The NetScaler appliance can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the ADC extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and port specified as a hexadecimal number. The ADC extracts the server ID from subsequent client requests and uses it to select the server.

URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see "Policy Configuration and Reference."

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

Example: Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request,after matching token sid=. Thus, a request with the URL `http://www.citrix.com/index.asp?\\&sid;=c0a864100050` is directed to the server with the IP address10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

> Note: For information about the parameters, see
> Load Balancing.

To configure persistence based on server IDs in URLs by using the CLI

At the command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

```
set lb vserver <name> -persistenceType URLPASSIVE

show lb vserver <name>
<!--NeedCopy-->
```

Example:

```
set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
Done
show lb vserver vserver-LB-1
    vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    .
    .
    .
    Persistence: URLPASSIVE
    Persistence Timeout: 2 min
    .
    .
    .
Done
```

```
<!--NeedCopy-->
```

To configure persistence based on server IDs in URLs by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select URLPASSIVE.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. In the Rule text box, enter a valid expression. Alternatively, click Configure next to the Rule text box and use the Create Expression dialog box to create an expression.
6. Click OK.
7. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure features to protect the load balancing configuration

September 21, 2020

You can configure URL redirection to provide notifications of virtual server malfunctions, and you can configure backup virtual servers to take over if a primary virtual server becomes unavailable.

Configure URL redirection

You can configure a redirect URL to communicate the status of the appliance in the event that a virtual server of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The appliance uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup virtual servers are down.

To configure a virtual server to redirect client requests to a URL by using the CLI

At the command prompt, type the following commands to configure a virtual server to redirect client requests to a URL and verify the configuration:

- <set lb vserver <name> -redirectURL <URL>
- <show lb vserver <name>

  Example

```
> set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
 Done
> show lb vserver vserver-LB-1
    vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    State: DOWN
    Last state change was at Wed Jun 17 08:56:34 2009 (+666 ms)
    .
    .
    .
    Redirect URL: http://www.newdomain.com/mysite/maintenance
    .
    .
    .
 Done
>

<!--NeedCopy-->
```

To configure a virtual server to redirect client requests to a URL by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure URL redirection (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Redirect URL text box, type the URL (for example, `http://www.newdomain.com/mysite/maintenance`, and then click OK.
4. Verify that the redirect URL you configured for the server appears in the Details section at the bottom of the pane.

Configure backup virtual servers

If the primary virtual server is down or disabled, the appliance can direct the connections or client requests to a backup virtual server that forwards the client traffic to the services. The appliance can also send a notification message to the client regarding the site outage or maintenance. The backup virtual server is a proxy and is transparent to the client.

You can configure a backup virtual server when you create a virtual server or when you change the optional parameters of an existing virtual server. You can also configure a backup virtual server for an existing backup virtual server, thus creating a cascaded backup virtual server. The maximum depth of cascading backup virtual servers is 10. The appliance searches for a backup virtual server that is up and accesses that virtual server to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup virtual servers are down or have reached their thresholds for handling requests.

Note: If no backup virtual server exists, an error message appears, unless the virtual server is configured with a redirect URL. If both a backup virtual server and a redirect URL are configured, the backup virtual server takes precedence.

To configure a backup virtual server by using the CLI

At the command prompt, type the following commands to configure a backup server and verify the configuration:

- <set lb vserver <name> [-backupVserver <string>]
- <show lb vserver <name>

Example

```
> set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
 Done
> show lb vserver vserver-LB-1
    vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    State: DOWN
    Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
    .
    .
    .
    Backup: vserver-LB-2
    .
    .
    .
 Done
>
```

```

<!--NeedCopy-->
```

To set up a backup virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure the backup virtual server (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Backup Virtual Server list, select the backup virtual server (for example, vserver-LB-2, and then click OK.
4. Verify that the backup virtual server you configured appears in the Details section at the bottom of the pane.
   Note: If the primary server goes down and then comes back up, and you want the backup virtual server to function as the primary server until you explicitly reestablish the primary virtual server, select the
   Disable Primary When Down check box.

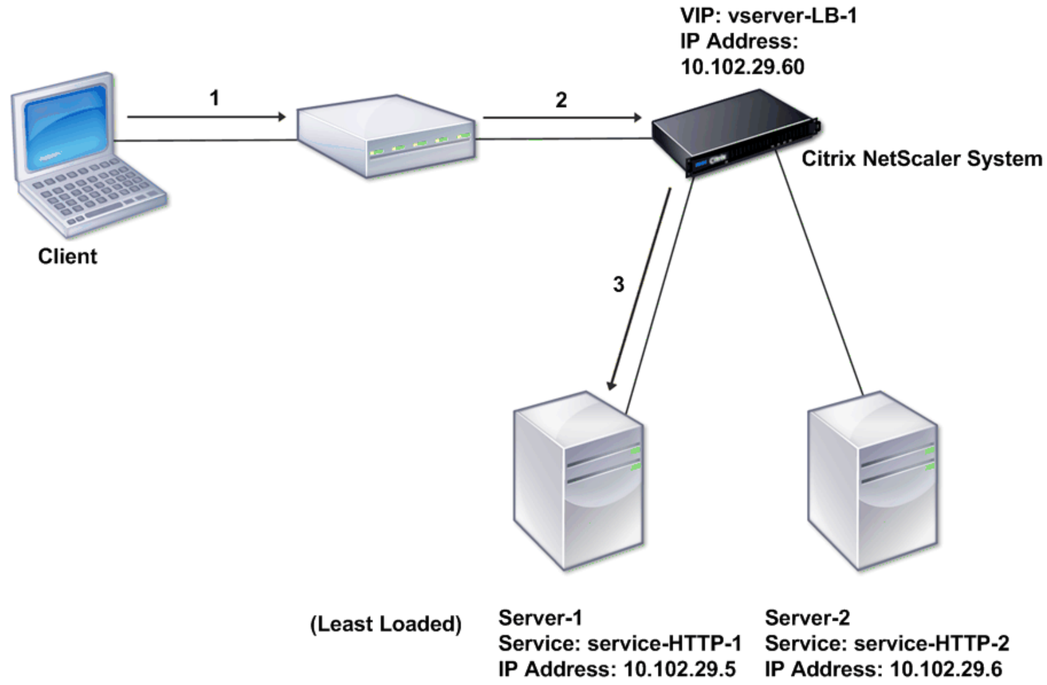
A typical load balancing scenario

September 21, 2020

In a load balancing setup, the NetScaler appliances are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology



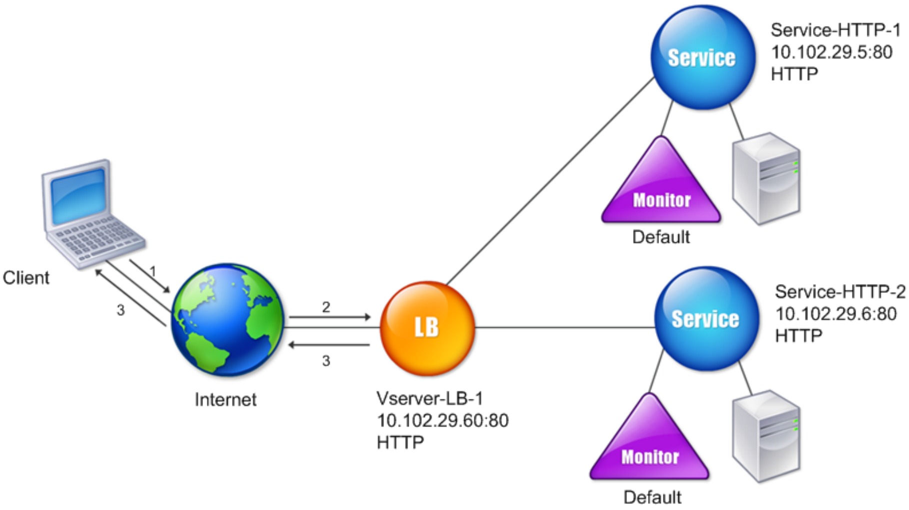
VIP: vserver-LB-1
IP Address:
10.102.29.60
1
2
Citrix NetScaler System
Client
3
(Least Loaded)
Server-1
Service: service-HTTP-1
IP Address: 10.102.29.5
Server-2
Service: service-HTTP-2
IP Address: 10.102.29.6

The virtual server selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the virtual server named virtual server-LB-1. Virtual server-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

Table 1. LB Configuration Parameter Values

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model



Service
Service-HTTP-1
10.102.29.5:80
HTTP
Monitor

LB
Vserver-LB-1
10.102.29.60:80
HTTP
Service
Service-HTTP-2
10.102.29.6:80
HTTP
Monitor
Default

The following tables list the commands used to configure this load balancing setup by using the command line interface.

Task	Command
To enable load balancing	enable feature lb
To create a service named service-HTTP-1	add service service-HTTP-1 10.102.29.5 HTTP 80
To create a service named service-HTTP-2	add service service-HTTP-2 10.102.29.6 HTTP 80
To create a virtual server named vserver-LB-1	add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
To bind a service named service-HTTP-1 to a virtual server named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-1
To bind a service named service-HTTP-2 to a virtual server named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-2

Table 2. Initial Configuration Tasks

For more information about the initial configuration tasks, see Setting Up Basic Load Balancing.

Task	Command
To view the properties of a virtual server named vserver-LB-1	show lb vserver vserver-LB-1
To view the statistics of a virtual server named vserver-LB-1	stat lb vserver vserver-LB-1
To view the properties of a service named service-HTTP-1	show service service-HTTP-1
To view the statistics of a service named service-HTTP-1	stat service service-HTTP-1
To view the bindings of a service named service-HTTP-1	show service bindings service-HTTP-1

Table 3. Verification Tasks

Task	Command
To configure persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2
To configure COOKIEINSERT persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
To configure URLPassive persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
To configure a virtual server to redirect the client request to a URL on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -redirectURL `http://www.newdomain.com/mysite/maintenance`
To set a backup virtual server on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -backupVserver vserver-LB-2

Table 4. Customization Tasks

For more information about configuring persistence, see Choosing and Configuring Persistence Settings. For information about configuring a virtual server to redirect a client request to a URL and setting up a backup virtual server, see Configuring Features to Protect the Load Balancing Configuration.

Accelerate load balanced traffic by using compression

September 21, 2020

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the NetScaler appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

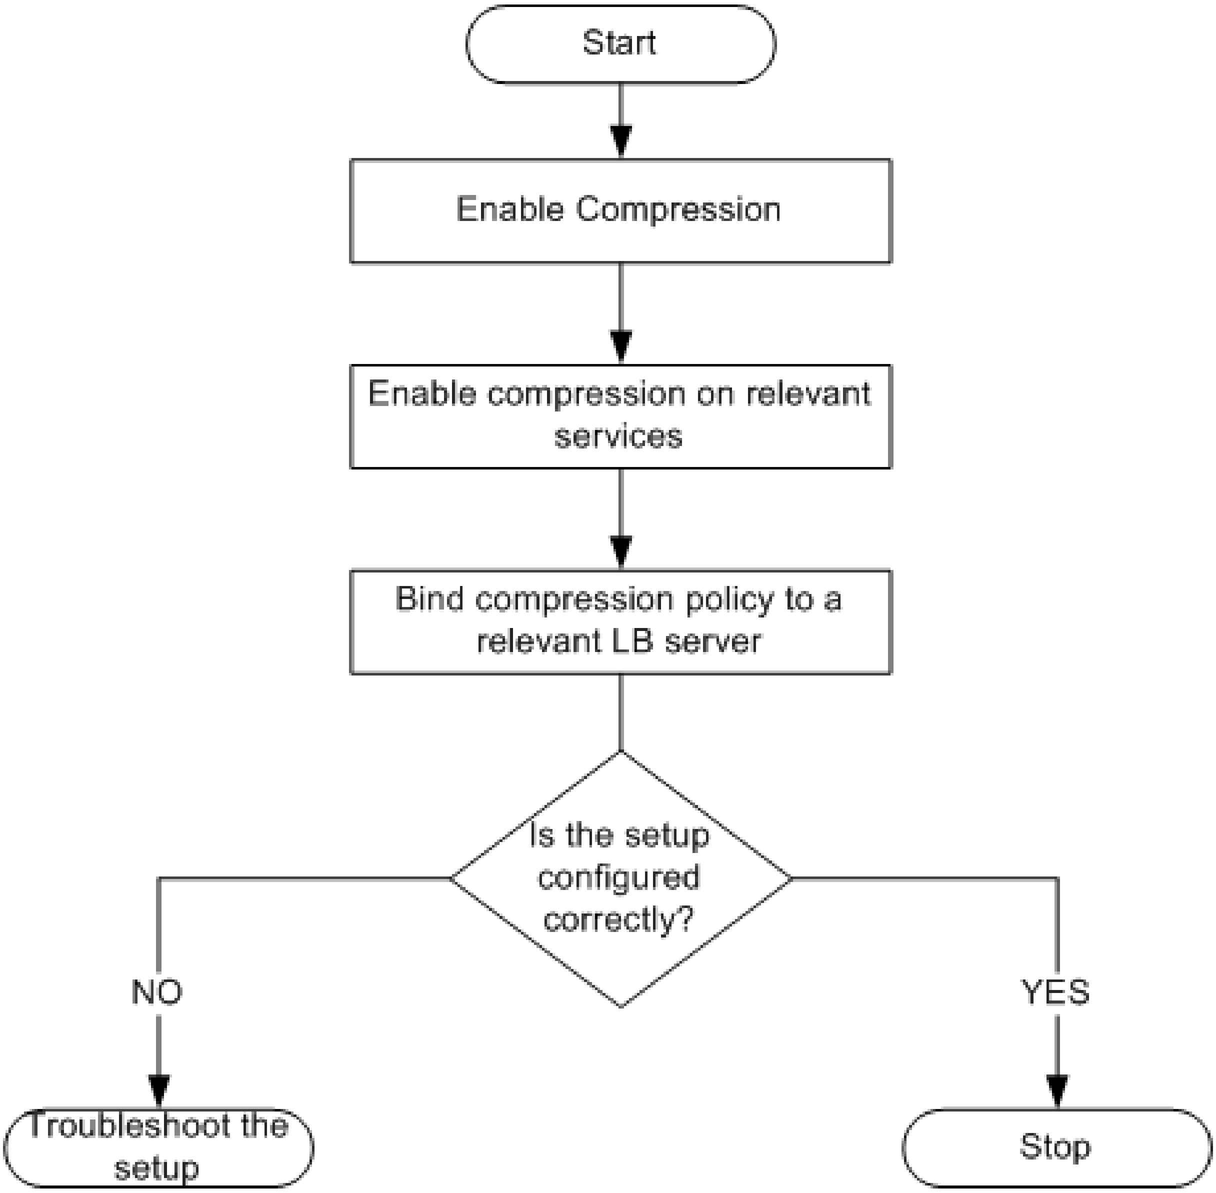
NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switching, you should bind the polices to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

Compression configuration task sequence

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression



Start
Enable Compression
Enable compression on relevant services
Bind compression policy to a relevant LB server
Is the setup configured correctly?
NO
YES
Troubleshoot the setup
Stop

> Note: The steps in the above figure assume that load balancing has already been configured.

Enable compression

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

To enable compression by using the CLI

At the command prompt, type the following commands to enable compression and verify the configuration:

- enable ns feature CMP
- show ns feature

```
> enable ns feature CMP

Done

> show ns feature

       Feature                        Acronym              Status

       -------                        -------              ------

1)     Web Logging                    WL                   ON

2)     Surge Protection               SP                   OFF

.

7) Compression Control CMP ON

8)     Priority Queuing               PQ                   OFF

.

Done
```

To enable compression by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Compression check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click Yes.

Configure services to compress data

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed.

To enable compression on a service by using the CLI

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- set service <name> -CMP YES
- show service <name>

```
> show service SVC_HTTP1

SVC_HTTP1 (10.102.29.18:80) - HTTP

State: UP

Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)

```

To enable compression on a service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to configure compression (for example, service-HTTP-1), and then click Open.
3. On the Advanced tab, under Settings, select the Compression check box, and then click OK.
4. Verify that, when the service is selected, HTTP Compression(CMP): ON appears in the **Details** section at the bottom of the pane.

Bind a compression policy to a virtual server

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the Configure Virtual Server (Load Balancing) dialog box or from the Compression Policy Manager dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the Configure Virtual Server (Load Balancing) dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the Compression Policy Manager dialog box, see Configuring and Binding Policies with the Policy Manager.

To bind or unbind a compression policy to a virtual server by using the command line

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

(bind	unbind) lb vserver <name> -policyName <string>

-
- show lb vserver <name>

Example:

```
      bind lb vserver lbvip -policyName ns_cmp_msapp
  Done
 > show lb vserver lbvip
 lbvip (8.7.6.6:80) - HTTP Type: ADDRESS
 State: UP
 Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
 Time since last state change: 19 days, 04:26:50.470
 Effective State: UP
 Client Idle Timeout: 180 sec
 Down state flush: ENABLED
 Disable Primary Vserver On Down : DISABLED
 Port Rewrite : DISABLED
 No. of Bound Services : 1 (Total) 1 (Active)
 Configured Method: LEASTCONNECTION
 Current Method: Round Robin, Reason: Bound service's state changed to UP
 Mode: IP
 Persistence: NONE
 Vserver IP and Port insertion: OFF
 Push: DISABLED Push VServer:
 Push Multi Clients: NO
 Push Label Rule:

 Bound Service Groups:
 1) Group Name: Service-Group-1

 1) Service-Group-1 (10.102.29.252: 80) - HTTP State: UP Weight: 1

 1) Policy : ns_cmp_msapp Priority:0
 Done
<!--NeedCopy-->
```

To bind or unbind a compression policy to a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, Vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Policies tab, click Compression.
4. Do one of the following:
   - To bind a compression policy, click Insert Policy, and then select the policy you want to bind to the virtual server.

  - To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click Unbind Policy.
5. Click OK.

Secure load balanced traffic by using SSL

September 21, 2020

The NetScaler SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

For detailed information about SSL offloading, see SSL offload and acceleration.

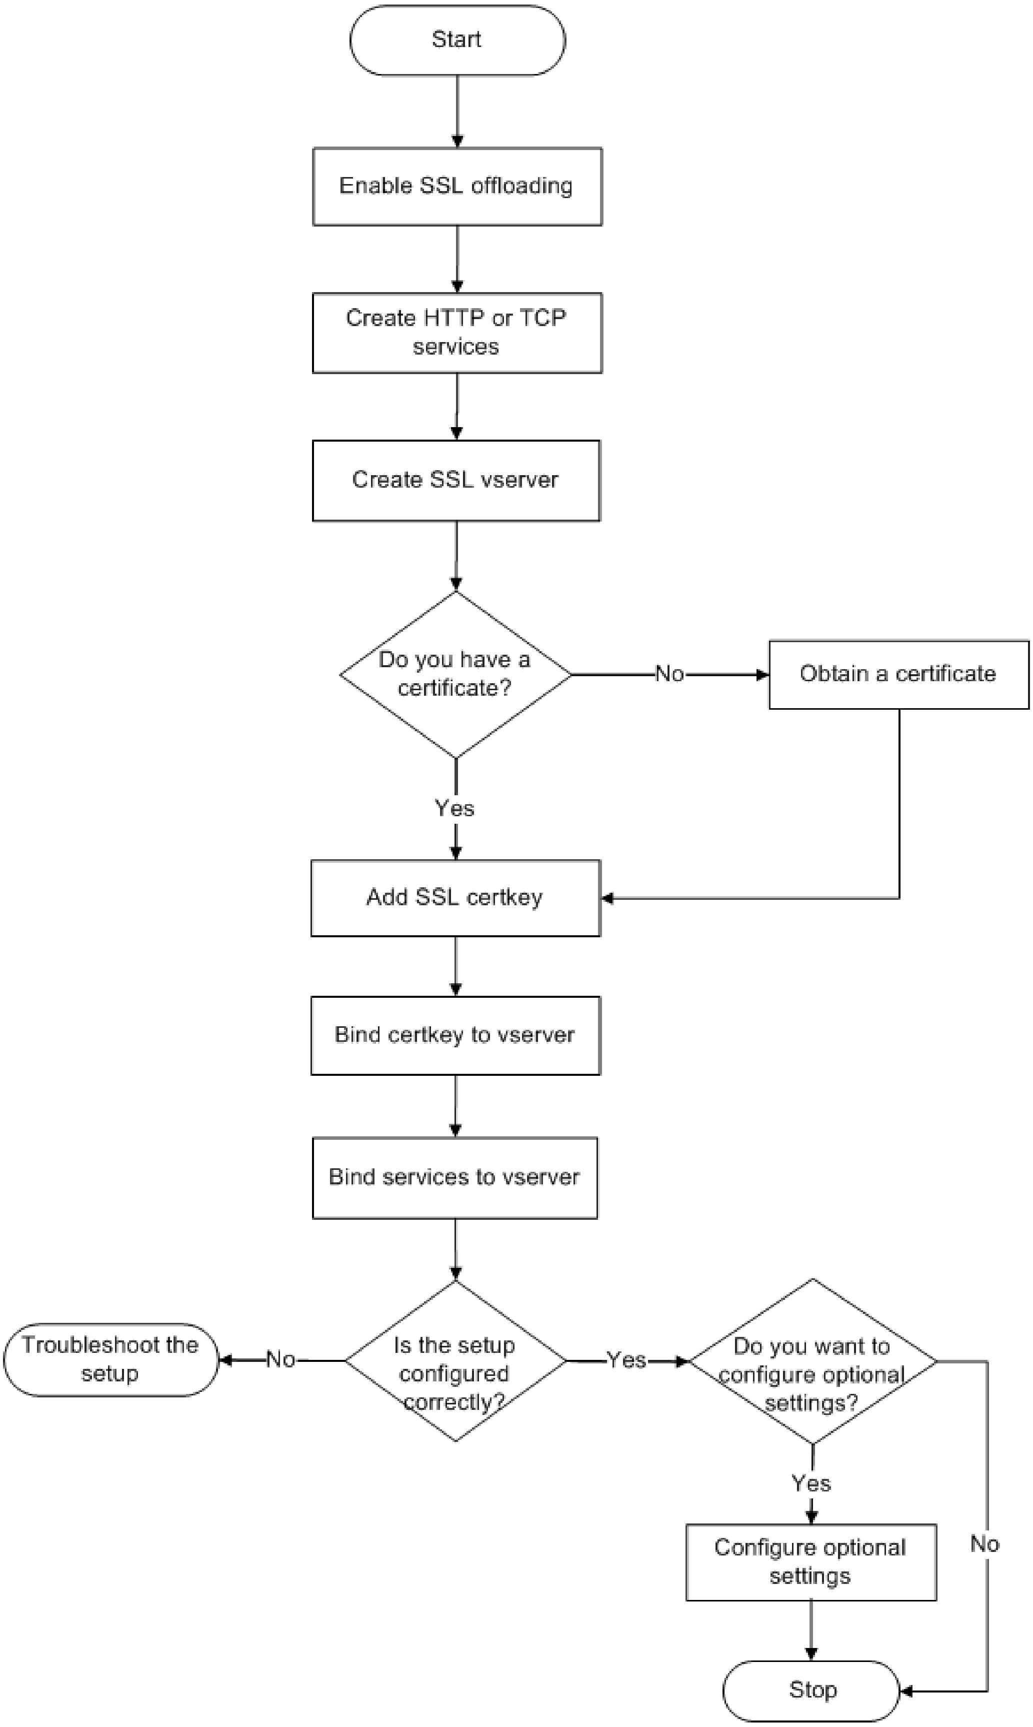
SSL configuration task sequence

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler appliance. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler appliance for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading



Start
Enable SSL offloading
Create HTTP or TCP services
Create SSL vserver
Do you have a certificate?
No
Obtain a certificate
Yes
Add SSL certkey
Bind certkey to vserver
Bind services to vserver
Troubleshoot the setup
No
Is the setup configured correctly?
Yes
Do you want to configure optional settings?
Yes
Configure optional settings
No
Stop

Enable SSL offload

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

Eenable SSL by using the CLI

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

- enable ns feature SSL
- show ns feature

```
> enable ns feature ssl

Done

> show ns feature

Feature Acronym Status

------- ------- ------

1) Web Logging WL ON

2) SurgeProtection SP OFF

3) Load Balancing LB ON . . .

 9) SSL Offloading SSL ON

10) Global Server Load Balancing GSLB ON . .

```

```
Done >
<!--NeedCopy-->
```

Enable SSL by using the GUI

Follow thesee steps:

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. Select the SSL Offloading check box, and then click OK.
4. In the Enable/Disable Feature(s)? message box, click Yes.

Create HTTP services

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.

Add an HTTP service by using the CLI

At the command prompt, type the following commands to add a HTTP service and verify the configuration:

add service <name> (<IP>	<serverName>) <serviceType> <port>

-
- show service <name>

Example:

```
> add service SVC_HTTP1 10.102.29.18 HTTP 80

 Done

> show service SVC_HTTP1

```

```
        SVC_HTTP1 (10.102.29.18:80) - HTTP

        State: UP

        Last state change was at Wed Jul 15 06:13:05 2009

        Time since last state change: 0 days, 00:00:15.350

        Server Name: 10.102.29.18

        Server ID : 0   Monitor Threshold : 0

        Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits

        Use Source IP: NO

        Client Keepalive(CKA): NO

        Access Down Service: NO

        TCP Buffering(TCPB): NO

        HTTP Compression(CMP): YES

        Idle timeout: Client: 180 sec   Server: 360 sec

        Client IP: DISABLED

        Cacheable: NO

        SC: OFF

        SP: OFF

        Down state flush: ENABLED

1)      Monitor Name: tcp-default

                State: UP       Weight: 1

                Probes: 4       Failed [Total: 0 Current: 0]

                Last response: Success - TCP syn+ack received.

                Response Time: N/A

 Done

<!--NeedCopy-->
```

Add an HTTP service by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Services.
2. In details pane, click Add.
3. In the Create Service dialog box, in the Service Name, Server, and Port text boxes, type the name of the service, IP address, and port (for example, SVC_HTTP1, 10.102.29.18, and 80).
4. In the Protocol list, select the type of the service (for example, HTTP).
5. Click Create, and then click Close. The HTTP service you configured appears in the Services

page.

6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the Details section at the bottom of the pane.

Add an SSL based virtual server

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

Add an SSL-based virtual server by using the CLI

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

- add lb vserver <name> <serviceType> [<IPAddress> <port>]
- show lb vserver <name>

> Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Example:

```
> add lb vserver vserver-SSL-1 SSL 10.102.29.50 443

  Done

  > show lb vserver vserver-SSL-1

  vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS

  State: DOWN[Certkey not bound] Last state change was at Tue Jun 16 06:33:08 2009 (+176 ms)

  Time since last state change: 0 days, 00:03:44.120

```

```
    Effective State: DOWN Client Idle Timeout: 180 sec

    Down state flush: ENABLED

    Disable Primary Vserver On Down : DISABLED

    No. of Bound Services : 0 (Total) 0 (Active)

    Configured Method: LEASTCONNECTION Mode: IP

    Persistence: NONE

    Vserver IP and Port insertion: OFF

    Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule:
        Done
<!--NeedCopy-->
```

Add an SSL-based virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (SSL Offload) dialog box, in the Name, IP Address, and Port text boxes, type the name of the virtual server, IP address, and port (for example, Vserver-SSL-1, 10.102.29.50, and 443).
4. In the Protocol list, select the type of the virtual server, for example, SSL.
5. Click Create, and then click Close.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

> Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Bind services to the SSL virtual server

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.

Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see [sSSL offload and acceleration.

Bind a service to a virtual server by using the CLI

At the command prompt, type the following commands to bind service to the SSL virtual server and verify the configuration:

- bind lb vserver <name> <serviceName>
- show lb vserver <name>

Example:

```
> bind lb vserver vserver-SSL-1 SVC_HTTP1

 Done

 > show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) - SSL Type:

 ADDRESS State: DOWN[Certkey not bound]

 Last state change was at Tue Jun 16 06:33:08 2009 (+174 ms)

 Time since last state change: 0 days, 00:31:53.70

 Effective State: DOWN Client Idle

 Timeout: 180 sec

```

```

  Down state flush: ENABLED Disable Primary Vserver On Down :

  DISABLED No. of Bound Services : 1 (Total) 0 (Active)

  Configured Method: LEASTCONNECTION Mode: IP Persistence: NONE Vserver IP and

  Port insertion: OFF Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule:

  1) SVC_HTTP1 (10.102.29.18: 80) - HTTP

  State: DOWN Weight: 1

  Done
<!--NeedCopy-->
```

Bind a service to a virtual server by using the GUI

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select a virtual server, and then click Open.
3. On the Services tab, in the Active column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click OK.
5. Verify that the Number of Bound Services counter in the Details section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

Add a certificate key pair

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler appliance, or you can create your own

SSL certificate. The appliance supports RSA/DSA certificates of up to 4096 bits.

> Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

Add a certificate key pair by using the CLI

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

- add ssl certKey <certkeyName> -cert <string> [-key <string>]
- show sslcertkey <name>

Example:

```
> add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key

 Done

> show sslcertkey CertKey-SSL-1

    Name: CertKey-SSL-1 Status: Valid,

    Days to expiration:4811 Version: 3

    Serial Number: 00 Signature Algorithm: md5WithRSAEncryption Issuer: C=US,ST=California,L=San

    Jose,O=Citrix ANG,OU=NS Internal,CN=de fault

    Validity Not Before: Oct 6 06:52:07 2006 GMT Not After : Aug 17 21:26:47 2022 GMT

    Subject: C=US,ST=California,L=San Jose,O=Citrix ANG,OU=NS Internal,
        CN=d efault Public Key

    Algorithm: rsaEncryption Public Key

    size: 1024

 Done
<!--NeedCopy-->
```

Add a certificate key pair by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Certificates.
2. In the details pane, click Add.
3. In the Install Certificate dialog box, in the Certificate-Key Pair Name text box, type a name for the certificate key pair you want to add, for example, Certkey-SSL-1.
4. Under Details, in Certificate File Name, click Browse (Appliance) to locate the certificate. Both the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select Local.
5. Select the certificate you want to use, and then click Select.
6. In Private Key File Name, click Browse (Appliance) to locate the private key file. To use a private key present on the local system, select Local.
7. Select the key you want to use and click Select. To encrypt the key used in the certificate key pair, type the password to be used for encryption in the Password text box.
8. Click Install.
9. Double-click the certificate key pair and, in the Certificate Details window, verify that the parameters have been configured correctly and saved.

Bind an SSL certificate key pair to the virtual server

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.

Bind an SSL certificate key pair to a virtual server by using the CLI

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

- bind ssl vserver <vServerName> -certkeyName <string>
- show ssl vserver <name>

Example:

```
> bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1

Done

> show ssl vserver Vserver-SSL-1

     Advanced SSL configuration for VServer Vserver-SSL-1:

     DH: DISABLED

     Ephemeral RSA: ENABLED Refresh Count: 0

     Session Reuse: ENABLED Timeout: 120 seconds

     Cipher Redirect: ENABLED

     SSLv2 Redirect: ENABLED

     ClearText Port: 0

     Client Auth: DISABLED

     SSL Redirect: DISABLED

     Non FIPS Ciphers: DISABLED

     SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate

1) Cipher Name: DEFAULT

   Description: Predefined Cipher Alias

Done
<!--NeedCopy-->
```

Bind an SSL certificate key pair to a virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server to which you want to bind the certificate key pair, for example, Vserver-SSL-1, and click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, on the SSL Settings tab, under Available, select the certificate key pair that you want to bind to the virtual server (for example, Certkey-SSL-1), and then click Add.
4. Click OK.
5. Verify that the certificate key pair that you selected appears in the Configured area.

Configure support for Outlook web access

If you use Outlook Web Access (OWA) servers on your NetScaler appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.

To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL virtual server.

Create an SSL action to enable OWA support

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

Create an SSL action to enable OWA support by using the CLI

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

- add ssl action <name> -OWASupport ENABLED
- show SSL action <name>

Example:

```
> add ssl action Action-SSL-OWA -OWASupport enabled

Done

> show SSL action Action-SSL-OWA

Name: Action-SSL-OWA

Data Insertion Action: OWA

```

```

Support: ENABLED

Done
```

Create an SSL action to enable OWA support by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Actions tab, click Add.
3. In the Create SSL Action dialog box, in the Name text box, type Action-SSL-OWA.
4. Under Outlook Web Access, select Enabled.
5. Click Create, and then click Close.
6. Verify that Action-SSL-OWA appears in the **SSL Actions** page.

Create SSL policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

Create an SSL policy by using the CLI

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

- add ssl policy <name> -rule <expression> -reqAction <string>
- show ssl policy <name>

Example:

```
> add ssl policy Policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA

Done

> show ssl policy Policy-SSL-1

Name: Policy-SSL-1 Rule: ns_true

Action: Action-SSL-OWA Hits: 0

```

```
Policy is bound to following entities

1) PRIORITY : 0

Done
<!--NeedCopy-->
```

Create an SSL policy by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, click Add.
3. In the Create SSL Policy dialog box, in the Name text box, type the name of the SSL Policy (for example, Policy-SSL-1).
4. In Request Action, select the configured SSL action that you want to associate with this policy (for example, Action-SSL-OWA). The ns_true general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see [SSL actions and policies](/en-us/netscaler/11-1/ssl/ssl-actions-and-policies.html0.
5. In Named Expressions, choose the built-in general expression ns_true and click Add Expression. The expression ns_true now appears in the Expression text box.
6. Click Create, and then click Close.
7. Verify that the policy is correctly configured by selecting the policy and viewing the Details section at the bottom of the pane.

Bind the SSL policy to the SSL virtual server

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

Bind an SSL policy to an SSL virtual server by using the CLI

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

- bind ssl vserver <vServerName> -policyName <string>
- show ssl vserver <name>

Example:

```
> bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1

 Done

> show ssl vserver Vserver-SSL-1

Advanced SSL configuration for VServer Vserver-SSL-1:

DH: DISABLED

Ephemeral RSA: ENABLED

Refresh Count: 0

Session Reuse: ENABLED

Timeout: 120 seconds

Cipher Redirect: ENABLED

SSLv2 Redirect: ENABLED

ClearText Port: 0

Client Auth: DISABLED

SSL Redirect: DISABLED

Non FIPS Ciphers: DISABLED

SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate

1) Policy Name: Policy-SSL-1 Priority: 0

1) Cipher Name: DEFAULT Description: Predefined Cipher Alias

Done
<!--NeedCopy-->
```

Bind an SSL policy to an SSL virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select the virtual server (for example, Vserver-SSL-1), and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, click Insert Policy, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the Priority field and type a new priority level.
4. Click OK.

Features at a glance

September 21, 2020

NetScaler features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see Processing Order of Features section.

Application switching and traffic management features

September 21, 2020

Below are the application switching and traffic management features.

SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see SSL offload and acceleration.

Access Control Lists

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler appliance to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. An ADC appliance does not compare incoming packets to disabled ACLs.

For more information, see Access Control List.

Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler appliance can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the ADC appliance can maintain session persistence based on source IP, cookie, server, group, or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts.
To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

For more information, see Load Balancing.

Traffic Domains

Traffic domains provide a way to create logical ADC partitions within a single NetScaler appliance. They enable you to segment network traffic for different applications. You can use traffic domains to create multiple isolated environments whose resources do not interact with each other. An application belonging to a specific traffic domain communicates only with entities, and processes traffic, within that domain. Traffic belonging to one traffic domain cannot cross the boundary of another traffic domain. Therefore, you can use duplicate IP addresses on the appliance as long as an addresses is not duplicated within the same domain.

For more information, see Traffic Domains.

Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP addresses, and/or the TCP/UDP port numbers, of IP packets that pass through the NetScaler appliance. Enabling NAT on the appliance enhances the security of your private network, and protects it from a public network such as the Internet, by modifying your network's source IP addresses when data passes through the NetScaler appliance.

The NetScaler appliance supports the following types of network address translation:

INAT: In Inbound NAT (INAT), an IP address (usually public) configured on the NetScaler appliance listens to connection requests on behalf of a server. For a request packet received by the appliance on a public IP address, the ADC replaces the destination IP address with the private IP address of the server. In other words, the appliance acts as a proxy between clients and the server. INAT configuration involves INAT rules, which define a 1:1 relationship between the IP address on the NetScaler appliance and the IP address of the server.

RNAT: In Reverse Network Address Translation (RNAT), for a session initiated by a server, the NetScaler appliance replaces the source IP address in the packets generated by the server with an IP address (type SNIP) configured on the appliance. The appliance thereby prevents exposure of the server's IP address in any of the packets generated by the server. An RNAT configuration involves an RNAT rule, which specifies a condition. The appliance performs RNAT processing on those packets that match the condition.

Stateless NAT46 Translation: Stateless NAT46 enables communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the NetScaler appliance. A stateless NAT46 configuration involves an IPv4-IPv6 INAT rule and an NAT46 IPv6 prefix.

Stateful NAT64 Translation: The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. A stateful NAT64 configuration involves an NAT64 rule and an NAT64 IPv6 prefix.

For more information, see
Configuring Network Address Translation.

Multipath TCP Support

NetScaler appliances support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You must enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.

For more information, see MPTCP (Multi-Path TCP).

Content Switching

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see Content Switching.

Global Server Load Balancing (GSLB)

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see Global Server Load Balancing.

Dynamic Routing

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see Configuring Dynamic Routes.

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.

```
For more information, see [Link Load Balancing](/en-us/netscaler/11-1/
    link-load-balancing.html).
```

TCP Optimization

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.

Some of the key optimization features that can be enabled by TCP profiles are:

- TCP keep-alive—Checks the operational status of the peers at specified time intervals to prevent the link from being broken.
- Selective Acknowledgment (SACK)— Improves the performance of data transmission, especially in long fat networks (LFNs).
- TCP window scaling— Allows efficient transfer of data over long fat networks (LFNs).

For more information on TCP Profiles, see Configuring TCP Profiles.

CloudBridge Connector

The Citrix NetScaler CloudBridge
Connector feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or NetScaler virtual appliances on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or NetScaler virtual appliance on a cloud instance to a NetScaler appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see CloudBridge.

DataStream

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

> Note: DataStream is supported for MySQL and MS SQL databases.

For more information, see DataStream.

Application acceleration features

September 21, 2020

- AppCompress

  Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user's browser.

- Cache Redirection

  Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

  For more information, see "Cache Redirection."

- AppCache

  Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

For more information, see "Integrated Caching."

- TCP Buffering

  Buffers the server's response and delivers it to the client at the client's speed, thus offloading the server faster and thereby improving the performance of web sites.

Application security and firewall features

September 21, 2020

Below are the secuirty and firewarall features.

Denial of service (DoS) attack defense

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardrop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see HTTP Denial-of-Service Protection.

Content Filtering

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the appliance to screen unwanted requests and reduces your servers' exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see Content Filtering.

Responder

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.

For more information, see Responder.

Rewrite

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.

When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see Rewrite.

Priority Queuing

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The appliance places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.

For more information, see Priority Queuing.

Surge Protection

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see Surge Protection.

Citrix Gateway

```
Citrix Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's mobile workforce.

For more information, see [Citrix Gateway](https://docs.citrix.com/en-us/netscaler-gateway.html).
```

Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see Application Firewall.

Application visibility feature

September 21, 2020

- NetScaler Insight Center

NetScaler Insight Center is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler ADC appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Insight Center provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.
HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird's eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

- EdgeSight for NetScaler

  Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.

  For more information, see "EdgeSight Monitoring for NetScaler."

- Enhanced Application Visibility Using AppFlow

  The NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

  Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

  AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

  To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

  You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

  For more information, see "AppFlow."

- Stream Analytics

The performance of your web site or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see “Action Analytics.”

Solutions for Telecom Service Providers

September 21, 2020

Information and Communication Technology (ICT) is about bringing the Internet user closer to the apps and data. The latest datacenter technologies have enabled the user, apps and data to be located anywhere. A user can access apps and data from the office or from home, or from a location such as an airport. The apps and data can be located either on the enterprise’s premises, in a public or private cloud, or on a hybrid host. The result has been on only increased productivity, but also reduced costs of ownership and maintenance.

Service provides offer the core infrastructure needed for carrying the user’s apps and data over the network. Because the core infrastructure serves millions of subscribers and a wide variety of apps and data, requirements for scale and protocol support are very high. The core infrastructure handles two major types of traffic: data plane and control plane. Each of these planes has its own scale and protocol-support requirements.

The data plane is the part of the core infrastructure that carries user apps and data from end to end, that is, between end-user equipment and the application server. The number of users accessing apps and data is in the thousands of millions, so throughput and IP-addressing requirements are very high. Every user in the network must be uniquely identifiable. Only then can the service provider control the traffic, monitor network usage, deliver user-specific services, and log information correctly. Many of the today's client devices and application servers support IPv6 natively. The core infrastructure must not only support a mix of IPv4 and IPv6 clients and servers, but also provide the technologies for cross-communication between IPv4 and IPv6. Finally, a service provider is measured by the quality of service (directly related to end-user experience) and the availability of service without disruptions. The data plane should be resilient enough to provide both quality and availability at the same time.

The control-plane infrastructure manages user traffic and maintains the business and network operations services. The most important of the many protocols that run in this plane are Diameter, Radius, and SMPP. Diameter is a base protocol over which several other function-specific protocols have been developed. For example:

- Gx interface between the Policy and Charging Enforcement Function (PCEF) and the Policy and Charging Rules Function (PCRF)
- Gy interface between the Online Charging System (OCS) and the Cisco Packet Data Network Gateway (PGW)/Policy and Charging Enforcement Function (PCEF)

The volume of control plane traffic is in direct proportion to user activity. To manage the control plane traffic, service providers use several ADC functionalities, such as load balancing and content switching. They need fine-grain control of control plane traffic, which equals data-plane traffic in complexity.

Service providers must meet demanding service-level agreements (SLAs), and are scrutinized thoroughly by regulators for compliance. Adhering to requirements while managing the data and control plane traffic requires a service provider to keep its infrastructure nimble, within budget, easily upgradable, and flexible. As the most powerful and advanced ADCs in the market today, NetScaler ADC products are a natural fit for the service-provider environment.

Large Scale NAT

September 21, 2020

> **Note**
>
> This feature is available with a NetScaler Advanced or Premium edition license.

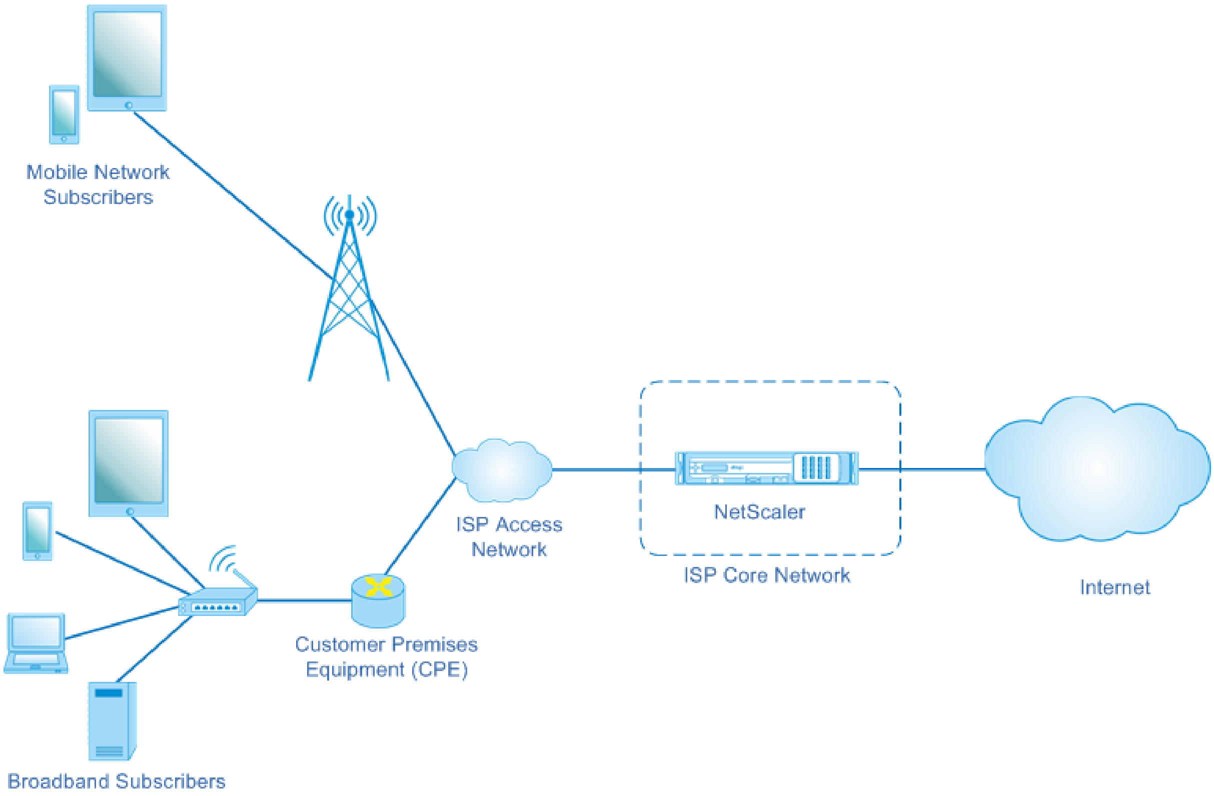
The Internet's phenomenal growth has resulted in a shortage of public IPv4 addresses. Large Scale NAT (LSN/CGNAT) provides a solution to this issue, maximizing the use of available public IPv4 addresses by sharing a few public IPv4 addresses among a large pool of Internet users.

LSN translates private IPv4 addresses into public IPv4 addresses. It includes network address and port translation methods to aggregate many private IP addresses into fewer public IPv4 addresses. LSN is designed to handle NAT on a large scale. The NetScaler LSN feature is very useful for Internet Service Providers (ISPs) and carriers providing millions of translations to support a large number of users (subscribers) and at very high throughput.

LSN Architecture

The LSN architecture of an ISP using Citrix products consists of subscribers (Internet users) in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP's core network. Subscribers are connected to the ISP through the ISP's access network. Usually, subscribers for commercial use of the Internet are directly connected to the ISP's access network. Serving those subscribers requires only one level of NAT (NAT44).

Noncommercial subscribers, however, are typically behind customer-premises equipment (CPE), such as routers and modems, that also implements NAT. These two levels of NAT create the NAT444 model. Deploying a NetScaler appliance in an ISP's core network for LSN functionality is transparent to the subscribers and requires no configuration changes to subscribers or the CPEs.



Large Scale NAT

The NetScaler appliance receives all subscriber packets destined to the Internet. The appliance is configured with a pool of pre-defined NAT IP addresses to use for LSN. The NetScaler appliance uses its LSN feature to translate the source IP address (private) and port of the packet to the NAT IP address (public) and NAT port, and then sends the packet to its destination on the Internet. The appliance maintains a record of all active sessions that use the LSN feature. These sessions are called LSN sessions. The NetScaler appliance also maintains the mappings between subscriber IP address and port, and NAT IP address and port, for each session. These mappings are called LSN mappings. From LSN sessions and LSN mappings, the NetScaler appliance recognizes a response packet (received from the Internet) belonging to a particular session. The appliance translates the destination IP address and port of the response packet from NAT IP address:port to the subscriber IP address:port, and sends the translated packet to the subscriber.

LSN Features Supported on NetScaler appliance

The following describes some of the LSN features supported on NetScaler appliance:

NAT Resource Allocation

The NetScaler appliance allocates NAT IP addresses and ports, from its pre-defined NAT resource pool, to subscribers to translate their packets for transmission to external hosts (Internet). The NetScaler appliance supports the following types of NAT IP address and port allocation for subscribers:

- **Deterministic.** The NetScaler appliance allocates a NAT IP address and a block of ports to each subscriber. The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

  The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

- **Dynamic.** The NetScaler appliance allocates a random NAT IP address and a port from the LSN NAT pool for a subscriber’s connection. When port block allocation is enabled in the configuration, the appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The NetScaler appliance then allocates this NAT IP address and one of the ports from the allocated block to each subsequent connection from this subscriber. If the entire block of ports is being used, the appliance allocates a new random port block to the subscriber when it initiates a new connection. One of the port in the new port block is allocated for the new connection.

IP Pooling

The following NAT resource allocation options are available for subsequent sessions of a subscriber who was allocated a random NAT IP address and port for an existing session.

- **Paired.** The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When no more ports are available for that address, the appliance drops any new connections from the subscriber. This option is needed for proper functioning of certain applications that require creation of multiple sessions on the same source IP address (for example in peer-to-peer applications that use RTP or RTCP protocol.
- **Random.** The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

Reusing LSN Mappings

The NetScaler appliance can reuse an existing LSN map for new connections originating from the same subscriber IP address and port. The NetScaler LSN feature supports the following types of LSN mapping reuse:

1. **Endpoint Independent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port. This type of LSN map reuse is useful for proper functioning of VOIP and peer-to-peer applications.
2. **Address dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
3. **Address port dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

LSN Filtering

The NetScaler appliance can filter packets from external hosts based on the active LSN sessions and LSN mappings. Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). The NetScaler LSN feature supports the following types of filtering:

1. **Endpoint Independent.** The NetScaler appliance filters out only those packets that are not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x), regardless of the external host IP address and port source (Z:z). The NetScaler appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external host to the subscriber. This type of filtering is useful

for proper functioning of VOIP and peer-to-peer applications.

2. **Address dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.
3. **Address port dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external IP address and port.

Quotas

The NetScaler appliance can limit the number of NAT ports and sessions for each subscriber to ensure fair distribution of resources among subscribers. The NetScaler appliance can also limit the number of session for a subscriber group to ensure fair distribution of resources among different subscriber groups.

- **Port quota.** The NetScaler appliance can limit the LSN NAT ports to be used at a time by each subscriber for a specified protocol. For example, you could limit each subscriber to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports of the specified protocol to that subscriber.
- **Subscriber Session Limit.** The number of concurrent session for a subscriber can be more than it port quota. The NetScaler appliance can limit the LSN sessions allowed for each subscriber for a specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions of the specified protocol.
- **Group Session Limit.** The NetScaler appliance can limit the total number of LSN sessions allowed for a subscriber group for a specified protocol. When the total number of LSN sessions reaches the limit for a group for a specified protocol, the NetScaler appliance does not allow any subscriber of the group to open additional sessions of the specified protocol. For example, You limit a group to a maximum of 10000 UDP sessions. When the total number of UDP sessions for this group reaches 10000, the NetScaler appliance does not allow any subscriber of the group to open additional UDP sessions.

Application Layer Gateways

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

Hairpin Support

The NetScaler appliance supports communication between subscribers or internal hosts using NAT IP addresses. This type of communication between two subscribers using NAT IP addresses is called hairpin flow. Hairpin flow is enabled by default, and you cannot disable it.

Points to Consider before Configuring LSN

September 21, 2020

Consider the following points before configuring LSN on a NetScaler appliance:

- Make sure that you understand the different components of Large Scale NAT, described in RFCs 6888, 5382, 5508, and 4787.
- Endpoint independent mapping (EIM) and endpoint independent filtering (EIF) are disabled by default. These options must be enabled for proper functioning of VoIP and peer-to-peer (P2P) applications.
- **Logging LSN**: Following are the consideration points for logging LSN information:
  - Citrix recommends logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large numbers of LSN log entries (in order of millions).
  - Citrix recomends using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.
  - The following limitations apply to SYSLOG over TCP:
    - The Syslog over TCP solution does not provide authentication, integrity check, and privacy.
    - The NetScaler appliance relies on the TCP protocol to provide confirmation of SYSLOG message delivery to external log servers.

- **High Availability**: Following are the consideration points for high availability of NetScaler appliances for LSN:
  - Citrix recommends configuring the LSN feature in a high availability deployment of two NetScaler appliances for uninterrupted and seamless operation of all LSN sessions.
  - In a high availability deployment, Citrix recommends:
    - Setting the SYNC VLAN parameter for dedicating a VLAN for all HA related communication.
    - Synchronizing the symmetric RSS key of the primary node to the secondary node for stateful synchronization of a large number of LSN mappings and sessions.
    - Binding the subnet of LSN IP addresses to a VLAN to avoid flooding of GARP broadcasts on all VLANs after a failover.
  - In a high availability deployment of NetScaler appliances, ALG-related sessions are not mirrored to the secondary appliance.
- **Application Layer Gateways (ALGs)**: Following are the consideration points related for ALGs on a NetScaler appliance:
  - The following are not supported for SIP ALG:
    - Multicast IP addresses
    - Encrypted SDP
    - SIP messages over TLS
    - FQDN translation in SIP messages
    - Authentication of SIP messages
    - Traffic domains, admin partitions, andNetScaler clusters.
    - SIP messages with multipart bodies.
  - The following are not supported for RTSP ALG:
    - Multicast RTSP sessions
    - RTSP session over UDP
    - NetScaler traffic domains, admin partitions, andNetScaler clusters
  - The NetScaler appliance does not support ALG for the IPSec protocol.
- If you disable the LSN feature when some LSN sessions exist on the NetScaler appliance, these sessions continue to exist for the duration of the configured timeout interval.
- LSN takes precedence over RNAT. If a packet from a specified LSN subscriber also matches a RNAT rule, the packet is translated according to the LSN configuration.
- Forwarding of packets related only to the LSN sessions is based on the NetScaler appliance's routing table.
- Unlike with subnet IP addresses, selection of an LSN NAT IP address for a subscriber's connection is not based on the routing entry for the destination IP address.
- For inbound packets, static LSN mappings take precedence over dynamic LSN mappings.
- For outbound packets, LSN application profiles take precedence over static mapping.
- When a large number of LSN sessions (> 1 million) exist on the NetScaler appliance, Citrix recom-

mends displaying selected LSN sessions instead of all of them. In the command line interface or the configuration utility, use the selection parameters for showing LSN session operation.

- LSN is not supported in a NetScaler cluster.
- To reduce the amount of active memory allocated to the LSN feature, you must warm restart the NetScaler appliance after changing the configured-memory setting. Without a warm restart, you can only increase the amount of active memory.

Configuration Steps for LSN

September 21, 2020

Configuring LSN on a NetScaler appliance consists of the following tasks:

1. **Set the global LSN parameters.** Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
2. **Create an LSN client entity and bind subscribers to it.** An LSN client entity is a set of subscribers on whose traffic you want the NetScaler appliance to perform LSN. The client entity includes IPv4 addresses and extended ACL rules for identifying subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.
3. **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The pool is assigned parameters, such as port block allocation and NAT type (Deterministic or Dynamic). An LSN pool bound to an LSN group applies to all subscribers of an LSN client entity bound to the same group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.
4. **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage, that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN

transport profile for that protocol.

5. **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.
6. **Create an LSN Group and bind LSN pools, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

The following table lists the maximum numbers of different LSN entities and bindings that can be created on a NetScaler appliance. These limits are also subject to memory available on the NetScaler appliance.

LSN entities and bindings	Limit
LSN clients	1024
LSN pools	128
LSN groups	1024
Subscriber networks that can be bound to an LSN client	64
Extended ACLs that can be bound to an LSN client	1024

LSN entities and bindings	Limit
NAT IP addresses in a Pool	4096
LSN pools that can be bound to an LSN group	8
LSN groups that can use the same LSN pool	16
LSN transport profiles that can be bound to an LSN group	3 (one each for TCP, UDP, and ICMP protocols)
LSN groups that can use same LSN transport profile	8
LSN application profiles that can be bound to an LSN group	64
LSN groups that can use same LSN application profile	8
Port ranges that can be bound to an LSN application profile	8

Configuration Using the Command Line Interface

To create an LSN client by using the command line interface

At the command prompt, type:

```
add lsn client <clientname>

show lsn client
<!--NeedCopy-->
```

To bind a network address or an ACL rule to an LSN client by using the command line interface

At the command prompt, type:

```
bind lsn client <clientname> ((-network <ip_addr> [-netmask <netmask>]
    [-td<positive_integer>]) | -aclname <string>)

show lsn client
<!--NeedCopy-->
```

To create an LSN pool by using the command line interface

At the command prompt, type:

```
add lsn pool <poolname> [-nattype ( DYNAMIC | DETERMINISTIC )] [-
    portblockallocation ( ENABLED | DISABLED )] [-portrealloctimeout <
    secs>] [-maxPortReallocTmq <positive_integer>]

show lsn pool
<!--NeedCopy-->
```

To bind an IP address range to an LSN pool by using the command line interface

At the command prompt, type:

```
bind lsn pool <poolname> <lsnip>

show lsn pool
<!--NeedCopy-->
```

Note: For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

To create an LSN transport profile by using the command line interface

At the command prompt, type:

```
add lsn transportprofile <transportprofilename> <transportprotocol> [-
    sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <
    positive_integer>] [-sessionquota <positive_integer>] [-
    portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (
    ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]

show lsn transportprofile
<!--NeedCopy-->
```

To create an LSN application profile by using the command line interface

At the command prompt, type:

```
add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (
    PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-
    tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]

show lsn appsprofile
```

```
<!--NeedCopy-->
```

To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
bind lsn appsprofile <appsprofilename> <lsnport>

show lsn appsprofile
<!--NeedCopy-->
```

To create an LSN group by using the command line interface

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC |
    DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging (
    ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-
    sessionSync (ENABLED | DISABLED )] [-snmptraplimit <positive_integer
    >] [-ftp ( ENABLED | DISABLED )]

show lsn group
<!--NeedCopy-->
```

To bind LSN profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
bind lsn group <groupname> (-poolname <string> | -transportprofilename
    <string> | -appsprofilename <string>)

show lsn group
<!--NeedCopy-->
```

Configuration Using the Configuration Utility

To configure an LSN client and bind an IPv4 network address or an ACL rule by using the configuration utility

Navigate to **System** > **Large Scale NAT** > **Clients**, and add a client and then bind an IPv4 network address or an ACL rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility

Navigate to **System > Large Scale NAT** > **Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN transport profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Transport** tab, and then add a transport profile.

To configure an LSN application profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Application** tab, and then add an application profile.

To configure an LSN group and bind an LSN client, pools, transport profiles, and application profiles by using the configuration utility

Navigate to **System > Large Scale NAT > Groups**, and add a group and then bind an LSN client, pools, transport profiles, and application profiles to the group.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn client
  - clientname

    Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn client1” or ‘lsn client1’).

    This is a mandatory argument. Maximum Length: 127

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn client
  - clientname

    Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn client1” or ‘lsn client1’).

  This is a mandatory argument. Maximum Length: 127

  - network

    IPv4 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the NetScaler appliance to perform Large Scale NAT.

  - netmask

    Subnet mask for the IPv4 address specified in the Network parameter.

    Default value: 255.255.255.255

  - td

    ID of the traffic domain on which this subscriber or the subscriber network (as specified by the network parameter) belongs.

    If you do not specify an ID, the subscriber or the subscriber network becomes part of the default traffic domain.

    Default value: 0

    Minimum value: 0

    Maximum value: 4094

  - aclname

    Name(s) of any configured extended ACL(s) whose action is ALLOW. The condition specified in the extended ACL rule identifies the traffic from an LSN subscriber for which the NetScaler appliance is to perform large scale NAT. Maximum Length: 127

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn pool
  - poolname

    Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn pool1” or ‘lsn pool1’).

    This is a mandatory argument. Maximum Length: 127

  - nattype

    Type of NAT IP address and port allocation (from the LSN pools bound to an LSN group) for subscribers (of the LSN client entity bound to the LSN group):

Available options function as follows:

    * **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.
    * **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscribers connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

      Possible values: DYNAMIC, DETERMINISTIC

      Default value: DYNAMIC

- portblockallocation

  Allocate a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber when the NAT allocation is set as Dynamic NAT. For any connection initiated from a subscriber, the NetScaler appliance allocates a NAT port from the subscribers allocated NAT port block to create the LSN session.

  You must set the port block size in the bound LSN group. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the NetScaler appliance allocates a new random port block for the subscriber.

  For Deterministic NAT, this parameter is enabled by default, and you cannot disable it.

  Possible values: ENABLED, DISABLED

  Default value: DISABLED

- portreallocetimeout

  The waiting time, in seconds, between deallocating LSN NAT ports (when an LSN mapping is removed) and reallocating them for a new LSN session. This parameter is necessary in order to prevent collisions between old and new mappings and sessions. It ensures that all established sessions are broken instead of redirected to a different subscriber. This is not applicable for ports used in:

  * Deterministic NAT
  * Address-Dependent filtering and Address-Port-Dependent filtering
  * Dynamic NAT with port block allocation

  In these cases, ports are immediately reallocated.

  Default value: 0

  Maximum value: 600

- maxPortReallocTmq

  Maximum number of ports for which the port reallocation timeout applies for each NAT IP address. In other words, the maximum deallocated-port queue size for which the reallocation timeout applies for each NAT IP address.

  When the queue size is full, the next port deallocated is reallocated immediately for a new LSN session.

  Default value: 65536

  Maximum value: 65536

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn pool
  - poolname

    Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1').

    This is a mandatory argument. Maximum Length: 127

  - lsnip

    IPv4 address or a range of IPv4 addresses to be used as NAT IP address(es) for LSN.

After the pool is created, these IPv4 addresses are added to the NetScaler appliance as NetScaler owned IP address of type LSN. An LSN IP address associated with an LSN pool cannot be shared with other LSN pools. IP addresses specified for this parameter must not already exist on the NetScaler appliance as any NetScaler owned IP addresses. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189. You can later remove some or all the LSN IP addresses from the pool, and add IP addresses to the LSN pool.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn transportprofile
    - transportprofilename

      Name for the LSN transport profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN transport profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn transport profile1” or ‘lsn transport profile1’).

      This is a mandatory argument. Maximum Length: 127
    - transportprotocol

      Protocol for which to set the LSN transport profile parameters.

      This is a mandatory argument.

      Possible values: TCP, UDP, ICMP
    - sessiontimeout

      Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds this value, the NetScaler appliance removes the session.

      This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints.

      Default value: 120

      Minimum value: 60
    - finrsttimeout

      Timeout, in seconds, for a TCP LSN session after a FIN or RST message is received from one of the endpoints.

      f a TCP LSN session is idle (after the NetScaler appliance receives a FIN or RST message) for a time that exceeds this value, the NetScaler appliance removes the session.

Since the LSN feature of the NetScaler appliance does not maintain state information of any TCP LSN sessions, this timeout accommodates the transmission of the FIN or RST, and ACK messages from the other endpoint so that both endpoints can properly close the connection.

Default value: 30

- portquota

  Maximum number of LSN NAT ports to be used at a time by each subscriber for the specified protocol. For example, each subscriber can be limited to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports for that subscriber.

  Default value: 0

  Minimum value: 0

  Maximum value: 65535

- sessionquota

  Maximum number of concurrent LSN sessions allowed for each subscriber for the specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions.

  Default value: 0

  Minimum value: 0

  Maximum value: 65535

- portpreserveparity

  Enable port parity between a subscriber port and its mapped LSN NAT port. For example, if a subscriber initiates a connection from an odd numbered port, the NetScaler appliance allocates an odd numbered LSN NAT port for this connection. You must set this parameter for proper functioning of protocols that require the source port to be even or odd numbered, for example, in peer-to-peer applications that use RTP or RTCP protocol.

  Possible values: ENABLED, DISABLED

  Default value: DISABLED

- portpreserverange

  If a subscriber initiates a connection from a well-known port (0-1023), allocate a NAT port from the well-known port range (0-1023) for this connection. For example, if a subscriber initiates a connection from port 80, the NetScaler appliance can allocate port 100 as the NAT port for this connection.

    This parameter applies to dynamic NAT without port block allocation. It also applies to Deterministic NAT if the range of ports allocated includes well-known ports.

    When all the well-known ports of all the available NAT IP addresses are used in different subscribers connections (LSN sessions), and a subscriber initiates a connection from a well- known port, the NetScaler appliance drops this connection.

    Possible values: ENABLED, DISABLED

    Default value: DISABLED

  - syncheck

    Silently drop any non-SYN packets for connections for which there is no LSN-NAT session present on the NetScaler appliance.

    If you disable this parameter, the NetScaler appliance accepts any non-SYN packets and creates a new LSN session entry for this connection.

    Following are some reasons for the NetScaler appliance to receive such packets:

    * LSN session for a connection existed but the NetScaler appliance removed this session because the LSN session was idle for a time that exceeded the configured session timeout.
    * Such packets can be a part of a DoS attack.

    Possible values: ENABLED, DISABLED

    Default value: ENABLED

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn appsprofile
  - appsprofilename

    Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn application profile1” or ‘lsn application profile1’).

    This is a mandatory argument. Maximum Length: 127

  - transportprotocol

    Name of the protocol for which the parameters of this LSN application profile applies.

    This is a mandatory argument.

Possible values: TCP, UDP, ICMP

- ippooling

  NAT IP address allocation options for sessions associated with the same subscriber.

  Available options function as follows:

  * **Paired**—The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When all the ports of a NAT IP address are used in LSN sessions (for same or multiple subscribers), the NetScaler appliance drops any new connection from the subscriber.
  * **Random**—The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

  This parameter is applicable to dynamic NAT allocation only.

  Possible values: PAIRED, RANDOM

  Default value: RANDOM

- mapping

  Type of LSN mapping to apply to subsequent packets originating from the same subscriber IP address and port.

  Consider an example of an LSN mapping that includes the mapping of the subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

  Available options function as follows:

  * **ENDPOINT-INDEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port.
  * **ADDRESS-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
  * **ADDRESS-PORT-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

  Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

  Default value: ADDRESS-PORT-DEPENDENT

- filtering

  Type of filter to apply to packets originating from external hosts.

Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

Available options function as follows:

- **ENDPOINT INDEPENDENT**—Filters out only packets not destined to the subscriber IP address and port X:x, regardless of the external host IP address and port source (Z:z). The NetScaler appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external hosts to the subscriber.
- **ADDRESS DEPENDENT**—Filters out packets not destined to subscriber IP address and port X:x. In addition, the appliance filters out packets from Y:y destined for the subscriber (X:x) if the client has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.
- **ADDRESS PORT DEPENDENT** (the default)—Filters out packets not destined to subscriber IP address and port (X:x). In addition, the NetScaler appliance filters out packets from Y:y destined for the subscriber (X:x) if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets first to that external IP address and port.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

- tcpproxy

  Enable TCP proxy, which enables the NetScaler appliance to optimize the TCP traffic by using Layer 4 features.

  Possible values: ENABLED, DISABLED

  Default value: DISABLED

- td

  ID of the traffic domain through which the NetScaler appliance sends the outbound traffic after performing LSN.

  If you do not specify an ID, the appliance sends the outbound traffic through the default traffic domain, which has an ID of 0.

  Default value: 65535

  Maximum value: 65535

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn appsprofile
    - appsprofilename

      Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1').

      This is a mandatory argument. Maximum Length: 127
    - lsnport

      Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn group
    - groupname

      Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1').

      This is a mandatory argument. Maximum Length: 127
    - clientname

      Name of the LSN client entity to be associated with the LSN group. You can associate only one LSN client entity with an LSN group. You cannot remove this association or replace with another LSN client entity once the LSN group is created.

      This is a mandatory argument. Maximum Length: 127
    - nattype

      Type of NAT IP address and port allocation (from the bound LSN pools) for subscribers:

      Available options function as follows:

    * **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.
    * **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber's connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

  Possible values: DYNAMIC, DETERMINISTIC

  Default value: DYNAMIC

- portblocksize

  Size of the NAT port block to be allocated for each subscriber.

  To set this parameter for Dynamic NAT, you must enable the port block allocation parameter in the bound LSN pool. For Deterministic NAT, the port block allocation parameter is always enabled, and you cannot disable it.

  In Dynamic NAT, the NetScaler appliance allocates a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

- logging

  Log mapping entries and sessions created or deleted for this LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

  The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG actions entities.

A log message for an LSN mapping entry consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type (MAPPING or SESSION)
- Whether the LSN mapping entry is created or deleted
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping
  - Only Destination IP address (and not port) is logged for Address-Dependent mapping
  - Destination IP address and port are logged for Address-Port-Dependent mapping

Possible values: ENABLED, DISABLED

Default value: DISABLED

- sessionLogging

Log sessions created or deleted for the LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

A log message for an LSN session consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type (MAPPING or SESSION)
- Whether the LSN session is created or removed
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

Possible values: ENABLED, DISABLED

Default value: DISABLED

  - sessionSync

    In a high availability (HA) deployment, synchronize information of all LSN sessions related to this LSN group with the secondary node. After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary).

    For this setting to work, you must enable the global session synchronization parameter.

    Possible values: ENABLED, DISABLED

    Default value: ENABLED

  - snmptraplimit

    Maximum number of SNMP Trap messages that can be generated for the LSN group in one minute.

    Default value: 100

    Minimum value: 0

    Maximum value: 10000

  - ftp

    Enable Application Layer Gateway (ALG) for the FTP protocol. For some application-layer protocols, the IP addresses and protocol port numbers are usually communicated in the packets payload. When acting as an ALG, the appliance changes the packets payload to ensure that the protocol continues to work over LSN.

    Note: The NetScaler appliance also includes ALG for ICMP and TFTP protocols. ALG for the ICMP protocol is enabled by default, and there is no provision to disable it. ALG for the TFTP protocol is disabled by default. ALG is enabled automatically for an LSN group when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

    Possible values: ENABLED, DISABLED

    Default value: ENABLED

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn group
  - groupname

    Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1').

This is a mandatory argument. Maximum Length: 127

- poolname

  Name of the LSN pool to bind to the specified LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

  For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. For Dynamic NAT, pools bound to an LSN group can be bound to multiple LSN groups. Maximum Length: 127

- transportprofilename

  Name of the LSN transport profile to bind to the specified LSN group. Bind a profile for each protocol for which you want to specify settings.

  By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called a default transport.

  An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol. Maximum Length: 127

- appsprofilename

  Name of the LSN application profile to bind to the specified LSN group. For each set of destination ports, bind a profile for each protocol for which you want to specify settings.

  By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile.

  When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. Maximum Length: 127

Sample LSN Configurations

September 21, 2020

The following are examples of configuring LSN through command line interface.

Create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and default settings:

```
add lsn client LSN-CLIENT-1

Done

bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-1

Done

bind lsn pool LSN-POOL-1 203.0.113.3

Done

add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1

Done

bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1

Done
<!--NeedCopy-->
```

Create an LSN configuration with an extended ACL for identifying LSN subscribers:

```
add ns acl LSN-ACL-2 ALLOW -srcIP 192.0.2.10-192.0.2.20

Done

apply acls

Done

add lsn client LSN-CLIENT-2

Done

bind lsn client LSN-CLIENT-2  - aclname LSN-ACL-2

Done

add lsn pool LSN-POOL-2
```

```

Done

bind lsn pool LSN-POOL-2 203.0.113.5-203.0.113.10

Done

add lsn group LSN-GROUP-2 -clientname LSN-CLIENT-2

Done

bind lsn group LSN-GROUP-2 -poolname LSN-POOL-2

Done
<!--NeedCopy-->
```

Create an LSN configuration with endpoint-independent mapping for HTTP protocol (port 80) and address-port dependent mapping for SSH protocol (port 22). Also, restrict each subscriber to use a maximum of 1000 NAT ports for TCP protocol and 100 NAT ports for UDP protocol. Restrict each subscriber to have a maximum of 2000 concurrent sessions for TCP protocol. Restrict the group to have a maximum of 30000 concurrent sessions for TCP protocol:

```
add lsn client LSN-CLIENT-3

Done

bind lsn client LSN-CLIENT-3 -network 192.0.3.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-3

Done

bind lsn pool LSN-POOL-3 203.0.113.11

Done

add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-3

Done

bind lsn group LSN-GROUP-3 -poolname LSN-POOL-3

```

```
Done

add lsn appsprofile LSN-APPS-HTTPPROFILE-3 TCP -mapping ENDPOINT-
    INDEPENDENT

Done

bind lsn appsprofile LSN-APPS-HTTPPROFILE-3 80

Done

bind lsn group LSN-GROUP-3 -applicationprofilename LSN-APPS-HTTPPROFILE
    -3

Done

add lsn appsprofile LSN-APPS-SSHPROFILE-3 TCP -mapping ADDRESS-PORT-
    DEPENDENT

Done

bind lsn appsprofile LSN-APPS-SSHPROFILE-3 22

Done

bind lsn group LSN-GROUP-3 -applicationprofilename LSN-APPS-SSHPROFILE
    -3

Done

add lsn transportprofile LSN-TRANS-PROFILE-TCP-3 TCP -portquota 1000 -
    sessionquota 2000 -groupSessionLimit 30000

Done

bind lsn group LSN-GROUP-3 -transportprofilename LSN-TRANS-PROFILE-TCP
    -3

Done

add lsn transportprofile LSN-TRANS-PROFILE-UDP-3 UDP -portquota 100

Done

bind lsn group LSN-GROUP-3 -transportprofilename LSN-TRANS-PROFILE-UDP
```

```
    -3

Done
<!--NeedCopy-->
```

Create an LSN configuration for a large set of subscribers:

```
add lsn client LSN-CLIENT-4

Done

bind lsn client LSN-CLIENT-4 -network 192.0.4.0 -netmask 255.255.255.0

Done

bind lsn client LSN-CLIENT-4 -network 192.0.5.0 -netmask 255.255.255.0

Done

bind lsn client LSN-CLIENT-4 -network 192.0.6.0 -netmask 255.255.255.0

Done

bind lsn client LSN-CLIENT-4 -network 192.0.7.0 -netmask 255.255.255.0

Done

bind lsn client LSN-CLIENT-4 -network 192.0.8.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-4

Done

bind lsn pool LSN-POOL-4 203.0.113.30-203.0.113.40

Done

bind lsn pool LSN-POOL-4 203.0.113.45-203.0.113.50

Done

bind lsn pool LSN-POOL-4 203.0.113.55-203.0.113.60

```

```
Done

add lsn group LSN-GROUP-4 -clientname LSN-CLIENT-4

Done

bind lsn group LSN-GROUP-4 -poolname LSN-POOL-4

Done

add lsn appsprofile LSN-APPS-WELLKNOWNPROFILE-4 TCP -mapping ENDPOINT-
   INDEPENDENT

Done

bind lsn appsprofile LSN-APPS-WELLKNOWN-PORTS-PROFILE-4 1- 1023

Done

bind lsn group LSN-GROUP-4 -applicationprofilename LSN-APPS-WELLKNOWN-
   PORTS-PROFILE-4

Done
<!--NeedCopy-->
```

Create an LSN configuration with sharing of NAT resources among multiple LSN groups. In this example, LSN pool LSN-POOL-5 is shared with LSN groups LSN-GROUP-5 and LSN-GROUP-6:

```
add lsn client LSN-CLIENT-5

Done

bind lsn client LSN-CLIENT-5 -network 192.0.15.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-5

Done

bind lsn pool LSN-POOL-5 203.0.113.12-203.0.113.14

Done

add lsn group LSN-GROUP-5 -clientname LSN-CLIENT-5
```

```

Done

bind lsn group LSN-GROUP-5 -poolname LSN-POOL-5

Done

add lsn client LSN-CLIENT-6

Done

bind lsn client LSN-CLIENT-6 -network 192.0.16.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-6

Done

bind lsn pool LSN-POOL-6 203.0.113.15-203.0.113.18

Done

add lsn group LSN-GROUP-6 -clientname LSN-CLIENT-6

Done

bind lsn group LSN-GROUP-6 -poolname LSN-POOL-6

Done

bind lsn group LSN-GROUP-6 -poolname LSN-POOL-5

Done
<!--NeedCopy-->
```

Create an LSN configuration with deterministic NAT resource allocation:

```
add lsn client LSN-CLIENT-7

Done

bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask 255.255.255.0

Done
```

```

add lsn pool LSN-POOL-7 -nattype DETERMINISTIC

Done

bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23

Done

add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype
    DETERMINISTIC -portblocksize 1024

Done

bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7

Done
<!--NeedCopy-->
```

Create an LSN configuration with multiple subscriber networks having the same network address but each network belonging to a different traffic domain. Also, restrict the outbound traffic related to HTTP protocol (port 80), sending it through a particular traffic domain (td 5):

```
add lsn client LSN-CLIENT-8

Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0
     -td 1

Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0
     -td 2

Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0
     -td 3

Done

add lsn pool LSN-POOL-8

Done
```

```

bind lsn pool LSN-POOL-8 203.0.113.80-203.0.113.86

Done

add lsn group LSN-GROUP-8 -clientname LSN-CLIENT-8

Done

bind lsn group LSN-GROUP-8 -poolname LSN-POOL-8

Done

add lsn appsprofile LSN-APPS-HTTP-PROFILE-8 TCP -td 5

Done

bind lsn appsprofile LSN-APPS-HTTP-PROFILE-8 80

Done

bind lsn group LSN-GROUP-8 -applicationprofilename LSN-APPS-HTTP-
    PROFILE-8

Done
<!--NeedCopy-->
```

Create an LSN configuration that restricts the outbound traffic of a specific protocol (TCP), sending it through a particular traffic domain (td 5). With endpoint-independent filtering, receive inbound traffic related to this protocol (TCP) on any traffic domain:

```
add lsn client LSN-CLIENT-9

Done

bind lsn client LSN-CLIENT-9 -network 192.0.9.0 -netmask 255.255.255.0
    -td 1

Done

add lsn pool LSN-POOL-9

Done

bind lsn pool LSN-POOL-9 203.0.113.90
```

```

Done

add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9

Done

bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9

Done

add lsn appsprofile LSN-APPS-PROFILE-9 TCP -filtering ENDPOINT-
    INDEPENDENT -td 5

Done

bind lsn group LSN-GROUP-9 -approfile LSN-APPS-PROFILE-9

Done
<!--NeedCopy-->
```

Create an LSN configuration that restricts outbound HTTP (port 80) traffic, sending it through a particular traffic domain (td 10). With address-dependent filtering, receive inbound traffic related to this protocol (HTTP) on the specified traffic domain (td 10):

```
add lsn client LSN-CLIENT-10

Done

bind lsn client LSN-CLIENT-10 -network 192.0.10.0 -netmask
    255.255.255.0 -td 1

Done

add lsn pool LSN-POOL-10

Done

bind lsn pool LSN-POOL-10 203.0.113.100

Done

add lsn group LSN-GROUP-10 -clientname LSN-CLIENT-10

Done
```

```

bind lsn group LSN-GROUP-10 -poolname LSN-POOL-10

Done

add lsn appsprofile LSN-APPS-PROFILE-10 TCP -mapping ENDPOINT -INDEPENDENT -filtering ADDRESS-DEPENDENT -td 10

Done

bind lsn appsprofile LSN-APPS-PROFILE-10 80

Done

bind lsn group LSN-GROUP-10 -approfile LSN-APPS-PROFILE-10

Done
<!--NeedCopy-->
```

Configuring Static LSN Maps

September 21, 2020

The NetScaler appliance supports manual creation of a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. Static LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP:Port maps to the subscriber IP address:Port. For example, Web servers located in the internal network.

To create a static LSN mapping by using the command line interface

At the command prompt, type:

```
add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td <positive_integer>] [<natIP> [<natPort>]] [-destIP <ip_addr> [-dsttd <positive_integer>]]

-  show lsn static
<!--NeedCopy-->
```

To create a static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new static mapping.

Parameter Descriptions (of commands listed in the CLI procedure)

add lsn static name

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn static1" or 'lsn static1'). This is a mandatory argument. Maximum Length: 127

transportprotocol

Protocol for the LSN mapping entry. This is a mandatory argument. Possible values: TCP, UDP, ICMP

subscrIP

IPv4 address of an LSN subscriber for the LSN mapping entry. This is a mandatory argument.

subscrPort

Port of the LSN subscriber for the LSN mapping entry. This is a mandatory argument. Maximum value: 65535

td

ID of the traffic domain to which the subscriber belongs. If you do not specify an ID, the subscriber is assumed to be a part of the default traffic domain. Default value: 0, Minimum value: 0, Maximum value: 4094

natIP

IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

natPort

NAT port for this LSN mapping entry.

destIP

Destination IP address for the LSN mapping entry.

dsttd

ID of the traffic domain through which the destination IP address for this LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0. Default value: 0, Minimum value: 0, Maximum value: 4094

Wildcard Port Static Maps

A static mapping entry is usually a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. A one-to-one static LSN mapping entry exposes only one port of the subscriber to the Internet.

Some situations might require exposing all ports (64K) of a subscriber to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64K one-to-one static mapping entries, one mapping entry for each port. Creating 64K entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

Another simple method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber to the Internet. For a subscriber's inbound or outbound connections matching a wildcard static mapping entry, the subscriber's port does not change after the NAT operation.

When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber's port by connecting to the NAT port that has the same number as the subscriber's port.

Configuring the NetScaler appliance to Provide Access to All Ports of an IPv4 Subscriber

To configure the NetScaler appliance to provide access to all ports of an IPv4 subscriber, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL

- Subscriber port = *
- NAT port = *

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
add lsn static <name> ALL <subscrIP> *  <natIP> * [-td <
    positive_integer>] [-destIP <ip_addr> [-dsttd <positive_integer>]]

show lsn static
<!--NeedCopy-->
```

Sample Configuration

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 192.0.2.10 are made accessible through NAT IP 203.0.11.33.

Sample configuration:

```
add lsn static NAT44-WILDCARD-STATIC-1 ALL  192.0.2.10 * 203.0.113.33 *

Done
<!--NeedCopy-->
```

Configuring Application Layer Gateways

September 21, 2020

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 21, 2020

You can enable or disable ALG for the FTP protocol for an LSN configuration by enabling or disabling the FTP option of the LSN group of the LSN configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an LSN configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Sample LSN Configuration for FTP ALG:
In the following sample LSN configuration, FTP ALG is enabled for subscribers that have IP address in the range 192.0.2.30-192.0.2.100.

```
add ns acl LSN-ACL-1 ALLOW -srcIP 192.0.2.30-192.0.2.100

Done

apply acls

Done

add lsn client LSN-CLIENT-1

Done

bind lsn client LSN-CLIENT-1  - aclname LSN-ACL

Done

add lsn pool LSN-POOL-1

Done

bind lsn pool LSN-POOL-1 203.0.113.10

Done

add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1  -FTP ENABLED

Done

```

```
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1

Done
<!--NeedCopy-->
```

Sample LSN Configuration for TFTP ALG:

In the following sample LSN configuration, endpoint-independent mapping and endpoint-independent filtering are enabled for TFTP protocol (UDP port 69). The NetScaler appliance automatically enables TFTP ALG for this LSN configuration.

```
add lsn client LSN-CLIENT-2

Done

bind lsn client LSN-CLIENT-2 -network 198.51.100.0 -netmask 255
    .255.255.0

Done

add lsn pool LSN-POOL-2

Done

bind lsn pool LSN-POOL-2 203.0.113.10-203.0.113.11

Done

add lsn group LSN-GROUP-2 -clientname LSN-CLIENT-2

Done

bind lsn group LSN-GROUP-2 -poolname pool1 LSN-POOL-2

Done

add lsn appsprofile LSNAPPSPROFILE-TFTP-2 UDP -mapping ENDPOINT-
    INDEPENDENT  - filtering  ENDPOINT-INDEPENDENT

Done

bind lsn appsprofile LSNAPPSPROFILE-TFTP-2 69

Done

```

```
bind lsn group LSN-GROUP-1 -applicationprofilename LSNAPPSPROFILE-TFTP
    -2

Done
<!--NeedCopy-->
```

Application Layer Gateway for PPTP Protocol

September 21, 2020

The NetScaler appliance supports Application Layer Gateways (ALGs) for the Point-to-Point Tunneling Protocol (PPTP).

PPTP is a network protocol that enables secure transfer of data from a remote client to an enterprise server by creating a tunnel across TCP/IP-based data networks. PPTP encapsulates PPP packets into IP packets for transmission over the Internet. PPTP establishes a tunnel for each communicating PPTP network server (PNS)-PPTP Access Concentrator (PAC) pair. After the tunnel is set up, enhanced generic routing encapsulation (GRE) is used to exchange PPP packets. A call ID in the GRE header indicates the session to which a particular PPP packet belongs.

The NetScaler appliance recognizes PPTP packets that arrive on the default TCP port, 1723. The appliance parses PPTP control packets, translates the call ID, and assigns a NAT IP address. For two-way data communication between the client and server, the NetScaler appliance creates an LSN session entry based on the server call ID, and an LSN session based on the client call ID. The appliance then parses the GRE data packets and translates call IDs on the basis of the two LSN session entries.

For PPTP protocol, the NetScaler appliance also includes timeout setting for any idle PPTP LSN sessions. If a PPTP LSN session is idle for a time that exceeds the timeout setting, the NetScaler appliance removes the session.

Limitations:

The following are the limitations of PPTP ALG on a NetScaler appliance:

- PPTP ALG is not supported for hairpin LSN flow.
- PPTP ALG is not supported to work with any RNAT configuration.
- PPTP ALG is not supported inNetScaler clusters.

Configuring PPTP ALG

Configuring PPTP ALG on the NetScaler appliance consist of the following tasks:

- Create an LSN configuration and enable PPTP ALG on it. In an LSN configuration, the LSN group includes the PPTP ALG setting. For instructions on creating an LSN configuration, see Configuration Steps for LSN.
- (Optional) Set the global timeout for idle PPTP LSN sessions.

To enable PPTP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-pptp ( ENABLED |
    DISABLED )]

show lsn group
<!--NeedCopy-->
```

To set the global timeout for idle PPTP LSN sessions by using the CLI

At the command prompt, type:

```
set appAlgParam -pptpGreIdleTimeout <positive_integer>

show appAlgParam
<!--NeedCopy-->
```

Example:

In the following sample LSN configuration, PPTP ALG is enabled for subscribers in the 192.0.2.0/24 network.

Also idle PPTP LSN session timeout is set to 200 secs.

```
add lsn client LSN-CLIENT-1

Done

bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-1

Done

bind lsn pool LSN-POOL-1 203.0.113.3
```

```

Done

add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1  -pptp ENABLED

Done

bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1

Done

set appAlgParam -pptpGreIdleTimeout 200

Done
<!--NeedCopy-->
```

Application Layer Gateway for SIP Protocol

September 21, 2020

Using Large Scale NAT (LSN) with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media.

SIP ALG adheres to the following RFCs:

- RFC 3261
- RFC 3581
- RFC 4566
- RFC 4475

How SIP ALG Works

How IP address translation is performed depends on the type and direction of the message. A message can be any of the following:

- Inbound request
- Outbound response
- Outbound request
- Inbound response

For an outgoing message, the private IP address and port number of the SIP client are replaced with the NetScaler owned public IP address and port number, called the *LSN pool IP address and port number*, specified during LSN configuration. For an incoming message, the LSN pool IP address and the port number are replaced with the private address of the client. If the message contains any public IP addresses, the NetScaler SIP ALG retains them. Also, a pinhole is created on the:

- LSN pool IP address and port on behalf of the private client, so that the messages that arrive at this IP address and port from the public network are treated as SIP messages.
- Public IP address and port on behalf of the public clients, so that the messages that arrive at this IP address and port from the private network are treated as SIP messages.

When a SIP message is sent out across the network, the SIP Application Layer Gateway (ALG) collects information from the message and translates the IP addresses in the following headers into LSN pool IP addresses:

- Via
- Contact
- Route
- Record-Route

In the following sample SIP request message, LSN replaces the IP addresses in the header fields to hide them from the outside network.

```
INVITE adam@10.102.185.156 SIP/2.0 Via: SIP/2.0/UDP 192.170.1.161:62914
     From: eve@10.120.210.3 To: adam@10.102.185.156 Call-ID: a12abcde@10
    .120.210.3 Contact: adam@10.102.185.156 Route: <sip:netscreen@10
    .150.20.3:5060> Record-Route: <sip:netscreen@10.150.20.3:5060>
<!--NeedCopy-->
```

When a message containing SDP information arrives, the SIP ALG collects information from the message and translates the IP addresses in the following fields into LSN pool IP addresses and port numbers:

- c= (connection information)

  This field can appear at the session or media level. It appears in the following format:

  `c=<network-type><address-type><connection-address>`

  If the destination IP address is a unicast IP address, the SIP ALG creates pinholes by using the IP address and port numbers specified in the m= field.

- m= (media announcement)

  This field appears at the media level and contains the description of the media. It appears in the following format:

  `m=<media><port><transport><fmt list>`

- a= (information about the media field)

  This field can appear at the session or media level, in the following format:

  `a=<attribute>`

  `a=<attribute>:<value>`

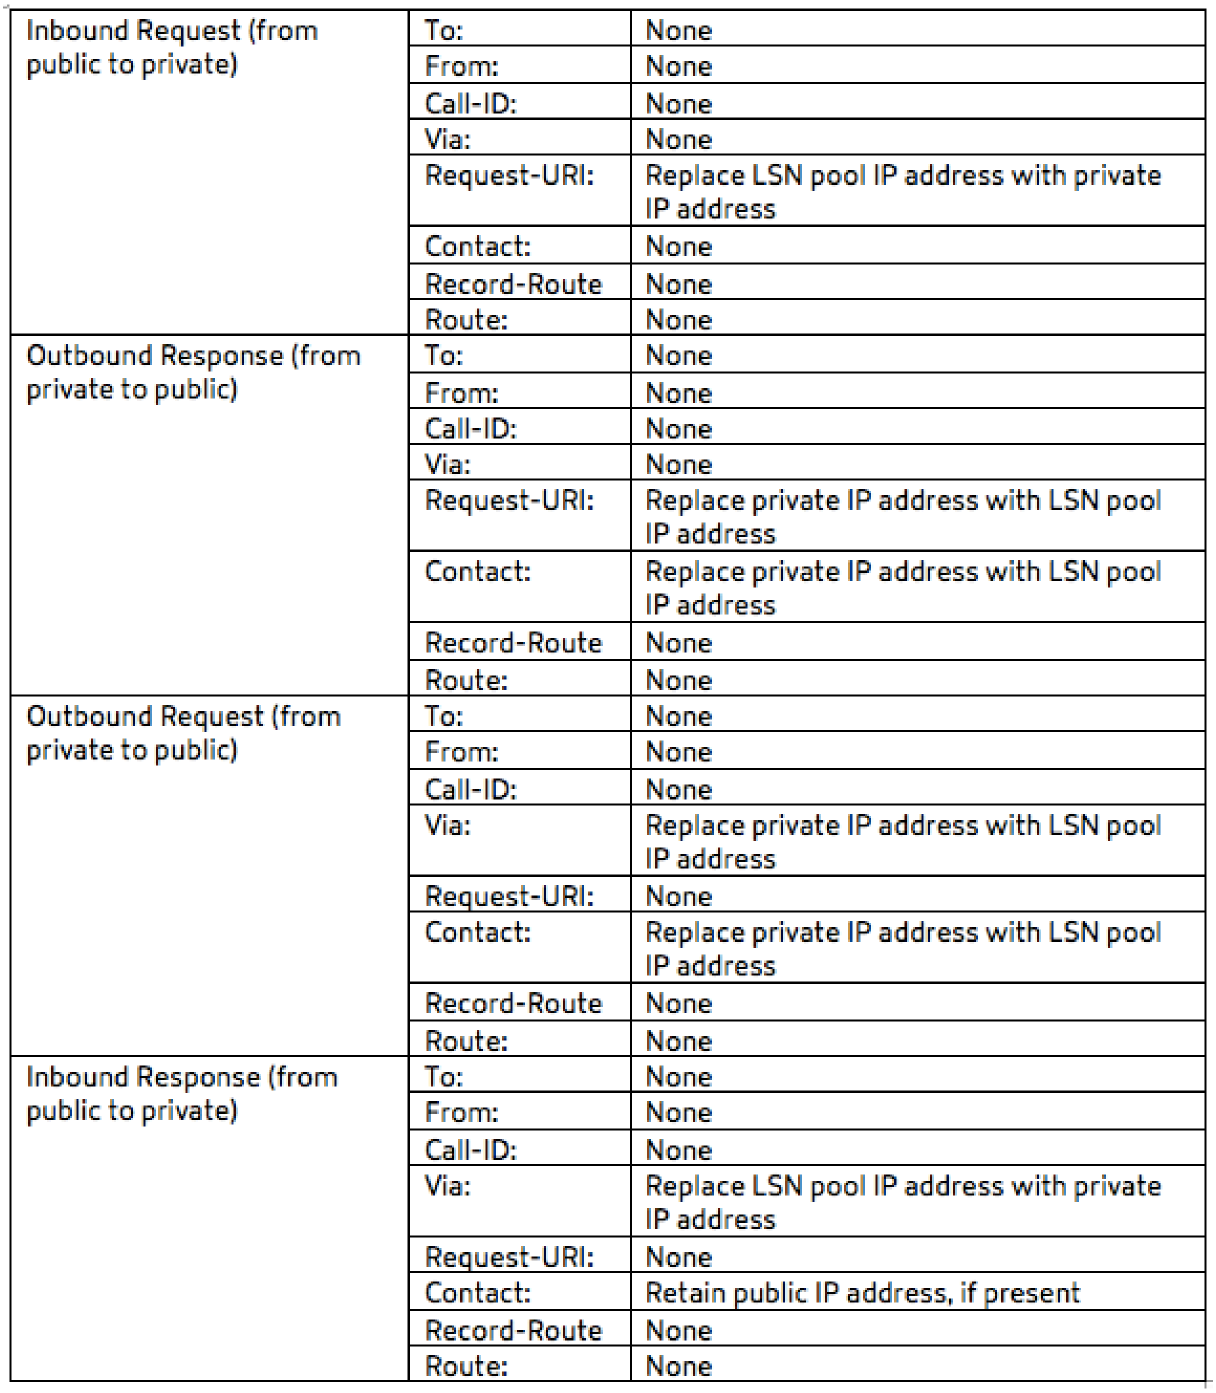
The following excerpt from a sample SDP section shows the fields that are translated for resource allocation.

o=user 2344234 55234434 IN IP4 10.150.20.3

c=IN IP4 10.150.20.3

m=audio 43249 RTP/AVP 0

The following table shows how SIP payload is translated.



Inbound Request (from public to private)	To:	None
	From:	None
	Call-ID:	None
	Via:	None
	Request-URI:	Replace LSN pool IP address with private IP address
	Contact:	None
	Record-Route	None
	Route:	None

Limitations of SIP ALG

A SIP ALG has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses

  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - TD/partitioning/cluster
  - Multipart body
  - SIP messages over IPv6 network
  - Line folding

Tested SIP Clients and Proxy Servers

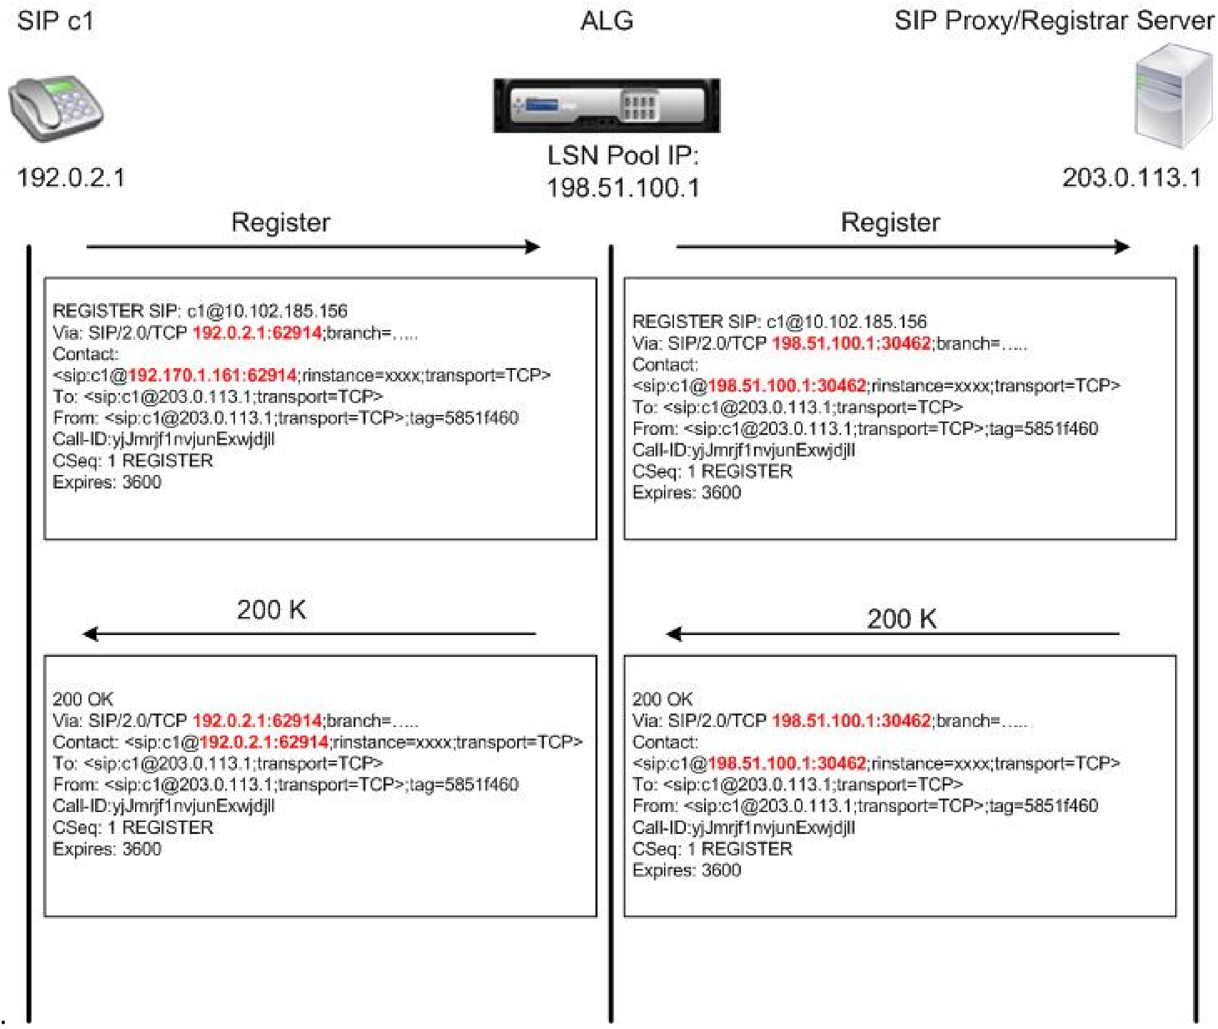
The following SIP clients and proxy server have been tested with SIP ALG:

- **SIP Clients:** X-Lite, Zoiper, Ekiga. Avaya
- **Proxy Server:** openSIPS

LSN SIP Scenario: SIP Proxy Outside the Private Network (Public Network)

SIP Client Registration

For a typical SIP call, SIP client must register with the SIP registrar by composing a REGISTER request and sending it to the SIP registrar. The NetScaler appliance's SIP ALG intercepts the request, replaces the IP address and port number in the request with the LSN pool IP address and port number provided in the LSN configuration, and forwards the request to the SIP registrar. The SIP ALG then opens a pinhole in the NetScaler configuration to allow further SIP communication between the SIP client and the SIP registrar. The SIP registrar sends a 200 OK response to the SIP client over the LSN pool IP address and port number. The NetScaler appliance captures this response in the pinhole, and the SIP ALG replaces the SIP header, putting the original Contact, Via, Route, and Record-Route SIP fields back into the message. The SIP ALG then forwards the message to the SIP client. The following figure shows how SIP ALG uses LSN in a SIP call registration



```

flow.

Outgoing Calls

A SIP call is initiated with a SIP INVITE message sent from the internal to the external network. The SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, replacing them with the LSN pool IP address and port number. LSN stores these mappings for subsequent SIP messages in the SIP call. The SIP ALG then opens separate pinholes in the NetScaler configuration to allow SIP and media through the NetScaler appliance on the dynamically assigned ports specified in the SDP and SIP headers. When a 200 OK message arrives at the NetScaler, it is captured by one of the created pinholes. The SIP ALG replaces the SIP header, restoring the original Contact, Via, Route, and Record-Route SIP fields, and then forwards the message to the internal SIP client.

Incoming Calls

A SIP incoming call is initiated with a SIP INVITE message from the external client to the internal network. The SIP registrar forwards the INVITE message to the SIP client in the internal network, using the pinhole that was created when the Internal SIP client registered with the SIP registrar.

The SIP ALG performs NAT on the LSN IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the IP address and port number of the internal SIP client, and forwards the request to the SIP client. When the 200 OK response message sent by the internal SIP client arrives at the NetScaler appliance, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the LSN pool IP address and port number, forwards the response message to the SIP registrar, and then opens a pinhole in the outbound direction for further SIP communica-

tion.

Call Termination

The BYE message terminates a call. When the device receives a BYE message, it translates the header fields in the message just as it does for any other message. But because a BYE message must be acknowledged by the receiver with a 200 OK, the ALG delays call teardown for 15 seconds to allow time for transmission of the 200 OK.

Call Between Clients in the Same Network

When both client A and client B in the same network initiate a call, the SIP messages are routed through the SIP proxy in the outside network. The SIP ALG processes the INVITE from client A as a normal outgoing call. Since client B is in the same network, the SIP proxy sends the INIVITE back to the NetScaler appliance. The SIP ALG examines the INIVITE message, determines that it contains the NAT IP address of client A, and replaces that address with the private IP address of client A before sending the message to client B. Once the call is established between the clients, the NetScaler is not involved in the media transmission between the clients.

More LSN SIP Scenarios: SIP Proxy Inside the Private Network

If you want to host the SIP Proxy server inside the private network, Citrix recommends that you do one of the following:

- Configure a static LSN Mapping for the private SIP proxy. For more information, see Configuring Static LSN Maps. Make sure that the NAT port is the same as the port configured in the SIP ALG profile.
- Configure the SIP Proxy server inside a demilitarized zone (DMZ).

Scenario 3

Figures 1 and 2 show the following scenarios:

- Scenario 1—SIP client in the private network registers with the SIP proxy server in the same network. ALG operations are not performed, because the SIP client and SIP proxy server are in the same network.
- Scenario 2—SIP client in the public network registers with the SIP proxy server in the private network. The REGISTER message from the public SIP client is sent to the NetScaler appliance by using the static LSN mapping configured on the appliance, and the appliance creates a pinhole

for further SIP operations.

- Scenario 3— SIP Incoming call flow. A SIP incoming call is initiated with a SIP INVITE message from the external to the internal network. The NetScaler appliance receives the INVITE message from SIP client C2, which is in the external network, through the static LSN maps configured on the NetScaler appliance.
  The appliance creates a pinhole and forwards the INVITE message to the SIP proxy. The SIP proxy then forwards the INVITE message to SIP client C1 in the internal network. SIP client C1 then sends 180 and 200 OK messages to the SIP proxy, which in turn forwards the message to SIP client C2 through the NetScaler appliance.
  When the 200 OK response message sent by internal SIP client C1 arrives at the NetScaler, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, and in the SDP fields, replacing them with the LSN pool IP address and port number. The SIP ALG then forwards the response message to SIP client C2 and opens a pinhole in the outbound direction for further SIP communication.

Support for Audit Logs

You can log ALG information as part of LSN logging by enabling ALG in the LSN audit logging configuration. For more information on LSN logging, see Logging and Monitoring LSN. A log message for an ALG entry in the LSN log consists of the following information:

- Time stamp
- Type of SIP message (for example, SIP request)
- Source IP address and port of the SIP client
- Destination IP address and port of the SIP proxy
- NAT IP address and port
- SIP method
- Sequence number
- Whether or not the SIP client is registered
- Caller's user name and domain
- Receiver's user name and domain

Sample audit log:

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Steps for LSN. While configuring LSN, make sure that you:

- Set the following parameters while adding the LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT

Important: For the SIP ALG to work, a full cone NAT configuration is mandatory.

Example:

```
add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
<!--NeedCopy-->
```

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range.

Example:

```
add lsn sipalgprofile sipalgprofile_tcp -sipsrcportrange 1-65535 -
    sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole
     ENABLED  - sipTransportProtocol TCP
<!--NeedCopy-->
```

- Set SIP ALG = ENABLED, while creating the LSN group.

Example:

```
add lsn group g1 -clientname c1 -sipalg ENABLED
<!--NeedCopy-->
```

- Bind the SIP ALG profile to the LSN group.

Sample SIP ALG Configuration:

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, SIP ALG specific setting, and configure SIP ALG:

```
add lsn pool p1

Done

bind lsn pool p1 10.102.185.190

Done

add lsn client c1

Done

bind lsn client c1 -network 192.170.1.0 -netmask 255.255.255.0

Done

add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT

Done

add lsn appsprofile app_udp UDP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT

Done

bind lsn appsprofile app_tcp 1-65535

Done

bind lsn appsprofile app_udp 1-65535

Done
```

```

add lsn sipalgprofile sipalgprofile_tcp -sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -sipTransportProtocol TCP

Done

add lsn sipalgprofile sipalgprofile_udp -sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -sipTransportProtocol UDP

Done

add lsn group g1 -clientname c1 -sipalg ENABLED

Done

bind lsn group g1 -poolname p1

Done

bind lsn group g1 -appsprofilename app_tcp

Done

bind lsn group g1 -appsprofilename app_udp

Done

bind lsn group g1 -sipalgprofilename sipalgprofile_tcp

Done

bind lsn group g1 -sipalgprofilename sipalgprofile_udp

Done
<!--NeedCopy-->
```

Application Layer Gateway for RTSP Protocol

September 21, 2020

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called an LSN pool IP address.
- Inbound response—LSN pool IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

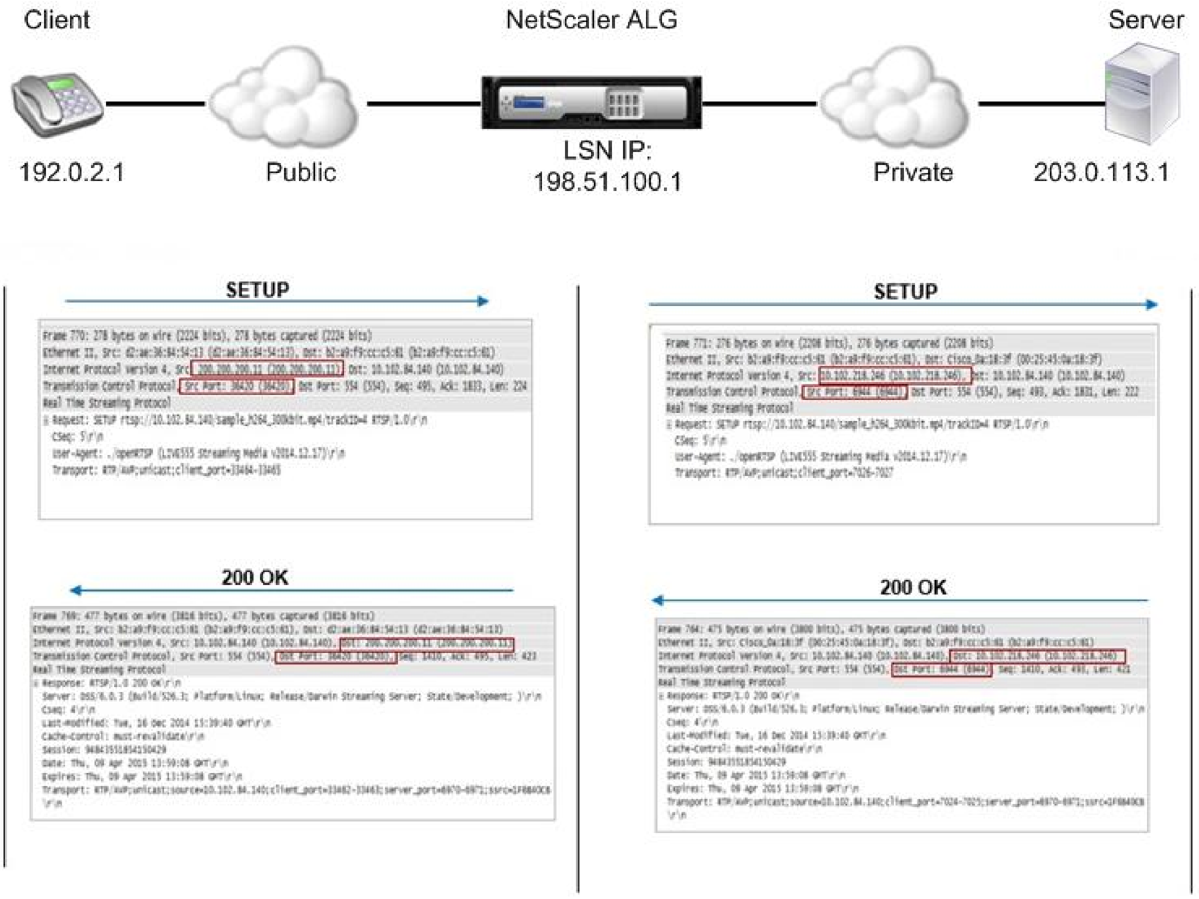
Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- TD/admin partitioning/cluster deployments
- RSTP Authentication
- HTTP tunneling

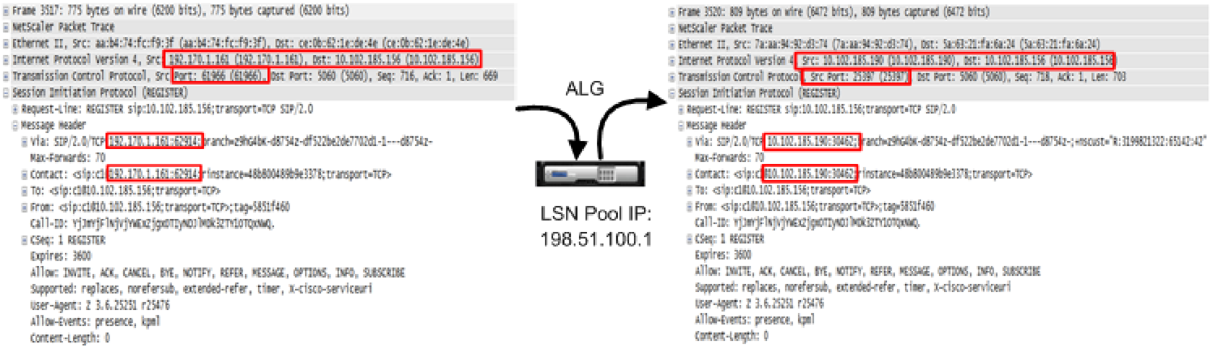
RTSP and LSN scenario

The following figure shows an RTSP SETUP request flow. Typically, a SETUP request specifies how a single media stream must be transported. The request contains the media stream URL and a transport specifier. This specifier typically includes one local port for receiving RTP data (audio or video), and another for receiving RTCP data (meta information). The server reply usually confirms the chosen parameters and fills in the missing parts, such as the server's chosen ports. Each media stream must be configured by using the SETUP command before an aggregate play request can be sent.



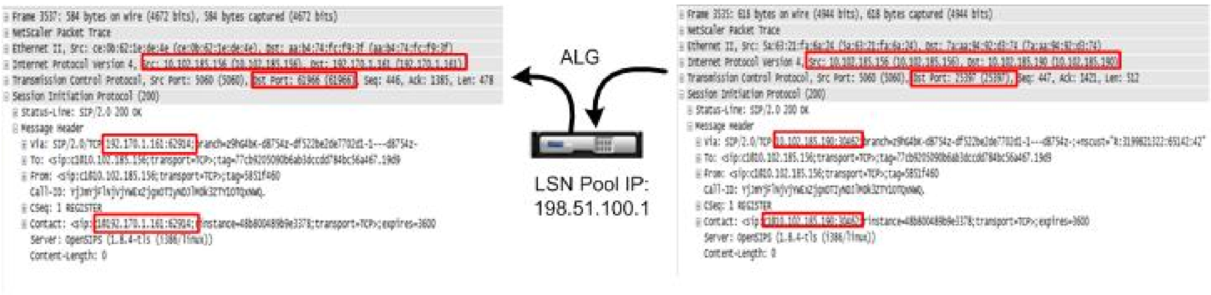
Client
NetScaler ALG
Server
192.0.2.1
Public
LSN IP:
198.51.100.1
Private
203.0.113.1
SETUP
200 OK
SETUP
200 OK

In a typical RTSP communication, the media client in the public network sends a SETUP request to the media server in the private network. RSTP ALG intercepts the request and, in the media stream, replaces the public IP address and port number with the LSN pool IP address and LSN port number. The following figure shows the translation performed by a NetScaler appliance in the media stream for an outbound request:



ALG
LSN Pool IP:
198.51.100.1

The media server in the private network uses the LSN pool IP address and LSN port number to send a 200 OK response to the media client in the public network. The NetScaler RTSP ALG intercepts the response and replaces the LSN pool IP address and LSN port number with the public IP address and port number of the media client. The following figure shows the translation performed by a NetScaler appliance in the media stream for an inbound response:



Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Steps for LSN. While configuring LSN, make sure that you:

- Set the **NAT Type** as DETERMINSTIC or DYNAMIC while adding the LSN pool.
- Set the following parameters while adding the LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

Sample RTSP ALG Configuration:

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and RTSP ALG settings:

```
enable ns feature WL SP LB CS LSN

Done

add lsn pool pool1 -nattype DETERMINISTIC

Done

Logging and Monitoring LSN

September 21, 2020

You can log LSN information to diagnose, troubleshoot problems, and to meet legal requirements. You can monitor the performance of the LSN feature by using LSN statistical counters and displaying current LSN sessions.

Logging LSN

Logging LSN information is one of the important functions required by the ISPs to meet legal requirements and for identifying the source of traffic at any given time.

A NetScaler appliance logs LSN mapping entries and the LSN sessions created or deleted for each LSN group. You can control logging of LSN information for an LSN group by using the logging and session logging parameters of the LSN group. These are group level parameters and are disabled by default. The NetScaler appliance logs LSN sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

Logging	Session Logging	Logging Behavior
Enabled	Enabled	Logs LSN mapping entries as well as LSN sessions.
Enabled	Disabled	Logs LSN mapping entries but not LSN sessions.
Disabled	Enabled	Logs neither mapping entries nor LSN sessions.

A log message for an LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (MAPPING)

- Whether the LSN mapping entry was created or deleted
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
    - Destination IP address and port are not logged for Endpoint-Independent mapping.
    - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
    - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for an LSN session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (SESSION)
- Whether the LSN session is created or removed
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG action entities.

For logging LSN information, Citrix recommends:

- Logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large amounts of LSN log entries (in order of millions).

- Using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.

  Note:

    - The SYSLOG generated on NetScaler appliance are dynamically sent to the external log servers.
    - When using SYSLOG over TCP, if the TCP connection is down or the SYSLOG server is busy, then the NetScaler appliances stores the logs in buffer and send the data once the connec-

tion is active.

For more information about configuring logging, see Audit Logging.

Configuring LSN logging consists of the following tasks:

- **Configuring the NetScaler appliance for logging.** This task involves creating and setting various entities and parameters of the NetScaler appliance:
  - **Create a SYSLOG or NSLOG audit logging configuration**. Creating an audit logging configuration involves the following tasks:
    - Create a NSLOG or SYSLOG audit action and enable the LSN parameter. Audit actions specify the IP addresses of log servers.
    - Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy. Audit actions specify the IP addresses of log servers. Optionally, you can set the transport method for log messages that are sent to the external log servers. By default UDP is selected, you can set the transport method as TCP for a reliable transport mechanism.Bind the audit policy to system global.
    - Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy.
    - Bind the audit policy to system global.

      Note: For an existing audit logging configuration, just enable the LSN parameter for logging LSN information in the server specified by the audit action.
  - **Enable logging and session logging parameters.** Enable logging and session logging parameters either as you add LSN groups or after you have created the groups. The NetScaler appliance generates log messages related to these LSN groups and sends them to the server of those audit actions that have the LSN parameter enabled.
- **Configuring log servers.** This task involves installing SYSLOG or NSLOG packages on the desired servers. This task also involves specifying the NSIP address of the NetScaler appliance in the configuration file of SYSLOG or NSLOG. Specifying the NSIP address enables the server to identify the log information sent by the NetScaler appliance for storing them in a log file.

For more information about configuring logging, see Audit Logging.

SYSLOG Configuration Using the Command Line Interface

To create a SYSLOG server action for LSN logging by using the command line interface

At the command prompt, type:

```
add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel
    <logLevel>... [-transport (TCP)] [-lsn ( ENABLED | DISABLED )]
<!--NeedCopy-->
```

To create a SYSLOG server policy for LSN logging by using the command line interface

At the command prompt, type:

```
add audit syslogPolicy <name> <rule> <action>
<!--NeedCopy-->
```

To bind a SYSLOG server policy to system global for LSN logging by using the command line interface

At the command prompt, type:

```
bind system global [<policyName> [-priority <positive_integer>]]
<!--NeedCopy-->
```

SYSLOG Configuration Using the Configuration Utility

To configure a SYSLOG server action for LSN logging by using the configuration utility

1. Navigate to **Systems** > **Auditing** > **Syslog** and, on the Servers tab, add a new auditing server or edit an existing server.
2. To enable LSN logging, select the **Large Scale NAT Logging** option.
3. (Optional) To enable SYSLOG over TCP, select the **TCP Logging** option.

To configure a SYSLOG server policy for LSN logging by using the configuration utility

Navigate to **Systems** > **Auditing** > **Syslog** and, on the **Policies** tab, add a new policy or edit an existing policy.

To bind a SYSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to **Systems** > **Auditing** > **Syslog**.
2. On the **Policies** tab, in the **Action** list, click **Global Bindings** to bind the audit global policies.

NSLOG Configuration Using the Command Line Interface

To create a NSLOG server action for LSN logging by using the command line interface

At the command prompt, type:

```
add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel
    <logLevel> ... [-lsn ( ENABLED | DISABLED )]
<!--NeedCopy-->
```

To create a NSLOG server policy for LSN logging by using the command line interface

At the command prompt, type:

```
add audit nslogPolicy <name> <rule> <action>
<!--NeedCopy-->
```

To bind a NSLOG server policy to system global for LSN logging by using the command line interface

At the command prompt, type:

```
bind system global [<policyName>]
<!--NeedCopy-->
```

NSLOG Configuration Using the Configuration Utility

To configure a NSLOG server action for LSN logging by using the configuration utility

1. Navigate to **Systems** > **Auditing** > **Nslog** and, on the **Servers** tab, add a new auditing server or, edit an existing server.
2. To enable LSN logging, select the **Large Scale NAT Logging** option.

To configure a NSLOG server policy for LSN logging by using the configuration utility

Navigate to **Systems** > **Auditing** > **Nslog** and, on the **Policies** tab, add a new policy or edit an existing policy.

To bind a NSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to **Systems** > **Auditing** > **Nslog**.
2. On the **Policies** tab, in the **Action** list, click **Global Bindings** to bind the audit global policies.

Example

The following configuration specifies two SYSLOG and two NSLOG servers for storing log entries including LSN logs. LSN Logging is configured for LSN groups LSN-GROUP-2 and LSN-GROUP-3.

The NetScaler appliance generates log messages related to LSN mappings and LSN sessions of these LSN groups, and sends them to the specified log servers.

```
add audit syslogAction SYS-ACTION-1 198.51.101.10 -logLevel ALL -lsn
    ENABLED
Done
add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1
Done
bind system global SYSLOG-POLICY-1
Done

add audit syslogAction SYS-ACTION-2 198.51.101.20 -logLevel ALL -lsn
    ENABLED
Done
add audit syslogPolicy SYSLOG-POLICY-2 ns_true SYS-ACTION-2
Done
bind system global SYSLOG-POLICY-2
Done

add audit nslogAction NSLOG-ACTION-1 198.51.101.30 -logLevel ALL -lsn
    ENABLED
Done
add audit nslogPolicy NSLOG-POLICY-1 ns_true NSLOG-ACTION-1
Done
bind system global NSLOG-POLICY-1
Done
add audit nslogAction NSLOG-ACTION-2 198.51.101.40 -logLevel ALL -lsn
    ENABLED
Done
add audit nslogPolicy NSLOG-POLICY-2 ns_true NSLOG-ACTION-2
Done
bind system global NSLOG-POLICY-2
Done

 add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-2  – logging ENABLED
     – sessionLogging ENABLED
Done
 set lsn group LSN-GROUP-2   – logging ENABLED  – sessionLogging ENABLED
Done
<!--NeedCopy-->
```

The following configuration specifies SYSLOG configuration for sending log messages to the external SYSLOG server 192.0.2.10 using TCP.

```
add audit syslogAction SYS-ACTION-1 192.0.2.10 -logLevel ALL -transport
     TCP
Done
```

```

add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1
Done

bind system global SYSLOG-POLICY-1
Done
<!--NeedCopy-->
```

The following table displays sample LSN log entries of each type stored on the configured log servers. These LSN log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

LSN Log Entry Type	Sample Log Entry
LSN session creation	Local4.Informational 10.102.37.115 08/05/2014:09:59:48 GMT 0-PPE-0 : LSN LSN_SESSION 2581750 : SESSION CREATED Client IP:Port:TD 192.0.2.10: 15136:0, NatIP:NatPort 203.0.113.6: 6234, Destination IP:Port:TD 198.51.100.9: 80:0, Protocol: TCP
LSN session deletion	Local4.Informational 10.102.37.115 08/05/2014:10:05:12 GMT 0-PPE-0 : LSN LSN_SESSION 3871790 : SESSION DELETED Client IP:Port:TD 192.0.2.11: 15130:0, NatIP:NatPort 203.0.113.6: 7887, Destination IP:Port:TD 198.51.101.2:80:0, Protocol: TCP
LSN mapping creation	Local4.Informational 10.102.37.115 08/05/2014:09:59:47 GMT 0-PPE-0 : LSN LSN_MAPPING 2581580 : EIM CREATED Client IP:Port 192.0.2.15: 14567, NatIP:NatPort 203.0.113.5: 8214, Protocol: TCP
LSN mapping deletion	Local4.Informational 10.102.37.115 08/05/2014:10:05:12 GMT 0-PPE-0 : LSN LSN_MAPPING 3871700 : EIM DELETED Client IP:Port 192.0.3.15: 14565, NatIP:NatPort 203.0.113.11: 8217, Protocol: TCP

Minimal Logging

Deterministic LSN configurations and Dynamic LSN configurations with port block significantly reduces the LSN log volume. For these two types of configuration, the NetScaler appliance allocates a NAT IP address and a block of ports to a subscriber. The NetScaler appliance generates a log message for a port block at the time of allocation to a subscriber. The NetScaler appliance also generates a log message when a NAT IP address and port block is freed. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. The appliance also neither logs any mapping entry created for a session nor when the mapping entry gets removed.

The minimal logging feature for deterministic LSN configurations and dynamic LSN configurations with port block is enabled by default and there is no provision to disable it. In other words, the NetScaler appliance automatically do minimal logging for deterministic LSN configurations and dynamic LSN configurations with port block. There is no option available for disabling this feature. The appliance sends the log messages to all the configured log servers.

A log message for each port block consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type as DETERMINISTIC or PORTBLOCK
- Whether a port block is allocated or is freed
- Subscriber's IP address and the assigned NAT IP address and port block
- Protocol name

Minimal Logging for Deterministic LSN Configuration

Consider an example of a simple deterministic LSN configuration for four subscribers having the IP address 192.0.17.1, 192.0.17.2, 192.0.17.3, and 192.0.17.4.

In this LSN configuration, the port block size is set to 32768 and LSN NAT IP address pool has IP addresses in the range 203.0.113.19-203.0.113.23.

```
add lsn client LSN-CLIENT-7
Done
bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask
   255.255.255.253
Done
add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
Done
bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
Done
add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype
   DETERMINISTIC -portblocksize 32768
```

```
Done
bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
Done
<!--NeedCopy-->
```

The NetScaler appliance sequentially preallocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-33791) on the beginning NAT IP address (203.0.113.19) to the beginning subscriber IP address (192.0.17.1). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The appliance logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers. The appliance generates the following log messages for the LSN configuration.

```
1) 03/23/2015:00:30:56 GMT  Informational 0-PPE-0 : default LSN
   LSN_DETERMINISTIC 79201453 0 :  Dtrstc ALLOC Client 12.0.0.241,
   NatInfo 50.0.0.2:59904 to 60415
2) 03/23/2015:00:30:56 GMT  Informational 0-PPE-0 : default LSN
   LSN_DETERMINISTIC 79201454 0 :  Dtrstc ALLOC Client 12.0.0.242,
   NatInfo 50.0.0.2:60416 to 60927
3) 03/23/2015:00:30:56 GMT  Informational 0-PPE-0 : default LSN
   LSN_DETERMINISTIC 79201455 0 :  Dtrstc ALLOC Client 12.0.0.243,
   NatInfo 50.0.0.2:60928 to 61439
4) 03/23/2015:00:30:56 GMT  Informational 0-PPE-0 : default LSN
   LSN_DETERMINISTIC 79201455 0 :  Dtrstc ALLOC Client 12.0.0.243,
   NatInfo 50.0.0.2:60928 to 61439
<!--NeedCopy-->
```

When you remove the LSN configuration, the allocated NAT IP address and block of ports is freed from each subscriber. The appliance logs NAT IP address and block of ports freed from each subscriber. The appliance generates the following log messages for each subscriber when you remove the LSN configuration.

“‘ pre codeblock
1) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201706 0 : Dtrstc FREE Client 12.0.0.238, NatInfo 50.0.0.2:58368 to 58879
2) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201707 0 : Dtrstc FREE Client 12.0.0.239, NatInfo 50.0.0.2:58880 to 59391
3) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201708 0 : Dtrstc FREE Client 12.0.0.240, NatInfo 50.0.0.2:59392 to 59903

```
### Minimal Logging for Dynamic LSN Configuration with Port Block
```

```

Consider an example of a simple dynamic LSN configuration with port
    block for any subscriber in the network 192.0.2.0/24. In this LSN
    configuration, the port block size is set to 1024 and LSN NAT IP
    address pool has IP addresses in the range 203.0.113.3-203.0.113.4.
```

set lsn parameter -memLimit 4000

Done

add lsn client LSN-CLIENT-1

Done

bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-1

Done

bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4

Done

add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024

Done

bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1

Done

```
The NetScaler appliance allocates a random NAT IP address and a block
    of ports, from the LSN NAT IP pool and on the basis of the set port
    block size, for a subscriber when it initiates a session for the
    first time. The NetScaler logs the NAT IP address and block of ports
     allocated to this subscriber. The appliance does not log any LSN
    session created or deleted for this subscriber. If all the ports are
     allocated (for different subscriber’ s sessions) from the
    subscriber’ s allocated port block, the appliance allocates a new
    random NAT IP address and port block for the subscriber for
    additional sessions. The NetScaler logs every NAT IP address and
    port block allocated to a subscriber.

The appliance generates the following log message when the subscriber,
    having the IP address 192.0.2.1, initiates a session. The log
    message shows that the appliance has allocated NAT IP address
    203.0.113.3 and port block 1024-2047 to the subscriber.
```

03/23/2015:00:07:12 GMT Informational 0-PPE-3 : default LSN LSN_PORTBLOCK 106725793 0 : Portblock ALLOC Client 12.0.2.72, NatInfo 203.0.113.3:1024 to 2047, Proto:TCP

```
Once there are no more sessions left that is using the allocated NAT IP
     address and one of the ports in the allocated port block, the
```

```
allocated NAT IP address and block of ports is freed from the subscriber. The NetScaler logs that the NAT IP address and the block of ports is freed from the subscriber. The appliance generates the following log messages for the subscriber, having the IP address 192.0.2.1 , when no more sessions are left that is using the allocated NAT IP address ( 203.0.113.3 ) and a port from the allocated port block ( 1024-2047 ). The log message shows that the NAT IP address and port block are freed from the subscriber.
```

03/23/2015:00:11:09 GMT Informational 0-PPE-3 : default LSN LSN_PORTBLOCK 106814342 0 : Portblock FREE Client 12.0.3.122, NatInfo 203.0.113.3: 1024 to 2047, Proto:TC

```
## Load Balancing SYSLOG Servers

The NetScaler appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

### Load balancing of SYSLOG servers using the command line interface

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.
```

add service (|) <serviceType (SYSLOGTCP | SYSLOGUDP)>

```
Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.
```

add lb vserver <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod]

```
Bing the service to the load balancing virtual server.
```

Bind lb vserver

```
Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.
```

add syslogaction [-lbVserverName] [-logLevel]

```
Add a SYSLOG policy by specifying the rule and action.
```

add syslogpolicy

```
Bind the SYSLOG policy to the system global for the policy to take effect.
```

bind system global

```
### Load balancing of SYSLOG servers using the configuration utility

1.  Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

    Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

1.  Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

    Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDPas protocol.

1.  Bing the service to the load balancing virtual server to the service.

    Bing the service to the load balancing virtual server.

    Navigate to Traffic Management > Virtual Servers, select a virtual server and then selectAUDITLOGHASH in the Load Balancing Method.

1.  Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

    Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option inServers.

1.  Add a SYSLOG policy by specifying the rule and action.

    Navigate to System > Syslog, click Policies and add a SYSLOG policy.

1.  Bind the SYSLOG policy to the system global for the policy to take effect.

    Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy
```

```
        to system global.

**Example:**

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.
```

```
add service service1 192.0.2.10 SYSLOGUDP 514
Done

add service service2 192.0.2.11 SYSLOGUDP 514
Done

add service service3 192.0.2.11 SYSLOGUDP 514
Done

add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
Done

bind lb vserver lbvserver1 service1
Done

bind lb vserver lbvserver1 service2
Done

bind lb vserver lbvserver1 service3
Done

add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
Done

add syslogpolicy syspol1 ns_true sysaction1
Done

bind system global syspol1
Done
```

```
## Logging HTTP Header Information

The NetScaler appliance can now log request header information of an HTTP connection that is using the LSN fucntionality of the NetScaler. The following header information of an HTTP request packet can be logged:

-  URL that the HTTP request is destined to.
-  HTTP Method specified in the HTTP request.
-  HTTP version used in the HTTP request.
-  IP address of the subscriber that sent the HTTP request.

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set a subscribers. For example, an ISP can use this feature to find out the most popular websites among a set of subscribers.

An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging. The HTTP header log profile is then bound to an LSN group. The NetScaler appliance then logs HTTP header attributes, which are enabled in the bound HTTP header log profile for logging, of any HTTP requests related to the LSN group. The appliance then sends the log messages to the configured log servers.

An HTTP header log profile can be bound to multiple LSN groups but an LSN group can have only one HTTP header log profile.

### To create an HTTP header log profile by using the the command line interface

At the command prompt, type:
```

add lsn httphdrlogprofile [-logURL (ENABLED | DISABLED)] [-logMethod (ENABLED | DISABLED)] [-logVersion (ENABLED | DISABLED)] [-logHost (ENABLED | DISABLED)]

show lsn httphdrlogprofile

```
### To bind an HTTP header log profile to an LSN group by using the the command line interface

At the command prompt, type:
```

bind lsn group -httphdrlogprofilename

show lsn group

```
### Example

In the following example of an LSN configuration, HTTP header log profile HTTP-Header-LOG-1 is bound to LSN group LSN-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging so that all these attributes are logged for any HTTP requests from subscribers (in the
network 192.0.2.0/24) related to the LSN group.
```

add lsn httphdrlogprofile HTTP-HEADER-LOG-1
Done

set lsn parameter -memLimit 4000
Done

add lsn client LSN-CLIENT-1
Done

bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done

add lsn pool LSN-POOL-1
Done

bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
Done

add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
Done

bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done

bind lsn group LSN-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG-1
Done

```
The NetScaler generates the following HTTP header log message when one of the subscriber belonging to the LSN configuration example sends an HTTP request.

The log message tells us that a client having the IP address 192.0.2.33 sends an HTTP request to URL example.com using HTTP method GET and HTTP version 1.1.
```

03/19/2015:16:24:04 GMT Informational 0-PPE-1 : default LSN Message 59 0 : "LSN Client IP:TD 10.102.37.118:0 URL: example.com Host: 192.0.2.33 Version: HTTP1.1 Method: GET"

```
## Logging MSISDN Information

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber's operator.
```

```

You can configure a NetScaler appliance to include MSISDNs in LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs helps the administrator in faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.3:45195.

|Log Entry Type|Sample Log Entry|
|-|-|
|LSN session creation|Oct 14 15:37:30 10.102.37.77 10/14/2015:10:08:14 GMT 0-PPE-6 : default LSN LSN_SESSION 25012 0 : SESSION CREATED E164:5556543210 Client IP:Port:TD 192.0.2.50:4649:0, NatIP:NatPort 203.0.113.3:45195, Destination IP:Port:TD 23.0.0.1:0:0, Protocol: TCP|
|LSN mapping creation|Oct 14 15:37:30 10.102.37.77 10/14/2015:10:08:14 GMT 0-PPE-6 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM CREATED E164:5556543210 Client IP:Port:TD 192.0.2.50:4649:0, NatIP:NatPort 203.0.113.3:45195, Destination IP:Port:TD 23.0.0.1:0:0, Protocol: TCP|
|LSN session deletion|Oct 14 15:40:30 10.102.37.77 10/14/2015:10:11:14 GMT 0-PPE-6 : default LSN LSN_SESSION 25012 0 : SESSION CREATED E164:5556543210 Client IP:Port:TD 192.0.2.50:4649:0, NatIP:NatPort 203.0.113.3:45195, Destination IP:Port:TD 23.0.0.1:0:0, Protocol: TCP|
|LSN mapping|Oct 14 15:40:30 10.102.37.77 10/14/2015:10:11:14 GMT 0-PPE-6 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM CREATED E164:5556543210 Client IP:Port:TD 192.0.2.50:4649:0, NatIP:NatPort 203.0.113.3:45195, Destination IP:Port:TD 23.0.0.1:0:0, Protocol: TCP|

### Perform the following tasks for including MSISDN information in LSN logs

-  **Create an LSN log profile**. An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration. Enable the log subscriber ID parameter when creating the LSN log profile.
-  **Bind the LSN log profile to an LSN group of an LSN configuration
```

```
**. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. For instructions on configuring Large Scale NAT, see [Configuration Steps for LSN](/en-us/netscaler/11-1/netscaler-support-for-telecom-service-providers/lsn-introduction/configuration-steps-lsn.html).

#### To create an LSN log profile by using the CLI

At the command prompt, type:
```

add lsn logprofile <logprofilename -logSubscriberID (ENABLED | DISABLED)

show lsn logprofile

```
#### To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:
```

bind lsn group -logProfileName

show lsn group

```
**Sample Configuration:**

In this example of LSN configuration, the LSN log profile has the log subscriber ID parameter enabled. The profile is bound to LSN group LSN-GROUP-9. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in the network 192.0.2.0/24).
```

add lsn logprofile LOG-PROFILE-MSISDN-9 -logSubscriberID ENABLED

Done
add lsn client LSN-CLIENT-9

Done
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0

Done
add lsn pool LSN-POOL-9

Done
bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4

Done
add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9

Done
bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9

Done
bind lsn group LSN-GROUP-9 -logprofilename LOG-PROFILE-MSISDN-9

Done

```
## Displaying Current LSN Sessions

You can display the current LSN sessions for detecting any unwanted or
    inefficient LSN sessions on the NetScaler appliance. You can display
     all or some LSN sessions on the basis of selection parameters.

Note: When more than a million LSN sessions exist on the NetScaler
    appliance, Citrix recommends displaying selected LSN sessions
    instead of all by using the selection parameters.

### Configuration Using the Command Line Interface

#### To display all LSN sessions by using the command line interface

At the command prompt, type:
```

show lsn session

```
#### To display selective LSN sessions by using the command line
    interface

At the command prompt, type:
```

show lsn session [-clientname] [-network [-netmask] [-td]] [-natIP [-natPort]]

```
##### Example

To display all LSN sessions existing on a NetScaler

![lsn-session](/en-us/netscaler/media/show-lsn-session1.png)

To display all LSN sessions related to an LSN client entity LSN-CLIENT
    -2

![lsn-session2](/en-us/netscaler/media/lsn-session-2.png)
Done

To display all LSN sessions that uses 203.0.113.5 as the NAT IP address
```

```

![lsn-session3](/en-us/netscaler/media/lsn-session-3.png)

### Configuration Using the Configuration Utility

#### To display all or selected LSN sessions by using the configuration utility

1.  Navigate to System  > Large Scale NAT > Sessions, and click the NAT44 tab.
1.  For displaying LSN sessions on the basis of selection parameters, click Search.

### Parameter Descriptions (of commands listed in the CLI procedure)

-
    show lsn session

    -
        clientname

        Name of the LSN Client entity. Maximum Length: 127

    -
        network

        IP address or network address of subscriber(s).

    -
        netmask

        Subnet mask for the IP address specified by the network parameter.

        Default value: 255.255.255.255

    -
        td

        Traffic domain ID of the LSN client entity.

        Default value: 0

        Minimum value: 0

        Maximum value: 4094

    -
        natIP

        Mapped NAT IP address used in LSN sessions.

## Displaying LSN Statistics

You can display statistics related to the LSN feature for evaluating
    the performance of the LSN feature or to troubleshoot problems. You
    can display a summary of statistics of the LSN feature or of a
    particular LSN group. The statistical counters reflect events since
    the NetScaler appliance was last restarted. All these counters are
    reset to 0 when the NetScaler appliance is restarted.

### To display all LSN statistics by using the command line interface

At the command prompt, type:
```

stat lsn

```
### To display statistics for a specified LSN group by using the
    command line interface

At the command prompt, type:
```

stat lsn group []

```
#### Example
```

> stat lsn

Large Scale NAT statistics
Rate(/s) Total
LSN TCP Received Packets 0 40
LSN TCP Received Bytes 0 3026
LSN TCP Transmitted Packets 0 40
LSN TCP Transmitted Bytes 0 3026
LSN TCP Dropped Packets 0 0
LSN TCP Current Sessions 0 0
LSN UDP Received Packets 0 0
LSN UDP Received Bytes 0 0
LSN UDP Transmitted Packets 0 0

LSN UDP Transmitted Bytes 0 0
LSN UDP Dropped Packets 0 0
LSN UDP Current Sessions 0 0
LSN ICMP Received Packets 0 982
LSN ICMP Received Bytes 0 96236
LSN ICMP Transmitted Packets 0 0
LSN ICMP Transmitted Bytes 0 0
LSN ICMP Dropped Packets 0 982
LSN ICMP Current Sessions 0 0
LSN Subscribers 0 1

Done

> stat lsn group LSN-GROUP-1

LSN Group Statistics
Rate (/s) Total
TCP Translated Pkts 0 40
TCP Translated Bytes 0 3026
TCP Dropped Pkts 0 0
TCP Current Sessions 0 0
UDP Translated Pkts 0 0
UDP Translated Bytes 0 0
UDP Dropped Pkts 0 0
UDP Current Sessions 0 0
ICMP Translated Pkts 0 0
ICMP Translated Bytes 0 0
ICMP Dropped Pkts 0 0
ICMP Current Sessions 0 0
Current Subscribers 0 1

Done

```
### Parameter Descriptions (of commands listed in the CLI procedure)

-
    stat lsn group

    -
        groupname

        Name of the LSN Group. Maximum Length: 127

    -
```

```
        detail

        Specifies detailed output (including more statistics). The output can be quite voluminous. Without this argument, the output will show only a summary.

    -
        fullValues

        Specifies that numbers and strings should be displayed in their full form. Without this option, long strings are shortened and large numbers are abbreviated.

    -
        ntimes

        The number of times, in intervals of seven seconds, the statistics should be displayed.

        Default value: 1

    -
        logFile

        The name of the log file to be used as input.

    -
        clearstats

        Clear the statsistics / counters

        Possible values: basic, full

## Compact Logging

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in
```

```
    log size.

The following examples of NAT44 mapping creation log entries show the advantage of compact logging.

|-|-|

|Default logging format|02/02/2016:01:13:01 GMT Informational 0-PPE-2 : default LSN LSN_ADDRPORT_MAPPING 85 0 : A&PDM CREATED ClientIP:Port:TD1.1.1.1:6500:0,NatIP:NatPort8.8.8.8:47902, DestinationIP:Port:TD2.2.2.2:80:0, Protocol: TCP|
|Compact logging format|02/02/2016:01:14:57 GMT Info 0-PE2:default LSN 87 0:A&PDMC|C-1.1.1.1:6500:0|N-8.8.8.9:51066|D-2.2.2.2:80:0|T|

## Configuration Steps

Perform the following tasks for logging LSN information in compact format:

-  **Create an LSN log profile.** An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
-  **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

### To create an LSN log profile by using the CLI

At the command prompt, type:
```

add lsn logprofile -logCompact (ENABLED|DISABLED)

show lsn logprofile

```
### To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:
```

bind lsn group -logProfileName

show lsn group

```
**Sample configuration:**
```

```
add lsn logprofile  LOG-PROFILE-COMPACT-9 -logCompact ENABLED

Done
add lsn client LSN-CLIENT-9
Done
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-9
Done
bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
Done
add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
Done
bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
Done
bind lsn group  LSN-GROUP-9 –logProfileName LOG-PROFILE-COMPACT-9
Done
```

```
## IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following large scale NAT44 related events:

-  Creation or deletion of an LSN session.
-  Creation or deletion of an LSN mapping entry.
-  Allocation or de-allocation of port blocks in the context of deterministic NAT.
-  Allocation or de-allocation of port blocks in the context of dynamic NAT.
-  Whenever subscriber session quota is exceeded.

### Points to Consider before you Configure IPFIX logging

Before you start configuring IPSec ALG, consider the following points:

-  You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature topic.
```

```

### Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format
   :

-  **Enable LSN logging in the AppFlow configuration**. Enable the LSN
   logging parameter as part of AppFlow configuration.
-  **Create an LSN log profile**. An LSN log profile includes the IPFIX
    parameter that enables or disables the log information in IPFIX
   format.
-  **Bind the LSN log profile to an LSN group of an LSN configuration
   **. Bind the LSN log profile to one or multiple LSN group(s). Events
    related to the bound LSN group will be logged in IPFIX format.

#### To enable LSN logging in the AppFlow configuration by using the
   CLI

At the command prompt, type:
```

set appflow param -lsnLogging (ENABLED | DISABLED)

show appflow param

```
#### To create an LSN log profile by using the CLIAt the command prompt

At the command prompt, type:
```

set lsn logprofile -logipfix (ENABLED | DISABLED)

show lsn logprofile

```
#### To bind the LSN log profile to an LSN group of an LSN
   configuration by using the CLI

At the command prompt, type:
```

bind lsn group -logProfileName

show lsn group
“‘

To create an LSN log profile by using the GUI

Navigate to **System** > **Large Scale NAT** > **Profiles**, click **Log** tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System** > **Large Scale NAT** > **LSN Group,** open the **LSN** group.
2. In **Advanced Settings,** click **+ Log Profile** to bind the created Log profile to the LSN group.

STUN Timeout

September 21, 2020

STUN (Session Traversal Utilities for NAT) enables an end host operating behind a NAT device to discover its NAT IP address and NAT port allocated by the NAT device. Interactive communication applications (for example real-time voice, video, and messaging) running on these hosts use the STUN protocol for discovering NAT IP address and port information. This information is used by these applications to connect to their peer applications in the Internet. STUN protocol includes servers, known as STUN servers, residing in the Internet. Using the STUN protocol, an application of an end host sends a request to a known STUN server, which in turn then embeds the NAT IP address and port in the payload of its response packet.

In an LSN deployment of a NetScaler appliance for an ISP, interactive communication applications (for example real-time voice, video, and messaging) running on a subscribers can use the STUN protocol to discover whether it is behind a NAT (NetScaler appliance) device or not. These applications send a request to a known STUN server. On receiving the request, the NetScaler allocates a NAT IP address and a port for this request, creates an LSN session and an LSN mapping entry, translates the packet with the allocated NAT IP address and port, and then forwards the packet to the STUN server. The STUN server embeds the allocated NAT IP address and port in the payload of its response packet. When the subscriber finally receives the packet, from the payload of the packet it learns that it is behind a NAT device, and the NAT IP address and port allocated for the session.

The application then notifies the peer applications that it is reachable at the NAT IP address and the port of the LSN mapping entry created for the STUN session. It notifies by embedding the NAT IP address and port in the payload of the packets sent to the peer applications. For making the application reachable at the same LSN mapping entry for any external application, full Cone NAT (endpoint Independent mapping and Endpoint Independent filtering) is enabled for the LSN configuration on the NetScaler appliance.

The NetScaler detects an LSN session of type STUN if the request packets are destined to TCP or UDP port 3478, and then marks the created mapping entry of type STUN. The NetScaler applies a timeout called, STUN timeout, to the created STUN LSN mapping entry. A STUN timeout is the maximum time that the NetScaler maintains an idle STUN LSN mapping entry since it was last used by any LSN session. If the STUN LSN mapping session is unused for a time that exceeds the STUN timeout, the NetScaler removes the mapping entry.

For an application on a subscriber that use STUN LSN mapping entry to stay available to other peer applications on the Internet, the application periodically sends keep-alive messages to the NetScaler appliance so that the STUN LSN mapping entry does not timeout. A higher frequency of keep-alive messages can have an affect on the performance a subscriber, especially, if the subscriber is a mobile device. A higher value of STUN timeout reduces the frequency of keep-alive messages from a subscriber.

ALGs on the NetScaler appliance do not apply to an LSN session that use a STUN LSN mapping entry because NAT IP address and NAT port are communicated in payload of the packets related to the session.

For subscribers' applications that use STUN protocol, the LSN configuration must have the following settings:

- STUN timeout. In an LSN configuration, the LSN group includes the STUN timeout setting.
- Endpoint-independent mapping and endpoint-independent filtering for STUN protocol ports.

For instructions on creating an LSN configuration, see Configuration Steps for LSN.

Example:

The following sample LSN configuration applies to applications that use STUN protocol over TCP or UDP. STUN timeout is set to 10 mins. Endpoint-independent mapping and endpoint-independent filtering is set for the STUN TCP port (3748) and the STUN UDP port (3748).

```
add lsn client LSN-CLIENT-1

Done

bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-1

Done

bind lsn pool LSN-POOL-1 203.0.113.3

Done

add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1  -stuntimeout 10

Done

bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1

```

```
Done

add lsn appsprofile LSNAPPSPROFILE-TCP-STUN-1 TCP -mapping ENDPOINT-
    INDEPENDENT  - filtering  ENDPOINT-INDEPENDENT

Done

bind lsn appsprofile LSNAPPSPROFILE-TCP-STUN-1 3748

Done

bind lsn group LSN-GROUP-1 -applicationprofilename LSNAPPSPROFILE-TCP-
    STUN-1

Done

add lsn appsprofile LSNAPPSPROFILE-UDP-STUN-1 UDP -mapping ENDPOINT-
    INDEPENDENT  - filtering  ENDPOINT-INDEPENDENT

Done

bind lsn appsprofile LSNAPPSPROFILE-UDP-STUN-1 3748

Done

bind lsn group LSN-GROUP-1 -applicationprofilename LSNAPPSPROFILE-UDP-
    STUN-1

Done
<!--NeedCopy-->
```

TCP SYN Idle Timeout

September 21, 2020

SYN idle timeout is the timeout for establishing TCP connections that use LSN on the NetScaler appliance. If a TCP session is not established within the configured timeout period, the NetScaler removes the session. SYN idle timeout is useful in providing protection against SYN flood attacks. In an LSN configuration, the LSN group entity includes the SYN idle timeout setting.

Example:

In the following sample LSN configuration, SYN idle timeout is set to 30 secs for TCP connections related to subscribers from the 192.0.2.0/24 network.

```
add lsn client LSN-CLIENT-1

Done

bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-1

Done

bind lsn pool LSN-POOL-1 203.0.113.3

Done

add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1  - synidletimeout 30

Done

bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1

Done
<!--NeedCopy-->
```

Overriding LSN configuration with Load Balancing Configuration

September 21, 2020

An LSN configuration takes precedence over any load balancing configuration by default. For overriding the large scale networking (LSN) configuration with the load balancing configuration for traffic matching both configurations, create a net profile with Override LSN parameter enabled and bind this profile to the virtual server of the load balancing configuration. USNIP or USIP settings of the load balancing configuration are applied to the traffic, instead of applying the LSN IP address of the LSN configuration.

This option is useful in an LSN deployment that includes NetScaler appliances and value added services, such as firewall and optimization devices. In this type of deployment, the ingress traffic on the NetScaler appliance is required to pass through these value-added services before an LSN configuration on the appliance is applied to the traffic. For the NetScaler appliance to send the ingress traffic to a value added service, a load balancing configuration is created and override LSN is enabled on the appliance. The load balancing configuration includes value added services, represented as load balancing services, bound to a virtual server of type ANY. The virtual server is configured with listen policies for identifying the traffic to be sent to the value added service.

To enable override lsn in a net profile by using the CLI

To enable override lsn while adding a net profile, at the command prompt, type

```
add netProfile <name> -overrideLsn ( ENABLED | DISABLED )

show netprofile <name>
<!--NeedCopy-->
```

To enable override lsn while adding a net profile, at the command prompt, type

```
set netProfile <name> -overrideLsn ( ENABLED | DISABLED )

show netprofile <name>
<!--NeedCopy-->
```

To enable override lsn in a net profile by using GUI

1. Navigate to **System** > **Network** > **Net Profiles**.
2. Set the **Override LSN** parameter while adding or modifying net profiles.

In the following sample configuration, net profile NETPROFILE-OVERRIDELSN-1 has override LSN option enabled and is bound to load balancing virtual server LBVS-1.

Sample configuration:

```
add netprofile NETPROFILE-OVERRIDELSN-1 -overrideLsn ENABLED

Done

set lb vserver LBVS-1 -netprofile NETPROFILE-OVERRIDELSN-1

Done
<!--NeedCopy-->
```

Clearing LSN Sessions

September 21, 2020

You can remove any unwanted or inefficient LSN sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected LSN sessions from the NetScaler appliance.

To clear all LSN sessions by using the command line interface

At the command prompt, type:

```
flush lsn session

show lsn session
<!--NeedCopy-->
```

To clear selective LSN sessions by using the command line interface

At the command prompt, type:

```
flush lsn session [-clientname <string>] [-network <ip_addr> [-netmask
    <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <
    port>]]

show lsn session
<!--NeedCopy-->
```

Example

Clear all LSN sessions existing on a NetScaler

```
flush lsn session

Done
<!--NeedCopy-->
```

Clear all LSN sessions related to LSN client entity LSN-CLIENT-1

```
flush lsn session -clientname LSN-CLIENT-1

Done
<!--NeedCopy-->
```

Clear all LSN sessions related to a subscriber network (192.0.2.0) of LSN client entity LSN-CLIENT-2 belonging to traffic domain 100

```
flush lsn session -clientname LSN-CLIENT-2  - network 192.0.2.0  -
    netmask 255.255.255.0  - td 100

Done
<!--NeedCopy-->
```

To clear all LSN sessions by using the configuration utility

Navigate to System > Large Scale NAT > Sessions, and click Flush Sessions.

Parameter Descriptions (of commands listed in the CLI procedure)

- flush lsn session
    - clientname

      Name of the LSN Client entity. Maximum Length: 127
    - network

      IP address or network address of subscriber(s).
    - netmask

      Subnet mask for the IP address specified by the network parameter.

      Default value: 255.255.255.255
    - td

      Traffic domain ID of the LSN client entity.

      Default value: 0

      Minimum value: 0

      Maximum value: 4094
    - natIP

      Mapped NAT IP address used in LSN sessions.

- natPort

  Mapped NAT port used in the LSN sessions.

Load Balancing SYSLOG Servers

September 21, 2020

The NetScaler appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
add service <name>(<IP> | <serverName>) <serviceType (SYSLOGTCP |
    SYSLOGUDP)> <port>
<!--NeedCopy-->
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

```
add lb vserver <name> <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod
    <AUDITLOGHASH>]
<!--NeedCopy-->
```

Bind the service to the load balancing virtual server.

```
bind lb vserver <name> <serviceName>
<!--NeedCopy-->
```

1. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
add syslogaction <name> <serverIP> [-lbVserverName <string>] [-
    logLevel <logLevel>]
<!--NeedCopy-->
```

Add a SYSLOG policy by specifying the rule and action.

```
add syslogpolicy <name> <rule> <action>
<!--NeedCopy-->
```

Bind the SYSLOG policy to the system global for the policy to take effect.

```
bind system global <policyName>
<!--NeedCopy-->
```

Load balancing of SYSLOG servers using the configuration utility

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

   Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

   Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDPas protocol.

3. Bing the service to the load balancing virtual server to the service.

   Bing the service to the load balancing virtual server.

   Navigate to Traffic Management > Virtual Servers, select a virtual server and then selectAUDITLOGHASH in the Load Balancing Method.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

   Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option inServers.

5. Add a SYSLOG policy by specifying the rule and action.

   Navigate to System > Syslog, click Policies and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

   Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

Example:

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
add service service1 192.0.2.10 SYSLOGUDP 514

add service service2 192.0.2.11 SYSLOGUDP 514

add service service3 192.0.2.11 SYSLOGUDP 514

add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH

bind lb vserver lbvserver1 service1

bind lb vserver lbvserver1 service2

bind lb vserver lbvserver1 service3

add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All

add syslogpolicy syspol1 ns_true sysaction1

bind system global syspol1
<!--NeedCopy-->
```

Limitations:

The NetScaler appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

Port Control Protocol

September 21, 2020

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled
- Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
- Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

> **Note**
>
> A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>]  [-maxMapLife <secs>] [-announceMultiCount <positive_integer>][-thirdParty ( ENABLED | DISABLED )]
```

```

show pcp profile <name>
<!--NeedCopy-->
```

To create a PCP server by using the CLI

At the command prompt, type:

```
add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
    string>]

show pcp server <name>
<!--NeedCopy-->
```

Sample Configuration for NAT44

In the following sample configuration, PCP server PCP-SERVER-9, with default PCP settings, is bound to LSN group LSN-GROUP-9. PCP-SERVER-9 serves PCP requests from subscribers in network 192.0.2.0/24.

Sample configuration:

```
add pcp server PCP-SERVER-9 192.0.3.9

Done

add lsn client LSN-CLIENT-9

Done

bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-9

Done

bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4

Done

add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
```

```

Done

bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9

Done

bind lsn group  LSN-GROUP-9  -pcpServer PCP-SERVER-9

Done
<!--NeedCopy-->
```

Dual-Stack Lite

September 21, 2020

Because of the shortage of IPv4 addresses, and the advantages of IPv6 over IPv4, many ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses only IPv4, and many subscribers do not support IPv6.

Dual Stack Lite (DS-Lite) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv4 subscribers to the Internet. DS-Lite uses IPv4-in-IPv6 tunneling to send a subscriber's IPv4 packet through a tunnel on the IPv6 access network to the ISP. The IPv6 packet is decapsulated to recover the subscriber's IPv4 packet and is then sent to the Internet after NAT address and port translation and other LSN related processing. The response packets traverse through the same path to the subscriber.

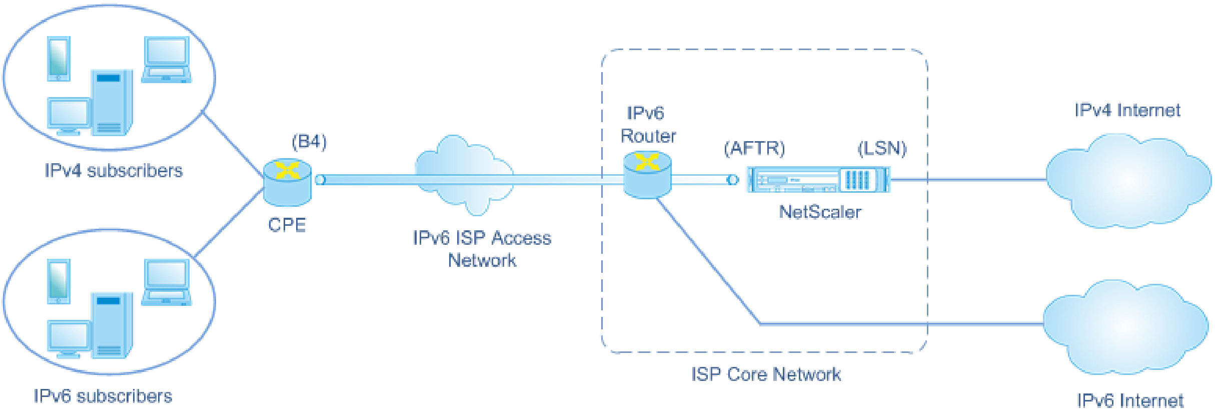
The NetScaler appliance implements the AFTR component of a DS-Lite deployment and is compliant with RFC 6333.

Architecture

The Dual-Stack Lite architecture for an ISP consists of the following components:

- **Basic Bridging Broadband (B4).** Basic Bridging broadband, or B4, is a device or component that resides in the subscriber premises. Typically, B4 is a component in the CPE devices in the subscriber premises. IPv4 subscribers are connected to the IPv6-only ISP access network through the CPE device containing the B4 component. The main function of the B4 is to initiate an IPv6 tunnel between B4 and an address family transition router (AFTR) in order to send or receive subscriber IPv4 request or response packets over the tunnel. B4 includes an IPv6 address known as the B4 tunnel endpoint address. B4 uses this address to source IPv6 packets to AFTR and receive packets from AFTR.

- **Address family transition router (AFTR).** AFTR is a device or component residing in the ISP's core network. AFTR terminates the IPv6 tunnel from the B4 device. In other words, the IPv6 tunnel is formed between B4 in the subscriber premise and AFTR in ISP core network. AFTR decapsulates IPv6 packets received from B4 to recover the subscribers' original IPv4 packets. AFTR sends the IPv4 packets to the LSN device or component. LSN routes the IPv4 packets to their destination after performing NAT address and port translation (NAT 44) and other LSN related processing. AFTR includes an IPv6 address known as the AFTR tunnel endpoint address. AFTR uses this address to source IPv6 packets to B4 and receive IPv6 packets from B4. The NetScaler appliance implements the AFTR component.
- **Softwire.** The IPv6 tunnel created between B4 and AFTR is called a softwire.



The DS-Lite architecture of an ISP using a NetScaler appliance consists of subscribers in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP's core network. IPv4 subscribers are connected to a CPE device that includes the DS-Lite B4 functionality. The CPE device is connected to the ISP core network through ISP's IPv6-only access network. The NetScaler appliance contains the DS-Lite AFTR and LSN functionality.

IPv4 subscribers connected to the CPE device are assigned private IPv4 addresses either manually or through DHCP server running on the CPE device. On the CPE device, the AFTR tunnel endpoint address is specified manually or through DHCPv6. Configuration of CPE devices is vendor specific and therefore outside the scope of this documentation.

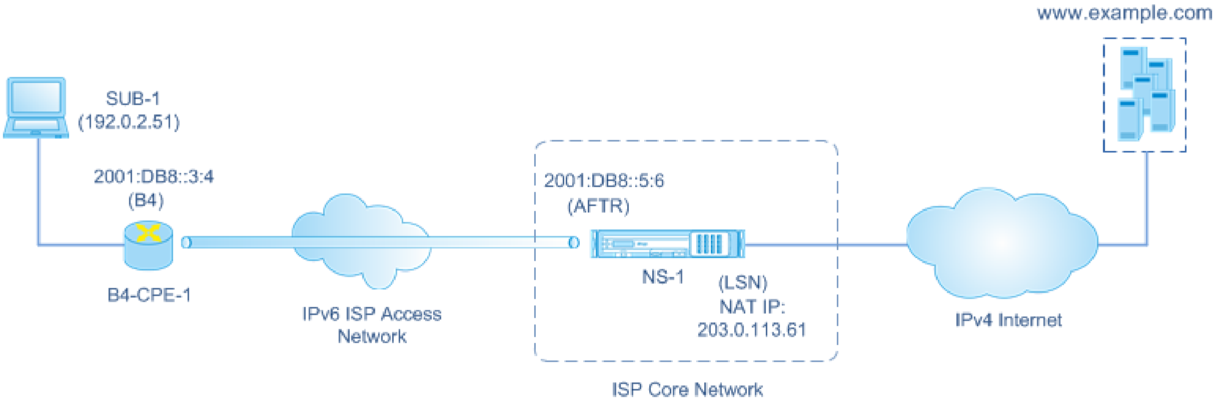
Upon receiving a request packet that is from an IPv4 subscriber and destined to a location on the Internet, the B4 component of the CPE device encapsulates the IPv4 packet in an IPv6 packet and sends it to the NetScaler appliance in the ISP core network. The NetScaler appliance's AFTR functionality decapsulates the IPv6 packet to recover the subscriber's original IPv4 packet. The LSN functionality of the NetScaler appliance translates the source IP address and port of the IPv4 packet to an NAT IP address and NAT port selected from the configured NAT pool, and then sends the packet to its destination on the Internet.

The appliance maintains a record of all active sessions that use the AFTR and LSN functionalities. These sessions are called DS-Lite sessions. The NetScaler appliance also maintains the mappings between B4 IPv6 address, subscriber IPv4 address and port, and NAT IPv4 address and port, for each DS-Lite session. These mappings are called DS-Lite LSN mappings. From DS-Lite session entries and DS-Lite LSN mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular DS-Lite session.

When the NetScaler appliance receives a response packet belonging to a particular DS-Lite session, the appliance's LSN functionality translates the destination IP address and port of the response packet from NAT IP address and port to the subscriber IP address and port, the AFTR functionality encapsulates the resulting packet in an IPv6 packet and sends it to the CPE device. The B4 functionality of the CPE device decapsulates the IPv6 packet to recover the IPv4 response packet, and then sends the IPv4 packet to the subscriber.

Example

Consider an example of a DS-Lite deployment consisting of NetScaler NS-1 in an ISP's core network, CPE device B4-CPE-1 in a subscriber premise, and a single IPv4 subscriber SUB-1. B4-CPE-1 supports the B4 functionality of DS-Lite feature.



The following table lists the settings used in this example.

Entity	Name	Details
IPv4 address of subscriber SUB-1		192.0.2.51
IPv6 address of softwire endpoint on the B4 device (B4-CPE-1)		2001:DB8::3:4
IPv6 address of the softwire endpoint on the AFTR device (NS-1)		2001:DB8::5:6

Settings on NetScaler appliance NS-1:

Entity	Name	Details
LSN client	LSN-DSLITE-CLIENT-1	Network6 (Identifying traffic from B4 devices) = 2001:DB8::3:0/100
LSN pool	LSN-DSLITE-POOL-1	LSN IPs (NAT IP) = 203.0.113.61 - 203.0.113.70
IPv6 Profile	LSN-DSLITE-PROFILE-1	Type = DS-LITE; IPv6 address (AFTR IPv6 address) = One of the NetScaler owned IPv6 address of type SNIP6 = 2001:DB8::5:6
LSN group	LSN-DSLITE-GROUP-1	LSN client = LSN-DSLITE-CLIENT-1; LSN pool = LSN-DSLITE-POOL-1;IPv6 profile = LSN-DSLITE-PROFILE-1

Following is the traffic flow in this example:

1. IPv4 subscriber SUB-1 sends a request to (`http://www.example.com/`). The IPv4 packet has:

   - Source IP address = 192.0.2.51
   - Source port = 2552
   - Destination IP address = 198.51.100.250
   - Destination port = 80

2. Upon receiving the IPv4 request packet, B4-CPE-1 encapsulates it in the payload of an IPv6 packet and then sends the IPv6 packet to NS-1. The IPv6 packet has:

   - Source IP address = 2001:DB8::3:4
   - Destination IP address = 2001:DB8::5:6

3. When NS-1 receives the IPv6 packet, the AFTR module decapsulates the packet by removing the IPv6 headers. The resulting packet is SUB-1's original IPv4 request packet.

4. The LSN module of NS-1 translates the source IP address and port of the packet to an NAT IP address and NAT port selected from the configured NAT pool. The translated IPv4 packet has:

   - Source IP address = 203.0.113.61

- Source port = 3002
- Destination IP address = 198.51.100.250
- Destination port = 80

5. The LSN module also creates an LSN mapping and session entry for this DS Lite session. The mapping includes the following information:

- Source IP address of the IPv6 packet (B4-CPE-1's IPv6 address) = 2001:DB8::3:4
- Source IP address of the IPv4 packet (SUB-1's IPv4 address) = 192.0.2.51
- Source port of the IPv4 packet = 2552
- NAT IP address = 203.0.113.61
- NAT port = 3002

6. NS-1 sends the resulting IPv4 packet to its destination on the Internet.

7. The server for www.example.com processes the request packet and sends a response packet. The IPv4 response packet has:

- Source IP address = 198.51.100.250
- Source port = 80
- Destination IP address = 203.0.113.61
- Destination port = 3002

8. Upon receiving the IPv4 packet, NS-1 examines the LSN mapping and session entries and finds that the IPv4 response packet belongs to a DS Lite session. The LSN module of NS-1 translates the destination IP address and port. The IPv4 packet now has:

- Source IP address = 198.51.100.250
- Source port = 80
- Destination IP address = 192.0.2.51
- Destination port = 2552

9. The AFTR module of NS-1 encapsulates the IPv4 packet in an IPv6 packet and then sends the IPv6 packet to B4-CPE-1. The IPv6 packet has:

- Source IP address = 2001:DB8::5:6
- Destination IP address = 2001:DB8::3:4

10. Upon receiving the packet, B4-CPE-1 decapsualtes the IPv6 packet by removing the IPv6 headers, and then sends the resulting IPv4 packet to CL-1.

Points to Consider before Configuring DS-Lite

September 21, 2020

Consider the following points before configuring DS-Lite on a NetScaler appliance:

1. You must understand the different components of DS-Lite, described in RFC 6333.

2. A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address AFTR component on a NetScaler appliance. For more information on NetScaler LSN feature, see Large Scale NAT.

3. For a DS-Lite configuration, the NetScaler appliance supports LSN for IPv4 packets that belong to one of the following protocols only. The NetScaler appliance drops IPv4 packets belonging to other protocols:

- TCP
- UDP
- ICMP

4. The NetScaler appliance supports the following ALGs DS-Lite:

- ICMP
- FTP
- TFTP
- Session Initiation Protocol (SIP)
- Real Time Streaming Protocol (RTSP)

Configuring DS-Lite

September 21, 2020

A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. For more information on the NetScaler LSN feature, see Large Scale NAT. A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address (of type SNIP6) of the DS-Lite AFTR component on a NetScaler appliance.

Configuring DS-Lite on a NetScaler appliance consists of the following tasks:

Set the global LSN parameters. Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.

- **Create an LSN client entity for identifying traffic from B4 CPE devices**. The LSN client entity refers to a set of DS-Lite B4 devices. The client entity includes IPv6 addresses or IPv6 network address or ACL6 rules for identifying the traffic from these B4 devices. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.

- **Create an LSN pool and bind NAT IP addresses to it**. An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.
- **Create an LSN IP6 profile.** An LSN IP6 profile defines the IPv6 address of the DS-Lite AFTR component on the NetScaler appliance. The IPv6 address must be one of the NetScaler owned IPv6 address of type SNIP6.
- **(Optional) Create an LSN Transport Profile for a specified protocol**. An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
- **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it**. An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.
- **Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group**. An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups

with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

Configuration by Using the Command Line

To create an LSN client by using the command line interface:

At the command prompt, type:

```
add lsn client <clientname>

show lsn client
<!--NeedCopy-->
```

To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface:

At the command prompt, type:

```
bind lsn client <clientname> (-network6 <ipv6_addr|*>| -acl6name <
    string>)

show lsn client
<!--NeedCopy-->
```

To create an LSN pool by using the command line interface:

At the command prompt, type:

```
add lsn pool <poolname> [-nattype ( DYNAMIC )] [-portblockallocation (
    ENABLED | DISABLED )] [-portrealloctimeout <secs>] [-
    maxPortReallocTmq <positive_integer>]

show lsn pool
<!--NeedCopy-->
```

To bind an IP address range to an LSN pool by using the command line interface:

At the command prompt, type:

```
bind lsn pool <poolname> <lsnip>

show lsn pool
```

```
<!--NeedCopy-->
```

Note: For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

To configure an LSN IPv6 profile by using the command line interface:

At the command prompt, type:

```
add lsn ip6profile <name> - type DS-Lite - network6 < ipv6_addr|*s >

show lsn ip6profile
<!--NeedCopy-->
```

To create an LSN transport profile by using the command line interface:

At the command prompt, type:

```
add lsn transportprofile <transportprofilename> <transportprotocol> [-
    sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <
    positive_integer>] [-sessionquota <positive_integer>] [-
    portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (
    ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]

show lsn transportprofile
<!--NeedCopy-->
```

To create an LSN application profile by using the command line interface:

At the command prompt, type:

```
add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (
    PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-
    tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]

show lsn appsprofile
<!--NeedCopy-->
```

To bind an application protocol port range to an LSN application profile by using the command line interface:

At the command prompt, type:

```
bind lsn appsprofile <appsprofilename> <lsnport>

show lsn appsprofile
<!--NeedCopy-->
```

To create an LSN group by using the command line interface:

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC )]
    [-portblocksize <positive_integer>] [-logging (ENABLED | DISABLED )]
     [-sessionLogging ( ENABLED | DISABLED )][-sessionSync ( ENABLED |
    DISABLED )] [-snmptraplimit<positive_integer>] [-ftp ( ENABLED |
    DISABLED )] [-pptp ( ENABLED |DISABLED )] [-sipalg ( ENABLED |
    DISABLED )] [-rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]

show lsn group
<!--NeedCopy-->
```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface:

At the command prompt, type:

```
bind lsn group <groupname> (-poolname <string> | -transportprofilename
    <string> | -httphdrlogprofilename <string> | -appsprofilename <
    string> | -sipalgprofilename <string> | rtspalgprofilename <string>)

show lsn group
<!--NeedCopy-->
```

Configuration by Using the Configuration Utility

To configure an LSN client and bind an IPv6 network address or an ACL6 rule by using the configuration utility:

Navigate to **System** > **Large Scale NAT** > **Clients**, and add a client and then bind an IPv6 network address or an ACL6 rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility:

Navigate to **System** > **Large Scale NAT** > **Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN IPv6 profile by using the configuration utility:

Navigate to **System** > **Large Scale NAT** > **Profiles**, click the **IPv6** tab, and assign an IPv6 address for DS-Lite AFTR.

To configure an LSN transport profile by using the configuration utility:

1. Navigate to **System** > **Large Scale NAT** > **Profiles**.

2. On the details pane, click **Transport**, and then add a transport profile.

To configure an LSN application profile by using the configuration utility:

1. Navigate to **System** > **Large Scale NAT** > **Profiles**.
2. On the details pane, click **Application**, and then add an application profile.

To configure an LSN group and bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles by using the configuration utility:

Navigate to **System** > **Large Scale NAT** > **Groups**, and add a group and then bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles to the group.

```
> add lsn client LSN-DSLITE-CLIENT-1
Done
> bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
Done
> add lsn pool LSN-DSLITE-POOL-1
Done
> bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
Done
> add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
    DB8::5:6
Done
> add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -
    portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1
Done
> add lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
Done
<!--NeedCopy-->
```

Logging and Monitoring DS-Lite

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted

- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
    - Destination IP address and port are not logged for Endpoint-Independent mapping.
    - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
    - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the follow-

ing conditions:

  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

LSN Log Entry Type	Sample Log Entry
DS-Lite session creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:38 GMT 0-PPE-1 : default LSN LSN_SESSION 37647607 0 : SESSION CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol:TCP
DS-Lite session deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:22 GMT 0-PPE-1 : default LSN LSN_SESSION 37647617 0 : SESSION DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol: TCP

DS-Lite LSN mapping creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:39 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647610 0 : EIM CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP
DS-Lite LSN mapping deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:25 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647618 0 : EIM DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP

Displaying Current DS-Lite Sessions

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

Configuration by Using the Command Line Interface

To display all DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
show lsn session -nattype DS-Lite
<!--NeedCopy-->
```

To display selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
show lsn session -nattype DS-Lite [-clientname <string>] [-network <
    ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
    ip_addr> [-natPort <port>]]
<!--NeedCopy-->
```

Example:

The following sample ouput displays all DS-Lite sessions existing on a NetScaler appliance:

```
show lsn session -nattype DS-Lite
```

```
  B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP NatPort Proto Dir

1.  2001:DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61 3002 TCP OUT

2.  2001:DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61 52862 TCP OUT

3.  2001:DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61 48116 ICMP OUT

4.  2001: DB8::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69 48305 TCP OUT

Done
<!--NeedCopy-->
```

Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. **Navigate to System** > **Large Scale NAT** > **Sessions**, and click the **DS-Lite** tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click **Search**.

Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.

To clear all DS-Lite sessions by using the command line interface:

At the command prompt, type:

flush lsn session –nattype DS-Lite
show lsn session –nattype DS-Lite

To clear selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
flush lsn session  - nattype DS-Lite [-clientname <string>] [-network <
    ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
    ip_addr> [-natPort <port>]]

show lsn session  - nattype DS-Lite
<!--NeedCopy-->
```

To clear all or selected DS-Lite sessions by using the configuration utility:

1. Navigate to **System** > **Large Scale NAT** > **Sessions**, and click the **DS-Lite** tab.
2. Click **Flush Sessions**.

Configuring DS-Lite Static Maps

September 21, 2020

The NetScaler appliance supports manual creation of DS-Lite LSN mappings, which contain the mapping between the following information:

- Subscriber's IP address and port, and IPv6 address of B4 device or component
- NAT IP address and port

Static DS-Lite LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP address and port map to the subscriber IP address and port through the specified B4 device (for example, web servers located in the internal network).

Note: This feature is supported in release 11.0 build 64.x and later.

To create a DS-Lite static LSN mapping by using the command line

At the command prompt, type:

```
add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td
    <positive_integer>] [-network6 <B4_ADDR>] [<natIP> [<natPort>]] [-
    destIP<ip_addr> [-dsttd <positive_integer>]]

show lsn static
<!--NeedCopy-->
```

Parameter Descriptions

add lsn static

- name

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "ds-lite lsn static1" or 'ds-lite lsn static1'). This is a mandatory argument. Maximum Length: 127

- transportprotocol

Protocol for the DS-Lite LSN mapping entry.

- subscrIP

IPv4 address of a subscriber for the DS-Lite LSN mapping entry.

- subscrPort

Port of the subscriber for the DS-Lite LSN mapping entry.

- Network6

IPv6 address of the B4 device or component.

- td

ID of the traffic domain to which the B4 device belongs. The IPv6 address of the B4 device is specified in the network6 paramter. If you do not specify an ID, the B4 device is assumed to be a part of the default traffic domain.

- natIP

IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

- natPort

NAT port for this DS-Lite LSN mapping entry.

- destIP

Destination IP address for the DS-Lite LSN mapping entry.

- dsttd

ID of the traffic domain through which the destination IP address for this DS-Lite LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0.

To create a DS-Lite static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new DS-Lite static LSN mapping.

Configuring Deterministic NAT Allocation for DS-Lite

September 21, 2020

Deterministic NAT allocation for DS-Lite LSN deployments is a type of NAT resource allocation in which the NetScaler appliance pre-allocates, from the LSN NAT IP pool and on the basis of the specified port block size, an LSN NAT IP address and a block of ports to each subscriber (subscriber behind B4 device).

Note: This feature is supported in release 11.0 build 64.x and later.

The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified by just its mapped NAT IP address and port block. For this reason, the NetScaler appliance does not log the creation or deletion of an LSN session.

A DS-Lite subscriber can have only one deterministic port block. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

Example: Deterministic DS-Lite

In this example, a deterministic DS-Lite configuration includes four subscribers with IP addresses 192.0.17.5, 192.0.17.6, 192.0.17.7, and 192.0.17.8. These ipv4 subscribers are behind a B4 device having the IPv6 address 2001:DB8::3:4. In this configuration, the port block size is set to 20480 and LSN NAT IP address pool has IP addresses in the range 203.0.113.41-203.0.113.42.

The NetScaler appliance sequentially pre-allocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-21503) on the beginning NAT IP address (203.0.113.41) to the beginning subscriber IP address (192.0.17.5). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The NetScaler logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers.

The following table lists the NAT IP address and blocks of ports allocated to each subscriber in this example:

Subscriber IP address	Allocated NAT IP address	Allocated Block of Ports	IPv6 address of B4
192.0.17.5	203.0.113.41	1024 - 21503	2001:DB8::3:4
192.0.17.6	203.0.113.41	21504 - 41983	2001:DB8::3:4
192.0.17.7	203.0.113.41	41984 - 62463	2001:DB8::3:4
192.0.17.8	203.0.113.42	1024 - 21503	2001:DB8::3:4

Configuration Steps

You need to configure deterministic NAT as part of the DS-Lite configuration. For instructions on configuring DS-Lite, see Configuring DS-Lite.

While configuring DS-Lite, make sure that you:

- Set the NAT Type parameter to Deterministic when adding the LSN pool and the LSN group.
- Set the desired port block size parameter when adding the LSN group, unless you can accept the default value.

Points to Consider before Configuring Deterministic DS-Lite

Consider the following points before configuring deterministic DS-Lite:

- The complete IP address of each subscriber must be specified in a separate add lsn client command, by setting the Network and Netmask parameters. (Set Netmask to 255.255.255.255.) Also the IPv4 address of the B4 device specified in Network6 parameter must be complete (/128 prefix). In other words, Network and Network6 parameter do not accept addresses other than /32 bit mask and /128 prefix, respectively.
- The NetScaler appliance drops connections from subscribers that are not specified in any deterministic DS-Lite configuration but are behind B4 devices specified in a deterministic DS-lite configuration.
- The NetScaler appliance recognizes subscribers having the same IPv4 address as different subscribers if they are behind different B4 devices. A combination of subscriber IPv4 address and B4 device defines a unique subscriber in the LSN client entity of a DS-Lite configuration.

Sample Deterministic DS-Lite Configuration:

The following configuration uses the settings listed in section Example: Deterministic DS-Lite.

```
add lsn client LSN-DSLITE-CLIENT-10

```

```
Done
bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.5 -netmask
    255.255.255.255 -network6 2001:DB8::3:4/128

Done
bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.6 -netmask 255
    .255.255.255 -network6 2001:DB8::3:4/128

Done
bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.7 -netmask 255
    .255.255.255 -network6 2001:DB8::3:4/128

Done
bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.8 -netmask 255
    .255.255.255 -network6 2001:DB8::3:4/128

Done
add lsn pool LSN-DSLITE-POOL-10 -nattype DETERMINISTIC

Done
bind lsn pool LSN-DSLITE-POOL-10  203.0.113.41-203.0.113.42

Done
add lsn ip6profile LSN-DSLITE-PROFILE-10 -type DS-Lite -network6 2001:
    DB8::5:6

Done
add lsn group LSN-DSLITE-GROUP-10 -clientname LSN-DSLITE-CLIENT-10 -
    nattype DETERMINISTIC -portblocksize 20480 -ip6profile LSN-DSLITE-
    PROFILE-10

Done
bind lsn group LSN-DSLITE-GROUP-10 -poolname LSN-DSLITE-POOL-10

Done
<!--NeedCopy-->
```

Configuring Application Layer Gateways for DS-Lite

September 21, 2020

For some application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway (AGL) for a protocol parses the packet payload and does necessary changes to ensure that the protocol continues to work over DS-Lite.

The NetScaler appliance supports ALG for the following protocols for DS-Lite:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 21, 2020

You can enable or disable ALG for the FTP protocol for a DS-Lite configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for a DS-Lite configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Application Layer Gateway for SIP Protocol

September 21, 2020

Using DS-Lite with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for DS-Lite is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

Limitations of SIP ALG

SIP ALG for DS-Lite has the following limitations:

- Only SDP payload is supported.

- The following are not supported:
    - Multicast IP addresses
    - Encrypted SDP
    - SIP TLS
    - FQDN translation
    - SIP layer authentication
    - Admin partitions
    - NetScaler clusters
    - Multipart body
    - Line folding

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring DS-Lite. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:

o IP Pooling = PAIRED

o Address and Port Mapping = ENDPOINT-INDEPENDENT

o Filtering = ENDPOINT-INDEPENDENT

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group
- Enable SIP ALG in the LSN group

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn group <groupname> -clientname <string>[-sipalg ( ENABLED | DISABLED )]

show lsn group<groupname>
<!--NeedCopy-->
```

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn sipalgprofile<sipalgprofilename>[-dataSessionIdleTimeout<
    positive_integer>][-sipSessionTimeout<positive_integer>][-
    registrationTimeout<positive_integer>][-sipsrcportrange<port[-port
    ]>][-sipdstportrange<port[-port]>][-openRegisterPinhole ( ENABLED |
    DISABLED )][-openContactPinhole ( ENABLED | DISABLED )][-
    openViaPinhole ( ENABLED | DISABLED )][-openRecordRoutePinhole (
    ENABLED | DISABLED )]-sipTransportProtocol ( TCP | UDP )[-
    openRoutePinhole ( ENABLED | DISABLED )][-rport ( ENABLED | DISABLED
     )]

show lsn sipalgprofile<sipalgprofilename>
<!--NeedCopy-->
```

Sample Configuration

The following sample DS-Lite configuration, SIP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::3:0/96.

```
add lsn client LSN-DSLITE-CLIENT-1
Done
bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/96
Done
add lsn pool LSN-DSLITE-POOL-1
Done
bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
    DB8::5:6
Done
add lsn appsprofile LSN-DSLITE-APPS-PROFILE-1 TCP -ippooling PAIRED -
    mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
add lsn sipalgprofile SIPALGPROFILE-1  -sipdstportrange 5060 -
    sipTransportProtocol TCP
Done
add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -
    portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1 -sipalg ENABLED
Done
bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
Done
bind lsn group LSN-DSLITE-GROUP-1 -appsprofilename LSN-DSLITE-APPS-
    PROFILE-1
Done
bind lsn group LSN-DSLITE-GROUP-1 -sipalgprofilename SIPALGPROFILE-1
```

```
Done
<!--NeedCopy-->
```

Application Layer Gateway for RTSP Protocol

September 21, 2020

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- NetScaler clusters
- RTSP Authentication
- HTTP tunneling

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring DS-Lite. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
    - IP Pooling = PAIRED
    - Address and Port Mapping = ENDPOINT-INDEPENDENT
    - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED |
    DISABLED )]

show lsn group <groupname>
<!--NeedCopy-->
```

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <
    positive_integer>] -rtspportrange <port[-port]> [-
    rtspTransportProtocol (TCP|UDP)]

show lsn rtspalgprofile <rtspalgprofilename>
<!--NeedCopy-->
```

Sample RTSP ALG Configuration

The following sample DS-Lite configuration, RTSP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::4:0/96.

Sample RTSP ALG Configuration:

```
add lsn client LSN-DSLITE-CLIENT-5
Done
bind lsn client LSN-DSLITE-CLIENT-5 -network6 2001:DB8::4:0/96
Done
add lsn pool LSN-DSLITE-POOL-5
Done
bind lsn pool LSN-DSLITE-POOL-5 203.0.113.61 - 203.0.113.70
Done
```

```
add lsn ip6profile LSN-DSLITE-PROFILE-5 -type DS-Lite -network6 2001:DB8::5:6
Done
add lsn appsprofile LSN-DSLITE-APPS-PROFILE-5 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
add lsn rtspalgprofile RTSPALGPROFILE-5 -rtspIdleTimeout 1000 -rtspportrange 554
Done
add lsn group LSN-DSLITE-GROUP-5 -clientname LSN-DSLITE-CLIENT-5 -portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-5 -rtspalg ENABLED
Done
bind lsn group LSN-DSLITE-GROUP-5 -poolname LSN-DSLITE-POOL-5
Done
bind lsn group LSN-DSLITE-GROUP-5 -appsprofilename LSN-DSLITE-APPS-PROFILE-5
Done
bind lsn group LSN-DSLITE-GROUP-5 -rtspalgprofilename RTSPALGPROFILE-5
Done
<!--NeedCopy-->
```

Logging and Monitoring DS-Lite

September 21, 2020

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name

- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
    - Destination IP address and port are not logged for Endpoint-Independent mapping.
    - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
    - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
    - Destination IP address and port are not logged for Endpoint-Independent mapping.
    - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.

  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

LSN Log Entry Type	Sample Log Entry
DS-Lite session creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:38 GMT 0-PPE-1 : default LSN LSN_SESSION 37647607 0 : SESSION CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol:TCP
DS-Lite session deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:22 GMT 0-PPE-1 : default LSN LSN_SESSION 37647617 0 : SESSION DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol: TCP

Displaying Current DS-Lite Sessions

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

To display all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
show lsn session -nattype DS-Lite
<!--NeedCopy-->
```

To display selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
show lsn session -nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
<!--NeedCopy-->
```

The following sample ouput displays all DS-Lite sessions existing on a NetScaler appliance:

> show lsn session –nattype DS-Lite

```
  B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP NatPort Proto Dir

1. 2001:DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61 3002 TCP OUT

2. 2001:DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61 52862 TCP OUT
```

```

3. 2001:DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61
    48116 ICMP OUT

4. 2001: DB8::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69
    48305 TCP OUT
Done
<!--NeedCopy-->
```

Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. **Navigate to System** > **Large Scale NAT** > **Sessions**, and click the **DS-Lite** tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click **Search**.

Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.

To clear all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
flush lsn session  - nattype DS-Lite

show lsn session  - nattype DS-Lite
<!--NeedCopy-->
```

To clear selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
flush lsn session  - nattype DS-Lite [-clientname <string>] [-network <
    ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
    ip_addr> [-natPort <port>]]

show lsn session  - nattype DS-Lite
```

```
<!--NeedCopy-->
```

To clear all or selected DS-Lite sessions by using the configuration utility

1. Navigate to **System** > **Large Scale NAT** > **Sessions**, and click the **DS-Lite** tab.
2. Click **Flush Sessions**.

Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the DS-Lite functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv4 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:

- **Create an HTTP header log profile**. An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- **Bind the HTTP header to an LSN group of a DS-Lite LSN configuration**. Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

To create an HTTP header log profile by using the command line interface

At the command prompt, type:

```
add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED |
    DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion (
    ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]

```

```
show lsn httphdrlogprofile
<!--NeedCopy-->
```

To bind an HTTP header log profile to an LSN group by using the command line interface

At the command prompt, type:

```
bind lsn group <groupname> -httphdrlogprofilename <string>

show lsn group <groupname>
<!--NeedCopy-->
```

Sample Configuration

In the following DS-Lite LSN configuration, HTTP header log profile HTTP-Header-LOG-1 is bound to LSN group LSN-DSLITE-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging, so that all these attributes are logged for any HTTP requests from B4 devices (in the network 2001:DB8:5001::/96).

Sample Configuration:

```
add lsn httphdrlogprofile HTTP-HEADER-LOG-1

Done

add lsn client LSN-DSLITE-CLIENT-1

Done

bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100

Done

add lsn pool LSN-DSLITE-POOL-1

Done

bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70

Done

add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
    DB8::5:6
```

```

Done

add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1

Done

bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1

Done

bind lsn group LSN-DSLITE-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG-1

Done
<!--NeedCopy-->
```

IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following DS_Lite related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

Points to Consider before you Configure IPFIX logging

Before you start configuring IPSec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature.

Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration**. Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile**. An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration**. Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

To enable LSN logging in the AppFlow configuration by using the CLI

At the command prompt, type:

```
set appflow param -lsnLogging (ENABLED |DISABLED )

show appflow param
<!--NeedCopy-->
```

To create an LSN log profile by using the CLIAt the command prompt, type

At the command prompt, type:

```
set lsn logprofile <logProfileName>  -logipfix ( ENABLED | DISABLED )

show lsn logprofile
<!--NeedCopy-->
```

To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```
bind lsn group <groupname>  -logProfileName <lsnlogprofilename>

show lsn group
<!--NeedCopy-->
```

To create an LSN log profile by using the GUI

Navigate to **System** > **Large Scale NAT** > **Profiles**, click **Log** tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System** > **Large Scale NAT** > **LSN Group,** open the **LSN** group.
2. In **Advanced Settings,** click **+ Log Profile** to bind the created Log profile to the LSN group.

Port Control Protocol for DS-Lite

September 21, 2020

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds

  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled
- Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
- Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group. Note: A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer (
    ENABLED | DISABLED )] [-minMapLife <secs>]  [-maxMapLife <secs>] [-
    announceMultiCount <positive_integer>][-thirdParty ( ENABLED |
    DISABLED )]

show pcp profile <name>
<!--NeedCopy-->
```

To create a PCP server by using the CLI

At the command prompt, type:

```
add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
    string>]

show pcp server <name>
<!--NeedCopy-->
```

Sample Configuration for DS-LITE

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-DSLITE-PROFILE-1, is bound to LSN group LSN-DSLITE-GROUP-1. PCP-SERVER-9 serves PCP requests from IPv4 subscribers behind B4 devices from network 2001:DB8::3:0/100.

Sample configuration:

```
add pcp profile PCP-DSLITE-PROFILE-1 -minMapLife 300
Done
add pcp server PCP-DSLITE-SERVER-1 192.0.3.10  -pcpProfile PCP-DSLITE-PROFILE-1
Done
add lsn client LSN-DSLITE-CLIENT-1
Done
bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
Done
add lsn pool LSN-DSLITE-POOL-1
Done
bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:DB8::5:6
Done
add lsn group LSN-DSLITE-PROFILE-1 -clientname LSN-NAT64-CLIENT-1  -ip6profile LSN-NAT64-PROFILE-1
Done
bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
bind lsn group LSN-DSLITE-GROUP-1 -poolname  PCP-NAT64-SERVER-1
Done
<!--NeedCopy-->
```

Large Scale NAT64

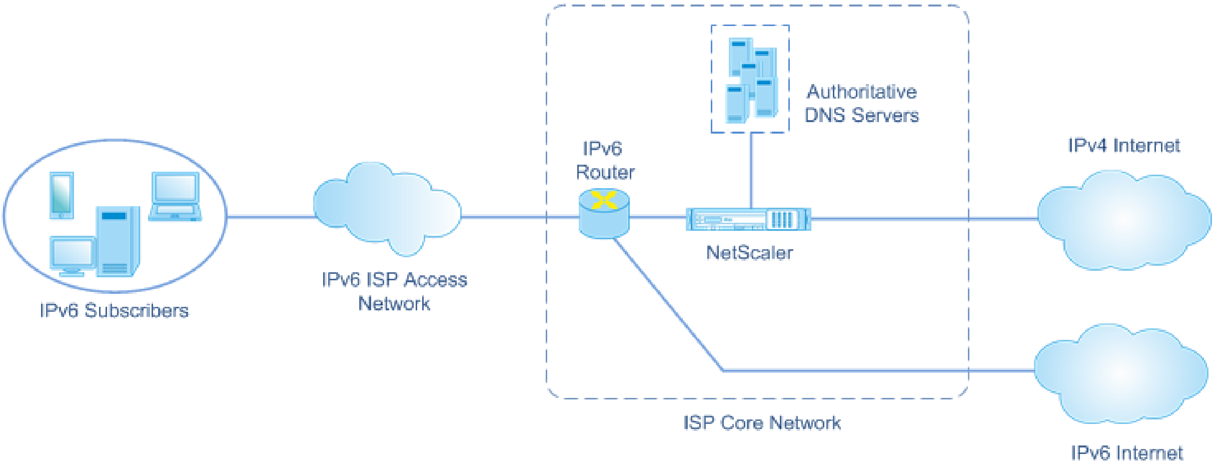
September 21, 2020

Because of the imminent exhaustion of IPv4 addresses, ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses IPv4. Large scale NAT64 is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv6-only subscribers to the IPv4 Internet. DNS64 is a solution for enabling discovery of IPv4-only domains by IPv6-only clients. DNS64 is used with large scale NAT64 to enable seamless communication between IPv6-only clients and IPv4-only servers.

A NetScaler appliance implements large scale NAT64 and DNS64 and is compliant with RFCs 6145, 6146, 6147, 6052, 3022, 2373, 2765, and 2464.

Architecture

The NAT64 architecture of an ISP using a NetScaler appliance consists of IPv6 subscribers accessing the IPv4 Internet through a NetScaler appliance deployed in the ISP's core network. IPv6 subscribers are connected to the ISP core network through the ISP's IPv6-only access network.



The large scale NAT64 functionality of a NetScaler appliance enables communication between IPv6 clients and IPv4 servers through IPv6-to-IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance.NetScaler DNS64 functionality represents IPv4-only domains to IPv6-subscribers by synthesizing DNS AAAA records for IPv4-only domains and sending them to the subscribers.

Large scale NAT64 has two main components: NAT64 prefix and NAT IPv4 pool. DNS64 has one main component, DNS64 prefix, which has the same value as NAT64 prefix.

Upon receiving an AAAA request from an IPv6-only subscriber for a domain name that is hosted on an IPv4-only web server on the Internet, the NetScaler DNS64 functionality synthesizes an AAAA record for the domain name and sends it to the subscriber. The AAAA record is synthesized by concatenating the DNS64 prefix (which is set to the NAT64 prefix) and the actual IPv4 address of the domain name.

The subscriber now has an IPv6 destination address that corresponds to the desired domain name. The subscriber sends the request to the synthesized IPv6 address. Upon receiving the IPv6 request, the large scale NetScaler NAT64 functionality translates the IPv6 request packet to an IPv4 request packet. Large scale NAT64 sets the IPv4 request's destination address to the IPv4 address, which is extracted from the IPv6 request's destination address by stripping the NAT64 prefix from the IPv6 address. The destination port is retained from the IPv6 request. Large Scale NAT64 also sets the source IP address:source port of the IPv4 packet to the NAT IP address:NAT port selected from the configured NAT pool.

The appliance maintains a record of all active sessions that use the large scale NAT64 functionality. These sessions are called large scale NAT64 sessions. The appliance also maintains the mappings between subscriber IPv6 address and port, and NAT IPv4 address and port, for each large scale NAT64 session. These mappings are called large scale NAT64 mappings. From large scale NAT64 session entries and large scale NAT64 mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular NAT64 session.

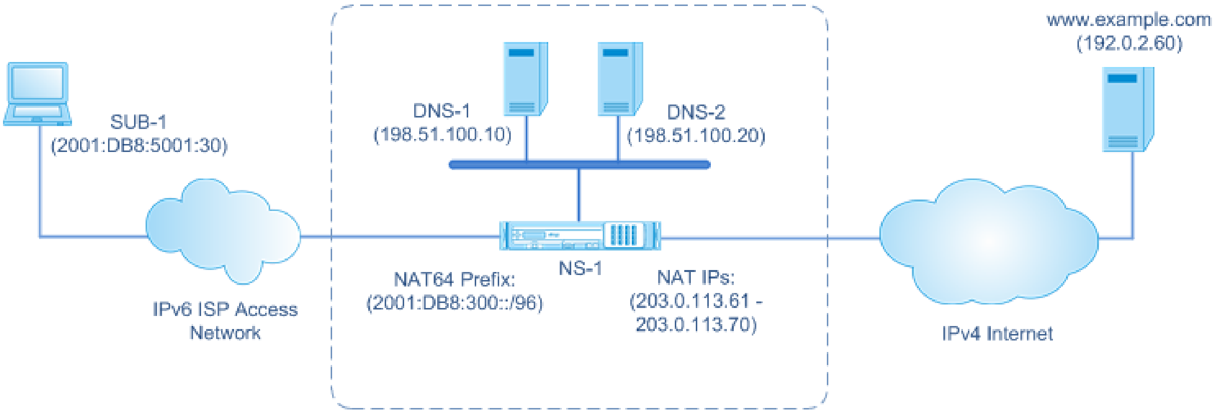
When the appliance receives an IPv4 response packet belonging to a particular NAT64 session, it uses the information stored in the NAT64 session to translate the IPv4 packet into an IPv6 packet, and then sends the IPv6 response packet to the subscriber.

Example: Traffic Flow of NAT64 and DNS64 Deployment

Consider an example of a large scale NAT64 and DNS64 deployment consisting of NetScaler appliance NS-1 and two local DNS servers, DNS-1 and DNS-2, in an ISP's core network, and IPv6 subscriber SUB-1. SUB-1 is connected to NS-1 through the ISP's IPv6 access network. NS-1 includes large scale NAT64 and DNS64 configurations for enabling the communication between IPv6 subscriber SUB-1 and IPv4 hosts (internal and external).

Large scale NAT64 configuration includes a NAT64 prefix (2001:DB8:300::/96) and NAT IPv4 pool for translation of IPv6 requests to IPv4 requests and IPv4 responses to IPv6 responses.

DNS64 configuration includes a DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) and a DNS64 prefix (2001:DB8:300::/96). LBVS-DNS64-1 represents local DNS server DNS-1 and DNS-2 to ISP's subscribers. The DNS64 prefix, which has the same value as the NAT64 prefix, is used for synthesizing DNS AAAA records from DNS A records received from DNS servers DNS-1 and DNS-2. NS-1 responds with a synthesized AAAA record to SUB-1 for a DNS request to resolve an IPv4 host.



DNS64 Traffic Flow

Traffic flows between IPv6 subscriber SUB-1 and site `www.example.com`, which resides on an IPv4-only web server on the Internet, as follows:

1. IPv6 subscriber SUB-1 sends a DNS AAAA request for `www.example.com` to its designated DNS server (2001:DB8:9999::99).

2. DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) on NetScaler appliance NS1 receives the AAAA request. LBVS-DNS64-1's load balancing algorithm selects DNS server DNS-1 and forwards the AAAA request to it.
3. DNS-1 returns an empty record or an error message, because there is no AAAA record available for `www.example.com`.
4. Because the DNS64 option is enabled on LBVS-DNS64-1 and the AAAA request from CL1 matches the condition specified in DNS64-Policy-1, NS1 sends a DNS A request to DNS-1 for the IPv4 address of `www.example.com`.
5. DNS-1 responds with the A record of 192.0.2.60 for `www.example.com`.
6. DNS64 module on NS1 synthesizes an AAAA record for `www.example.com` by concatenating the DNS64 Prefix (2001:DB8:300::/96) associated with LBVS-DNS64-1, and IPv4 address (192.0.2.60) for `www.example.com` = 2001:DB8:300::192.0.2.60
7. NS1 sends the synthesized AAAA record to IPv6 client CL1. NS1 also caches the A record into its memory. NS1 uses the cached A record to synthesize AAAA records for subsequent AAAA requests.

NAT64 Traffic Flow

1. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 `www.example.com`. The IPv6 packet has:

- Source IP address = 2001:DB8:5001:30
- Source port = 2552
- Destination IP address = 2001:DB8:300::192.0.2.60
- Destination port = 80

2.IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 `www.example.com`. The IPv6 packet has:

- Source IP address = 2001:DB8:5001:30
- Source port = 2552
- Destination IP address = 2001:DB8:300::192.0.2.60
- Destination port = 80

3. When NS-1 receives the IPv6 packet, the large scale NAT64 module creates a translated IPv4 request packet with:

- Source IP address = One of the IPv4 addresses available in the configured NAT pool (203.0.113.61)
- Source port = One of ports available with the allocated NAT IPv4 address (3002)
- Destination IP address = IPv4 address extracted from the IPv6 request's destination address by stripping the NAT64 prefix (2001:DB8:300::/96) from the IPv6 address (192.0.2.60)
- Destination port = IPv6 request's destination port (80)

4. The large scale NAT64 module also creates mapping and session entries for this large scale NAT64 flow. The session and mapping entries include the following information:

- Source IP address of the IPv6 packet = 2001:DB8:5001:30
- Source port of the IPv6 packet = 2552
- NAT IP address = 203.0.113.61
- NAT port = 3002
- NS-1 sends the resulting IPv4 packet to its destination on the Internet.

5. Upon receiving the request packet, the server for `www.example.com` processes the packet and sends a response packet to NS-1. The IPv4 response packet has:

- Source IP address = 192.0.2.60
- Source port = 80
- Destination IP address = 203.0.113.61
- Destination port = 3002

6. Upon receiving the IPv4 response packet, NS-1 examines the large scale NAT64 mapping and session entries and finds that the IPv4 response packet belongs to a large scale NAT64 session. The large scale NAT64 module creates a translated IPv6 response packet:

- Source IP address = 2001:DB8:300::192.0.2.60
- Source port = 80
- Destination IP address = 2001:DB8:5001:30
- Destination port = 2552

7. NS-1 sends the translated IPv6 response to client SUB-1.

Large Scale NAT64 features Supported on NetScaler appliances

Large scale NAT64 on a NetScaler appliance supports the standard LSN feature set. For more information on these LSN features, see LSN Architecture.

Following are some of the large scale NAT64 features supported on NetScaler appliances:

- ALGs. Support of application Layer Gateway (ALG) for SIP, RTSP, FTP, ICMP, and TFTP protocols.
- Deterministic/Fixed NAT. Support for pre-allocation of blocks of ports to subscribers to minimize logging.
- Mapping. Support of Endpoint-independent mapping (EIM), Address-dependent mapping (ADM), and Address-Port dependent mapping (APDM).
- Filtering. Support of Endpoint-Independent Filtering (EIF), Address-Dependent Filtering (ADF), and Address-Port-Dependent Filtering (APDF).
- Quotas. Configurable limits on number of ports, sessions per subscriber, and sessions per LSN group.
- Static Mapping. Support for manually defining a large scale NAT64 mapping.

- Hairpin Flow. Support for communication between subscribers or internal hosts using NAT IP addresses.
- 464XLAT connections. Support for communication between IPv4-only applications on IPv6 subscriber hosts and IPv4 hosts on the Internet through IPv6 network.
- Variable length NAT64 and DNS64 prefixes. The NetScaler appliance supports defining NAT64 and DNS64 prefixes of lengths of 32, 40, 48, 56, 64, and 96.
- Multiple NAT64 and DNS64 prefix. The NetScaler appliance supports multiple NAT64 and DNS64 prefixes.
- LSN Clients. Support for specifying or identifying subscribers for large scale NAT64 by using IPv6 prefixes and extended ACL6 rules.
- Logging. Support for logging NAT64 sessions for law enforcement. In addition, the following are also supported for logging.
  - **Reliable SYSLOG**. Support for sending SYSLOG messages over TCP to external log servers for a more reliable transport mechanism.
  - **Load balancing of log servers**. Support for load balancing of external log servers for preventing storage of redundant log messages.
  - **Minimal Logging**. Deterministic LSN configurations or Dynamic LSN configurations with port block significantly reduce the large scale NAT64 log volume.
  - **Logging MSISDN information**. Support for including subscribers' MSISDN information in large scale NAT64 logs to identify and track subscriber activity over the Internet.

Points to Consider for Configuring Large Scale NAT64

September 21, 2020

Before you start configuring large scale NAT64 and DNS64, consider these points:

1. Make sure you understand the different components of large scale NAT64, described in RFCs.
2. The NetScaler appliance supports only the following ALGs for large Scale NAT64:
   - FTP
   - TFTP
   - ICMP
   - SIP
   - RTSP
3. In a high availability setup of two NetScaler appliances, large NAT64 session synchronization (connection mirroring) is not supported.

Configuring DNS64

September 21, 2020

Creating the required entities for stateful NAT64 configuration on the NetScaler appliance involves the following procedures:

- Add DNS services. DNS services are logical representations of DNS servers for which the NetScaler appliance acts as a DNS proxy server. For more information on setting optional parameters of a service, see "Load Balancing".
- Add DNS64 action and DNS64 policy and then bind the DNS64 action to the DNS64 policy. A DNS64 policy specifies conditions to be matched against traffic for DNS64 processing according to the settings in the associated DNS64 action. The DNS64 action specifies the mandatory DNS64 prefix and the optional exclude-rule and mapped-rule settings.
- Create a DNS load balancing virtual server and bind the DNS services and the DNS64 policy to it. The DNS load balancing virtual server acts as a DNS proxy server for DNS servers represented by the bound DNS services. Traffic arriving at the virtual server is matched against the bound DNS64 policy for DNS64 processing. For more information on setting optional parameters of a load balancing virtual server, see "Load Balancing.

> **Note**
>
> The command line interface has separate commands for these two tasks, but the GUI combines them in a single dialog box.

- Enable caching of DNS records. Enable the global parameter for the NetScaler appliance to cache DNS records, which are obtained through DNS proxy operations. For more information on enabling caching of DNS records, see "Enabling Caching of DNS Records".

To create a service of type DNS by using the command line interface

At the command prompt, type:

```
add service <name> <IP> <serviceType> <port> …
<!--NeedCopy-->
```

To create a DNS64 action by using the command line interface

At the command prompt, type:

```
add dns action64 <actionName> -Prefix <ipv6_addr|*> [-mappedRule <expression>] [-excludeRule <expression>]
<!--NeedCopy-->
```

To create a DNS64 policy by using the command line interface

At the command prompt, type:

```
add dns policy64 <name> -rule <expression> -action <string>
<!--NeedCopy-->
```

To create a DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```
add lb vserver <name> DNS <IPAddress> <port> -dns64 (ENABLED | DISABLED ) [-bypassAAAA ( YES | NO)] …
<!--NeedCopy-->
```

To bind the DNS services and the DNS64 policy to the DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```
bind lb vserver <name> <serviceName> ...

bind lb vserver <name> -policyName <string> -priority <positive_integer> ...
<!--NeedCopy-->
```

Sample configuration:

```
add service SVC-DNS-1 203.0.113.50 DNS 53
Done
add service SVC-DNS-2 203.0.113.60 DNS 53
Done
add dns Action64 DNS64-Action-1 -Prefix 2001:DB8:300::/96
Done
add dns Policy64 DNS64-Policy-1 -rule "CLIENT.IPv6.SRC.IN_SUBNET(2001:DB8:5001::/64)" -action DNS64-Action-1
Done
add lb vserver LBVS-DNS64-1 DNS 2001:DB8:9999::99 53 -dns64 ENABLED
Done
bind lb vserver LBVS-DNS64-1 SVC-DNS-1
Done
bind lb vserver LBVS-DNS64-1 SVC-DNS-2
Done
bind lb vserver LBVS-DNS64-1 -policyname DNS64-Policy-1 -priority 2
```

```
Done

Configuring Large Scaler NAT64

September 21, 2020

A large scale NAT64 configuration on a NetScaler appliance uses the LSN commands sets. In a large scale NAT64 configuration, the LSN client entity specifies the IPv6 address or IPv6 network address, or ACL6 rules, for identifying IPv6 subscribers. A NAT64 configuration also includes an IPv6 profile, which specifies a NAT64 prefix.

Configuring NAT64 on a NetScaler appliance consists of the following tasks:

- Set the global LSN parameters. Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
- Create an LSN client entity for identifying traffic from IPv6 subscribers. The LSN client entity refers to a set of IPv6 subscribers. The client entity includes IPv6 addresses or IPv6 network prefixes, or ACL6 rules, for identifying the traffic from these subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The GUI combines these two operations on a single screen.
- Create an LSN pool and bind NAT IP addresses to it. An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform large scale NAT64. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The GUI combines these two operations on a single screen.
- Create an LSN IP6 profile. An LSN IP6 profile defines the NAT64 prefix for a large scale NAT64 configuration.
- (Optional) Create an LSN Transport Profile for a specified protocol. An LSN transport profile defines various timeouts and limits, such as maximum large scale NAT64 sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
- (Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it. An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you

bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The GUI combines these two operations on a single screen.

- Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group. An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The GUI combines these two operations in a single screen.

Configuration Using the Command Line

You can create different configurations using the command line interface. Follow the steps given below.

To create an LSN client by using the command line interface

At the command prompt, type:

```
add lsn client <clientname

show lsn client
<!--NeedCopy-->
```

To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface

At the command prompt, type:

```
bind lsn client <clientname> (-network6 <ipv6_addr|*>| -acl6name <
    string>)

show lsn client
<!--NeedCopy-->
```

To create an LAN pool by using the command line interface

At the command prompt, type:

```
add lsn pool <poolname>

show lsn pool <poolname>
<!--NeedCopy-->
```

To bind NAT IP addresses to an LSN pool by using the command line interface

At the command prompt, type:

```
bind lsn pool <poolname> <lsnip>

show lsn pool
<!--NeedCopy-->
```

> **Note**
>
> For removing NAT IP (LSN IP addresses) addresses from an LSN pool, use the unbind lsn pool command.

To configure an LSN IPv6 profile by using the command line interface

At the command prompt, type:

```
add lsn ip6profile <name>  - type NAT64 -natprefix <ipv6_addr|*>

show lsn ip6profile
<!--NeedCopy-->
```

To create an LSN transport profile by using the command line interface

At the command prompt, type:

```
add lsn transportprofile <transportprofilename> <transportprotocol> [-
    sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <
    positive_integer>] [-sessionquota <positive_integer>] [-
    portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (
    ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]

show lsn transportprofile
<!--NeedCopy-->
```

To create an LSN application profile by using the command line interface

At the command prompt, type:

```
add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (
    PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-
    tcpproxy ( ENABLED | DISABLED )]

show lsn appsprofile
<!--NeedCopy-->
```

To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
bind lsn appsprofile <appsprofilename> <lsnport>

show lsn appsprofile
<!--NeedCopy-->
```

To create an LSN group by using the command line interface

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC |
    DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging(
    ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-
    sessionSync ( ENABLED | DISABLED )] [-snmptraplimit<positive_integer
    >] [-ftp ( ENABLED | DISABLED )] [-sipalg ( ENABLED | DISABLED )] [-
    rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]

show lsn group
```

```
<!--NeedCopy-->
```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -httphdrlogprofilename <string> | -appsprofilename <string> | -sipalgprofilename <string> | rtspalgprofilename <string>)

show lsn group
<!--NeedCopy-->
```

Sample Large Scale NAT64 Configurations

Here are some sample configurations of large scale NAT64:

Simple large scale NAT64 configuration with default settings:

```
add lsn client LSN-NAT64-CLIENT-1

bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96

add lsn pool LSN-NAT64-POOL-1

bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70

add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96

add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1  -ip6profile LSN-NAT64-PROFILE-1

bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1

<!--NeedCopy-->
```

Simple large scale NAT64 configuration with an extended ACL6 rule for identifying subscribers:

```
add ns acl6 LSN-NAT64-ACL-2 ALLOW  - srcIPv6 = 2001:DB8:5002::20 - 2001:DB8:5002::200

apply acl6s
```

```

add lsn client LSN-NAT64-CLIENT-2

bind lsn client LSN-NAT64-CLIENT-2  - acl6name LSN-NAT64-ACL-2

add lsn pool LSN-NAT64-POOL-2

bind lsn pool LSN-NAT64-POOL-2 203.0.113.5-203.0.113.10

add lsn ip6profile LSN-NAT64-PROFILE-2 -type NAT64 -natprefix 2001:DB8:302::/96

add lsn group LSN-NAT64-GROUP-2 -clientname LSN-NAT64-CLIENT-2 -ip6profile LSN-NAT64-PROFILE-2

bind lsn group LSN-NAT64-GROUP-2 -poolname LSN-NAT64-POOL-2

<!--NeedCopy-->
```

Large scale NAT64 configuration with deterministic NAT resource allocation:

```
add lsn client LSN-NAT64-CLIENT-7

bind lsn client LSN-NAT64-CLIENT-7 -network6 2001:DB8:1002::7/128

add lsn pool LSN-NAT64-POOL-7 -nattype DETERMINISTIC

bind lsn pool LSN-NAT64-POOL-7 203.0.113.24-203.0.113.27

add lsn ip6profile LSN-NAT64-PROFILE-7 -type NAT64 -natprefix 2001:DB8:307::/96

add lsn group LSN-NAT64-GROUP-7 -clientname LSN-NAT64-CLIENT-7 -ip6profile LSN-NAT64-PROFILE-7 -nattype DETERMINISTIC -portblocksize 256

bind lsn group LSN-NAT64-GROUP-7 -poolname LSN-POOL-7

<!--NeedCopy-->
```

Configuring Application Layer Gateways for Large Scale NAT64

September 21, 2020

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over large scale NAT64.

The NetScaler appliance supports ALG for the following protocols for large scale NAT64:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 21, 2020

You can enable or disable ALG for the FTP protocol for an large scale NAT64 configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an large scale NAT64 configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Application Layer Gateway for SIP Protocol

September 21, 2020

Using Large Scale NAT64 with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for large scale NAT64 is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

Limitations of SIP ALG

SIP ALG for large scale NAT64 has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - Traffic Domains
  - Admin partitions
  - NetScaler clusters
  - Multipart body
  - Line folding

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Large Scale NAT64. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group.
- Enable SIP ALG in the LSN group.

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-sipalg ( ENABLED |
    DISABLED )]

show lsn group <groupname>
<!--NeedCopy-->
```

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn sipalgprofile <sipalgprofilename>[-dataSessionIdleTimeout <positive_integer>][-sipSessionTimeout <positive_integer>] [-registrationTimeout <positive_integer>] [-sipsrcportrange <port[-port]>] [-sipdstportrange <port[-port]>] [-openRegisterPinhole ( ENABLED | DISABLED )] [-openContactPinhole ( ENABLED | DISABLED )] [-openViaPinhole ( ENABLED | DISABLED )] [-openRecordRoutePinhole ( ENABLED | DISABLED )]-sipTransportProtocol ( TCP | UDP ) [-openRoutePinhole ( ENABLED | DISABLED )] [-rport ( ENABLED | DISABLED )]

show lsn sipalgprofile <sipalgprofilename
<!--NeedCopy-->
```

Sample Configuration

The following sample large scale NAT64 configuration, SIP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1003::/96.

```
add lsn client LSN-NAT64-CLIENT-9

Done
bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96

Done
add lsn pool LSN-NAT64-POOL-9

Done
bind lsn pool LSN-NAT64-POOL-9 203.0.113.90

Done
add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8:309::/96

Done
add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT

Done
add lsn sipalgprofile SIPALGPROFILE-9  -sipdstportrange 5060  -sipTransportProtocol TCP

```

```
Done
add lsn group LSN-NAT64-GROUP-9 -clientnameLSN-NAT64-CLIENT-9 -
    ip6profile LSN-NAT64-PROFILE-7 -sipalg ENABLED

Done
bind lsn group LSN-NAT64-GROUP-9 -poolnameLSN-NAT64-POOL-9
Done
bind lsn group LSN-NAT64-GROUP-9 -appsprofilename LSN-NAT64-APPS-
    PROFILE-9
Done
bind lsn group LSN-NAT64-GROUP-9 -sipalgprofilename SIPALGPROFILE-9
Done
<!--NeedCopy-->
```

Application Layer Gateway for RTSP Protocol

September 21, 2020

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions

- RTSP session over UDP
- Admin partitions
- NetScaler clusters
- RTSP Authentication
- HTTP tunneling

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring Large Scale NAT64. While configuring, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED |
    DISABLED )]

show lsn group <groupname>
<!--NeedCopy-->
```

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <
    positive_integer>] -rtspportrange <port[-port]> [-
    rtspTransportProtocol (TCP|UDP)]

show lsn rtspalgprofile <rtspalgprofilename>
<!--NeedCopy-->
```

Sample RTSP ALG Configuration

The following sample large scale NAT64 configuration, RTSP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1002::/96.

```
add lsn client LSN-NAT64-CLIENT-9
Done
bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
Done
add lsn pool LSN-NAT64-POOL-9
Done
bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
Done
add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8
    :309::/96
Done
add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -
    mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
add lsn rtspalgprofile RTSPALGPROFILE-9 -rtspIdleTimeout 1000 -
    rtspportrange 554
Done
add lsn group LSN-NAT64-GROUP-9 -clientname LSN-NAT64-CLIENT-9 -
    ip6profile LSN-NAT64-PROFILE-7 -rtspalg ENABLED
Done
bind lsn group LSN-NAT64-GROUP-9 -poolname LSN-NAT64-POOL-9
Done
bind lsn group LSN-NAT64-GROUP-9 -appsprofilename LSN-NAT64-APPS-
    PROFILE-9
Done
bind lsn group LSN-NAT64-GROUP-9  -rtspalgprofilename RTSPALGPROFILE-9
Done
<!--NeedCopy-->
```

Configuring Static Large Scale NAT64 Maps

September 21, 2020

The NetScaler appliance supports manual creation of NAT64 mappings, which contain the mapping between the following information:

- Subscriber’s IP address and port
- NAT IP address and port

Static Large Scale NAT64 mappings are useful in cases where you want to ensure that the IPv4 connections initiated to a NAT IP address:port are IPv6 translated and mapped to the subscriber IP address:port (for example, web servers located in the internal network).

To create a Large Scale NAT64 mapping by using the command line

At the command prompt, type:

```
add lsn static <name> <transportprotocol> <subscrIP> <subscrPort>  [<
    natIP> [<natPort>]] [-destIP <ip_addr> [-dsttd <positive_integer>]]

show lsn static
<!--NeedCopy-->
```

Wildcard Port Static Large Scale NAT64 Maps

A static large scale NAT64 mapping entry is usually a one-to-one mapping between a subscriber IPv6 address:port and a NAT IPv4 address:port. A one-to-one static large scale NAT64 mapping entry exposes only one port of the subscriber IP address to the Internet.

Some situations might require exposing all ports (64K - limited to the maximum number of ports of a NAT IPv4 address) of a subscriber IP address to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64 thousand one-to-one static mapping entries, one mapping entry for each port. Creating those entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

A simpler method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber IP address for all protocols to the Internet.

For a subscriber's inbound or outbound connections matching a wildcard static mapping entry, the subscriber's port does not change after the NAT operation. When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber's port by connecting to the NAT port that has the same number as the subscriber's port.

To configure the NetScaler appliance to provide access to all ports of a subscriber IPv6 address, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL
- Subscriber port = *
- NAT port = *

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
add lsn static <name> ALL <subscrIP> *  <natIP> * [-td <positive_integer>] [-destIP <ip_addr>

show lsn static
<!--NeedCopy-->
```

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 2001:DB8:5001::3 are made accessible through NAT IP 203.0.11.33.

```
add lsn static NAT64-WILDCARD-STATIC-1 ALL 2001:DB8:5001::3 * 203.0.113.33 *
Done
<!--NeedCopy-->
```

Logging and Monitoring Large Scale NAT64

September 21, 2020

You can log large scale NAT64 information to diagnose and troubleshoot problems, and to meet legal requirements. You can monitor the performance of the large scale NAT64 deployment by using statistical counters and displaying the related current sessions.

Logging Large Scale NAT64

Logging large scale NAT64 information is required for ISPs to meet legal requirements and identify the source of traffic at any given time.

A log message for a large scale NAT64 mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp.

- Entry type (MAPPING).
- Whether the mapping entry was created or deleted.
- Subscriber's IP address, port, and traffic domain ID.
- NAT IP address and port.
- Protocol name.
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for endpoint-independent mapping.
  - Only the destination IP address is logged for address-dependent mapping. The port is not logged.
  - Destination IP address and port are logged for address-port-dependent mapping.

A log message for a large scale NAT64 session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the session is created or removed
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table displays sample large scale NAT64 log entries of each type stored on the configured log servers. The log entries show that a subscriber whose IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

Log Entry Type	Sample Log Entry
Session Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_SESSION 5532 0 : SESSION CREATED Client IP-Port:TD **2001:db8:5001::9-34937:0**, NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP

Log Entry Type	Sample Log Entry
Mapping Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_ADDR_MAPPING 5533 0 : ADM CREATED Client IP-Port:TD **2001:db8:5001::9-34937:0**, NatIP:NatPort 203.0.113.63:45195, Destination IP:TD 23.0.0.1:80, Protocol: TCP
Session Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_SESSION 25012 0 : SESSION DELETED Client IP-Port:TD **2001:db8:5001::9-34937:0**, NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM DELETED Client IP-Port:TD **2001:db8:5001::9-34937:0**, NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP

Configuration Steps

You can configure logging of large scale NAT64 information for a large scale NAT64 configuration by setting the LSN groups's logging and session logging parameters. These are group level parameters and are disabled by default. The NetScaler appliance logs large scale NAT64 sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

Logging	Session Logging	Logging Behavior
Enabled	Enabled	Logs LSN mapping entries as well as LSN sessions
Enabled	Disabled	Logs LSN mapping entries but not LSN sessions
Disabled	Enabled	Logs neither mapping entries nor LSN sessions

To log large scale NAT64 information by using the CLI

To set the logging and session logging parameters while adding an LSN group, at the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-logging (ENABLED|
    DISABLED)] [-sessionLogging (ENABLED|DISABLED)]

show lsn group
<!--NeedCopy-->
```

To set the logging and session logging parameters for an existing LSN group, at the command prompt, type:

```
set lsn group <groupname> [-logging (ENABLED|DISABLED)] [-
    sessionLogging (ENABLED|DISABLED)]

show lsn group
<!--NeedCopy-->
```

Sample Configuration

In this example of large scale NAT64 configuration, logging and session logging paramters are enabled for LSN group LSN-NAT64-GROUP-1.

The NetScaler appliance logs large scale NAT64 session and mapping information for connections from subscribers (in the network 2001:DB8:5001::/96).

Sample configuration:

```
add lsn client LSN-NAT64-CLIENT-1 Done
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
    :300::/96
Done
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1  -
    ip6profile LSN-NAT64-PROFILE-1  -logging ENABLED -sessionLogging
    ENABLED
Done
```

```
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
<!--NeedCopy-->
```

Logging MSISDN Information for Large Scale NAT64

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber’s operator.

You can configure a NetScaler appliance to include MSISDNs in large scale NAT64 LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs facilitates faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 and IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

Log Entry Type	Sample Log Entry
Session Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_SESSION 5532 0 : SESSION CREATED **E164:5556543210** Client IP-Port:TD **2001:db8:5001::9-34937:0**, NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_ADDR_MAPPING 5533 0 : ADM CREATED **E164:5556543210** Client IP-Port:TD **2001:db8:5001::9-34937:0**, NatIP:NatPort 203.0.113.63:45195, Destination IP:TD 23.0.0.1:80, Protocol: TCP
Session Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_SESSION 25012 0 : SESSION DELETED **E164:5556543210** Client IP-Port:TD **2001:db8:5001::9-34937:0**, NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP

Log Entry Type	Sample Log Entry
Mapping Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM DELETED **E164:5556543210** Client IP-Port:TD **2001:db8:5001::9-34937:0**, NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP

Configuration Steps

Perform the following tasks for including MSISDN information in LSN logs:

- **Create an LSN log profile**. An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration.
- Bind the LSN log profile to an LSN group of an LSN configuration.Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. MSISDN information is included in all LSN logs related to mobile subscribers of this LSN group.

To create an LSN log profile by using the CLI

At the command prompt, type:

```
add lsn logprofile <logprofilename> -logSubscriberID ( ENABLED |
    DISABLED )

show lsn logprofile
<!--NeedCopy-->
```

To bind an LSN log profile to an LSN group of an NAT64 LSN configuration by using the CLI

At the command prompt, type:

```
bind lsn group <groupname>  -logProfileName <lsnlogprofilename>

show lsn group
<!--NeedCopy-->
```

Sample Configuration

In this example of NAT64 LSN configuration, the LSN log profile LOG-PROFILE-MSISDN-1 has the log subscriber ID parameter enabled. LOG-PROFILE-MSISDN-1 is bound to LSN group LSN-NAT64-GROUP-1. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in network 2001:DB8:5001::/96).

```
add lsn logprofile  LOG-PROFILE-MSISDN-1  -logSubscriberID ENABLED
Done
add lsn client LSN-NAT64-CLIENT-1
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
Done
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1  -ip6profile LSN-NAT64-PROFILE-1
Done
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
bind lsn group LSN-NAT64-GROUP-1 -logprofilename  LOG-PROFILE-MSISDN-1
Done
<!--NeedCopy-->
```

Compact Logging for Large Scale NAT

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

Configuration Steps

Perform the following tasks for logging LSN information in compact format:

1. Create an LSN log profile. An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
2. Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

To create an LSN log profile by using the CLI

At the command prompt, type:

```
add lsn logprofile <logprofilename> -logCompact (ENABLED|DISABLED)

show lsn logprofile
<!--NeedCopy-->
```

To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```
bind lsn group <groupname> -logProfileName <lsnlogprofilename>

show lsn group
<!--NeedCopy-->
```

Sample Configuration for NAT64:

```
add lsn logprofile  LOG-PROFILE-COMPACT-1 -logCompact ENABLED
Done
add lsn client LSN-NAT64-CLIENT-1
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
    :300::/96
Done
add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1  -
    ip6profile LSN-NAT64-PROFILE-1
Done
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
```

```
Done
bind lsn group LSN-NAT64-GROUP-1  - logProfileName LOG-PROFILE-COMPACT-1
Done
<!--NeedCopy-->
```

Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the NetScaler large scale NAT64 functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv6 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:

- Create an HTTP header log profile. An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- Bind the HTTP header to an LSN group of a large scale NAT64 configuration. Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

To create an HTTP header log profile by using the the command line interface

At the command prompt, type:

```
add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED |
    DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion (
    ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]

show lsn httphdrlogprofile
<!--NeedCopy-->
```

To bind an HTTP header log profile to an LSN group by using the the command line interface

At the command prompt, type:

```
bind lsn group <groupname> -httphdrlogprofilename <string>

show lsn group <groupname>
<!--NeedCopy-->
```

Sample Configuration

```
add lsn httphdrlogprofile HTTP-HEADER-LOG-1
Done
add lsn client LSN-NAT64-CLIENT-1 Done
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
    :300::/96
Done
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1  -
    ip6profile LSN-NAT64-PROFILE-1
Done
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
bind lsn group LSN-NAT64-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG
    -1
Done
<!--NeedCopy-->
```

Displaying Current Large Scale NAT64 Sessions

You can display the current large scale NAT64 sessions in order to detect any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some large scale NAT64 sessions on the basis of selection parameters.

> **Note**
>
> When more than a million large scale NAT64 sessions exist on the NetScaler appliance, Citrix rec-

> ommends using the selection parameters to display selected large scale NAT64 sessions instead of displaying all of them.

To display all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
show lsn session -nattype NAT64
<!--NeedCopy-->
```

To display selective large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
show lsn session -nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname
    <string>] [-natIP <ip_addr> [-natPort <port>]]
<!--NeedCopy-->
```

Displaying Large Scale NAT64 Statistics

You can display statistics related to large scale NAT64 module, and evaluate its performance or troubleshoot problems. You can display a summary of statistics of all large scale NAT64 configurations or of a particular large scale NAT64 configuration. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

To display total statistics of large scale NAT64 by using the command line interface

At the command prompt, type:

```
stat lsn nat64
<!--NeedCopy-->
```

To display statistics for a specified large scale NAT64 configuration by using the command line interface

At the command prompt, type:

```
stat lsn group <groupname>
<!--NeedCopy-->
```

Clearing Large Scale NAT64 Sessions

You can remove any unwanted or inefficient large scale NAT64 sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected large scale NAT64 sessions from the NetScaler appliance.

To clear all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
flush lsn session  - nattype NAT64

show lsn session  - nattype NAT64
<!--NeedCopy-->
```

To clear selective large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
flush lsn session  - nattype NAT64 [-network6 <ipv6_addr|*>] [-
    clientname <string>] [-natIP <ip_addr> [-natPort <port>]]

show lsn session  - nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname
     <string>] [-natIP <ip_addr> [-natPort <port>]]
<!--NeedCopy-->
```

Sample configuration:

Clear all large scale NAT64 sessions existing on a NetScaler appliance

```
flush lsn session   - nattype NAT64
Done
<!--NeedCopy-->
```

Clear all large scale NAT64 sessions related to client entity LSN-NAT64-CLIENT-1

```
flush lsn session  - nattype NAT64 -clientname LSN-NAT64-CLIENT-1
Done
<!--NeedCopy-->
```

Clear all large scale NAT64 sessions related to a subscriber network (2001:DB8:5001::/96) of LSN client entity LSN-NAT64-CLIENT-2

```
flush lsn session -nattype NAT64 -network6 2001:DB8:5001::/96 -
   clientname LSN-NAT64-CLIENT-2
Done
<!--NeedCopy-->
```

Port Control Protocol for Large Scale NAT64

September 21, 2020

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- **(Optional) Create a PCP profile**. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled

  - Peer: Enabled
  - Minimum map life: 120 seconds
  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled
- **Create a PCP server and bind a PCP profile to it**. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) or (SNIP6) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
- **Bind the PCP server to an LSN group of an LSN configuration**. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

> **Note**
>
> A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer (
    ENABLED | DISABLED )] [-minMapLife <secs>]  [-maxMapLife <secs>] [-
    announceMultiCount <positive_integer>][-thirdParty ( ENABLED |
    DISABLED )]

show pcp profile <name>
<!--NeedCopy-->
```

To create a PCP server by using the CLI

At the command prompt, type:

```
add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
    string>]

show pcp server <name>
<!--NeedCopy-->
```

Sample Configuration for NAT64

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-PROFILE-1,is bound to LSN group LSN-NAT64-GROUP-1. PCP-SERVER-1 serves PCP requests from IPv6 subscribers in network 2001:DB8:5001::/96.

Sample configuration:

```
add pcp profile PCP-PROFILE-1 -minMapLife 400
Done
add pcp server PCP-SERVER-1 2001:DB8:6001::90  -pcpProfile PCP-PROFILE-1
Done
add lsn client LSN-NAT64-CLIENT-1
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
Done
add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1  -ip6profile LSN-NAT64-PROFILE-1
Done
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
bind lsn group LSN-NAT64-GROUP-1  - pcpServer PCP-NAT64-SERVER-1
Done
<!--NeedCopy-->
```

Telco subscriber management

September 21, 2020

The number of subscribers in a telco network is increasing at an unprecedented rate, and managing them is becoming a challenge for service providers. Newer, faster, and smarter devices are placing high demand on the network and the subscriber management systems. It is no longer feasible to provide each subscriber the same standard of service, and the need for traffic processing on a per-subscriber basis is imperative.

The NetScaler appliance provides the intelligence to profile subscribers on the basis of their information stored in the Policy and Charging Rules Function (PCRF). When a mobile subscriber connects to the Internet, the packet gateway associates an IP address with the subscriber and forwards the data packet to the appliance. The appliance receives the subscriber information dynamically, or you can configure static subscribers. This information enables the appliance to apply its rich traffic management capabilities, such as content switching, integrated caching, rewrite, and responder, on a per-subscriber basis to manage the traffic.

Before you configure the NetScaler appliance to manage subscribers, you must allocate memory to the module that stores subscriber sessions. For dynamic subscribers, you must configure an interface through which the appliance receives session information. Static subscribers must be assigned IDs, and you can associate them with policies.

You can also do the following:

- Subscriber policy enforcement and management.
- Configure the appliance to uniquely identify a subscriber by using only the IPv6 prefix instead of the complete IPv6 address.
- Use policies to optimize TCP traffic for both dynamic and static subscribers. These policies associate different TCP profiles with different types of users.
- Manage idle sessions on a NetScaler appliance.
- Enable logging to a log server.
- Remove LSN sessions for deleted subscriber sessions.

Allocating memory for the subscriber session store module

Each subscriber session entry consumes 1 KB of memory. Storing 500,000 subscriber sessions at any point in time requires 500 MB of memory. This value must be added to the minimum memory requirement, which is shown as part of the output of the “show extendedmemoryparam” command. In the following example, the output is for a NetScaler VPX instance with 3 packet engines and 8 GB memory.

To store 500,000 subscriber sessions on this appliance, the configured memory must be 2058+500 MB (500,000 x 1 KB = 500 MB.)

> **Note**
>
> The configured memory must be in multiples of 2 MB and must not exceed the maximum memory usage limit. The appliance must be restarted for the changes to take effect.

Example

```
show extendedmemoryparam
        Extended Memory Global Configuration. This memory is utilized by
      LSN and Subscriber Session Store Modules:
        Active Memory Usage: 0 MBytes
        Configured Memory Limit: 0 MBytes
        Minimum Memory Required: 2058 MBytes
        Maximum Memory Usage Limit: 2606 MBytes
    Done
    set extendedmemoryparam -memLimit 2558
    Done
    show extendedmemoryparam
            Extended Memory Global Configuration. This memory is utilized by LSN and Subscriber Session Store Modules:

            Active Memory Usage: 2558 MBytes
            Configured Memory Limit: 2558 MBytes
            Minimum Memory Required: 2058 MBytes
            Maximum Memory Usage Limit: 2606 MBytes
    Done
<!--NeedCopy-->
```

Configure an interface for dynamic subscribers

The NetScaler appliance dynamically receives the subscriber information through any of the following types of interface:

- Gx Interface
- RADIUS Interface
- RADIUS and Gx Interface

> **Note**
>
> - In an HA setup, the subscriber sessions are continually synchronized on the secondary node. In the event of a failover, the subscriber information is still available on the secondary node.

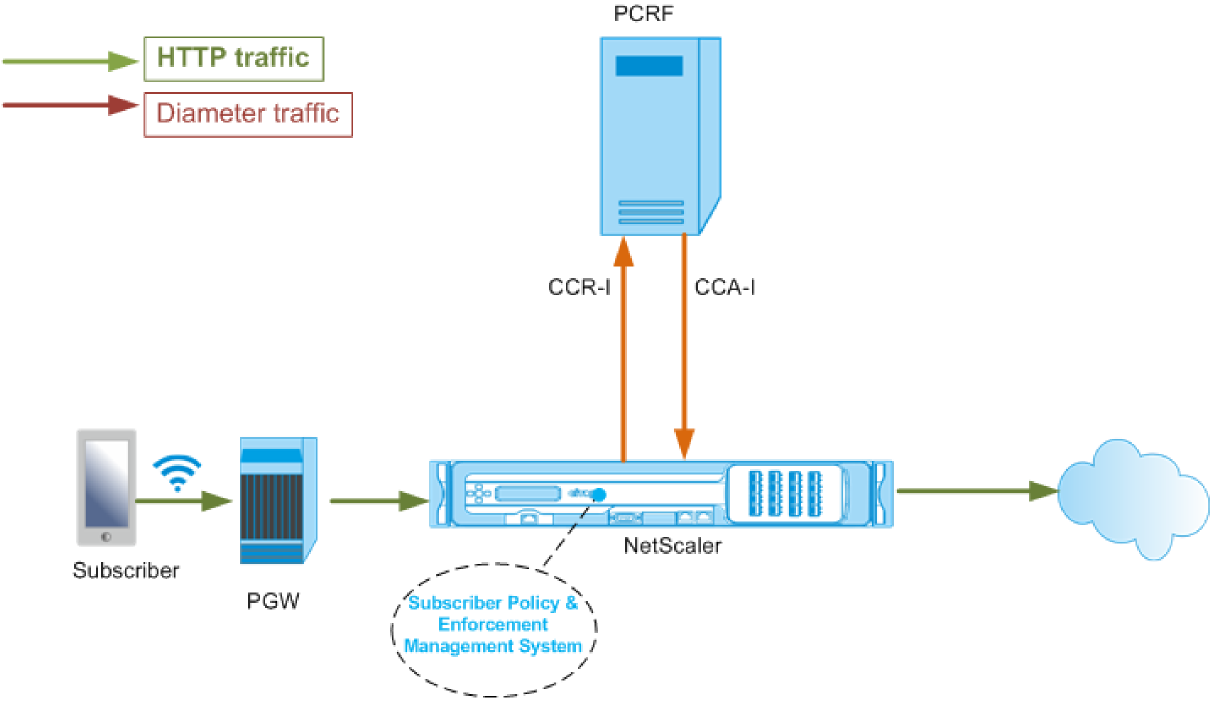
Gx interface

A Gx interface (as specified in 3GPP 29.212) is a standard interface based on the Diameter protocol that allows exchange of policy control and charging rules between a PCRF and a Policy and Charging Enforcement Function (PCEF) entity in a Telco network.

As soon as an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the PCRF as a Diameter message. When the data packet arrives at the appliance from packet gateway (PGW), the appliance uses the subscriber IP address to query the PCRF to get the subscriber information. This is also known as secondary PCEF functionality.

The Policy and Charging Control (PCC) rules received by the appliance over the Gx interface are stored on the appliance for the duration of the subscriber session, that is, until the PCRF sends a Re-Auth-Request (RAR) message with a Session-Release-Cause AVP or the subscriber session is terminated from the CLI or the configuration utility. If there are any updates to an existing subscriber, the PCRF sends the updates in an RAR message. A subscriber session is initiated when a subscriber logs on to the network, and terminated when the subscriber logs off.

The following illustration shows the high-level traffic flow. It assumes that the data plane traffic is HTTP. The appliance sends a Credit Control Request (CCR) over a Gx interface to the PCRF server and, in the credit control answer (CCA), receives the PCC rules and, optionally, other information, such as the Radio Access Technology (RAT) type, that applies to the particular subscriber. PCC rules include one or more policy (rule) names and other parameters. The appliance uses this information to retrieve the predefined rules stored on the appliance, and to direct the flow of traffic. It also stores this information in the subscriber policy and enforcement management system for the duration of the subscriber session. After a subscriber session is terminated, the appliance discards all the information about the subscriber.



The following example shows the commands for configuring a Gx interface. The commands are in boldface.

To set up a Gx interface, perform the following tasks

Add a DIAMETER service for each Gx interface. For example:

```
add service pcrf-svc1 203.0.113.1 DIAMETER 3868

add service pcrf-svc2 203.0.113.2 DIAMETER 3868
<!--NeedCopy-->
```

Add a non-addressable DIAMETER load balancing virtual sever and bind the services created in step 1 to this virtual server. For more than one service, specify a persistenceType and the persistAVPno so that specific sessions are handled by the same PCRF server. For example:

```
add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -persistAVPno 263

bind lb vserver vdiam pcrf-svc1

bind lb vserver vdiam pcrf-svc2
<!--NeedCopy-->
```

Configure NetScaler diameter identity and realm. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client. For example:

```
set ns diameter  - identity netscaler.com  - realm com
<!--NeedCopy-->
```

Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server. Specify the PCRF realm to use as Destination-Realm AVP in diameters messages sent by the Gx client. For example:

```
set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf.com
<!--NeedCopy-->
```

Set the subscriber interface type to GxOnly. For example:

```
set subscriber param -interfaceType GxOnly
<!--NeedCopy-->
```

To see the Gx interface configuration and status, type:

```
show subscriber gxinterface
<!--NeedCopy-->
```

Example

```
show subscriber gxinterface
    Gx Interface parameters:
        PCRF Vserver: vdiam (UP)
        Gx Client Identity...:  netscaler.com
        Gx Client Realm ..........:  com
        PCRF Realm: pcrf.com
        Hold Packets On Subscriber Absence: YES
        CCR Request Timeout: 10 Seconds
        CCR Request Retry Attempts: 3
        RevalidationTimeout: 1200 Seconds
        NegativeTTL: 120 Seconds
        ServicePath AVP code:262099 ServicePath AVP VendorID: 3845
        PCRF Connection State: Gx Connection Established with PCRF.
    Done

<!--NeedCopy-->
```

ARGUMENTS

vServer

Name of the load balancing or content switching virtual server to which the Gx connections are established. The service type of the virtual server must be DIAMETER or SSL_DIAMETER. This parameter is mutually exclusive with the service parameter. Therefore, you cannot set both service and the virtual server in the Gx interface.

Service

Name of DIAMETER or SSL_DIAMETER service corresponding to PCRF to which the Gx connection is established. This parameter is mutually exclusive with the vserver parameter. Therefore, you cannot set both service and the virtual server in the Gx Interface.

pcrfRealm

The realm of PCRF to which the message is to be routed. This is the realm used in Destination-Realm AVP by NetScaler Gx client (as a Diameter node).

holdOnSubscriberAbsence

Set to Yes to hold packets until the subscriber session information is fetched from the PCRF server. If set to No, the default subscriber profile is applied until the subscriber session information is fetched from the PCRF server. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes.

requestTimeout

Time, in seconds, within which the Gx CCR request must complete. If the request does not complete within this time, the request is retransmitted for the number of times specified in the requestRetryAttempts parameter. If request is not complete even after retransmitting, then the default subscriber profile is applied to this subscriber. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes. Zero disables the timeout. Default value: 10

requestRetryAttempts

Specify the number of times a request must be retransmitted if the request does not complete within the value specified in the requestTimeout parameter. Default value: 3

revalidationTimeout

Time, in seconds, after which the Gx CCR-U request is sent after any PCRF activity on a session. Any RAR or CCA message resets the timer. Zero value disables the idle timeout.

negativeTTL

Time, in seconds, after which the Gx CCR-I request is resent for sessions that have not been resolved by PCRF because the server is down or there is no response or a failed response is received. Instead of polling the PCRF server constantly, a negative-TTL makes the appliance hold on to an unresolved session. For negative sessions, the appliance inherits the attributes from the default subscriber profile, if one is configured and from the RADIUS accounting message, if one is received. Zero value disables the negative sessions. The appliance does not install negative sessions even if a subscriber session could not be fetched. Default value: 600

servicePathAVP

The AVP code in which PCRF sends the service path applicable to a subscriber.

servicePathVendorid

The vendor id of the AVP in which PCRF sends the service path applicable to a subscriber.

To configure Gx interface by using the GUI

1. Navigate to **Traffic Management** > **Subscriber** > **Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **GxOnly**.
4. Specify the values for the all required parameters.

5. Click **OK**.

RADIUS interface

With a RADIUS interface, the packet gateway forwards the subscriber information in a RADIUS Accounting Start message to the appliance through the RADIUS interface as soon as an IP-CAN session is established. A service of type RADIUSListener processes RADIUS Accounting messages. Add a shared secret for the RADIUS client. If a shared secret is not configured, the RADIUS message is silently dropped. The following example shows the commands for configuring a RADIUS interface. The commands are in boldface.

To set up a RADIUS interface, perform the following tasks:

Create a RADIUS listener service at the SNIP address where the RADIUS messages are received. For example:

```
add service srad1 192.0.0.206 RADIUSLISTENER 1813
<!--NeedCopy-->
```

Configure the subscriber RADIUS interface to use this service. For example:

```
set subscriber radiusInterface -listeningService srad1
<!--NeedCopy-->
```

Set the subscriber interface type to RadiusOnly. For example:

```
set subscriber param -interfaceType RadiusOnly
<!--NeedCopy-->
```

Add a RADIUS client specifying a subnet and shared secret. For example:

```
add radius client 192.0.2.0/24 -radkey client123
<!--NeedCopy-->
```

A subnet of 0.0.0.0/0 implies that it is the default shared secret for all clients.To see the RADIUS interface configuration and status, type:

```
show subscriber radiusInterface
<!--NeedCopy-->
```

RADIUS Interface parameters:

Radius Listener Service: srad1(UP)

Done

Example:

```
add service pcrf-svc1 203.0.113.1 DIAMETER 3868

add service pcrf-svc2 203.0.113.2 DIAMETER 3868
<!--NeedCopy-->
```

ARGUMENTS

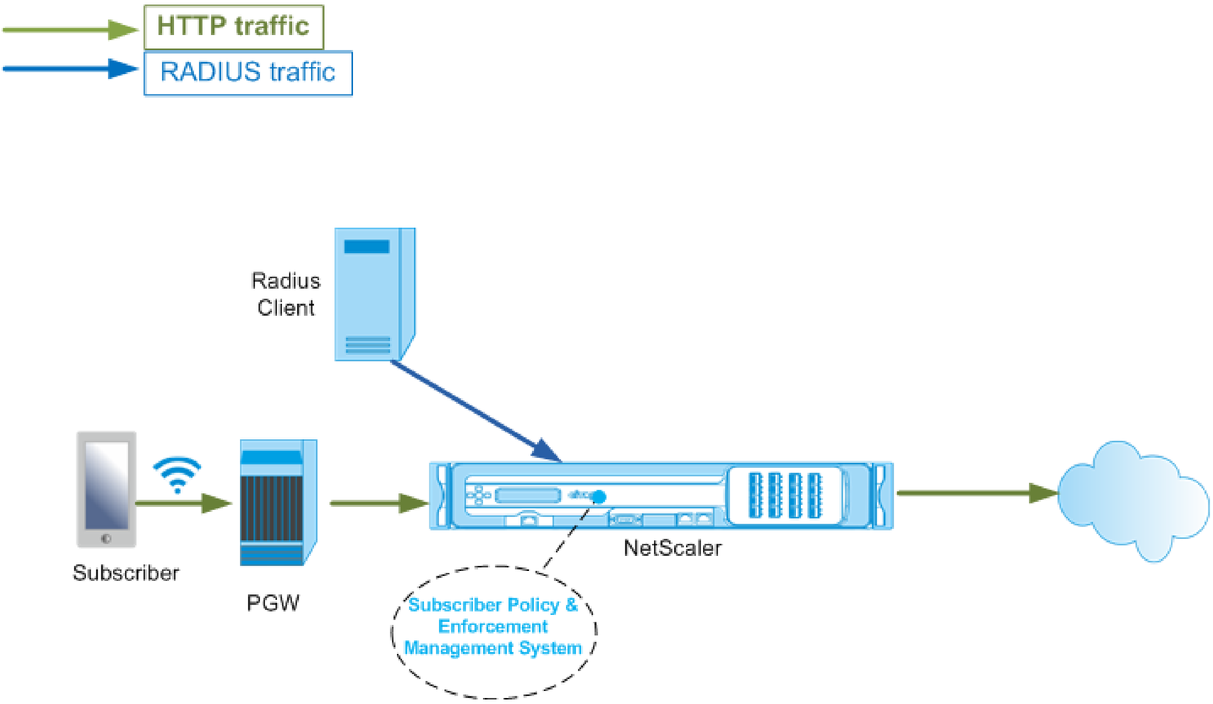
ListeningService

Name of the RADIUS listening service that will process the RADIUS accounting requests.

svrState

The state of the RADIUS listening service.

The following illustration shows the high-level traffic flow.



HTTP traffic
RADIUS traffic
Radius Client
Subscriber
PGW
NetScaler
Subscriber Policy & Enforcement Management System

To configure RadiusOnly interface by using the GUI

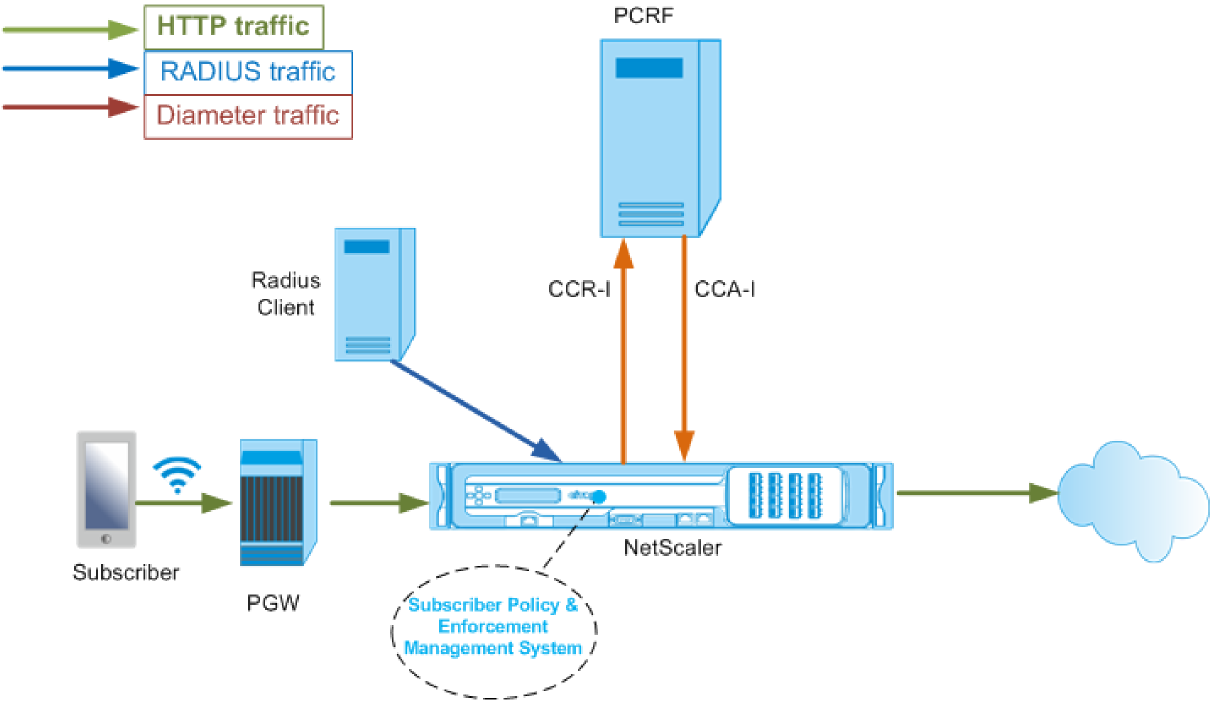
1. Navigate to **Traffic Management** > **Subscriber** > **Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **RadiusOnly**.
4. Specify the values for the all required parameters.
5. Click **OK**.

RADIUS and Gx interface

With a RADIUS and Gx interface, as soon as an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the appliance through the RADIUS interface. The appliance uses this subscriber ID to query the PCRF on the Gx interface to get the subscriber information. This is known as primary PCEF functionality. The following example shows the commands for configuring a RADIUS and Gx interface.

```
set subscriber param -interfaceType RadiusandGx
add service pcrf-svc 203.0.113.1 DIAMETER 3868
add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
    persistAVPno 263
bind lb vserver vdiam pcrf-svc
set subscriber gxInterface -vServer vdiam -pcrfRealm testrealm1.net -
    holdOnSubscriberAbsence YES -revalidationTimeout 60 -negativeTTL 120
add service srad1 192.0.0.206 RADIUSLISTENER 1813    set subscriber
    radiusInterface -listeningService srad1
<!--NeedCopy-->
```

The following illustration shows the high-level traffic flow.



HTTP traffic
RADIUS traffic
Diameter traffic
PCRF
Radius Client
CCR-I
CCA-I
Subscriber
PGW
NetScaler
Subscriber Policy & Enforcement Management System

To configure RadiusAndGx interface by using the GUI

1. Navigate to **Traffic Management** > **Subscriber** > **Parameters**.
2. Click **Configure Subscriber Parameters**.

3. In Interface Type, select **RadiusAndGx**.
4. Specify the values for the all required parameters.
5. Click **OK**.

Configure static subscribers

You can configure the subscribers manually on the NetScaler appliance by using the command line or the configuration utility. You create static subscribers by assigning a unique subscriber ID and optionally associating a policy with each subscriber. The following examples show the commands for configuring a static subscriber.

In the following examples, **subscriptionIdvalue** specifies the international telephone number, and **subscriptionIdType** (E164 in this example) specifies the general format for international telephone numbers.

```
add subscriber profile 203.0.113.6 -subscriberRules policy1 policy2 -
    subscriptionIdType E164  - subscriptionIdvalue 98767543211
add subscriber profile 2002::a66:e8d3/64 -subscriberRules policy1
    policy3 -subscriptionIdtype E164  - subscriptionIdvalue 98767543212
```

To view the configured subscriber profiles, type:

> show subscriber profile

```
> show subscriber profile
1)      Subscriber IP: 2002::/64
        Profile Attributes:
                Active Rules: policy1, policy3
                Subscriber Id Type: E164
                Subscriber Id Value: 98767543212
2)      Subscriber IP: 203.0.113.6
        Profile Attributes:
                Active Rules: policy1, policy2
                Subscriber Id Type: E164
                Subscriber Id Value: 98767543211
 Done
```

Default subscriber profile

A default subscriber profile is used if the subscriber IP address is not found in the subscriber session store on the appliance. In the following example, a default subscriber profile is added with the subscriber rule policy1.

```
> add subscriber profile * -subscriberRules policy1
```

View and clear subscriber sessions

Use the following command to display all the static and dynamic subscriber sessions.

> show subscriber sessions

```
> show subscriber sessions
1)      Subscriber IP: 2002::/64
        Session Attributes:
                Active Rules: policy1, policy3
                Subscriber Id Type: E164
                Subscriber Id Value: 98767543212
2)      Subscriber IP: *
        Session Attributes:
                Active Rules: policy1
3)      Subscriber IP: 203.0.113.6
        Session Attributes:
                Active Rules: policy1, policy2
                Subscriber Id Type: E164
                Subscriber Id Value: 98767543211
4)      Subscriber IP: 192.168.0.11
        Session Attributes:
                Idle TTL remaining: 361 Seconds
                Active Rules: policy1
                Subscriber Id Type: E164
                Subscriber Id Value: 1234567811
                Service Path: policy1
                AVP(44): 34 44 32 42 42 38 41 43  2D 30 30 30 30 30 30
    31 31
                AVP(257): 00 01 C0 A8 0A 02
                PCRF-Host: host.pcrf.com
                AVP(280): 74 65 73 74 2E 63 6F 6D
…
Done
```

Use the following command to clear a single session or the complete session store. If you do not specify an IP address, the complete subscriber session store is cleared.

```
clear subscriber sessions <ip>
<!--NeedCopy-->
```

Subscriber policy enforcement & management system

The NetScaler appliance uses the subscriber's IP address as the key to the subscriber policy enforcement and management system.

You can add subscriber expressions to read the subscriber information available in the Subscriber Policy Enforcement & Management System. These expressions can be used with policy rules and actions that are configured for NetScaler features, such as integrated caching, rewrite, responder, and content switching.

The following commands are an example of adding a subscriber-based responder action and policy. The policy evaluates to true if the subscriber rule value is"pol1".

```
add responder action error_msg respondwith '"HTTP/1.1 403 OKrnrn" + "
    You are  not authorized to access Internet"'
add responder policy no_internet_access "SUBSCRIBER.RULE_ACTIVE("pol1")
    " error_msg
```

The following example shows the commands to add a subscriber-based rewrite action and policy. The action inserts an HTTP header "X-Nokia-MSISDN" by using the value of AVP(45) in the subscriber session.

```
> add rewrite action AddHDR-act insert_http_header X-Nokia-MSISDN "
    SUBSCRIBER.AVP(45).VALUE"
> add rewrite policy AddHDR-pol "HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL)
    .EQUALS_ANY("patset-test")" AddHDR-act
```

In the following example, two policies are configured on the appliance. When the appliance checks the subscriber information and the subscriber rule is cache_enable, it performs caching. If the subscriber rule is cache_disable, the appliance does not perform caching.

```
> add cache policy nocachepol -rule "SUBSCRIBER.RULE_ACTIVE("
    cache_disable")" - action NOCACHE
> add cache policy cachepol -rule "SUBSCRIBER.RULE_ACTIVE("cache_enable
    ")" - action CACHE -storeInGroup cg1
```

For a complete list of expressions starting with "SUBSCRIBER." see the Policy Configuration Guide.

IPv6 prefix based subscriber sessions

A telco user is generally identified by the IPv6 prefix rather than the complete IPv6 address. The NetScaler appliance now uses the prefix instead of the complete IPv6 address (/128) to identify a subscriber in the database (subscriber store). For communicating with the PCRF server (for example, in a CCR-I message), the appliance now uses the framed-IPv6-Prefix AVP instead of the complete IPv6 address. The default prefix length is /64, but you can configure the appliance to use a different value.

To configure the IPv6 prefix by using the command line

set subscriber param [-ipv6PrefixLookupList ...]

The first example command below sets a single prefix and the second example command sets multiple prefixes.

```
set subscriber param -ipv6PrefixLookupList 64
set subscriber param -ipv6PrefixLookupList 64 72 96
```

To configure the IPv6 prefix by using the configuration utility

1. Navigate to **Traffic Management** > **Subscriber** > **Parameters**.
2. In the details pane, under **Settings**, click **Configure Subscriber Parameters** and in **IPv6 Prefix Lookup List**, specify one or more prefixes.

Idle session management of subscriber sessions in a Telco network

Subscriber session cleanup on a NetScaler appliance is based on control plane events, such as a RADIUS Accounting Stop message, a Diameter RAR (session release) message, or a "clear subscriber session" command. In some deployments, the messages from a RADIUS client or a PCRF server might not reach the appliance. Additionally, during heavy traffic, the messages might be lost. A subscriber session that is idle for a long time continues to consume memory and IP resources on the NetScaler appliance. The idle session management feature provides configurable timers to identify idle sessions, and cleans up these sessions on the basis of the specified action.

A session is considered idle if no traffic from this subscriber is received on the data plane or the control plane. You can specify an update, terminate (inform PCRF and then delete the session), or delete (without informing PCRF) action. The action is taken only after the session is idle for the time specified in the idle timeout parameter.

To configure the idle session timeout and the associated action by using the command line

```
set subscriber param [-idleTTL <positive_integer>] [-idleAction <
    idleAction>]
<!--NeedCopy-->
```

Examples:

```
set subscriber param -idleTTL 3600 -idleAction ccrTerminate

set subscriber param -idleTTL 3600 -idleAction ccrUpdate

set subscriber param -idleTTL 3600 -idleAction delete
<!--NeedCopy-->
```

To disable the idle session timeout, set the idle timeout to zero.

set subscriber param –idleTTL 0

To configure the idle session timeout and the associated action by using the configuration utility

1. Navigate to **Traffic Management** > **Subscriber** > **Parameters**.
2. In the details pane, under **Settings**, click **Configure Subscriber Parameters** and specify an **Idle Time** and **Idle Action**.

Subscriber session event logging

If you enable subscriber logging, you can track the RADIUS and Gx control plane messages specific to a subscriber, and use the historical data to analyze subscriber activities. Some of the key attributes are MSISDN and time stamp. The following attributes are also logged:

- Session Event (Install, Update, Delete, Error)
- Gx Message Type (CCR-I, CCR-U, CCR-T, RAR)
- Radius Message Type (Start, Stop)
- Subscriber IP
- SubscriberID Type (MSISDN(E164), IMSI)
- SubscriberID value

By using these logs, you can track users by IP address and, if available, MSISDN.

You can enable subscriber session logging to a local or remote syslog or nslog server. The following example shows how to enable subscriber logging to a remote syslog server.

```
> add syslogAction sysact1 192.0.2.0 -loglevel EMERGENCY ALERT CRITICAL
    ERROR WARNING NOTICE INFORMATIONAL -subscriberlog enabled
```

From these logs, you can learn about any activity related to a user, such as the time when a session was updated, deleted, or created (installed). Additionally, error messages are also logged.

Examples:

1. The following log entries are examples of RADIUSandGx session creation, session update, and session deletion.

```
09/30/2015:16:29:18 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 147 0 : Session Install, GX MsgType: CCR-I, RADIUS MsgType: Start, IP: 100.10.1.1, ID: E164 - 30000000001

09/30/2015:16:30:18 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 148 0 : Session Update, GX MsgType: CCR-U, IP: 100.10.1.1, ID: E164 - 30000000001

09/30/2015:17:27:56 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 185 0 : Session Delete, GX MsgType: CCR-T, RADIUS MsgType: Stop, IP: 100.10.1.1, ID: E164 - 30000000001
```

2. The following log entries are examples of failure messages, such as when a subscriber is not found on the PCRF server and when the appliance cannot connect to the PCRF server.

```
09/30/2015:16:44:15 GMT Error 0-PPE-0 : default SUBSCRIBER SESSION_FAILURE 169 0 : Failure Reason: PCRF failure response, GX MsgType: CCR-I, IP: 100.10.1.1

Sep 30 13:03:01 09/30/2015:16:49:08 GMT 0-PPE-0 : default SUBSCRIBER SESSION_FAILURE 176 0 : Failure Reason: Unable to connect to PCRF, GX MsgType: CCR-I, RADIUS MsgType: Start, IP: 100.10.1.1, ID: E164 - 30000000001#000#000#000#000#000#000#000#000#000#00
```

Subscriber aware LSN session termination

In earlier releases, if a subscriber session is deleted when a RADIUS Accounting STOP or a PCRF-RAR message is received, or as a result of any other event, such as TTL expiry or flush, the corresponding LSN sessions of the subscriber are removed only after the configured LSN timeout period. LSN sessions that are kept open until this timeout expires continue to consume resources on the appliance.

From release 11.1, a new parameter (subscrSessionRemoval) is added. If this parameter is enabled, and the subscriber information is deleted from the subscriber database, LSN sessions corresponding to that subscriber are also removed. If this parameter is disabled, the subscriber sessions are timed out as specified by the LSN timeout settings.

To configure subscriber aware LSN session termination by using the CLI

At the command prompt, type:

```
set lsn parameter -subscrSessionRemoval (          DISABLED )
ENABLED
```

```
> set lsn parameter -subscrSessionRemoval ENABLED
Done
> sh lsn parameter
```

```
            LSN Global Configuration:

            Active Memory Usage: 0 MBytes
            Configured Memory Limit: 0 MBytes
            Maximum Memory Usage Limit: 912 MBytes
            Session synchronization: ENABLED
            Subscriber aware session removal: ENABLED
```

To configure subscriber aware LSN session termination by using the GUI

1. Navigate to **System** > **Large Scale NAT**.
2. In **Getting started**, click **Set LSN Parameter**.
3. Set the **Subscriber Aware Session Removal parameter**.

Troubleshooting

If your deployment is not working as expected, use the following commands to troubleshoot:

- show subscriber gxinterface
  This command's output can include the following error messages (shown here with suggested responses):
  - Gx Interface Not Configured-Use set subscriber param command to configure the correct interface type.
  - PCRF not configured-Configure a Diameter vServer or Service on GxInterface-Use the set subscriber gx interface command to assign a Diameter virtual server or service to this interface.
  - PCRF is not ready-Check corresponding vserver/service for more details-Use the show LB vserver or show service command to check the state of the service.
  - NetScaler is waiting for CEA from PCRF-Capability negotiation between the PCRF and NetScaler might be failing. This could be an intermittent state. If it persists, check the DIAMETER settings on your PCRF server.
  - Memory is not configured to store subscriber sessions. Please use 'set extendedmemoryparam -memlimit <>'-Use the set extendedmemoryparam command to configure extended memory.
- show subscriber radiusinterface
  If "Not Configured" is the output of this command, use the set subscriber radiusinterface command to specify a RADIUSListener service.

If subscriber logging is enabled, you can get more detailed information from the log files.

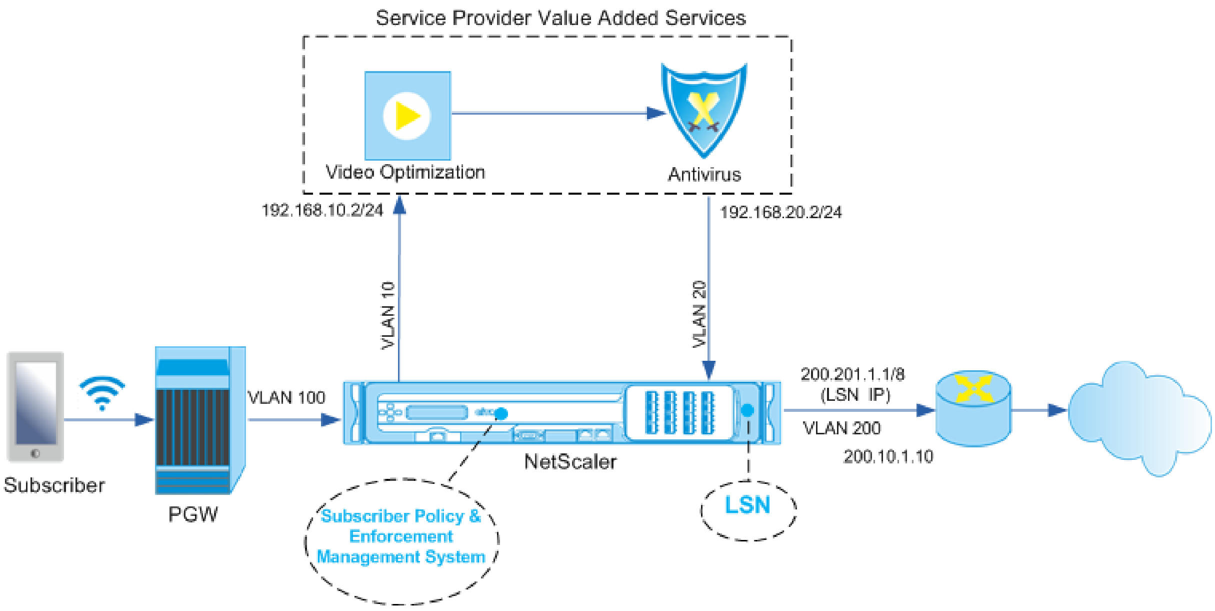
Subscriber aware traffic steering

September 21, 2020

Traffic steering directs subscriber traffic from one point to another. When a subscriber connects to the network, the packet gateway associates an IP address with the subscriber and forwards the data packet to the NetScaler appliance. The appliance communicates with the PCRF server over the Gx interface to get the policy information. Depending on the policy information, the appliance performs one of the following actions:

- Forward the data packet to another set of services (as shown in the following illustration).
- Drop the packet.
- Perform only Large Scale NAT (LSN), if LSN is configured on the appliance.

The values shown in the following figure are configured in the CLI procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.



Service Provider Value Added Services
Video Optimization
Antivirus
192.168.10.2/24
192.168.20.2/24
VLAN 10
VLAN 20
VLAN 100
Subscriber
PGW
NetScaler
Subscriber Policy & Enforcement Management System
LSN
200.201.1.1/8 (LSN IP)
VLAN 200
200.10.1.10

To configure traffic steering for the above deployment by using the CLI

Add the appliance's subnet IP (SNIP) addresses.

Example:

```
add ns ip 192.168.10.1 255.255.255.0 -type snip

add ns ip 192.168.20.1 255.255.255.0 -type snip

add ns ip 100.100.100.1 255.0.0.0 -type snip

add ns ip 200.200.200.1 255.0.0.0 -type snip

add ns ip 100.1.1.1 255.0.0.0 -type snip

add ns ip 200.201.1.1 255.0.0.0 -type snip
<!--NeedCopy-->
```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses.

Example:

```
add vlan 10

add vlan 20

add vlan 100

add vlan 200

bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0

bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0

bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0

bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.1.1.1 255.0.0.0
<!--NeedCopy-->
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

Example:

```
set ns param -servicePathIngressVLAN 100

set subscriber gxinterface -servicepathAVP 1001 1005 -
   servicepathVendorid 10415

set subscriber param -interfaceType RadiusAndGx
<!--NeedCopy-->
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

Example:

```
add service sd1 10.102.232.200 DIAMETER 3868

add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
    persistAVPno 263

bind lb vserver vdiam sd1

set ns diameter -identity netscaler.sc1.net -realm pcrf1.net

set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -
    holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120

add service srad1 10.102.232.236 RADIUSListener 1813

set subscriber radiusInterface -listeningService srad1
<!--NeedCopy-->
```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must already be configured as part of the global configuration. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

Example:

```
add ns servicefunction SF1 -ingressVLAN 20

add ns servicepath pol1

bind ns servicepath pol1 -servicefunction SF1 -index 255

add subscriber profile * -subscriberrules default_path
```

```
<!--NeedCopy-->
```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

```
add lsn pool pool1

bind lsn pool pool1 200.201.1.1

add lsn client client1

bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0

add lsn group group1 -clientname client1

bind lsn group group1 -poolname pool1
<!--NeedCopy-->
```

The appliance performs LSN by default. To override LSN, you must create a net profile with the overrideLsn parameter enabled, and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

Example:

```
add netprofile np1

set netprofile np1 -overrideLsn ENABLED

set lb vserver vs1 -netprofile np1
<!--NeedCopy-->
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

```
add service vas1 192.168.10.2 ANY 80 -usip YES

add service sint 200.10.1.10 ANY 80 -usip YES

add lb vserver vs1 ANY -m MAC -l2Conn ON

add lb vserver vint ANY -m MAC -l2Conn ON

bind lb vserver vs1 vas1

bind lb vserver vint sint
```

```
<!--NeedCopy-->
```

Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

Example:

```
add cs vserver cs1 ANY * 80 -l2Conn ON

add cs action csact1 -targetLBVserver vs1

add cs action csactint -targetLBVserver vint

add cs policy cspol1 -rule  SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") &&
    SYS.VSERVER("vs1").STATE.EQ(UP)" -action csact1

bind cs vserver cs1 -policyName cspol1 -priority 110

bind cs vserver cs1 -lbvserver vint
<!--NeedCopy-->
```

To configure traffic steering on the appliance by using the GUI

1. Navigate to **System**> **Network**> **IPs** and add the subnet IP addresses.
2. Navigate to System > Network > **VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management**> **Service Chaining**> **Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management**> **Subscriber**> **Parameters**> **Configure Subscriber Parameters** and specify the following:
    - Interface Type: Specify **RadiusAndGx**.
    - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
    - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management**> **Service Chaining**> **Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System**> **Network**> **Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to **System**> **Network**> **Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System**> **Network**> **Settings**> **Configure Layer 3 Parameters** and verify

that **Override LSN** is not selected.

8. Navigate to **Traffic Management**> **Load Balancing**> **Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to **Traffic Management**> **Content Switching**> **Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

To configure service chaining on the appliance by using the GUI

1. Navigate to **System**> **Network**> **IPs** and add the subnet IP addresses.
2. Navigate to System > Network > **VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management**> **Service Chaining**> **Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management**> **Subscriber**> **Parameters**> **Configure Subscriber Parameters** and specify the following:
    - Interface Type: Specify **RadiusAndGx**.
    - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
    - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management**> **Service Chaining**> **Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System**> **Network**> **Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to **System**> **Network**> **Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System**> **Network**> **Settings**> **Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.
8. Navigate to **Traffic Management**> **Load Balancing**> **Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to **Traffic Management**> **Content Switching**> **Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

Subscriber aware service chaining

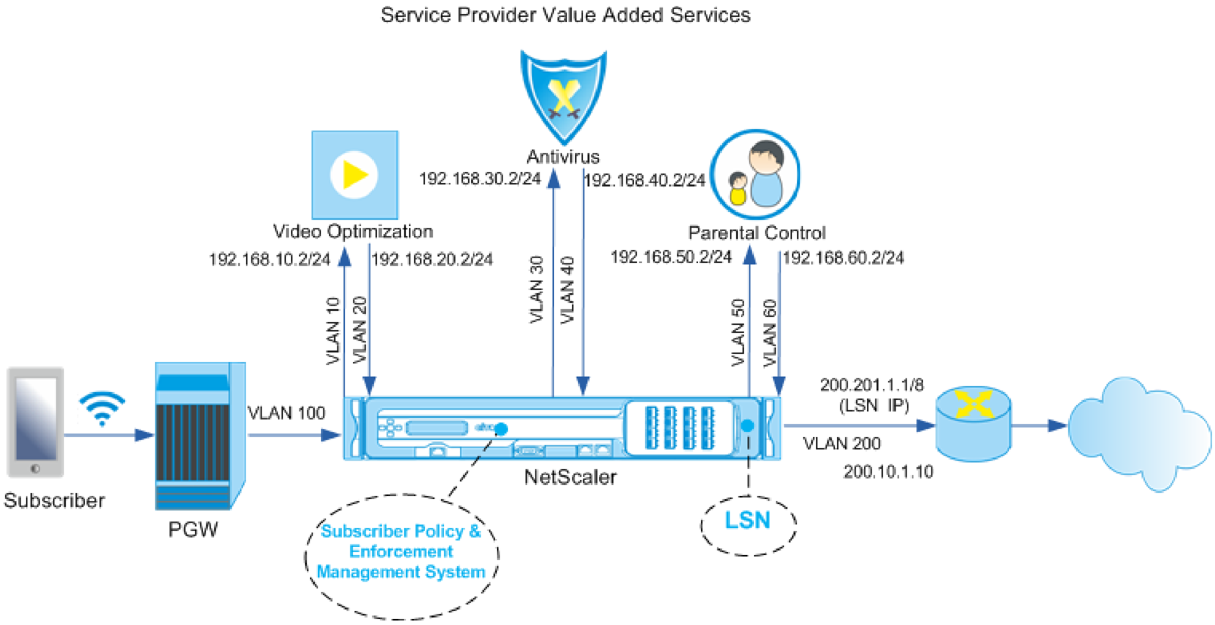
September 21, 2020

With the huge increase in the data traffic passing through telco networks, it is no longer feasible for service providers to steer all the traffic through all the value added services (VAS). A service provider should be able to optimize usage of VAS and intelligently steer traffic to improve the user experience. For example, video optimization is not required for traffic that does not include a video. Moreover, if a subscriber is connected to a 4G network, content can be streamed in high definition (HD), and video optimization might not be needed. However, video optimization improves the experience for a user in a 3G network. Similarly, caching provides a faster and better user experience and can be enabled depending on the subscriber plan. Another example of VAS is parental control. If parents provide a mobile handset to a minor child, they would like some kind of control over the websites that their child visits.

To do the above and more, service providers must be able to provide value-added services on a per-subscriber basis. In other words, entities in the service provider network must be capable of extracting the subscriber information and intelligently steering the packet on the basis of this information.

Service chaining determines the set of services through which the traffic from a subscriber must pass before going to the Internet. Instead of sending all the traffic to all the services, the NetScaler intelligently routes all requests from a subscriber to a specific set of services on the basis of the policy defined for that subscriber.

The following figure shows the entities involved in service chaining. The values shown are configured in the procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.



Service Provider Value Added Services
Antivirus
192.168.30.2/24
192.168.40.2/24
Video Optimization
192.168.10.2/24
192.168.20.2/24
Parental Control
192.168.50.2/24
192.168.60.2/24
VLAN 10
VLAN 20
VLAN 30
VLAN 40
VLAN 50
VLAN 60
VLAN 100
200.201.1.1/8
(LSN IP)
VLAN 200
200.10.1.10
Subscriber
PGW
NetScaler
Subscriber Policy &
Enforcement
Management System
LSN

To configure service chaining for the above deployment by using the CLI

Add the appliance's subnet IP (SNIP) addresses.

Example:

```
add ns ip 192.168.10.1 255.255.255.0 -type snip

add ns ip 192.168.20.1 255.255.255.0 -type snip

add ns ip 192.168.30.1 255.255.255.0 -type snip

add ns ip 192.168.40.1 255.255.255.0 -type snip

add ns ip 192.168.50.1 255.255.255.0 -type snip

add ns ip 192.168.60.1 255.255.255.0 -type snip

add ns ip 100.1.1.1 255.0.0.0 -type snip

add ns ip 200.201.1.1 255.0.0.0 -type snip
<!--NeedCopy-->
```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses. Add an ingress and an egress VLAN for each VAS.

Example:

```
add vlan 10

add vlan 20

add vlan 30

add vlan 40

add vlan 50

add vlan 60

add vlan 100

add vlan 200

bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0

bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0

bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.30.1 255.255.255.0

bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.40.1 255.255.255.0

bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.50.1 255.255.255.0

bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.60.1 255.255.255.0

bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0

bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.201.1.1 255.0.0.0
<!--NeedCopy-->
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

Example:

```
set ns param -servicePathIngressVLAN 100

set subscriber gxinterface -servicepathAVP 1001 1005 -
    servicepathVendorid 10415

set subscriber param -interfaceType RadiusAndGx
<!--NeedCopy-->
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

Example:

```
add service sd1 10.102.232.200 DIAMETER 3868

add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
    persistAVPno 263

bind lb vserver vdiam sd1

set ns diameter -identity netscaler.sc1.net -realm pcrf1.net

set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -
    holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120

add service srad1 10.102.232.236 RADIUSListener 1813

```

```
set subscriber radiusInterface -listeningService srad1
<!--NeedCopy-->
```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must be configured as part of the global configuration earlier. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

Example:

```
add ns servicefunction SF1 -ingressVLAN 20

add ns servicefunction SF2 -ingressVLAN 40

add ns servicefunction SF3 -ingressVLAN 60

add ns servicepath pol1

bind ns servicepath pol1 -servicefunction SF1 -index 255

bind ns servicepath pol1 -servicefunction SF2 -index 254

bind ns servicepath pol1 -servicefunction SF3 -index 253

add ns servicepath pol2

bind ns servicepath pol2 -servicefunction SF2 -index 255

add ns servicepath pol3

bind ns servicepath pol3 -servicefunction SF1 -index 255

add subscriber profile * -subscriberrules default_path
<!--NeedCopy-->
```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

Example:

```
add lsn pool pool1

bind lsn pool pool1 200.201.1.1

add lsn client client1

bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0

add lsn group group1 -clientname client1

bind lsn group group1 -poolname pool1
<!--NeedCopy-->
```

The appliance performs LSN by default. To override LSN, you must create a net profile with overrideLsn parameter enabled and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

Example:

```
add netprofile np1

set netprofile np1 -overrideLsn ENABLED

set lb vserver vs1 -netprofile np1
<!--NeedCopy-->
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

Example:

```
add service vas1 192.168.10.2 ANY 80 -usip YES

add service vas2 192.168.30.2 ANY 80 -usip YES

add service vas3 192.168.50.2 ANY 80 -usip YES

add service sint 200.10.1.10 ANY 80 -usip YES

add lb vserver vs1 ANY -m MAC -l2Conn ON

add lb vserver vs2 ANY -m MAC -l2Conn ON

add lb vserver vs3 ANY -m MAC -l2Conn ON

add lb vserver vint ANY -m MAC -l2Conn ON

bind lb vserver vs1 vas1

bind lb vserver vs2 vas2

bind lb vserver vs3 vas3

bind lb vserver vint sint
<!--NeedCopy-->
```

Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

Example:

```
add cs vserver cs1 ANY * 80 -l2Conn ON

add cs action csact1 -targetLBVserver vs1

add cs action csact2 -targetLBVserver vs2

add cs action csact3 -targetLBVserver vs3

add cs action csactint -targetLBVserver vint

add cs policy cspol1 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") &&
   SYS.VSERVER("vs1").STATE.EQ(UP)" -action csact1

add cs policy cspol2 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF2") &&
   SYS.VSERVER("vs2").STATE.EQ(UP)" -action csact2

add cs policy cspol3 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF3") &&
   SYS.VSERVER("vs3").STATE.EQ(UP)" -action csact3

bind cs vserver cs1 -policyName cspol1 -priority 110

bind cs vserver cs1 -policyName cspol2 -priority 120

bind cs vserver cs1 -policyName cspol3 -priority 130

bind cs vserver cs1 -lbvserver vint
<!--NeedCopy-->
```

To configure service chaining on the appliance by using the GUI

1. Navigate to **System** > **Network** > **IPs** and add the subnet IP addresses.
2. Navigate to **System** > **Network** > **VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management** > **Service Chaining**> **Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management** > **Subscriber** > **Parameters** > **Configure Subscriber Parameters** and specify the following:
    - Interface Type: Specify **RadiusAndGx**.
    - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
    - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management** > **Service Chaining**> **Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System**> **Network**> **Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to **System**> **Network**> **Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System**> **Network**> **Settings**> **Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.
8. Navigate to **Traffic Management**> **Load Balancing**> **Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to **Traffic Management**> **Content Switching**> **Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

Policy based TCP profile selection

September 21, 2020

You can configure the NetScaler appliance to perform TCP optimization based on subscriber attributes. For example, the appliance can select different TCP profiles at run time, based on the network to which the user equipment (UE) is connected. As a result, you can improve a mobile user's experience by setting some parameters in the TCP profiles and then using policies to select the appropriate profile.

Create separate TCP profiles for subscribers connecting through a 4G network and for users connecting through any other network. Define a policy rule that is selected on the basis of a subscriber parameter, such as RAT-type. In the following examples, if RAT-Type is EUTRAN, a TCP profile that supports a faster connection is selected (Example 1). For all other RAT-Type values, a different TCP profile is selected (Example 2).

> **Note**
>
> The RAT-Type AVP (AVP code 1032) is of type Enumerated and is used to identify the radio access technology that is serving the UE.
>
> The value "1004" indicates that the RAT is EUTRAN. (RFC 29.212).

Example1:

```
add ns tcpProfile tcp2 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd 16 - oooQSize 15000 -slowStartIncr 1 -bufferSize 1000000 -flavor BIC - dynamicReceiveBuffering DISABLED -sendBuffsize 1000000 -dsack DISABLED -maxcwnd 4000000 -fack ENABLED -minRTO 500 -maxburst 15

add appqoe action appact2 -priority HIGH -tcpprofile tcp2

add appqoe policy apppol2 -rule "SUBSCRIBER.AVP(1032).VALUE.GET_UNSIGNED32(0, BIG_ENDIAN).EQ(1004)" -action appact2

bind cs vserver <name>  -policyname apppol2 -priority 20 -type request
<!--NeedCopy-->
```

Example2:

```
add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd 16 - oooQSize 15000 -slowStartIncr 1 -bufferSize 150000 -flavor BIC - dynamicReceiveBuffering DISABLED -sendBuffsize 150000 -dsack DISABLED -maxcwnd 4000000 -fack ENABLED -minRTO 200 -maxburst 15

add appqoe action appact1 -priority HIGH -tcpprofile tcp1

add appqoe policy apppol1 -rule "SUBSCRIBER.AVP(1032).VALUE.GET_UNSIGNED32(0, BIG_ENDIAN).NE(1004)" -action appact1

bind cs vserver <name>  -policyname apppol1 -priority 10 -type request
<!--NeedCopy-->
```

Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols

September 21, 2020

With the increase in control-plane traffic, the servers can become a bottleneck because the traffic is not optimally distributed among the servers. Therefore, messages must be load balanced. The NetScaler appliance supports Diameter, SIP, and SMPP load balancing.

SIP

NetScaler enables you to load balance SIP messages over UDP or over TCP (including TLS) to a group of proxy servers. NetScaler also provides Call-ID based persistence and Call-ID hash load balancing method using which you direct packets for a particular SIP session to the same load balanced SIP server.
The NetScaler default expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for SIP protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

For more information, see Load Balancing a Group of SIP Servers.

SMPP

Millions of short messages are exchanged daily between individuals and value-added service providers, such as banks, advertisers, and directory services, by using the short message peer to peer (SMPP) protocol. Often, message delivery is delayed because servers are overloaded and traffic is not optimally distributed among the servers.
The NetScaler appliance provides optimal distribution of messages across your servers, preventing poor performance and outages. The NetScaler appliance:

- Load balances messages originating from the server and from the client
- Monitors the health of the message centers
- Provides content switching support for the message centers
- Handles concatenated messages

Limitation: Message IDs, from the message center, longer than 59 bytes are not supported. If the message ID length returned by the message center is more than 59 bytes, ancillary operations fail and the NetScaler appliance responds with an error message.

For more information, see SMPP Load Balancing

Diameter

Diameter is a base protocol with more than 50 protocols (also called applications) built over it. Therefore, the diameter traffic generated in a Telco network is high. To optimally maintain this diameter traffic, the NetScaler appliance performs load balancing, content switching, and acts as a relay agent. Additionally, the appliance offers rewrite and responder functionality. The appliance supports rate limiting of Diameter messages.

For more information, see Configuring Diameter Load Balancing.

Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers

September 21, 2020

Telecom service providers can configure the NetScaler appliance to function as a DNS proxy. Caching of DNS records, which is an important function of a DNS proxy, is enabled by default on the NetScaler appliance. This enables the NetScaler appliance to provide quick responses for repeated translations and hence enhances the customer experience and also saves the bandwidth. The caches responses from DNS name servers. When the appliance receives a DNS query, it checks for the queried domain in its cache. If the address for the queried domain is present in its cache, the NetScaler appliance returns the corresponding address to the client. Otherwise, it forwards the query to a DNS name server that checks for the availability of the address and returns it to the NetScaler appliance. The NetScaler appliance then returns the address to the client.

For requests for a domain that has been cached earlier, the NetScaler appliance serves the Address record of the domain from the cache without querying the configured DNS server and hence saves the bandwidth.

From 11.0 release onwards, NetScaler also logs the DNS requests that it receives and also the responses that it sends to the client. Telecom service providers can use this log to:

- Audit the DNS responses to the client
- Audit DNS clients
- Detect and prevent DNS attacks
- Troubleshooting

For more information, see
Domain Name System.

Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider

September 21, 2020

Scalability, high availability and performance are critical to service provider deployments. While many service providers deploy there infrastructure at a single location or multiple location, these deployments are subject to a number of inherent limitations, such as:

- If the site loses connectivity to all or part of the public Internet, it will be inaccessible to users and customers, which can have significant impact on the business.
- Users accessing the site from geographically distant locations may experience large and highly variable delays, which are exacerbated by the large number of round trips that HTTP requires to transfer content.

NetScaler appliance's Global Server Load Balancing (GSLB) overcomes these problems by distributing traffic among sites deployed in multiple geographic locations. By serving content from many different points in the Internet, GSLB alleviates the impact of network bandwidth bottlenecks and provides robustness in case of network failures at a particular site. Users can be automatically directed to the nearest or least loaded site at the time of the request, minimizing the likelihood of long download delays and/or service disruptions.
You can use NetScaler appliance's global server load balancing for:

- Disaster recovery or high availability by configuring an Active-standby data center setup that consists of an active and a standby data center. When a failover occurs as a result of a disaster event, the standby data center becomes operational.
- High availability and speed by configuring an active-active data center setup that consists of multiple active data centers. Client requests are load balanced across active data centers.
- Directing client requests to the data center that is closest in geographical distance or network distance by configuring a proximity setup.
- Full-DNS resolutions, GSLB processes DNS queries of the A, AAAA and CNAME types, and the DNS function option can process DNS queries of all other types, such as MX and PTR. Also, if the recursive resolution is enabled, the appliance will forward DNS queries for domain names that are not configured on the NetScaler appliance.

For more information, see Global Server Load Balancing.

Bandwidth Utilization Using Cache Redirection Functionality

September 21, 2020

The volume of web traffic on the Internet is enormous and a large percentage of that traffic is redundant. Multiple clients ask web servers for the same content repeatedly leading to inefficient use of bandwidth. To relieve the origin web server of processing each request, Internet Service Providers (ISPs) can use the cache redirection feature of NetScaler appliance and serve the content from a cache server instead of from the origin server. The NetScaler appliance analyzes incoming requests, sends requests for cacheable data to cache servers, and sends non-cacheable requests and dynamic HTTP requests to origin servers. Cache redirection feature of NetScaler is policy-based, and by default, requests that match a policy are sent to the origin server, and all other requests are sent to a cache server. You can combine content switching with cache redirection to cache selective content and serve content from specific cache servers for specific types of requested content.

For more information, see Cache Redirection.

NetScaler TCP Optimization

September 21, 2020

The NetScaler appliance provides advanced TCP tuning and optimization techniques and capabilities that are well suited to modern 3.5 and 4G networks, improving user experience and perceived download speeds significantly.

This section focuses on detailed instructions relevant to:

- Choosing and inserting an appropriate NetScaler T1000 Series model in a mobile network for TCP optimization
- Full configuration instructions related to not only TCP optimization but also for appropriate Layer-2 and Layer-3 configuration of the T1 device

Getting Started

September 21, 2020

Hardware

Citrix provides a wide breath of NetScaler models that might be loosely based on two factors:

- Capacity, currently ranging from hundreds of Mbps for the low-end VPX appliance to 160Gbps for the high-end 25000 MPX series appliance
- Telco grade, with the availability of the T1000 series for Telco datacenters.

Your Citrix Sales or Support representative can help you select the appropriate hardware for your demo, trial, or production needs.

The remainder of this section uses a NetScaler T1200 as a reference hardware. Note that putting aside superficial differences related to number and notation of available interfaces (see ⋆ in note) or well-documented limitations of NetScaler VPX (see ⋆⋆ in note) the instructions should apply mostly verbatim regardless of the NetScaler model selected.

> **Note**
>
> ⋆ For instance the T1010 model only has 12x1GbE typically marked as 1/1-1/12 rather than the 10/x notation used in this document.
>
> ⋆⋆ A NetScaler VPX instance typically doesn't support LACP aggregation; it might also not support VLAN tagging.

Initial Setup

Through Serial Console

After a serial cable is connected, you can log on to the NetScaler appliance with the following credentials:

- Username: nsroot
- Password: nsroot

Once logged in, configure the basic details of the NetScaler appliance as shown in the screen capture below.

Example:

```
set ns config - IPAddress <ip_addr> -netmask <netmask>

saveconfig

reboot -warm
<!--NeedCopy-->
```

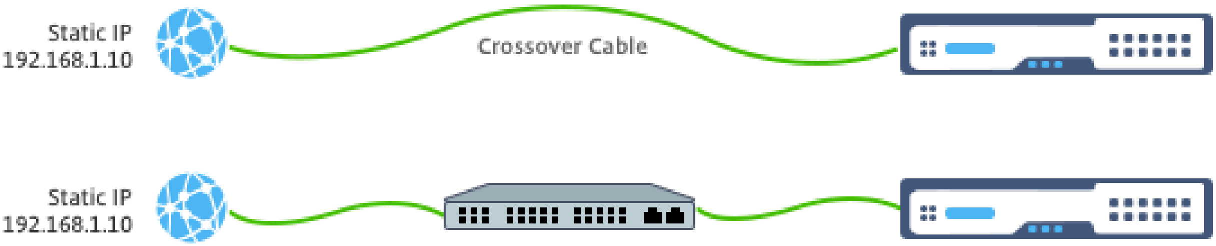
After you restart the appliance, you might use SSH for further configuration of the T1100 nodes.

Through LOM

Lights out Management (LOM) port on the front panel of the NetScaler appliance allows operator to remotely monitor and manage the appliance independently of the operating system. Operator can change the IP address, power cycle, and perform a code dump by connecting to the NetScaler appliance through the LOM port.

Default IP Address of LOM port is 192.168.1.3

Figure. Intial Configuration of LOM Module



Set a static IP on your laptop and plug it directly into the LOM interface with a crossover cable or into a switch in the same broadcast domain as the LOM interface.

For initial configuration, type the port's default address: http://192.168.1.3 in a web browser and change the LOM port's default IP address.

Refer to Configuration Guides for further details.

Software

The NetScaler TCP optimization for mobile networks is constantly evolving. The capabilities and tunings outlined in this document require a NetScaler Telco build. Here is an example showing the NetScaler Telco build.

Example:

```
show ver

NetScaler NS11.0: Build 64.957.nc, Date: Aug 26 2016, 02:00:23
<!--NeedCopy-->
```

If the T1000 has not shipped with the appropriate build revision, contact the NetScaler Customer Support.

> **Important**
>
> Both the appliances should have the same software image.

SSH Client

A NetScaler appliance can be configured by using either the CLI or the HTML5 GUI. However, this section provides only CLI-based instructions.

While the CLI is accessible through the NetScaler serial console, an SSH client is normally recommended to allow for remote NetScaler configuration.

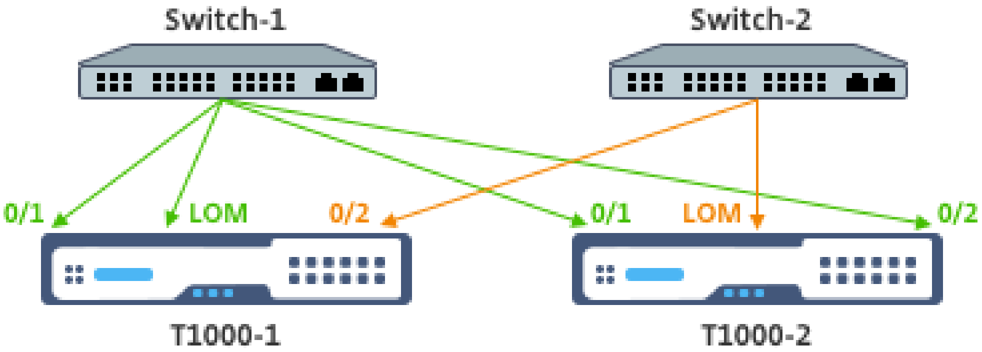
Management Network

September 21, 2020

Connectivity

Most NetScaler devices offer redundant 1GbE OAM ports, notated as 0/1 and 0/2. To provide for redundancy in case of a switch failure, you should connect the relevant ports to different upstream switches.

A high-level overview of the recommended connectivity is outlined in the following diagram:



After the NetScaler appliance is connected to the management network, subsequent configuration steps can be performed remotely using SSH or web connectivity to the CLI and GUI respectively.

Routing

The add route command may be used to configure any routes appropriate to the management network. The relevant gateway should be reachable on the NSIP subnet, as shown below.

Example:

```
add route <network>  <netmask>  <gateway>
<!--NeedCopy-->
```

Licensing

September 21, 2020

A valid license file should be installed on the NetScaler appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.

License files should be copied through an SCP client to the /nsconfig/license of the appliance, as shown in the screen capture below.

EXample:

```
shell ls /nsconfig/license/

CNS_V3000_SERVER_PLT_Retail.lic ssl
<!--NeedCopy-->
```

Do a warm restart to apply the new license, as shown in the screen capture below.

EXample:

```
reboot -warm

Are you sure you want to restart NetScaler (Y/N)? [N]:y

Done
<!--NeedCopy-->
```

After the restart completes, verify that the license has been properly applied, by using the show license CLI.

In the example below a 3Gbps Platinum license has been successfully installed.

EXample:

```
> show license

             License status:

                                     Web Logging: YES

                                               ...

                                 Model Number ID: 3000

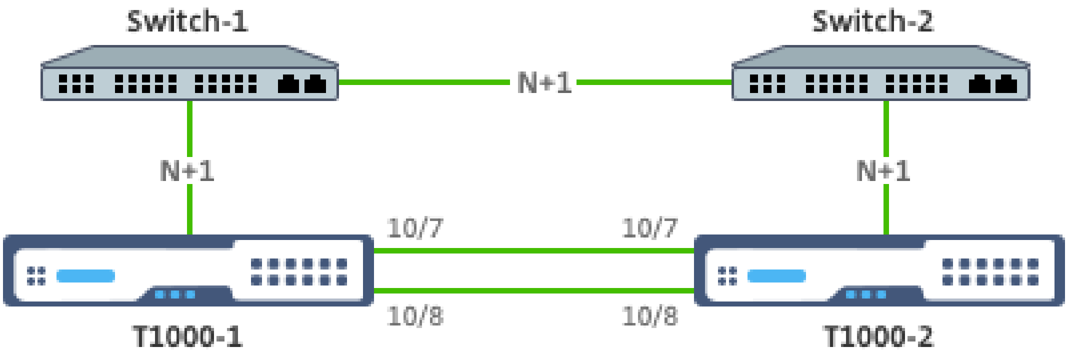
High Availability

September 21, 2020

High availability (HA) refers to an active-standby operational mode of a NetScaler device pair. Each device has its own dedicated management IP address. All other IP addresses are owned by the active device in the pair.

Connectivity

While there are multiple connectivity options for aNetScaler HA pair, the most recommended one is depicted in the following diagram:



Switch-1
Switch-2
N+1
N+1
N+1
10/7
10/7
10/8
10/8
T1000-1
T1000-2

In the above diagram, the N+1 red links between each T1000 and the respective switch imply N+1 redundancy - as explained in Connectivity. For instance, considering a 45 Gbps Gi-LAN N=5 is an appropriate value, with 6x10GbE LACP channels between each switch and the respective T1000 as well as between the two switches.

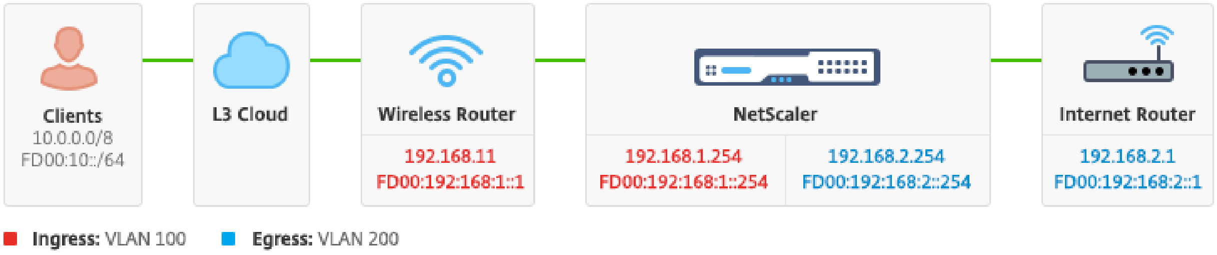
An extra pair of links is recommended between the NetScaler pair, to provide for HA communication isolation from the OAM network.

Gi-LAN Integration

September 21, 2020

Typically, a NetScaler appliance is inserted as a separate L3 inline node in the Gi-LAN, similarly to an L3 router.

Figure: A simple depiction of a Gi-LAN



Clients
10.0.0.0/8
FD00:10::/64

FD00:192:168:2::254
Internet Router
192.168.2.1
FD00:192:168:2::1
Ingress: VLAN 100
Egress: VLAN 200

Connectivity

A physical NetScaler connectivity to upstream switches is recommended to provide for sufficient redundancy. For example, assuming that a NetScaler appliance is inserted in a Gi-LAN that is handling a total (uplink+downlink) of 24Gbps, connectivity with 4x10GbE or more interfaces is recommended. This effectively provides for N+1 redundancy in case of a link failure.

The relevant ports on the upstream switch should be configured for LACP port aggregation. The relevant configuration on NetScaler is outlined below:

Connectivity Configuration:

```
set interface 10/1 - tagall ON - lacpMode ACTIVE - lacpKey 1

set interface 10/2 - tagall ON - lacpMode ACTIVE - lacpKey 1

set interface 10/3 - tagall ON - lacpMode ACTIVE - lacpKey 1

set interface 10/4 - tagall ON - lacpMode ACTIVE - lacpKey 1
<!--NeedCopy-->
```

You can verify the appropriate functionality of LACP using the “show interface” command:

show interface:

sh interface LA/1

```
    1)      Interface LA/1 (802.3ad Link Aggregate) #39

            flags=0x4100c020 <ENABLED, UP, AGGREGATE, UP, HAMON, 802.1q>

            MTU=1500, native vlan=1, MAC=02:e0:ed:33:88:b0, uptime 340h11m56s

            Requested: media NONE, speed AUTO, duplex NONE, fctl NONE,

            throughput 0

            Actual: throughput 4000

            LLDP Mode: NONE,

            RX: Pkts(918446) Bytes(110087414) Errs(0) Drops(795989) Stalls(0)

```

```
              TX: Pkts(124113) Bytes(15255532) Errs(0) Drops(0) Stalls
         (0)

              NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0)
         Muted(0)

              Bandwidth thresholds are not set.

<!--NeedCopy-->
```

Disable the remaining unused interfaces and turn off the monitor.

set interface 10/5 –haMonitor OFF

Command:

```
set interface 10/24  - haMonitor OFF

disable interface 10/5

disable interface 10/24
<!--NeedCopy-->
```

Configuration of physical interfaces is not shared across the two NetScaler units. Hence, the above commands must be run across both NetScaler nodes in case of an HA pair deployment.

HA Configuration

All other configuration parameters are shared between the NetScaler nodes of an HA pair. Hence, HA sync should be enabled prior to any other configuration commands being run. Basic HA configuration involves the following steps:

1. Using the exact same NetScaler hardware, software, and license: HA pairs are not supported between different models (i.e. a T1100 and an MPX21550) or same models with different firmware levels. Refer to the appropriate instructions on upgrading an existing HA pair - Upgrading to Release 11.1.

2. Establishing the HA pair.

Example:

```
netscaler-1> add HA node 1 <netscaler-2-NSIP>

netscaler-2> add HA node 1 <netscaler-1-NSIP>
<!--NeedCopy-->
```

3. Verify the HA pair establishment running the following command in either node; both nodes should be visible, one of them as Primary (active), the other as a Secondary (standby).

Example:

"'show HA node

```
4\. Enable failsafe mode and maxFlips. This ensures that in case of a
   route monitor failure on both nodes at least one node remains active
    without active/standby status constantly switching.

**Example:**
```

set HA node –failsafe ON

set HA node -maxFlips 3 -maxFlipTime 1200

```
5\. Finally, enable HA sync to occur over the dedicated intra-NetScaler
    ports rather than the OAM network.

**Example:**
```

add vlan 4080 -aliasName syncVlan

set HA node -syncvlan 4080

```
> **Note**
>
> The VLAN 4080 in the commands in the above example shouldn' t be
   taken literally. Any unused VLAN-ID might be reserved.

## VLAN Configuration

After the physical interfaces have been appropriately configured, you
   might configure the appropriate Gi-LAN VLANs. For instance, consider
    a rather simple Gi-LAN environment with an ingress/egress VLAN pair
    with 100/101 VLAN-identifier respectively.

The following commands configure the relevant VLANs on top of the LACP
   channel created in the prior step.
```

add vlan 100
add vlan 101
bind vlan 100 –ifnum LA/1 –tagged
bind vlan 101 –ifnum LA/1 –tagged

```
## IPv4 Configuration
```

```

Typically, a NetScaler appliance requires one SNIP per VLAN. The example below assumes that the networks outlined in the Gi-LAN integration diagram, given in the begining of this page, have a /24 subnet mask:
```

add ns ip 192.168.1.254 255.255.255.0 –vserver DISABLED –mgmtAccess DISABLED
add ns ip 192.168.2.254 255.255.255.0 –vserver DISABLED –mgmtAccess DISABLED

```
After the SNIPs have been configured they should be associated with the appropriate VLAN:
```

bind vlan 100 –IPAddress 192.168.1.254 255.255.255.0
bind vlan 101 –IPAddress 192.168.2.254 255.255.255.0

```
## IPv4 Static Routing

The example outlined in the [Management Network](/en-us/netscaler/11-1/netscaler-support-for-telecom-service-providers/NS_TCP_optimization/NS_TCP_opt_mgmt_network.html) section calls for only a couple of static routing rules:

-  A 10.0.0.0/8 static route to the clients through the ingress router
-  A default route to the internet through the egress router

**Example:**
```

add route 0.0.0.0 0.0.0.0 192.168.2.1
add route 10.0.0.0 255.0.0.0 192.168.1.1

```
## IPv4 Policy-Based (VLAN - VLAN) routing

A NetScaler appliance allows for policy-based routing instead of static routing, with routing decisions usually keyed against the incoming interface and/or VLAN rather than destination IP. Policy-based routing is either a convenient alternative, in case the client source IP address range is subject to periodic changes, or a mandatory consideration, in case a packet’ s destination IP address is not sufficient by itself to reach a routing decision (i.e. in case of overlapping client IP addresses across multiple VLANs).

**Example:**
```

add ns pbr fromWirelessToInternet ALLOW –nextHop 192.168.2.1 –vlan 100 –priority 10

Done

add ns pbr fromInternetToWireless ALLOW –nextHop 192.168.1.1 –vlan 200 –priority 20

Done

apply ns pbrs

```
## IPv6 Configuration

The following commands assign IPv6 SNIP per vlan. The example below
    assumes that the networks outlined in the Figure: A simple depiction
     of a Gi-LAN in this page have a /64 subnet mask:

**Command:**
```

add ns ip6 fd00:192:168:1::254/64 -vServer DISABLED –mgmtAccess DISABLED
add ns ip6 fd00:192:168:2::254/64 -vServer DISABLED –mgmtAccess DISABLED
bind vlan 100 -IPAddress fd00:192:168:1::254/64
bind vlan 200 -IPAddress fd00:192:168:2::254/64

```
## IPv6 Routing

After  IPv6 addressing is complete, IPv6 static routing might be
    configured:

-  A fd00:10::/64 static route to the clients via the ingress router
-  A default route to the internet via the egress router

**Example:**
```

add route6 fd00:10::/64 fd00:192:168:1::1
add route6 ::/0 fd00:192:168:2::1

```
Or using policy-based routing:

**Example:**
```

add ns pbr6 fromWirelessToInternetv6 ALLOW -vlan 100 -priority 10 -nextHop fd00:192:168:2::1

add ns pbr6 fromInternetToWirelessv6 ALLOW -vlan 200 -priority 20 -nextHop fd00:192:168:1::1

apply ns pbr6

```
## LACP Redundancy and Failover

```

```
In case of an HA configuration, it’ s recommended to leverage the throughput option to configure a low threshold for the LACP channel. For instance, consider a 25Gbps Gi-LAN and a 4x10GbE channel between each NetScaler appliance in the HA pair and the upstream switch to provide N+1 link redundancy:

**Example:**
```

set interface LA/1 –haMonitor ON –throughput 29000

```
In case of a double-link failure between the primary appliance and the upstream switch the maximum Gi-LAN throughput that can be supported would fall to 20Gbps. A 29Gbps low threshold per the example above would result in a redundancy switchover event to the secondary appliance (which has not suffered similar link failures) so that Gi-LAN traffic is not affected.

## Route Monitors

In addition to LACP redundancy, route monitor checks might be configured and associated with the HA pair configuration. Route monitor checks can be useful to detect failures between the NetScaler appliance and the next-hop routers, especially if said routers are not directly connected but through an upstream switch.

A typical HA route monitor configuration per the sample Gi-LAN in section 2.5.1 is outlined below:
```

add route 192.168.1.0 255.255.255.0 192.168.1.1 -msr ENABLED -monitor arp
add route 192.168.2.0 255.255.255.0 192.168.2.1 -msr ENABLED -monitor arp
bind HA node -routeMonitor 192.168.1.0 255.255.255.0
bind HA node -routeMonitor 192.168.2.0 255.255.255.0
‘‘‘

TCP optimization configuration

September 21, 2020

Before configuring TCP optimization, apply the following basic configuration settings on the NetScaler appliance:

Initial configuration:

```
enable ns feature LB IPv6PT
enable ns mode FR L3 USIP MBF Edge USNIP PMTUD
disable ns feature SP
disable ns mode TCPB
set lb parameter -preferDirectRoute NO
set lb parameter -vServerSpecificMac ENABLED
set l4param -l2ConnMethod Vlan
set rsskeytype -rsstype SYMMETRIC
set ns param -useproxyport DISABLED
<!--NeedCopy-->
```

> **Note**
>
> Restart the NetScaler appliance if you change the `rsskeytype` system parameter.

TCP termination

For NetScaler T1 to apply TCP optimization it needs to first terminate incoming TCP traffic. Towards this end, a wildcard TCP vserver should be created and configured to intercept ingress traffic and then forward it to the Internet router.

Static or dynamic routing environment

For environments with static or dynamic routing in place, vserver can rely on routing table info to forward packets towards internet router. Default route must point to the internet router and also routing entries for client subnets towards wireless router should be in place:

Example:

```
add lb vserver vsrv-wireless TCP * * -persistenceType NONE -
   Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER(\"vsrv-wireless
   \").STATE.EQ(UP)" -m IP -cltTimeout 9000
add route 0.0.0.0 0.0.0.0 192.168.2.1
add route 10.0.0.0 255.0.0.0 192.168.1.1
<!--NeedCopy-->
```

VLAN-to-VLAN (PBR) environment

There are customer environments where subscriber traffic is segmented to multiple flows and needs to be forwarded to different routers based on incoming traffic parameters. Policy Based Routing (PBR) can be used to route packets based on incoming packet parameters, such as VLAN, MAC address, Interface, source IP, source port, destination IP address, and destination port.

add ns pbr pbr-vlan100-to-vlan200 ALLOW -vlan 100 -nexthop 172.16.200.1

add ns pbr pbr-vlan101-to-vlan201 ALLOW -vlan 101 -nexthop 172.16.201.1

add ns pbr pbr-vlan102-to-vlan202 ALLOW -vlan 102 -nexthop 172.16.202.1
<!--NeedCopy-->
```

Using Policy Based Routing to route TCP optimized traffic is a new feature added in release 11.1 50.10. For previous releases, having multiple "mode MAC" vserver entities per VLAN is an alternative solution for multi-VLAN environments. Each vserver has a bound service representing the internet router for the particular flow.

Example:

```
add server internet_router_1 172.16.200.1

add server internet_router_2 172.16.201.1

add server internet_router_3 172.16.202.1

add service svc-internet-1 internet_router_1 TCP * -usip YES -useproxyport NO

add service svc-internet-2 internet_router_2 TCP * -usip YES -useproxyport NO

add service svc-internet-3 internet_router_3 TCP * -usip YES -useproxyport NO

```

```
bind service svc-internet-1 -monitorName arp

bind service svc-internet-2 -monitorName arp

bind service svc-internet-3 -monitorName arp

add lb vserver vsrv-wireless-1 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER(\"vsrv-wireless-1\").STATE.EQ(UP)" -m MAC -l2Conn ON

add lb vserver vsrv-wireless-2 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(101) && SYS.VSERVER(\"vsrv-wireless-2\").STATE.EQ(UP)" -m MAC -l2Conn ON

add lb vserver vsrv-wireless-3 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(102) && SYS.VSERVER(\"vsrv-wireless-3\").STATE.EQ(UP)" -m MAC -l2Conn ON

bind lb vserver vsrv-wireless-1 svc-internet-1

bind lb vserver vsrv-wireless-2 svc-internet-2

bind lb vserver vsrv-wireless-3 svc-internet-3
<!--NeedCopy-->
```

> **Note**
>
> The vserver mode is MAC in contrast to previous examples where it is mode IP. This is required to retain the destination IP information when we have service(s) bound to vserver. Also, the additional PBR configuration need to route non-optimized traffic.

TCP Optimization

Out-of-the-box NetScaler TCP termination is configured for TCP pass-through functionality. TCP pass-through essentially means that NetScaler T1 may transparently intercept a client-server TCP stream but does not retain separate client/server buffers or otherwise apply any optimization techniques.

To enable TCP optimization a TCP profile, named as nstcpprofile, is used to specify TCP configurations that is used if no TCP configurations are provided at the service or virtual server level and it should be modified as follows:

Command:

```
add ns tcpProfile nstcpprofile -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
```

```
bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT
<!--NeedCopy-->
```

> **Note:**
>
> If there is not any profile explicitly created and bound to vserver and service, the profile nstcp_default_profile is bound by default.
>
> In case of multiple TCP profiles requirement, extra TCP profiles can be created and associated with the appropriate virtual server

Command:

```
add ns tcpProfile custom_profile -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT

set lb vserver vsrv-wireless -tcpProfileName custom_profile
<!--NeedCopy-->
```

> **Note:**
>
> For deployments with vserver -m MAC and service, same profile should be associated with service.

```
set service svc-internet -tcpProfileName custom_profile
<!--NeedCopy-->
```

TCP optimization capabilities

Most of the relevant TCP optimization capabilities of a NetScaler appliance are exposed through a corresponding TCP profile. Typical CLI parameters that should be considered when creating a TCP profile are the following:

1. **Window Scaling (WS)**: TCP Window scaling allows increasing the TCP receive window size beyond 65535 bytes. It helps improving TCP performance overall and specially in high bandwidth and long delay networks. It helps with reducing latency and improving response time over TCP.
2. **Selective acknowledgment (SACK)**: TCP SACK addresses the problem of multiple packet loss which reduces the overall throughput capacity. With selective acknowledgement the receiver

can inform the sender about all the segments which are received successfully, enabling sender to only retransmit the segments which were lost. This technique helps T1 improve overall throughput and reduce the connection latency.

3. **Window Scaling Factor (WSVal)**: Factor used to calculate the new window size. It must be configured with a high value in order to allow the advertised window by NS to be at least equal to the buffer size.
4. **Maximum Segment Size (MSS)**: MSS of a single TCP segment. This value depends on the MTU setting on intermediate routers and end clients. A value of 1460 corresponds to an MTU of 1500.
5. **maxBurst**: Maximum number of TCP segments allowed in a burst.
6. **Initial Congestion Window size(initialCwnd)**: TCP initial congestion window size determines the number of bytes which can be outstanding in beginning of the transaction. It enables T1 to send those many bytes without bothering for congestion on the wire.
7. **Maximum OOO packet queue size(oooQSize)**: TCP maintains Out Of Order queue to keep the OOO packets in the TCP communication. This setting impacts system memory if the queue size is long as the packets need to be kept in runtime memory. Thus this needs to be kept at optimized level based on the kind of network and application characteristics.
8. **Minimum RTO(minRTO)**: The TCP retransmission timeout is calculated on each received ACK based on internal implementation logic. The default retransmission timeout happens at 1 second to start with and this can be tweaked with this setting. For second retransmission of these packets RTO will be calculated by N*2 and then N*4 … N*8… goes on till last retransmission attempt.
9. **bufferSize / sendBuffsize**: these refer to the maximum amount of data that the T1 may receive from the server and buffer internally without sending to the client. They should be set to a value larger (at least double) than the Bandwidth Delay Product of the underlying transmission channel.
10. **flavor**: this refers to the TCP congestion control algorithm. Valid values are Default, BIC, CUBIC, Westwood and Nile.
11. **Dynamic receive buffering**: allows the receive buffer to be adjusted dynamically based on memory and network conditions. It will fill up the buffer as much as it's required to keep the client's download pipe full instead of filling up, by reading ahead from server, a fixed size buffer, as latter is specified in TCP profile and typically based on criteria such as 2*BDP, for a connection. NetScaler T1 monitors the network conditions to the client and estimates how much it should read ahead from the server.
12. **Keep-Alive (KA)**: Send periodic TCP keep-alive (KA) probes to check if peer is still up.
13. rstWindowAttenuate: Defending TCP against spoofing attacks. It will reply with corrective ACK when a sequence number is invalid.
14. **rstMaxAck**: Enable or disable acceptance of RST that is out of window yet echoes highest ACK sequence number.
15. **spoofSynDrop**: Drop of invalid SYN packets to protect against spoofing.

16. **Explicit Congestion Notification(ecn)**: It sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption.
17. **Forward RTO-Recovery**: In case of spurious retransmissions, the congestion control configurations are reverted to their original state.
18. **TCP maximum congestion window (maxcwnd)**: TCP maximum congestion window size that is user configurable.
19. **Forward acknowledgment (FACK)**: To avoid TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either T1 or a client) control the amount of data injected into the network during retransmission timeouts.
20. **tcpmode**: TCP optimization modes for specific profile.
21. **tcpmode**: TCP optimization modes for specific profile. There are two TCP optimization modes - Transparent and Endpoint.

- Endpoint. In this mode, the appliance manages the client and server connections seperately.
- Transparent. In the transparent mode the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance.

Analytics and Reporting

September 21, 2020

The TCP Speed Reporting is a NetScaler feature which extracts TCP connection statistics, as a measure of TCP download and upload performance, and is utilized in TCP Insight reports of the Citrix Application Delivery Management (ADM). To achieve this, NetScaler monitors each TCP connection, locates packet bursts on an idle time-out basis and reports key metrics (such as byte count, retransmitted byte count and duration) for the identified maximum burst. TCP Speed Reporting feature is enabled by default, support both TCP and HTTP vServers and depends on the Appflow/ULFD reporting infrastructure.

Real-time Statistics

September 21, 2020

The stat command might be used to verify that TCP optimization is properly applied:

Command:

```
> stat lb vserver vsrv-wireless

The Total counters should constantly increase for an operational system. In addition, the Rate counters should be non-zero.

> **Note**
>
> The preceding output is from an operational yet idle lab system, explaining the zero rate.

SNMP

September 21, 2020

SNMP agent can be queried for system specific information from a remote device (SNMP Manager). Based on the query, the agent searches for the equal object identifier (OID) in the management information base (MIB) for the data requested and sends the information to the SNMP Manager. The following are the most useful SNMP OIDs for Telco deployments:

Memory

- **resMemUsage (1.3.6.1.4.1.5951.4.1.1.41.2)**

Percentage of memory utilization on NetScaler.

Packet Engine CPU

- **resCpuUsage (1.3.6.1.4.1.5951.4.1.1.41.1)**

CPU utilization percentage.

- **nsCPUTable (1.3.6.1.4.1.5951.4.1.1.41.6)**

This table contains information about each CPU in NetScaler.

Indexed on: nsCPUname

- **nsCPUname (1.3.6.1.4.1.5951.4.1.1.41.6.1.1)**

The name of the CPU.

- **nsCPUusage (1.3.6.1.4.1.5951.4.1.1.41.6.1.2)**

CPU utilization percentage.

Throughput

- **allNicTotRxMbits (1.3.6.1.4.1.5951.4.1.1.71.1)**

Number of megabits received by the NetScaler appliance.

- **allNicTotTxMbits (1.3.6.1.4.1.5951.4.1.1.71.2)**

Number of megabits transmitted by the NetScaler appliance.

- **ipTotRxPkts (1.3.6.1.4.1.5951.4.1.1.43.25)**

IP packets received.

- **ipTotRxMbits (1.3.6.1.4.1.5951.4.1.1.43.27)**

Megabits of IP data received.

- **ipTotTxPkts (1.3.6.1.4.1.5951.4.1.1.43.28)**

IP packets transmitted.

- **ipTotTxMbits (1.3.6.1.4.1.5951.4.1.1.43.30)**

Megabits of IP data transmitted.

Connections

Active connections:

- **tcpActiveServerConn (1.3.6.1.4.1.5951.4.1.1.46.8)**

Connections to a server currently responding to requests.

Total connections:

- **tcpCurServerConn (1.3.6.1.4.1.5951.4.1.1.46.1)**

Server connections, including connections in the Opening, Established, and Closing state.

- **tcpCurClientConn (1.3.6.1.4.1.5951.4.1.1.46.2)**

Client connections, including connections in the Opening, Established, and Closing state.

Note: Because of SYN-Cookie, this doesn’t include Client in Opening state

- **tcpTotZombieCltConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.26)**

Client connections that are flushed because the client has been idle for some time.

- **tcpTotZombieSvrConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.27)**

Server connections that are flushed because there have been no client requests in the queue for some time.

Errors

- **tcpErrSynGiveUp (1.3.6.1.4.1.5951.4.1.1.46.37)**

Attempts to establish a connection on the NetScaler that timed out.

- **tcpErrRetransmitGiveUp (1.3.6.1.4.1.5951.4.1.1.46.60)**

Number of times NetScaler terminates a connection after retransmitting the packet seven times on that connection.Retrasnmission happens when recieving end doesn’t acknowledges the packet.

- **ifInDiscards (1.3.6.1.2.1.2.2.1.13)**

The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.

- **ifOutDiscards (1.3.6.1.2.1.2.2.1.19)**

The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.

- **ifErrTxOverflow (1.3.6.1.4.1.5951.4.1.1.54.1.36)**

Number of packets that have passed through the overflow queues, during transmission on the specified interface, since the NetScaler appliance was started or the interface statistics were cleared. This gets incremented only on congested ports.

Optimized/Bypass connections

- **tcpOptimizationEnabled (1.3.6.1.4.1.5951.4.1.1.46.131)**

Total number of connections enabled with TCP optimization.

- **tcpOptimizationBypassed (1.3.6.1.4.1.5951.4.1.1.46.132)**

Total number of connections bypassed TCP Optimization.

Technical Recipes

September 21, 2020

The NetScaler T1 models provide advanced features and a powerful policy configuration language that allow for evaluation of complex decision in runtime.

While it is not possible to evaluate all capabilities that are potentially unlocked by the T1000 features and policy configuration guide, technical receipes consider implementation of various requirements brought in by Telco operators. Feel free to re-use the "recipes" as is or adapt to your environment.

Per-user Connection Limit

The NetScaler T1 model can be configured to limit the number of connections per unique subscriber IP. With the below configuration, N concurrent TCP connections per IP (CLIENT.IP.SRC) is allowed. For every attempt for connection beyond the configured threshold, T1 sends an RST. For maximum 2 concurrent connections per user:

Command:

```
add stream selector streamSel_usrlimit CLIENT.IP.SRC
add ns limitIdentifier limitId_usrlimit -threshold 2 -mode CONNECTION -
    selectorName streamSel_usrlimit
add responder policy respPol_usrlimit "SYS.CHECK_LIMIT(\"
    limitId_usrlimit\")" RESET
bind lb vserver vsrv-wireless -policyName respPol_usrlimit -priority 1
    -gotoPriorityExpression END
<!--NeedCopy-->
```

Smooth Insertion/Deletion of Vserver

Many operators concern about TCP connections disruption when the NetScaler T1 model is activated inline for TCP optimization or when it is disabled for maintenance purposes. To avoid breaking existing connections when vserver is introduced, the following configuration needs to be applied before configuring or activating vserver for TCP optimization:

Command:

```
add ns acl acl-ingress ALLOW  - vlan 100
add forwardingSession fwd-ingress  - aclname acl-ingress
apply ns acls
<!--NeedCopy-->
```

Forwarding sessions are effective on top of routing (either static or dynamic or PBR) and create session entries for traffic that is routed (L3 mode). Any existing connection is handled by forwarding session due to corresponding sessions, and upon vserver introduction it starts capturing only new TCP connections.

ACLs can be configured to capture only specific ports like vserver, in order to avoid creating sessions for unnecessary traffic, which is memory consuming. Another option is to remove specific configuration after vserver activation.

For maintenance purposes, vserver should be disabled and its state appears as OUT OF SERVICE. When this happens, the vserver terminates all connections immediately by default. To make vserver to still serve the existing connections and not accept new, the following configuration should be applied:

Command:

```
set lb vserver vsrv-wireless  - downStateFlush DISABLED
<!--NeedCopy-->
```

New connections go through the routing table, and corresponding session entries are created due to forwarding sessions.

Policy-Based TCP Profiling

Policy-based TCP Profile selection allows operators to configure TCP profile dynamically for clients coming from different traffic domains (i.e. 3G or 4G). Some of the QoS metrics are different for these traffic domains, and in order to achieve better performance, you need to change some of the TCP parameter dynamically. Consider a case where clients coming from 3G and 4G hit same vserver and use same TCP profile, which have negative impact on some client's performance. AppQoE functionality can classify these clients and dynamically change TCP profile on vserver.

Example:

```
enable feature AppQoE

add ns tcpProfile nstcpprofile1 -WS ENABLED -SACK ENABLED -WSVal 8 -mss
     1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
    slowStartIncr 1 -bufferSize 4000000 -flavor BIC -KA ENABLED -
    sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop
```

```
ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -tcpmode
    ENDPOINT

add ns tcpProfile nstcpprofile2 -WS ENABLED -SACK ENABLED -WSVal 8 -mss
     1460 -maxBurst 15 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
    slowStartIncr 1 -bufferSize 128000 -flavor BIC -KA ENABLED -
    sendBuffsize 6000000 -rstWindowAttenuate ENABLED -spoofSynDrop
    ENABLED -frto ENABLED -maxcwnd 64000 -fack ENABLED -tcpmode ENDPOINT

add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1

add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2

add appqoe policy appqoe_4G -rule "CLIENT.VLAN.ID.EQ(100)" -action
    action_1

add appqoe policy appqoe_3G -rule "CLIENT.VLAN.ID.EQ(200)" -action
    action_2

bind lb vserver vsrv-wireless -policyName appqoe_4G -priority 100

bind lb vserver vsrv-wireless -policyName appqoe_3G -priority 110
<!--NeedCopy-->
```

The NetScaler T1 model is capable to receive the subscriber information dynamically through Gx or Radius or Radius and Gx interface and apply different TCP profile on a per-subscriber basis.

Command:

```
add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1

add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2

add appqoe policy appqoe_4G -rule "SUBSCRIBER.RULE_ACTIVE(\"3G\")" -
    action action_1

add appqoe policy appqoe_3G -rule "SUBSCRIBER.RULE_ACTIVE(\"4G\")" -
    action action_2
<!--NeedCopy-->
```

For integration of the NetScaler T1 model with operator control-plane network, see Telco Subscriber Management.

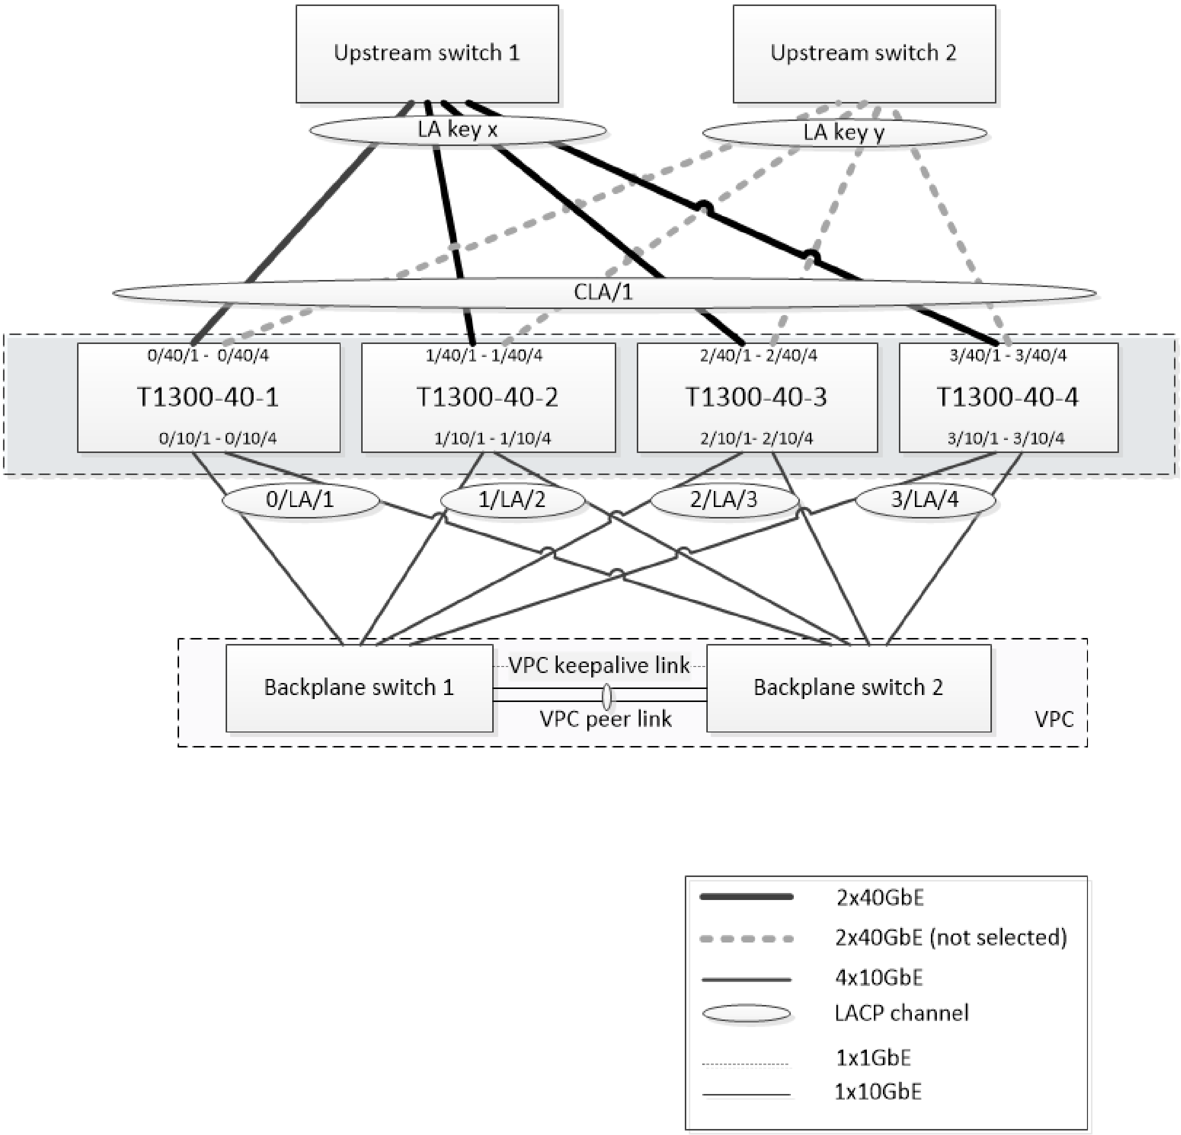
Scalability

September 21, 2020

Because TCP optimization is resource intensive, a single NetScaler appliance, even a high end –appliance, might not be able to sustain high Gi-LAN throughputs. To expand the capacity of your network, you can deploy NetScaler appliances in an N+1 cluster formation. In a cluster deployment, the NetScaler appliances work together as a single system image. The client traffic is distributed across the cluster nodes with the help of external switch device.

Topology

Figure 1 is an example of a cluster consisting of four T1300-40G nodes.



Upstream switch 1
Upstream switch 2
LA key x
LA key y
CLA/1
0/40/1 - 0/40/4
T1300-40-1
0/10/1 - 0/10/4
1/40/1 - 1/40/4
T1300-40-2
1/10/1 - 1/10/4
2/40/1 - 2/40/4
T1300-40-3
2/10/1- 2/10/4
3/40/1 - 3/40/4
T1300-40-4
3/10/1 - 3/10/4
0/LA/1
1/LA/2
2/LA/3
3/LA/4
Backplane switch 1
VPC keepalive link
VPC peer link
Backplane switch 2
VPC
2x40GbE
2x40GbE (not selected)
4x10GbE
LACP channel
1x1GbE
1x10GbE

The setup shown in Figure 1 has the following properties:

1. All cluster nodes belong to the same network (also known as an L2 cluster).
2. Data plane and backplane traffic are handled by different switches.
3. Assuming Gi-LAN throughput is 200 Gbps and that a T1300-40G appliance can sustain 80Gbps of throughput, we need three T1300-40G appliances. To provide redundancy in case of single cluster node failure, we deploy four appliances in total.
4. Each node will receive up to 67Gbps of traffic (50Gbps in normal operating conditions and 67Gbps in case of single cluster node failure), so it needs 2x40Gbps connections to the upstream switch. To provide redundancy in case of switch failure, we deploy a couple of upstream switches and double the number of connections.
5. Cluster Link Aggregation (CLAG) is used to distribute traffic across cluster nodes. A single CLAG handles both client and server traffic. Link Redundancy is enabled on the CLAG, so only one "subchannel" is selected at any given time and handles the traffic. If some link fails or throughput falls below specified threshold, the other subchannel is selected.
6. The upstream switch performs symmetric port-channel load balancing (for example, source-dest-ip-only algorithm of Cisco IOS 7.0(8) N1(1)) so that forward and reverse traffic flows are handled by the same cluster node. This property is desirable because it eliminates packet re-ordering, which would degrade TCP performance.
7. Fifty percent of data traffic is expected to be steered to backplane, which means each node will steer up to 34Gbps to other cluster nodes (25Gbps in normal operating conditions and 34Gbps in case of single cluster node failure). Thus, each node needs at least 4x10G connections to the backplane switch. To provide redundancy in case of switch failure, we deploy a couple of backplane switches and double the number of connections. Link redundancy is not currently supported for backplane, so Cisco VPC or equivalent technology is desired to achieve switch-level redundancy.
8. MTU size of steered packets is 1578 bytes, so backplane switches must support an MTU more than 1500 bytes.

Note: The design depicted in Figure 1 is also applicable to T1120 and T1310 appliances. For T1310 we would use 40GbE interfaces for the backplane connections, since it lacks 10GbE ports.

Note: While this document uses Cisco VPC as an example, if working with non-Cisco switches alternate equivalent solutions could be used, such as Juniper's MLAG.

Note: While other topologies such as ECMP instead of CLAG are possible, they are not currently supported for this particular use case.

Configuring TCP Optimization in a NetScaler T1000 Cluster

After physical installation, physical connectivity, software installation, and licensing are completed, you can proceed with the actual cluster configuration. The configurations described below apply to the cluster depicted in Figure 1.

Note: For more information about cluster configuration, see "Setting up a NetScaler cluster."

Assume that the four T1300 nodes in Figure 1 have the following NSIP addresses:

Four T1300 nodes with NSIP address:

```
T1300-40-1: 10.102.29.60
T1300-40-2: 10.102.29.70
T1300-40-3: 10.102.29.80
T1300-40-4: 10.102.29.90
```

The cluster will be managed through the cluster IP (CLIP) address, which is assumed to be 10.78.16.61.

Setting Up the Cluster

To begin configuring the cluster shown in Figure 1, log on to the first appliance that you want to add to the cluster (for example, T1300-40-1) and do the following.

1. At the command prompt, enter the following commands:

Command:

```
> add cluster instance 1
> add cluster node 0 10.102.29.60 -state ACTIVE
> add ns ip 10.102.29.61 255.255.255.255 -type clip
> enable cluster instance 1
> save ns config
> reboot  - warm
```

2. After the appliance restarts, connect to the Cluster IP (CLIP) address and add the rest of the nodes to the cluster:

Command:

```
> add cluster node 1 10.102.29.70 -state ACTIVE
> add cluster node 2 10.102.29.80 -state ACTIVE
> add cluster node 3 10.102.29.90  - state ACTIVE
> save ns config
```

3. Connect to the NSIP address of each of the newly added nodes and join the cluster:

Command:

```
> join cluster -clip 10.102.29.61 -password nsroot
> save ns config
> reboot  - warm
```

4. After the nodes restart, proceed with backplane configuration. On the cluster IP address, enter the following commands to create an LACP channel for the backplane link of each cluster node:

Command:

```
> set interface 0/10/[1-8]  - lacpkey 1  - lacpmode ACTIVE
> set interface 1/10/[1-8]  - lacpkey 2  - lacpmode ACTIVE
> set interface 2/10/[1-8]  - lacpkey 3  - lacpmode ACTIVE
> set interface 3/10/[1-8]  - lacpkey 4  - lacpmode ACTIVE
```

5. Similarly, configure dynamic LA and VPC on the backplane switches. Make sure the MTU of the backplane switch interfaces is at least 1578 bytes.

6. Verify the channels are operational:

Command:

```
> show channel 0/LA/1
> show channel 1/LA/2
> show channel 2/LA/3
> show channel 3/LA/4
```

7. Configure the cluster node backplane interfaces.

Command:

```
> set cluster node 0 -backplane 0/LA/1
> set cluster node 1 -backplane 1/LA/2
> set cluster node 2 -backplane 2/LA/3
> set cluster node 3  - backplane 3/LA/4
```

8. Check the cluster status and verify that the cluster is operational:

```
> show cluster instance
> show cluster node
```

For more information on cluster setup, see "Setting up aNetScaler cluster"

Distributing Traffic Across Cluster Nodes

After you have formed theNetScaler cluster, deploy Cluster Link Aggregation (CLAG) to distribute traffic across cluster nodes. A single CLAG link will handle both client and server traffic.

On the cluster IP address, execute the following commands to create the Cluster Link Aggregation (CLAG) group shown in Figure 1:

Command:

```
> set interface 0/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
> set interface 1/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
> set interface 2/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
> set interface 3/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
```

Configure dynamic link aggregation on the external switches.

Then, enable Link Redundancy as follows:

Code:

```
> set channel CLA/1 -linkRedundancy ON -lrMinThroughput 240000
```

Finally, check the channel status by entering:

Command:

```
> show channel CLA/1
```

The channel should be UP and the actual throughput should be 320000.

For more information about cluster link aggregation, see the following topics:

- Dynamic Cluster Link Aggregation
- Link Redundancy in a Cluster with LACP.

Because we will be using MAC-based forwarding (MBF), configure a linkset and bind it to the CLAG group as follows:

Command:

```
> add linkset LS/1
> bind linkset LS/1 -ifnum CLA/1
```

More information about linksets, see the following topics:

- Configuring Linksets
- Using Cluster LA Channel with Linksets

Configuring VLAN and IP Addresses

We will be using striped IP configuration, which means that IP addresses are active on all nodes (default setting). See "Striped, Partially Striped, and Spotted Configurations" for more information about this topic.

1. Add the ingress and egress SNIPs:

Command:

```
> add ns ip 172.16.30.254 255.255.255.0  - type SNIP
> add ns ip 172.16.31.254 255.255.255.0  - type SNIP
> add ns ip6 fd00:172:16:30::254/112  - type SNIP
> add ns ip6 fd00:172:16:31::254/112  - type SNIP
```

2. Add the corresponding ingress and egress VLANs:

Command:

```
> add vlan 30 -aliasName wireless
> add vlan 31 -aliasName internet
```

3. Bind VLANs with IPs and linkset:

Command:

```
> bind vlan 31 -ifnum LS/1 -tagged
> bind vlan 30 -ifnum LS/1 -tagged
> bind vlan 30 -IPAddress 172.16.30.254 255.255.255.0
> bind vlan 31 -IPAddress 172.16.31.254 255.255.255.0
> bind vlan 30 -IPAddress fd00:172:16:30::254/112
> bind vlan 31 -IPAddress fd00:172:16:31::254/112
```

More ingress and egress VLANs can be added if needed.

Configuring TCP Optimization

At this point, we have applied all cluster specific commands. To complete the configuration, follow the steps described in TCP optimization configuration".

Configuring Dynamic Routing

A NetScaler cluster can be integrated into the dynamic routing environment of the customer's network. Following is an example of dynamic routing configuration using BGP routing protocol (OSPF is also supported).

1. From the CLIP address, enable BGP and dynamic routing on ingress and egress IP addresses:

Command:

```
> enable ns feature bgp
> set ns ip 172.16.30.254  - dynamicRouting ENABLED
> set ns ip 172.16.31.254  - dynamicRouting ENABLED
```

2. Open vtysh and configure BGP for the egress side:

Code:

```
> shell
root@ns# vtysh
ns# configure terminal
ns(config)# router bgp 65531
ns(config-router)# network 10.0.0.0/24
ns(config-router)# neighbor 172.16.31.100 remote-as 65530
ns(config-router)# neighbor 172.16.31.100 update-source 172.16.31.254
ns(config-router)# exit
ns(config)# ns route-install propagate
ns(config)# ns route-install default
ns(config)# ns route-install bgp
ns(config)# exit
```

3. Configure the egress-side BGP peer to advertise the default route to the NetScaler cluster. For example:

Command:

```
router bgp 65530
 bgp router-id 172.16.31.100
 network 0.0.0.0/0
 neighbor 172.16.31.254 remote-as 65531
```

4. Follow similar steps to configure the ingress side.

5. From vtysh verify that configuration is propagated to all cluster nodes, by entering:

Command:

```
ns# show running-config
```

6. Finally, log on to NSIP address of each cluster node and verify routes advertised from BGP peer:

Command:

```
> show route | grep BGP
```

Optimizing TCP Performance using TCP Nile

September 21, 2020

TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

Congestion Control Strategies

The Transmission Control Protocol (TCP) has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

NILE Algorithm

Citrix Systems has developed a new congestion-control algorithm, NILE, a TCP optimization algorithm designed for high-speed networks such as LTE, LTE advanced and 3G. Nile addresses unique challenges caused by fading, random or congestive losses, link layer retransmissions and carrier aggregation.

The NILE algorithm:

- Bases queue-latency estimates on round-trip time measurements.
- Uses a congestion-window-increase function that is inversely proportional to the measured queue latency. This method results in approaching the network congestion point more slowly than does the standard TCP method, and reduces the packet losses during congestion.
- Can distinguish between random loss and congestion based loss on the network by using the estimated queue latency.

The telecom service providers can use the NILE algorithm in their TCP infrastructure to:

- Optimize mobile and long-distance networks— The NILE algorithm achieves higher throughput compared to standard TCP. This feature is especially important for mobile and long-distance networks.
- Decrease application perceived latency and enhance subscriber experience— The Nile algorithm uses packet loss information to determine whether the transmission-window size should be increased or decreased, and uses queuing delay information to determine the size of the increment or decrement. This dynamic setting of transmission-window size decreases the application latency on the network.

To configure NILE support using the command line interface

At the command prompt, type the following:

```
set ns tcpProfile <name> [-flavor NILE]
```

```
<!--NeedCopy-->
```

Configuring NILE support using the configuration utility

1. Navigate to **System**> **Profiles**> **TCP Profiles** and click **TCP profiles**.
2. From the **TCP Flavor** drop-down list, select **NILE**.

Example:

```
set ns tcpProfile tcpprofile1 -flavor NILE
<!--NeedCopy-->
```

Proportional Rate Recovery (PRR) Algorithm

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

TCP Fast Open (TFO)

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP's initial handshake. This feature is available as a TCP option in the TCP profile bound to a virtual server of a NetScaler appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the NetScaler appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using the TFO mechanism, you can reduce an application's network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

How TFO works

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the NetScaler appliance can include data in the SYN-ACK segment even though it has not received the final ACK segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a backend server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.

1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the NetScaler appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client's IP address under a secret key) and responds to the client with a SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.
3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The NetScaler appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with a SYN-ACK, TFO Cookie, and HTTP Response.

Note: If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the NetScaler appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the backend server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.
5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same backend server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the backend server.
6. The backend server acknowledges the event with both data and a SYN.

Note: If the server acknowledges the event with only a SYN segment, the NetScaler appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.

Configuring TCP Fast Open

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

To enable or disable TFO by using the command line

At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

Note: The default value is DISABLED.

```
add tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
set tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
unset tcpprofile <TCP Profile Name> - tcpFastOpen
<!--NeedCopy-->
```

Examples:

add tcpprofile Profile1 – tcpFastOpen
Set tcpprofile Profile1 – tcpFastOpen Enabled
unset tcpprofile Profile1 – tcpFastOpen

To set TCP Fast Open cookie timeout value by using the command line interface

At the command prompt, type:

```
set tcpparam –tcpfastOpenCookieTimeout <Timeout Value>
<!--NeedCopy-->
```

Example:

```
set tcpprofile –tcpfastOpenCookieTimeout 30secs
<!--NeedCopy-->
```

To configure the TCP Fast Open by using the GUI

1. Navigate to **Configuration** > **System** > **Profiles** > and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **TCP Fast Open** checkbox.
3. Click **OK** and then **Done**.

To Configure the TCP Fast Cookie timeout value by using the GUI

Navigate to **Configuration** > **System** > **Settings** > **Change TCP Parameters** and then **Configure TCP Parameters** page to set the TCP Fast Open Cookie timeout value.

TCP Hystart

A new TCP profile parameter, hystart, enables the Hystart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to congestion avoidance without heavy packet losses. This new parameter is disabled by default.

If congestion is detected, Hystart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

Configuring TCP Hystart

To use the Hystart feature, enable the Cubic Hystart option in the relevant TCP profile.

To configure Hystart by using the command line interface (CLI)

At the command prompt, type one of the following commands to enable or disable Hystart in a new or existing TCP profile.

```
add tcpprofile <profileName> -hystart ENABLED
set tcpprofile <profileName> -hystart ENABLED
unset tcprofile <profileName> -hystart
<!--NeedCopy-->
```

Examples:

```
add tcpprofile Profile1 - tcpFastOpen
Set tcpprofile Profile1 - tcpFastOpen Enabled
unset tcpprofile Profile1 - tcpFastOpen
<!--NeedCopy-->
```

To configure Hystart support by using the GUI

1. Navigate to **Configuration** > **System** > **Profiles** > and click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Cubic Hystart** check box.
3. Click **OK** and then **Done**.

Optimization Techniques

TCP uses the following optimization techniques and methods for optimized flow controls.

Policy based TCP Profile Selection

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network traffic. The AppQoE policy classifies a virtual server's traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.

To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

Configuring Policy Based TCP Profile Selection

Configuring policy based TCP profile selection consists of the following tasks:

- Enabling AppQoE. Before configuring the TCP profile feature, you must enable the AppQoE feature.
- Adding AppQoE Action. After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.
- Configuring AppQoE based TCP Profile Selection. To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your NetScaler appliance can distinguish the connections and bind the correct AppQoE action to each policy.
- Binding AppQoE Policy to Virtual Server. Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

Configuring using the command line interface

To enable AppQoE by using the command line interface:

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

```
enable ns feature appqoe

show ns feature
<!--NeedCopy-->
```

To bind a TCP profile while creating an AppQoE action using the command line interface

At the command prompt, type the following AppQoE action command with tcpprofiletobind option.

Binding a TCP Profile:

```
add appqoe action <name> [-priority <priority>] [-respondWith ( ACS |
    NS ) [<CustomFile>] [-altContentSvcName <string>] [-altContentPath <
    string>] [-maxConn <positive_integer>] [-delay <usecs>]] [-polqDepth
     <positive_integer>] [-priqDepth <positive_integer>] [-
    dosTrigExpression <expression>] [-dosAction ( SimpleResponse |
    HICResponse )] [-tcpprofiletobind <string>]

show appqoe action
```

```
<!--NeedCopy-->
```

To configure an AppQoE policy by using the command line interface

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
<!--NeedCopy-->
```

To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface

At the command prompt, type:

```
bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <
    priority>
bind lb vserver <name> - policyName <appqoe_policy_name> -priority <
    priority>
bind cr vserver <name> -policyName <appqoe_policy_name> -priority <
    priority>
<!--NeedCopy-->
```

Example:

```
add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle
    ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500 -
    slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -
    sendBuffsize 4194304 -rstWindowAttenuate ENABLED -spoofSynDrop
    ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack ENABLED
    -tcpmode ENDPOINT

add appqoe action appact1 -priority HIGH -tcpprofile tcp1

add appqoe policy apppol1 -rule "client.ip.src.eq(10.102.71.31)" -
    action appact1

bind lb vserver lb2 -policyName apppol1 -priority 1 -
    gotoPriorityExpression END -type REQUEST

bind cs vserver cs1 -policyName apppol1 -priority 1 -
    gotoPriorityExpression END -type REQUEST
<!--NeedCopy-->
```

Configuring Policy based TCP Profiling using the GUI

To enable AppQoE by using the GUI

1. Navigate to **System**> **Settings**.
2. In the details pane, click **Configure Advanced Features.**
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

To configure AppQoE policy by using the GUI

1. Navigate to **App-Expert** > **AppQoE** > **Actions**.
2. In the details pane, do one of the following:
3. To create a new action, click **Add**.
4. To modify an existing action, select the action, and then click **Edit**.
5. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the AppQoE Action" as follows (asterisk indicates a required parameter):
    a) Name—name
    b) Action type—respondWith
    c) Priority—priority
    d) Policy Queue Depth—polqDepth
    e) Queue Depth—priqDepth
    f) DOS Action—dosAction

6. Click **Create**.

To bind AppQoE policy by using the GUI

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**, select a server and then click **Edit**.
2. In the **Policies** section and click (+) to bind an AppQoE policy.
3. In the **Policies** slider, do the following:
    a) Select a policy type as AppQoE from the drop-down list.
    b) Select a traffic type from the drop-down list.
4. In the **Policy Binding** section, do the following:
    a) Click **New** to create a new AppQoE policy.
    b) Click **Existing Policy** to select an AppQoE policy from the drop-down list.
5. Set the binding priority and click **Bind** to the policy to the virtual server.
6. Click **Done**.

SACK Block Generation

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgement (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into reassembly block, send the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

Note: A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

Client Reneging

A NetScaler appliance can handle client reneging during SACK based recovery.

Memory checks for marking end_point on PCB is not considering total available memory

In a NetScaler appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

Unnecessary retransmissions due to missing SACK blocks

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers additional retransmissions from the server.

SNMP for number of connections bypassed optimization because of overload

The following SNMP ids have been added to a NetScaler appliance to track number of connections bypassed TCP optimization due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.13 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.

Dynamic Receive Buffer

To maximize TCP performance, a NetScaler appliance can now dynamically adjust the TCP receive buffer size.

Troubleshooting Guidelines

September 21, 2020

Technical Support

All troubleshooting and escalation queries require a recent NetScaler techsupport bundle, which captures current configuration, firmware version installed, log files, outstanding cores, and others.

Example:

```
show techsupport

showtechsupport data collector tool - $Revision: #5 $!
...
All the data will be collected under
        /var/tmp/support/collector_P_192.168.121.117_18Jun2015_09_53
...
Archiving all the data into "/var/tmp/support/collector_P_192.168.121.117_18Jun2015_09_53.tar.gz" ....
Created a symbolic link for the archive with /var/tmp/support/support.tgz
/var/tmp/support/support.tgz  ---- points to ---> /var/tmp/support/collector_P_192.168.121.117_18Jun2015_09_53.tar.gz

After a techsupport bundle has been generated, it might be copied using SCP.
<!--NeedCopy-->
```

Traces

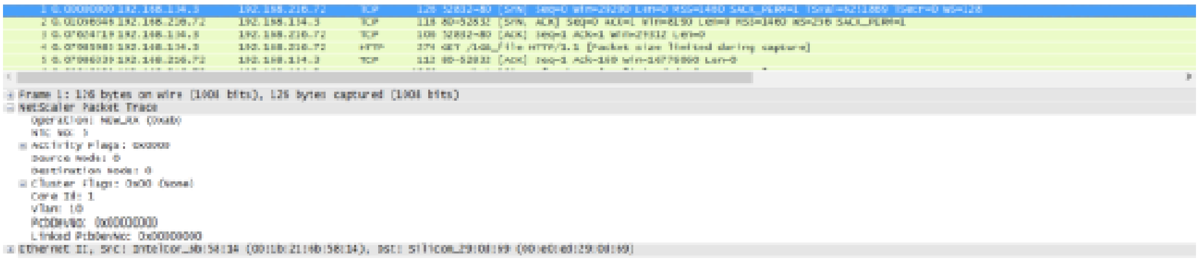
NetScaler TCP optimization issues normally require NetScaler traces to troubleshoot properly. Note that one should try to capture traces under similar conditions, i.e. on the same cell, during the same time of day, using the same user equipment and application, and others.

The start nstrace and stop nstrace commands might be used to capture traces:

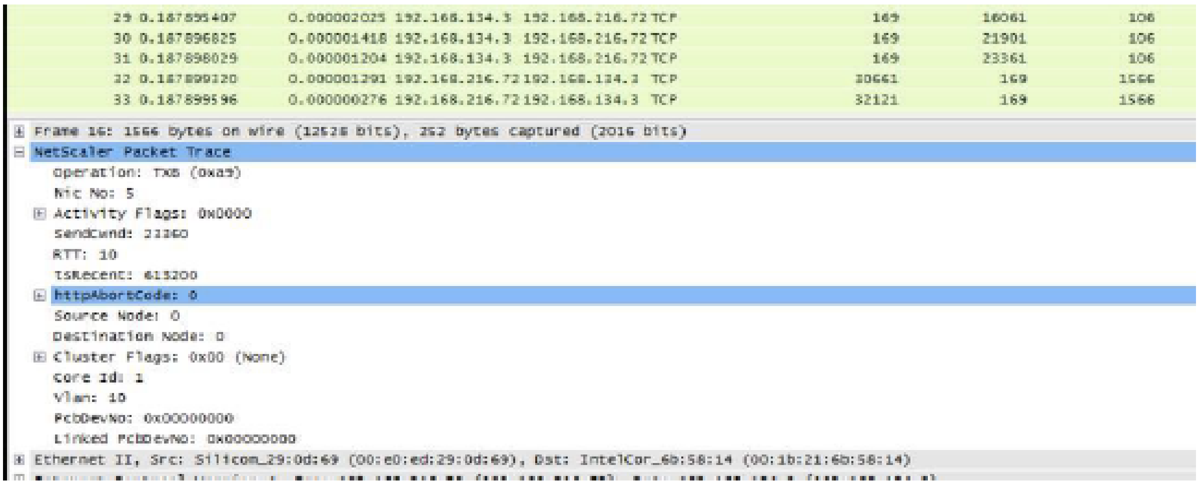
- It's strongly recommended that the appropriate filter is used to avoid capturing extraneous, unnecessary packets on the trace. For instance use start nstrace -filter 'IP == 10.20.30.40' to only capture packets being sent to or received from IP address 10.20.30.40, which is the user equipment IP address.
- Do not use the -tcpdump option, since it strips the nstrace headers which are required for debugging.

Trace Analysis

After a NetScaler trace has been captured, it might be viewed with Wireshark 1.12 or later. Verify that the captured traces include the appropriate NetScaler Packet Trace headers, as shown in the screen capture below:



The additional debug headers are also visible per the illustration below:



```
29 0.187895407   0.000002025 192.168.134.3  192.168.216.72 TCP   169   16061   106

```

Connection Table

When the issue is related to TCP optimization and it can be reproduced or it's on-going, it is best to get also the connection table when the issue occurs from the primary T1 node.

To get the table you shall need to switch to the BSD shell and run the following command:

```
shell
...

nscli -U 127.0.0.1:nsroot:nsroot show connectiontable -detail full link
     > /var/tmp/contable.log
<!--NeedCopy-->
```

> **Note**
>
> The command might be executed for a longer time and management CPU might be stressed at that time (depends on the number of connection table entries), but it's not service affecting.

Frequently Asked Questions

September 21, 2020

Timeouts

> **Important**
>
> Before using *any nsapimgr* knob, consult with Citrix Customer Support.

The following is a list of different idle connection timeouts that can be set on NetScaler T1 virtual servers and services. Idle timeout set for client or server connections at the vserver or service level are applicable only for the connections in TCP ESTABLISHED state and are idle.

- Load Balancing virtual server cltTimeout parameter specifies the time in seconds that a connection from a client to a Load Balancing virtual server must be idle, before the appliance closes the connection.
- Service svrTimeout parameter specifies the time in seconds that a connection from the appliance to a service or server must be idle, before the appliance closes the connection.
- Service cltTimeout parameter specifies the time in seconds that a connection from a client to a service must be idle, before the appliance closes the connection.

When a service is bound to a Load Balancing virtual server, then the cltTimeout for the Load Balancing virtual server takes precedence, and the service cltTimeout for service is ignored.

In case of there is not service bound to Load Balancing virtual server, global idle timeout, namely tcpServer, is used for server side connections. It can be configured as follows:

Command:

```
set ns timeout - tcpServer 9000
```

```
<!--NeedCopy-->
```

Connections in other state have different timeout values:

- Half open connections idle timeout: 120 seconds (hardcoded value)
- TIME_WAIT connections idle timeout: 40 seconds (hardcoded value)
- Half close connections idle timeout. By default it is 10s and can be configured between 1s and 600s using the snippet

Command:

```
 set ns timeout - halfclose 10
<!--NeedCopy-->
```

When half-close timeout is triggered, connection is moved to zombie state. When zombie timeout expires, zombie cleanup kicks in and T1 sends RST on both client and server side for given connection by default.

- Zombie timeout: Interval at which the zombie cleanup process must run to clean up inactive TCP connections. Default timeout value is 120s and can be configured between 1s and 600s.

Command:

```
set ns timeout - zombie 120
<!--NeedCopy-->
```

Maximum Segment Size Table

A NetScaler T1 appliance defends against SYN flood attacks by using SYN cookies instead of maintaining half-open connections on the system memory stack. The appliance sends a cookie to each client that requests a TCP connection, but it does not maintain the states of half-open connections. Instead, the appliance allocates system memory for a connection only upon receiving the final ACK packet, or, for HTTP traffic, upon receiving an HTTP request. This prevents SYN attacks and allows normal TCP communications with legitimate clients to continue uninterrupted. Specific function is enabled by default without option to disable.

However, there is caveat as standard SYN cookies limit connections to the use of only eight Maximum Segment Size (MSS) values. If connection MMS does not match with any predefined value, it will pick up the next available lower value towards both client and server side.

The predefined TCP Maximum Segment Size (MSS) values are the following and can be configured through a new nsapimgr knob.

1460	1440	1330	1220	956	536	384	128

The new MSS table:

- Need not contain Jumbo-Frame support. Even though by default 8 values are reserved in the MSS table for jumbo frames, the table settings can be modified to include standard Ethernet-sized frames only.
- Should have 16 values
- Should have values in descending order
- Should include 128 as the last value

If the new MSS table is valid, the table is stored and the old values are switched out at the SYN-cookie rotation time. Otherwise the new table returns an error. Changes are applied to new connections while existing connections preserve the old MSS table until the connections expire or are terminated.

To display the current MSS table in a NetScaler appliance, type the following command.

Command:

```
>shell

#nsapimgr -d mss_table
```

EXample:

```
#nsapimgr -d mss_table

MSS table

{
 9176,9156,8192,7168,6144,4196,3072,2048,1460,1440,1330,1212,956,536,384,128
     }

Done.
```

To change the mss table, type the following command:

Command:

```
>shell

#nsapimgr -s mss_table=<16 comma seperated values>
```

Example:

```
#nsapimgr -ys mss_table=9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128

# nsapimgr -d mss_table

MSS table

{
 9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128 }

Done.
```

An example using standard Ethernet-sized values is depicted below:

Example:

```
#nsapimgr -ys mss_table=1460,1440,1420,1400,1380,1360,1340,1320,1300,1280,1260,1212,956,536,384,128

# nsapimgr -d mss_table

MSS table

{
 1460,1440,1420,1400,1380,1360,1340,1320,1300,1280,1260,1212,956,536,384,128 }

Done.
```

To make this change permanent even after the NetScaler appliance restarts, include the command "#nsapimgr -ys mss_table=<16 comma seperated values>" in the "/nsconfig/rc.netscaler" file. If the "rc.netscaler" file doesn't exist, create it under the "/nsconfig" folder, and then append the command.

Memory Overload Protection

A NetScaler Packet Processing Engine (PPE) starts bypassing connections from TCP optimization if the memory in use by that one PPE is more than a specified high watermark value. If a PPE memory utilization goes above ~2.6GB, then it starts bypassing *any new* connections from optimization. The existing connections (ones admitted for optimization previously) continues getting optimization. This watermark value has been purposefully selected and is not recommended for tuning.

> **Note**
>
> If you believe that there is a good reason to change that watermark value, contact Customer Support.

Support for Happy Eyeballs Clients

If the NetScaler appliance receives a SYN for a destination for which the state is unknown, the appliance first checks the reachability of the server and then acknowledges the client. This probing mechanism enables clients with dual IP stacks to discover the reachability of dual-stack internet servers. If the client discovers that both IPv6 and IPv4 access are available, it establishes a connection to the server that responds more quickly, and resets the other. For the connection for the NetScaler appliance receives a reset, it will reset the corresponding server side connection.

Note: This feature has no user configurable TCP settings to be disabled/enabled on the NetScaler appliance.

For more information on Happy Eyeballs support, see RFC 6555.

NetScaler Solutions

September 21, 2020

NetScaler solutions simplify the task of setting up frequently deployed configurations.

This section includes the following solutions

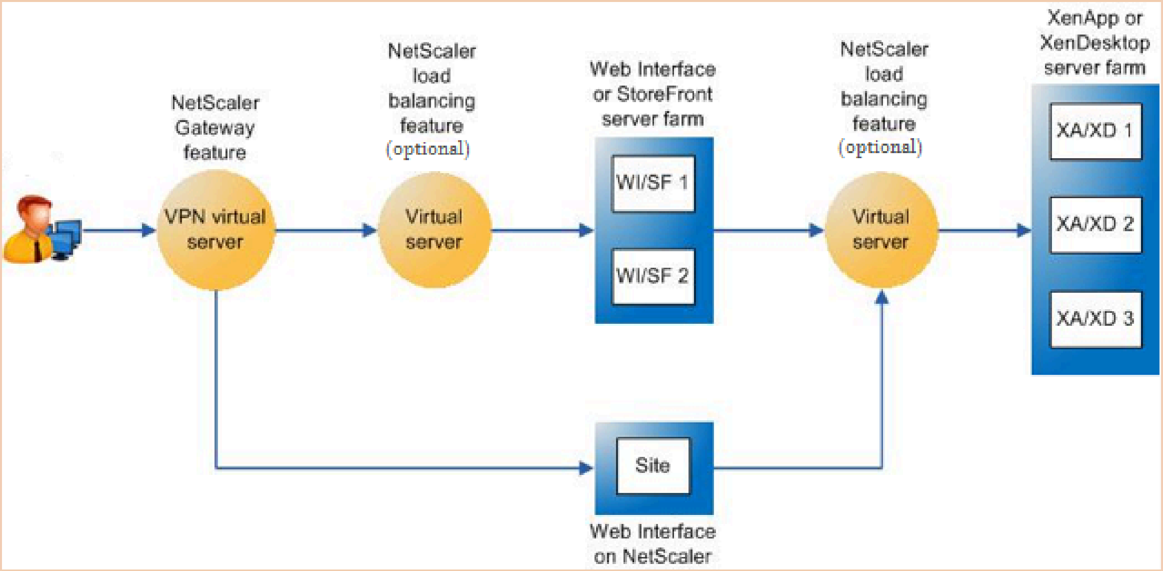
- Setting Up NetScaler for XenApp/XenDesktop
- Global Server Load Balancing (GSLB) Powered Zone Preference
- NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

Setting up NetScaler for Citrix Virtual Apps and Desktops

September 21, 2020

A NetScaler appliance can provide load balanced, secure remote access to your Citrix Virtual Apps and Desktops applications. You can use the NetScaler load balancing feature to distribute traffic across the Citrix Virtual Apps and Desktops server, and the Citrix Gateway feature to provide secure remote access to the servers. NetScaler can also accelerate and optimize the traffic flow and offer visibility features that are useful for Citrix Virtual Apps and Desktops deployments.

Figure 1. NetScaler appliance in Citrix Virtual Apps and Desktops setup



NetScaler Gateway feature
VPN virtual server
NetScaler load balancing feature (optional)
Virtual server
Web Interface or StoreFront server farm

WI/SF 2
NetScaler load balancing feature (optional)
Virtual server
XenApp or XenDesktop server farm
XA/XD 1
XA/XD 2
XA/XD 3
Site
Web Interface on NetScaler

The above figure shows the components involved in this deployment:

- **NetScaler Gateway.** Provides the URL for user access, and provides security by authenticating the users.
- **NetScaler load balancing virtual server.** Load balances the traffic for the Web Interface or StoreFront servers. You can also deploy a load balancing virtual server in front of the Citrix Virtual Apps and Desktop servers to load balance key components such as XML Broker and Desktop Delivery Controller (DDC) server.
- **Web Interface or StoreFront or Web Interface on NetScaler.** Provides the interface through which you can access the applications.

  Note: Web Interface on NetScaler (WIonNS) is a customization of the Web Interface product, hosted on the NetScaler appliance.
- **Citrix Virtual Apps and Desktops.** Provides the applications that your users want to access.

To set up the NetScaler for Citrix Virtual Apps and Desktops by using the NetScaler GUI

Prerequisites

- Citrix Virtual Apps and Desktop servers are configured and available.
- Web Interface, StoreFront, or Web Interface on NetScaler servers are configured and available.
- You have a working knowledge of Citrix Gateway, NetScaler, Citrix Virtual Apps and Desktops, and StoreFront/Web Interface/Web Interface on NetScaler.
- Make sure that you have configured a virtual server and a service and bound the service to the virtual server.

Procedure:

1. Log on to the NetScaler appliance and on the **Configuration** tab click **XenApp and XenDesktop**.
2. On the **Details** pane, click **Get Started**. If the setup exists on the NetScaler, click the **Edit** link corresponding to each of the section that you want to modify.
3. Select the product (StoreFront, Web Interface, or Web Interface on NetScaler) that in your deployment provides the interface for access to the Citrix Virtual Apps and Desktops applications.
4. Set up secure remote access.
   a) In the **NetScaler Gateway Settings** section, specify the details for the VPN virtual server and click **Continue**.
   b) In the S**erver Certificate** section, choose an existing certificate or install a new certificate and click **Continue**.
   c) In the **Authentication** section, configure the primary authentication mechanism to be used and specify the server details or use an existing server and click **Continue**.
   d) In the **StoreFront** section, specify the details of the server that provides the interface for accessing the applications and click **Continue**.
   e) You can use one of the following as your StoreFront server.
      i. LB vserver pointing to multiple SF servers.
      ii. Web Interface or StoreFront server directly reachable from the NetScaler appliance.
      iii. Web Interface on NetScaler.
5. Click **Done** to complete the configuration.

Global Server Load Balancing (GSLB) Powered Zone Preference

September 21, 2020

GSLB powered zone preference is a feature that integrates Citrix Virtual Apps and Desktops, StoreFront, and NetScaler to provide clients access to the most optimized data center on the basis of the client location.

In a distributed Citrix Virtual Apps and Desktops deployment, StoreFront might not select an optimal datacenter when multiple equivalent resources are available from multiple datacenters. In such cases, StoreFront randomly selects a datacenter. It can send the request to any of the Citrix Virtual Apps and Desktops servers in any datacenter, regardless of proximity to the client making the request.

With this enhancement, the client IP address is examined when an HTTP request arrives at the Citrix Gateway appliance, and the real client IP address is used to create the datacenter preference list that is forwarded to StoreFront. If the NetScaler appliance is configured to insert the zone preference header, StoreFront 3.5 or later can use the information provided by the appliance to reorder the list of delivery controllers and connect to an optimal delivery controller in the same zone as the client. StoreFront selects the optimal gateway VPN virtual server for the selected datacenter zone, adds this information to the ICA file with appropriate IP addresses, and sends it to the client. Storefront then tries to launch applications hosted on the preferred datacenter's delivery controllers before trying to contact equivalent controllers in other datacenters.

For more information about configuring this solution, click here.

For a video overview about GSLB powered zone preference solution, click https://www.youtube.com/watch?v=Y8DELum0Xp0.

NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

September 21, 2020

You can use a NetScaler appliance for load balancing in a private cloud that is managed through Microsoft Windows Azure Pack. The network for the private cloud is automated by using Cisco ACI and NetScaler.

This solution involves many integration points, such as Windows Azure Pack (WAP) to Cisco APIC, Cisco APIC to System Center Virtual Machine Manager (SCVMM), and Cisco APIC to NetScaler. As a tenant in the private cloud, you can enable NAT, provision network services, and add a load balancer.

WAP supports tenant and administrator portals where an administrator can perform administrative tasks such as ACI registration, VIP range, NetScaler device association with virtual machine cloud, tenant user account creation, and so on. Tenants can log on to the WAP Tenant Portal and configure the network, bridge domains, and Virtual Routing and Forwarding (VRFs), and make use of the NetScaler load balancing and RNAT features.

> **Important**
>
> - In this solution, the NetScaler appliance provides only basic load balancing.
> - Tenants can deploy multiple VIP addresses with different ports for the same network, but must ensure that the IP and port combination is unique.

> - The NetScaler device package supports only single-context deployment. Each Tenant gets a dedicated NetScaler instance.
> - WAP supports NetScaler MPX appliances and NetScaler VPX virtual appliances, including NetScaler VPX instances deployed on the NetScaler SDX platform.

The following illustration provides an overview of the solution:

Prerequisites

Make sure that:

- You have conceptual knowledge of Cisco ACI components and NetScalers.
  - For more information about Cisco ACI and its components, see the product documentation at: http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tsd-products-support-series-home.html.
  - For more information about the NetScalers, see the NetScaler product documentation at

  http://docs.citrix.com/.

- All the required components of Cisco ACI, including Cisco APIC in the datacenter, are set up and configured. For more information about Cisco ACI and its components, see the product documentation at: http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tsd-products-support-series-home.html.
- You know how to integrate Cisco ACI with Microsoft Windows Azure Pack. See the product documentation at: http://www.cisco.com/c/en/us/td/docs/switches/datacenter/aci/apic/sw/2-x/virtualization/b_ACI_Virtualization_Guide_2_2_1.html.
- You have conceptual knowledge of Microsoft Windows Azure Pack. See the product documentation at: https://www.microsoft.com/en-in/cloud-platform/windows-azure-pack.
- You have installed NetScaler software release 11.1 or later.
- You configure NetScalers in Cisco ACI, so that they can be managed by using Cisco APIC.
- From Cisco APIC, make sure that:
  - Management connectivity of Cisco APIC to NetScaler are established.
  - You upload the NetScaler device package version *11.1-52.3* and register the NetScaler device in Cisco ACI by using Cisco APIC.
  - You configure the NetScaler appliance in Cisco APIC's common tenant and make sure that there are no faults in Cisco APIC.
  - You have configured all the APIC specific configurations such as, VLAN pool, L3OutServicesDom, L3ExtOUt, resource pool, and so on. For more information, see *Cisco documentation*.

Creating a NetScaler Load Balancer in a Plan in the Service Management Portal (Admin Portal)

September 21, 2020

The Service Management Portal in WAP allows an administrator to register Cisco APIC with WAP and also create a hosting plan. As part of the plan, you can specify the VIP range, associate the NetScaler load balancer with the plan, create tenant user accounts, and so on.

To create a NetScaler Load Balancer in a Plan in the Admin Portal:

1. Log in to the Service Management Portal (Admin Portal).
2. In the Navigation pane, select **PLANS**.

6. Create a tenant user account and associate the user with the plan you have created.

Configuring a NetScaler Load Balancer by Using the Service Management Portal (Tenant Portal)

September 21, 2020

In WAP, once the Tenant creates the Bridge Domain (BD), VRF, and a Network, the Tenant can configure NetScaler Load Balancer through the Service Management Portal (Tenant Portal).

To configure NetScaler Load Balancer in Service Management Portal (Tenant Portal):

1. Log on to the Service Management Portal (Tenant Portal).
2. Create a bridge domain and VRF, as follows:
   a. In the navigation pane, select **ACI**.
   b. Click **NEW**.
   c. In the **NEW** pane, select **BRIDGE DOMAIN**.

Deploying Citrix NetScaler VPX

September 21, 2020

The NetScaler VPX product is a virtual appliance that can be hosted on a wide variety of hypervisors and cloud platforms.

For more information, see the VPX datas sheet.

For more information about provisioning a Citrix ADC VPX instance on an SDX appliance, see Provisioning Citrix ADC instances.

Support matrix and usage guidelines

June 25, 2021

This document lists the different hypervisors and features supported on a NetScaler VPX instance, and their usage guidelines and limitations.

- Table 1-6 list the different supported hypervisors.
- Table 7 lists the different VPX features and limitations for the different hypervisors supported on a NetScaler VPX instance.
- Table 8 lists the supported web browsers that allow you access the GUI and Dashboard.

Table 1. VPX instance on XenServer

XenServer version	SysID	VPX models
6.2, 6.5	450000	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G

Table 2. VPX instance on VMware ESX server

VMware ESX version	SysID	VPX models
5.5 (build number: 3568722); 6.0 (build number: 3620759)	450010	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, VPX 100G

Table 3. VPX on Microsoft Hyper-V

Hyper-V version	SysID	VPX models
2012, 2012R2	450020	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000

Table 4. VPX instance on generic KVM

Generic KVM version	SysID	VPX models
RHEL 7.2, Ubuntu 15	450070	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G. VPX 25G, VPX 40G, VPX 100G

> Note: The VPX instance is qualified for hypervisor release versions mentioned in table 1–4, and not for patch releases within a version. However, the VPX instance is expected to work seamlessly with patch releases of a supported version. If it does not, log a support case for troubleshooting and debugging.

Table 5. VPX instance on AWS

AWS version	SysID	VPX models
N/A	450040	VPX 10, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 15G, VPX BYOL

Table 6. VPX instance on Azure

Azure version	SysID	VPX models
N/A	450020	VPX 10, VPX 200, VPX 1000, VPX 3000, VPX BYOL

Table 7. VPX feature matrix

	VPX on XenServer		VPX on VMware ESX				VPX on Microsoft Hyper-V	VPX on generic KVM			VPX on AWS	VPX on Azure

Multi-PE Support	√	√	√	√	√	√	√	√	√	√	√	√
Clustering Support	√	*√	√	*√	√	√	√	√	*√	√	X	X
VLAN Tagging	√	√	√	√	√	√	√ ((Only on 2012R2))	√	√	√	X	X
Detecting Link Events	**X	***√	**X	***√	**X	***√	**X	**X	***√	***√	**X	**X
Interface Parameter Configuration	X	X	X	X	X	√	X	X	X	√	X	X
Static LA	**√	***√	**√	X	**√	***√	**√	**√	***√	***√	X	X
LACP	X	***√	**√	X	**√	***√	X	**√	***√	***√	X	X
Static CLAG	X	X	X	X	X	X	X	X	X	X	X	X
LACP CLAG	X	X	**√	X	**√	***√	X	**√	***√	***√	X	X
Hot-Plug	X	X	X	X	X	X	X	X	X	X	√	X

*Clustering support is available on SRIOV for client- and server-facing interfaces and not for the backplane.

**Interface DOWN events are not recorded in NetScaler VPX instances.

For Static LA, traffic might still be sent on the interface whose physical status is DOWN.

For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.

Short timeout: 3 seconds

Long timeout: 90 seconds

For LACP, interfaces must not be shared across VMs.

For Dynamic routing, convergence time depends on the Routing Protocol since link events are not detected.

Monitored static Route functionality fails if monitors are not bound to static routes since Route state depends on the VLAN status. The VLAN status depends on the link status.

Partial failure detection does not happen in high availability if there is link failure. High availability-split brain condition might happen if there is link failure.

***When any link event (disable/enable, reset) is generated from a VPX instance, the physical status of the link does not change. For static LA, any traffic initiated by the peer gets dropped on the instance.

For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.

Short timeout: 3 seconds

Long timeout: 90 seconds

For LACP, interfaces should not be shared across VMs.

- For the VLAN tagging feature to work, do the following:

On the VMware ESX, set the port group's VLAN ID to 1 - 4095 on the vSwitch of VMware ESX server. For more information about setting a VLAN ID on the vSwitch of VMware ESX server, see pdf.

Table 8. Supported browsers

Operating system	Browser and versions
Windows 7	Internet Explorer- 8, 9, 10, and 11; Mozilla Firefox 3.6.25 and above; Google Chrome- 15 and above
Windows 64 bit	Internet Explorer - 8, 9; Google Chrome - 15 and above
MAC	Mozilla Firefox - 12 and above; Safari - 5.1.3; Google Chrome - 15 and above

Usage guidelines

Follow these usage guidelines:

- See the **VMware ESXi CPU Considerations** section in the document Performance Best Practices for VMware vSphere 6.5. Here's an extract:

  It is not recommended that virtual machines with high CPU/Memory demand sit on a Host/Cluster that is overcommitted.
  In most environments ESXi allows significant levels of CPU overcommitment (that is, running more
  vCPUs on a host than the total number of physical processor cores in that host) without impacting virtual
  machine performance.
  If an ESXi host becomes CPU saturated (that is, the virtual machines and other loads on the host demand
  all the CPU resources the host has), latency-sensitive workloads might not perform well. In this case you
  might want to reduce the CPU load, for example by powering off some virtual machines or migrating them to a different host (or allowing DRS to migrate them automatically).

- The Citrix ADC VPX is a latency-sensitive, high-performance virtual appliance. To deliver its expected performance, the appliance requires vCPU reservation, memory reservation, vCPU pinning on the host. Also, hyper threading must be disabled on the host. If the host does not meet these requirements, issues such as high-availability failover, CPU spike within the VPX instance, sluggishness in accessing the VPX CLI, pitboss daemon crash, packet drops, and low throughput occur.

- A hypervisor is considered over-provisioned if one of the following two conditions is met:
  - The total number of virtual cores (vCPU) provisioned on the host is greater than the total number of physical cores (pCPUs).
  - The total number of provisioned VMs consume more vCPUs than the total number of pCPUs.

    At times, if an instance is over-provisioned, the hypervisor might not be able to guarantee the resources reserved (such as CPU, memory, and others) for the instance due to hypervisor scheduling over-heads or bugs or limitations with the hypervisor. This can cause lack of CPU resource for Citrix ADC and might lead to issues mentioned in the first point under **Usage guidelines**. As administrators, you're recommended to reduce the tenancy on the host so that the total number of vCPUs provisioned on the host is lesser or equal to the total number of pCPUs.

    Example

For ESX hypervisor, if the `%RDY%` parameter of a VPX vCPU is greater than 0 in the `esxtop` command output, the ESX host is said to be having scheduling overheads, which can cause latency related issues for the VPX instance.

In such a situation, reduce the tenancy on the host so that `%RDY%` returns to 0 always. Alternatively, contact the hypervisor vendor to triage the reason for not honoring the resource reservation done.

Install a NetScaler VPX instance on XenServer

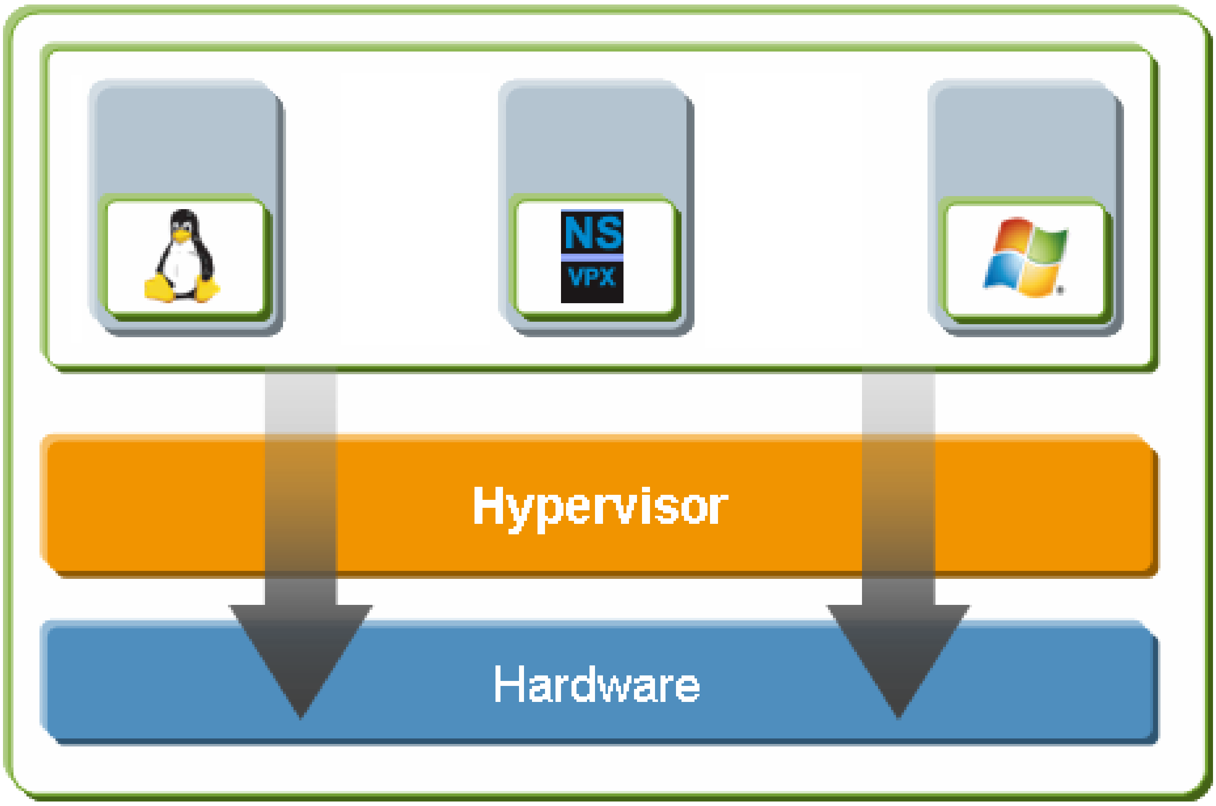
September 21, 2020

To install VPX instances on Citrix XenServer, you must first install XenServer on a machine with adequate system resources. To perform the NetScaler VPX instance installation, you use Citrix XenCenter, which must be installed on a remote machine that can connect to the XenServer host through the network.

For more information about XenServer, see XenServer documentation.

The following figure shows the bare-metal solution architecture of NetScaler VPX instance on XenServer.

Figure. A NetScaler VPX instance on XenServer



Prerequisites for installing a NetScaler VPX instance on XenServer

Before you begin installing a virtual appliance, do the following:

- Install XenServer version 6.0 or later on hardware that meets the minimum requirements.
- Install XenCenter on a management workstation that meets the minimum system requirements.
- Obtain virtual appliance license files. For more information about virtual appliance licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx122426.

XenServer hardware requirements

The following table describes the minimum hardware requirements for a XenServer platform running a NetScaler VPX instance.

Table 1. Minimum system requirements for XenServer running a nCore VPX instance

Component	Requirement
CPU	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT) enabled. AMD processor is not supported. To run NetScaler VPX instance, hardware support for virtualization must be enabled on the XenServer host. Make sure that the BIOS option for virtualization support is not disabled. For more details, see BIOS documentation.
RAM	3 GB
Disk space	Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space. Note: XenServer installation creates a 4 GB partition for the XenServer host control domain; the remaining space is available for NetScaler VPX instance and other virtual machines.
NIC	One 1-Gbps NIC; recommended: two 1-Gbps NICs

For information about installing XenServer, see the XenServer documentation at http://support.citrix.com/product/xens/.

The following table lists the virtual computing resources that XenServer must provide for each nCore VPX virtual appliance.

Table 2. Minimum virtual computing resources required for running a ncore VPX instance

Component	Requirement
Memory	2 GB
Virtual CPU (VCPU)	2
Virtual network interfaces	2

> Note: For production use of
> NetScaler VPX instance, Citrix recommends that CPU priority (in virtual machine properties) be set to the highest level, in order to improve scheduling behavior and network latency.

XenCenter system requirements

XenCenter is a Windows client application. It cannot run on the same machine as the XenServer host. For more information about minimum system requirements and installing XenCenter, see the following XenServer documents:

- System requirements
- Install

Install NetScaler VPX instances on XenServer by using XenCenter

After you have installed and configured XenServer and XenCenter, you can use XenCenter to install virtual appliances on XenServer. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running XenServer.

After you have used XenCenter to install the initial NetScaler VPX instance (.xva image) on XenServer, you have the option to use Command Center to provision NetScaler VPX instance. For more information, see the Command Center documentation.

To install NetScaler VPX instances on XenServer by using XenCenter, follow these steps:

1. Start XenCenter on your workstation.
2. On the Server menu, click Add.
3. In the Add New Server dialog box, in the Hostname text box, type the IP address or DNS name of the XenServer that you want to connect to.
4. In the User Name and Password text boxes, type the administrator credentials, and then click Connect. The XenServer name appears in the navigation pane with a green circle, which indicates that the XenServer is connected.
5. In the navigation pane, click the name of the XenServer on which you want to install NetScaler VPX instance.

6. On the VM menu, click Import.
7. In the Import dialog box, in Import file name, browse to the location at which you saved the NetScaler VPX instance .xva image file. Make sure that the Exported VM option is selected, and then click Next.
8. Select the XenServer on which you want to install the virtual appliance, and then click Next.
9. Select the local storage repository in which to store the virtual appliance, and then click Import to begin the import process.
10. You can add, modify, or delete virtual network interfaces as required. When finished, click Next.
11. Click Finish to complete the import process.
    Note: To view the status of the import process, click the
    Log tab.
12. If you want to install another virtual appliance, repeat steps 5 through 11.

> **Note**
>
> After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see Upgrading or Downgrading the System Software.

Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces

September 21, 2020

After you have installed and configured a NetScaler VPX instance on XenServer, you can configure the virtual appliance to use SR-IOV network interfaces.

Limitations

XenServer does not support the following features on SRIOV interfaces:

- L2 mode switching
- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active - Active mode]
- Jumbo frames
- IPv6 protocol in Cluster environment

Prerequisites

On the XenServer host, ensure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the host.
- Blacklist the ixgbevf driver by adding the following entry to the **/etc/modprobe.d/blacklist.conf** file:
  blacklist ixgbevf
- Enable SR-IOV Virtual Functions (VFs) by adding the following entry to the **/etc/modprobe.d/ixgbe** file:
  options ixgbe max_vfs=<*number_of_VFs*>
  where <*number_VFs*> is the number of SR-IOV VFs that you want to create.
- Verify that SR-IOV is enabled in BIOS.

IXGBE driver version 3.22.3 is recommended.

Assign SR-IOV VFs to the VPX instance by using the XenServer host

To assign SR-IOV network interfaces to NetScaler VPX instance, follow these steps:

1. On the XenServer host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance:

xe host-call-plugin plugin=iovirt host-uuid=<*Xen host UUID*> **fn=assign_free_vf args:uuid**=<*Netscalar VM UUID*> **args:ethdev**=<*interface name*> **args:mac=**<*mac addr*>

Where:

• <*Xen host UUID*> is the UUID of the XenServer host.

• <*Netscalar VM UUID*> is the UUID of the NetScaler VPX instance.

• <*interface name*> is the interface for the SR-IOV VFs.

• <*mac addr* > is the mac address of the SR-IOV VF.

> **Note**
>
> Specify the mac address that you want use in the args:mac= parameter, if not specified, the iovirt script randomly generates and assigns a mac address. Also, if you want use the SR-IOV VFs in Link Aggregation mode, make sure that you specify the mac address as 00:00:00:00:00:00.

2. Boot the NetScaler VPX instance.

Unassign SR-IOV VFs to the VPX instance by using the XenServer host

If you have assigned an incorrect SR-IOV VFs or if you want modify the a assigned SR-IOV VFs, you need to unassign and reassign the SR-IOV VFs to the NetScaler VPX instance.

To unassign SR-IOV network interface assigned to a NetScaler VPX instance, follow these steps:

1. On the XenServer host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance and reboot the NetScaler VPX instance:

```
xe host-call-plugin plugin=iovirt host-uuid=<Xen_host_UUID> fn=unassign_all args:uuid=<Netscalar_VM_UUID
```

Where:

- *<Xen_host_UUID>* - The UUID of the XenServer host.
- *<Netscalar_VM_UUID>* - The UUID of the NetScaler VPX instance

2. Boot the NetScaler VPX instance.

Configuring VLAN on the SR-IOV Interface

> **Important**
>
> While you are assigning the SR-IOV VFs to the NetScaler VPX instance, make sure that you specify MAC address 00:00:00:00:00:00 for the VFs.

To use the SR-IOV virtual functions in link aggregation mode, you need to disable spoof checking for virtual functions that you have created. On the XenServer host, use the following command to disable spoof checking:

```
ip link set <interface_name> vf <VF_id> spoofchk off
```

Where:

- <interface_name> is the interface name.
- <VF_id> is the virtual function ID.

After disabling spoof checking for all the Virtual Function that you have created, restart the NetScaler VPX instance and configure link aggregation. For instructions, see Configure link aggregation.

Configure VLAN on the SR-IOV interface

You can configure VLAN on the SR-IOV Virtual Functions, for instructions, see Configuring a VLAN.

> **Important**
>
> Make sure that the XenServer host does not contain VLAN settings for the VF interface.

Install a NetScaler VPX instance on VMware ESX

September 21, 2020

Before installing
NetScaler VPX instances on VMware ESX, make sure that VMware ESX Server is installed on a machine

with adequate system resources. To install a NetScaler VPX instance on VMware ESXi
, you use VMware vSphere client. The client or tool must be installed on a remote machine that can connect to VMware ESX through the network.

> **Important**
>
> You cannot install standard VMware Tools or upgrade the VMware Tools version available on a NetScaler VPX instance. VMware Tools for a NetScaler VPX instance are delivered as part of the NetScaler software release.

Prerequisites

Before you begin installing a virtual appliance, do the following:

- Install VMware ESX on hardware that meets the minimum requirements.
- Install VMware Client on a management workstation that meets the minimum system requirements.
- Download the NetScaler VPX appliance setup files.
- Label the physical network ports of VMware ESX.
- Obtain VPX license files. For more information about NetScaler VPX instance licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx131110.

VMware ESX hardware requirements

The following table describes the minimum system requirements for VMware ESX servers running NetScaler VPX ncore virtual appliance.

Table 1. Minimum system requirements for a VMware ESX server running a NetScaler VPX instance

Component	Requirement
-	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT) enabled. Note that to run NetScaler VPX instance, hardware support for virtualization must be enabled on the VMware ESX host. Make sure that the BIOS option for virtualization support is not disabled. For more information, see your BIOS documentation.
RAM	3 GB
Disk space	40 GB of disk space available
Network	One 1-Gbps NIC; Two 1-Gbps NICs recommended

For information about installing VMware ESX, see http://www.vmware.com/.

The following table lists the virtual computing resources that the VMware ESX server must provide for each VPX ncore virtual appliance.

Table 2. Minimum virtual computing resources required for running a NetScaler VPX instance

Component	Requirement
Memory	2 GB
Virtual CPU (VCPU)	2
Virtual network interfaces	1. Note that with ESX, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded version to 7 or higher.
Disk space	20 GB

> Note that this is in addition to any disk requirements for the hypervisor.

For production use of VPX virtual appliance, the full memory allocation must be reserved. CPU cycles (in MHz) equal to at least the speed of one CPU core of the ESX should also be reserved.

VMware vSphere client system requirements

VMware vSphere is a client application that can run on Windows and Linux operating systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 3. Minimum system requirements for VMware vSphere client installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the "vSphere Compatibility Matrixes" PDF file at http://kb.vmware.com/.
CPU	750 megahertz (MHz); 1 gigahertz (GHz) or faster recommended
RAM	1 GB; 2 GB recommended
Network Interface Card (NIC)	100 Mbps or faster NIC

OVF Tool 1.0 system requirements

OVF Tool is a client application that can run on Windows and Linux systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 4. Minimum system requirements for OVF tool installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the "OVF Tool User Guide" PDF file at http://kb.vmware.com/.
CPU	750 MHz minimum, 1 GHz or faster recommended
RAM	1 GB Minimum, 2 GB recommended
Network Interface Card (NIC)	100 Mbps or faster NIC

For information about installing OVF, search for the "OVF Tool User Guide" PDF file at http://kb.vmware.com/.

Downloading the NetScaler VPX setup files

The NetScaler VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from the Citrix website. You need a Citrix account to log on. If you do not have a Citrix account, access the home page at http://www.citrix.com, click the New Users link, and follow the instructions to create a new Citrix account.

Once logged on, navigate the following path from the Citrix home page:

Citrix.com > Downloads > NetScaler > Virtual Appliances.

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-9.3-39.8-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-9.3-39.8.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-9.3-39.8.mf)

Label the physical network ports of VMware ESX

Before installing a VPX virtual appliance, label of all the interfaces that you plan to assign to virtual appliances, in a unique format, for example, NS_NIC_1_1, NS_NIC_1_2, and so on. In large deployments, labeling in a unique format helps in quickly identifying the interfaces that are allocated to the VPX virtual appliance among other interfaces used by other virtual machines, such as Windows and Linux. Such labeling is especially important when different types of virtual machines share the same interfaces.

To label the physical network ports of VMware ESX server, follow these steps:

1. Log on to the VMware ESX server by using the vSphere client.
2. On the vSphere client, select the Configuration tab, and then click Networking.
3. At the top-right corner, click Add Networking.
4. In the Add Network Wizard, for **Connection Type**, select **Virtual Machine**, and then click Next.
5. Scroll through the list of vSwitch physical adapters, and choose the physical port that will map to interface 1/1 on the virtual appliances.
6. Enter the label of the interface, for example, **NS_NIC_1_1** as the name of the vSwitch that will be associated with interface 1/1 of the virtual appliances.
7. Click Next to finish the vSwitch creation. Repeat the procedure, beginning with step 2, to add any additional interfaces to be used by your virtual appliances. Label the interfaces sequentially, in the correct format (for example, NS_NIC_1_2).

Install a NetScaler VPX instance on VMware ESX

After you have installed and configured VMware ESX, you can use the VMware vSphere client to install virtual appliances on the VMware ESX server. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX.

To install NetScaler VPX instances on VMware ESX by using VMware vSphere Client, follow these steps:

1. Start the VMware vSphere client on your workstation.
2. In the **IP address / Name** text box, type the IP address of the VMware ESX server that you want to connect to.
3. In the **User Name** and **Password** text boxes, type the administrator credentials, and then click Login.
4. On the **File** menu, click **Deploy OVF Template**.
5. In the **Deploy OVF Template** dialog box, in **Deploy from file**, browse to the location at which you saved the NetScaler VPX instance setup files, select the .ovf file, and click **Next**.
6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the ESX host. Click **Next**to start installing a virtual appliance on VMware ESX. When installation is complete, a pop-up window informs you of the successful installation.
7. You are now ready to start the NetScaler VPX instance. In the navigation pane, select the NetScaler VPX instance that you have just installed and, from the right-click menu, select **Power On**. Click the **Console**tab to emulate a console port.
8. If you want to install another virtual appliance, repeat steps **4** through **6**.

> **Note**
>
> By default, the NetScaler VPX instance uses E1000 network interfaces.

After the installation, you can use vSphere client or vSphere Web Client to manage virtual appliances on VMware ESX.

> **Note**
>
> For the VLAN tagging feature to work,on the VMware ESX, set the port group's VLAN ID to 1 - 4095 on the VSwitch of VMware ESX server. For more information about setting a VLAN ID on the VSwitch of VMware ESX server, see http://www.vmware.com/pdf/esx3_vlan_wp.pdf.

Configure a NetScaler VPX instance to use VMXNET3 network interface

September 21, 2020

After you have installed and configured the NetScaler VPX instance on the VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use VMXNET3 network interfaces.

To configure NetScaler VPX instances to use VMXNET3 network interfaces by using the VMware vSphere Web Client:

1. In the vSphere Web Client, select Hosts and Clusters.
2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX, as follows:
   a. Power off the NetScaler VPX instance.
   b. Right-click the NetScaler VPX instance and select Compatibility > Upgrade VM Compatibility.

c. In the Configure VM Compatibility dialog box, select ESXi 5.5 and later from the Compatible with drop-down list and click OK.

3. Right-click on the NetScaler VPX instance and click Edit Settings.

    interface
```

> **Note**
>
> After you add a VMXNET3 interface and restart the NetScaler VPX appliance, the VMWare ESX hypervisor might change the order in which the NIC is presented to the VPX appliance. So, network adapter 1 might not always remain 0/1, resulting in loss of management connectivity to the VPX appliance. To avoid this issue, change the virtual network of the network adapter accordingly.
>
> This is a VMWare ESX hypervisor limitation.

Configure a NetScaler VPX instance to use SR-IOV network interface

September 21, 2020

After you have installed and configured the NetScaler VPX instance on VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use single root I/O v irtualization (SR-IOV) network interfaces.

Limitations

A NetScaler VPX configured with SR-IOV network interface has the following limitations:

- The following features are not supported on SR-IOV interfaces using Intel 82599 10G NIC on ESX VPX:
  - L2 mode switching
  - Static Link Aggregation and LACP
  - Clustering
  - Admin partitioning [Shared VLAN mode]
  - High Availability [Active - Active mode]
  - Jumbo frames
  - IPv6
- The following features are not supported for on SR-IOV interface with an Intel 82599 10G NIC on KVM VPX:
  - Static Link Aggregation and LACP
  - L2 mode switching

- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active – Active mode]
- Jumbo frames
- IPv6
- VLAN configuration on Hypervisor for SR-IOV VF interface through "ip link" command is not supported

Prerequisite

Make sure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the ESX Host. IXGBE driver version 3.7.13.7.14iov is recommended.

- Enable SR-IOV on the host physical adapter, as follows:

1. In the vSphere Web Client, navigate to the Host.

2. On the **Manage > Networking** tab, select **Physical adapters**. The SR-IOV Status field shows whether a physical adapter supports SR-IOV.

Configured speed, Duplex: Auto negotiate

SR-IOV is a technology that allows multiple virtual machines to use the same PCI device as a virtual pass-through device.

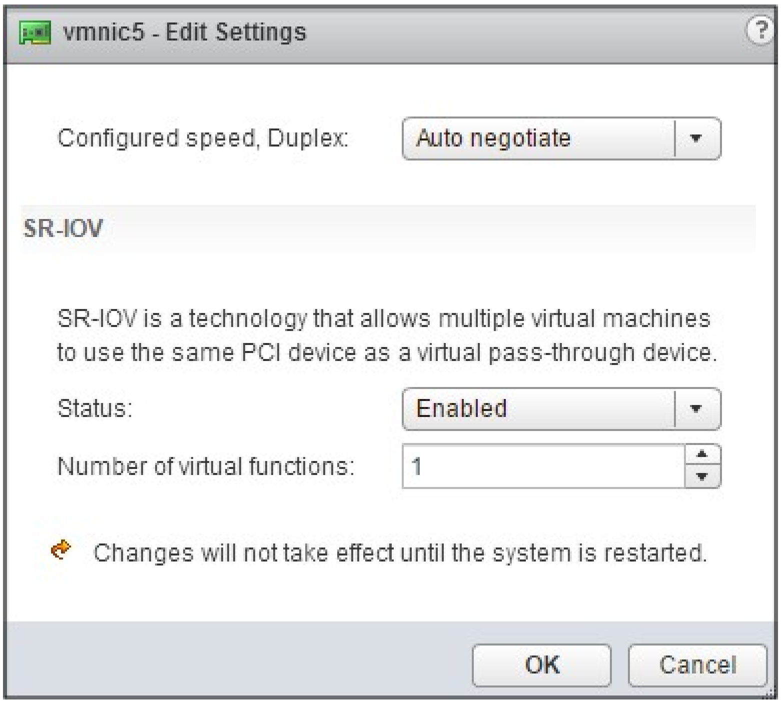
Status: Enabled

Number of virtual functions:

Changes will not take effect until the system is restarted.

5. In the **Number of virtual functions** field, enter the number of virtual functions that you want to

configure for the adapter.



Configured speed, Duplex: Auto negotiate

SR-IOV

SR-IOV is a technology that allows multiple virtual machines to use the same PCI device as a virtual pass-through device.

Status: Enabled

Number of virtual functions: 1

Changes will not take effect until the system is restarted.

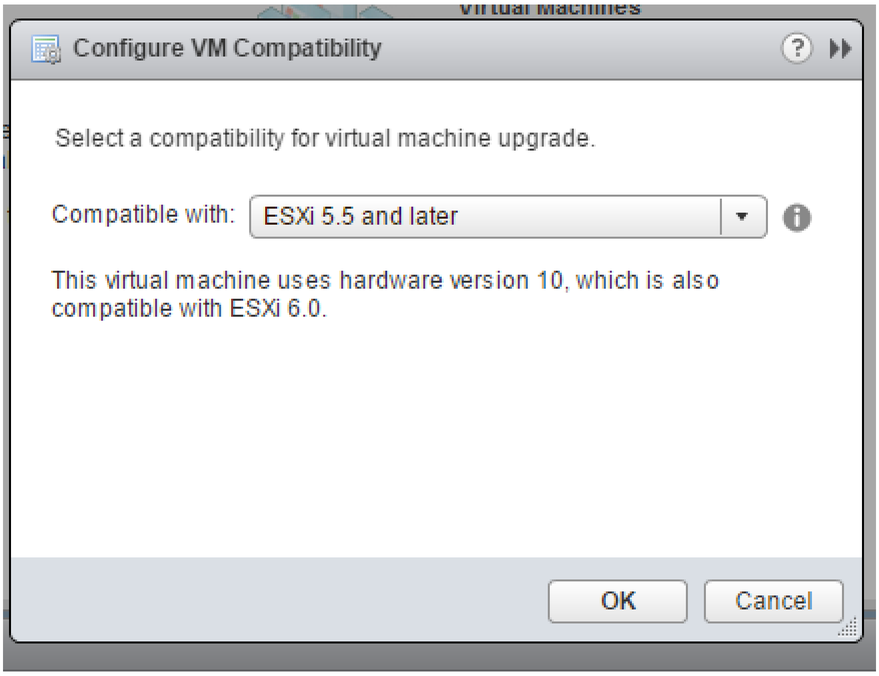
6. Click **OK**.
7. Restart the host.

- Create a Distributed Virtual Switch (DVS) and Portgroups. For instructions, see the VMware Documentation.

> **Note**
>
> Citrix has qualified the SR-IOV configuration on DVS and Portgroups only.

To configure NetScaler VPX instances to use SR-IOV network interface by using VMware vSphere Web Client:

1. In the vSphere Web Client, select **Hosts and Clusters**.
2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX 5.5 or later, as follows:
   a. Power off the NetScaler VPX instance.
   b. Right-click the NetScaler VPX instance and select **Compatibility > Upgrade VM Compatibility**.
   c. In the **Configure VM Compatibility** dialog box, select **ESXi 5.5 and later** from the **Compatible with** drop-down list and click **OK**.



Configure VM Compatibility
OK
Cancel

Select a compatibility for virtual machine upgrade.

Compatible with: ESXi 5.5 and later

This virtual machine uses hardware version 10, which is also compatible with ESXi 6.0.

3. Right-click on the NetScaler VPX instance and click **Edit Settings**.

6. In the **Memory** section, update the following settings:

   - Size of RAM

   - Reservations

   - Limit

   - Shares

   Set the values as follows:

   a. In the **RAM** drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPU is 4 then RAM = 4 x 2 GB = 8 GB.

Note: For Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces

September 21, 2020

You can configure your exiting NetScaler VPX instances that use E1000 network interfaces to use SR-IOV or VMXNET3 network interfaces.

To configure an existing NetScaler VPX instance to use SR-IOV network interfaces, see Configuring NetScaler VPX instances to use Single Root I/O Virtualization (SR-IOV) Network Interface.

To configure an existing NetScaler VPX instance to use VMXNET3 network interfaces, see Configuring NetScaler VPX instances to use VMXNET3 Network Interface.

Configure a NetScaler VPX instance to use PCI passthrough network interface

September 21, 2020

Overview

After you have installed and configured a NetScaler VPX instance on VMware ESX Server, you can use the vSphere Web Client to configure the virtual appliance to use PCI passthrough network interfaces.

The PCI passthrough feature allows a guest virtual machine to directly access physical PCI and PCIe devices connected to a host.

Prerequisites

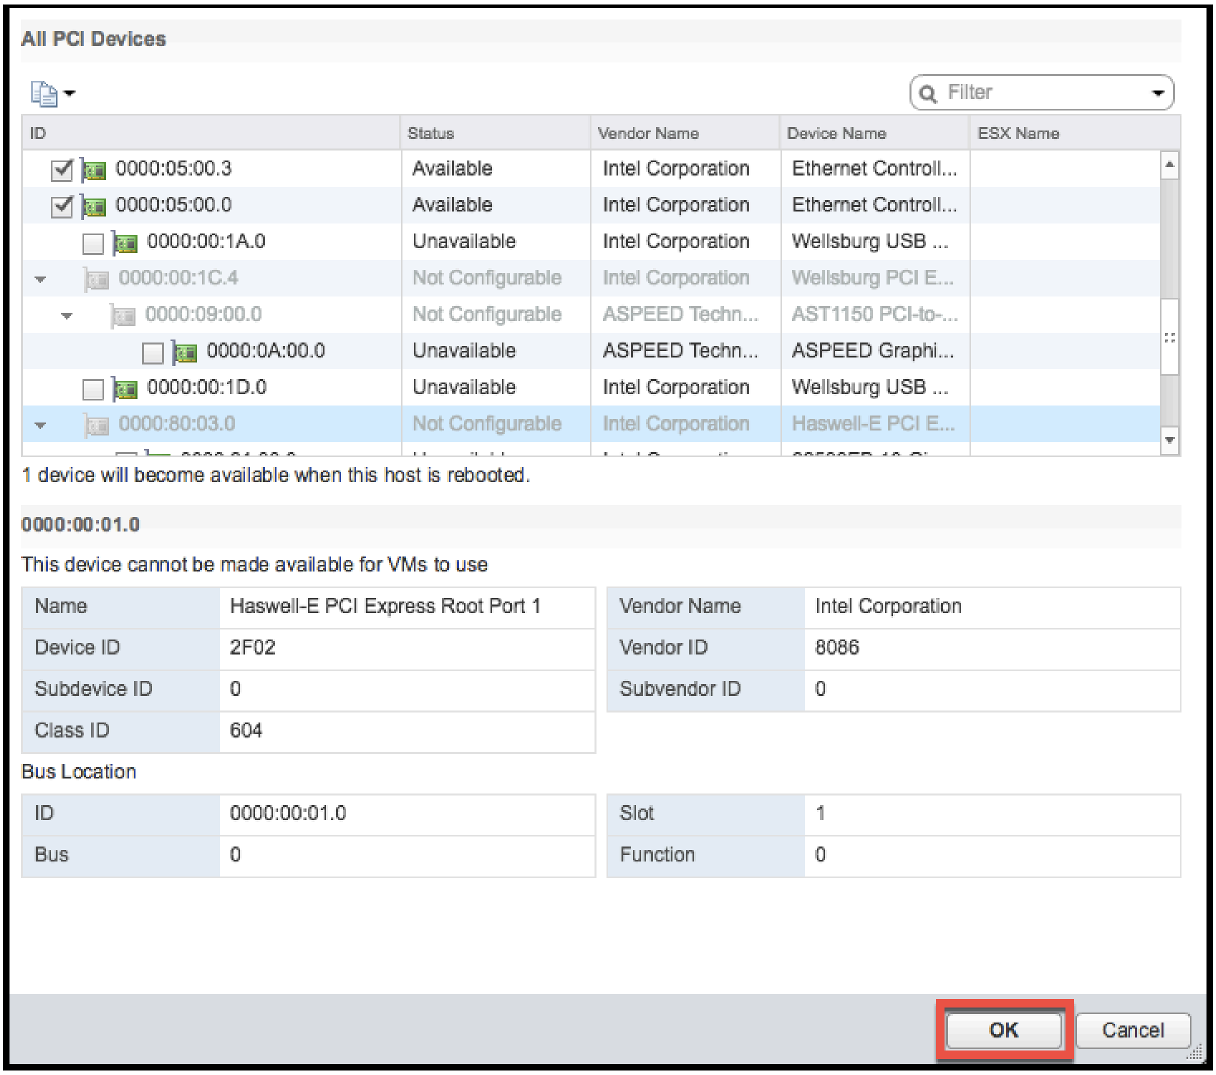
- The firmware version of the Intel XL710 NIC on the host is 5.04.
- A PCI passthrough device connected to and configured on the host
- Supported NICs:
  - Intel X710 10G NIC
  - Intel XL710 Dual Port 40G NIC
  - Intel XL710 Single Port 40G NIC

Configure passthrough devices on a host

Before configuring a passthrough PCI device on a virtual machine, you should configure it on the host machne. Follow these steps to configure passthrough devices on a host.

1. Select the host from the Navigator panel of the vSphere Web Client.
2. Click **Manage** > **Settings** > **PCI Devices**. All available passthrough devices are displayed.
3. Right-click the device that you want to configure and click **Edit**.
4. The **Edit PCI Device Availability** window appears.

5. Select the devices to be used for passthrough and click **OK**.



All PCI Devices

Bus	0	Function	0

6. Restart the host machine.

Configure passthrough devices on a NetScaler VPX instance

Follow these steps to configure a passthrough PCI device on a NetScaler VPX instance.

1. Power off the virtual machine.
2. Right-click the virtual machine and select **Edit Settings**.
3. On the **Virtual Hardware** tab, select **PCI Device** from the **New Device** drop-down menu, and click **Add**.

6. Power on the guest virtual machine.

You have completed the steps to configuring NetScaler VPX to use PCI passthrough network interfaces.

Install a NetScaler VPX instance on Microsoft Hyper-V server

September 21, 2020

To install Citrix
NetScaler VPX instances on Microsoft Windows Server, you must first install Windows Server, with the

Hyper-V role enabled, on a machine with adequate system resources. While installing the Hyper-V role, be sure to specify the NIC on the server that Hyper-V uses to create the virtual networks. You can reserve some NICs for the host. Use Hyper-V Manager to perform the NetScaler VPX instance installation.

NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. It includes the default configuration for elements such as CPU, network interfaces, and hard-disk size and format. After you install NetScaler VPX instance, you can configure the network adapters on virtual appliance, add virtual NICs, and then assign the NetScaler IP address, subnet mask, and gateway, and complete the basic configuration of the virtual appliance.

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see Upgrade a NetScaler VPX standalone appliance

> **Note**
>
> Intermediate System-to-Intermediate System (ISIS) protocol is not supported on the NetScaler VPX virtual appliance hosted on the HyperV-2012 platform.

Prerequisites for installing NetScaler VPX instance on Microsoft servers

Before you begin installing a virtual appliance, do the following:

- Enable the Hyper-V role on Windows Servers. For more information, see http://technet.microsoft.com/en-us/library/ee344837(WS.10).aspx.
- Download the virtual appliance setup files.
- Obtain NetScaler VPX instance license files. For more information about NetScaler VPX instance licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx131110.

Microsoft server hardware requirements

The following table describes the minimum system requirements for Microsoft Servers.

Table 1. Minimum system requirements for Microsoft servers

Component	Requirement
CPU	1.4 GHz 64-bit processor
RAM	3 GB
Disk Space	32 GB or greater

The following table lists the virtual computing resources for each NetScaler VPX instance.

Table 2. Minimum virtual computing resources required for running a NetScaler VPX instance

Component	Requirement
RAM	2 GB
Virtual CPU	2
Disk Space	20 GB
Virtual Network Interfaces	1

Download the NetScaler VPX setup files

The NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. You can download the files from the Citrix website. You need a Citrix account to log in. If you do not have a Citrix account, access the home page at http://www.citrix.com, click **Sign In > My account > Create Citrix Account**, and follow the instructions to create a Citrix account.

To download the NetScaler VPX instance setup files, follow these steps:

1. In a web browser, go to http://www.citrix.com/.
2. Sign in with your user name and password.
3. Click **Downloads**.
4. In **Select a Product** drop-down menu, select **Citrix ADC (NetScaler ADC)**.
5. Under **NetScaler ADC Release X.X > Virtual Appliances**, click **NetScaler VPX Release X.X**
6. Download the compressed file to your server.

Install the NetScaler VPX instance on Microsoft servers

After you have enabled the Hyper-V role on Microsoft Server and extracted the virtual appliance files, you can use Hyper-V Manager to install NetScaler VPX instance. After you import the virtual machine, you need to configure the virtual NICs by associating them to the virtual networks created by Hyper-V.

You can configure a maximum of eight virtual NICs. Even if the physical NIC is DOWN, the virtual appliance assumes that the virtual NIC is UP, because it can still communicate with the other virtual appliances on the same host (server).

> **Note**
>
> You cannot change any settings while the virtual appliance is running. Shut down the virtual appliance and then make changes.

To install NetScaler VPX instance on Microsoft Server by using Hyper-V Manager:

1. To start Hyper-V Manager, click **Start**, point to **Administrative Tools**, and then click **Hyper-V Manager**.
2. In the navigation pane, under **Hyper-V Manage**r, select the server on which you want to install NetScaler VPX instance.
3. On the **Action** menu, click **Import Virtual Machin**e.
4. In the **Import Virtual Machine** dialog box, in **Location**, specify the path of the folder that contains the NetScaler VPX instance software files, and then select **Copy the virtual machine (create a new unique ID)**. This folder is the parent folder that contains the Snapshots, Virtual Hard Disks, and Virtual Machines folders.
5. Note: If you received a compressed file, make sure that you extract the files into a folder before you specify the path to the folder.
6. Click **Import**.
7. Verify that the virtual appliance that you imported is listed under **Virtual Machines**.
8. To install another virtual appliance, repeat steps **2** through **6**.

> **Important**
>
> Make sure that you extract the files to a different folder in step **4**.

Auto-provision a NetScaler VPX instance on Hyper-V

Auto-provisioning of NetScaler VPX instance is optional. If auto-provisioning is not done, the virtual appliance provides an option to configure the IP address and so on.

To auto-provision NetScaler VPX instance on Hyper-V, follow these steps.

1. Create an ISO9660 compliant ISO image using the xml file as depicted in the example. Make sure that the name of the xml file is **userdata**.

<?xml version=”1.0” encoding=”UTF-8” standalone=”no”?>

<Environment xmlns:oe="`http://schemas.dmtf.org/ovf/environment/1`”

xmlns:xsi="`http://www.w3.org/2001/XMLSchema-instance`”

oe:id=””

xmlns="`http://schemas.dmtf.org/ovf/environment/1`”>

<PlatformSection>

<Kind>HYPER-V</Kind>

<Version>2013.1</Version>

<Vendor>CISCO</Vendor>

<Locale>en</Locale>

```
</PlatformSection>

<PropertySection>

<Property oe:key=”com.citrix.netscaler.ovf.version” oe:value=”1.0”/>

<Property oe:key=”com.citrix.netscaler.platform” oe:value=”NS1000V”/>

<Property oe:key=”com.citrix.netscaler.orch_env” oe:value=”cisco-orch-env”/>

<Property oe:key=”com.citrix.netscaler.mgmt.ip” oe:value=”10.102.100.122”/>

<Property oe:key=”com.citrix.netscaler.mgmt.netmask” oe:value=”255.255.255.128”/>

<Property oe:key=”com.citrix.netscaler.mgmt.gateway” oe:value=”10.102.100.67”/></PropertySection>

</Environment>
```

2. Copy the ISO image to hyper-v server.

3. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**. You can also select the virtual appliance and then right click and select **Settings**. The **Settings** window for the selected virtual appliance is displayed.

4. In the **Settings** window, under the hardware section, click on **IDE Controller**.

5. In the right window pane, select **DVD Drive** and click **Add**. The DVD Drive is added under the **IDE Controller** section in the left window pane.

6. Select the **DVD Drive** added in step 5. In the right window pane, select the **Image file** radio button and click on Browse and select the ISO image that you copied on Hyper-V server,
in step 2.

7. Click **Apply**.

> **Note**
>
> The virtual appliance instance comes up in the default IP address, when:
>
> - The DVD drive is attached and the ISO file is not provided.
> - The ISO file does not include the user data file.
> - The user data file name or format is not correct.

To configure virtual NICs on the NetScaler VPX instance, follow these steps:

1. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**.
2. In the **Settings for <virtual appliance name>** dialog box, click **Add Hardware** in the left pane.
3. In the right pane, from the list of devices, select **Network Adapter**.
4. Click **Add**.
5. Verify that **Network Adapter (not connected)** appears in the left pane.
6. Select the network adapter in the left pane.

7. In the right pane, from the **Network** drop-down menu, select the virtual network to connect the adapter to.
8. To select the virtual network for additional network adapters that you want to use, repeat steps **6** and **7**.
9. Click **Apply**, and then click **OK**.

To configure the NetScaler VPX instance:

1. Right-click the virtual appliance that you previously installed, and then select **Start**.
2. Access the console by double-clicking the virtual appliance.
3. Type the NetScaler IP address, subnet mask, and gateway for your virtual appliance.

You have completed the basic configuration of your virtual appliance. Type the IP address in a Web browser to access the virtual appliance.

> **Note**
>
> You can also use virtual machine (VM) template to provision NetScaler VPX instance using SCVMM.
>
> If you use Microsoft Hyper-V NIC teaming solution with NetScaler VPX instances, see article CTX224494 for more information.

Install a NetScaler VPX instance on Linux-KVM platform

September 21, 2020

To set up a NetScaler VPX for the Linux-KVM platform, you can use the graphical Virtual Machine Manager (Virt-Manager) application. If you prefer the Linux-KVM command line, you can use the virsh program.

The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. The number of virtual machines (VMs) that can be deployed on the hypervisor depends on the application requirement and the chosen hardware.

After you provision a NetScaler VPX instance, you can add additional interfaces.

Limitations and usage guidelines

General recommendations

To avoid unpredictable behavior, apply the following recommendations:

- Do not change the MTU of the vnet interface associated with the VPX VM. Shut down the VPX VM before modifying any configuration parameters, such as Interface modes or CPU.
- Do not force a shutdown of the VPX VM. That is, do not use the **Force off** command.

- Any configurations done on the host Linux might or might not be persistent, depending on your Linux distribution settings. You can choose to make these configurations persistent to ensure consistent behavior across reboots of host Linux operating system.
- The NetScaler package has to be unique for each of the NetScaler VPX instance provisioned.

Limitations

- Live migration of a VPX instance that runs on KVM is not supported.

Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform

March 30, 2021

Check the minimum system requirements for a Linux-KVM serves running a NetScaler VPX instance.

CPU requirement:

- 64-bit x86 processors with the hardware virtualization features included in the AMD-V and Intel VT-X processors.

To test whether your CPU supports Linux host, enter the following command at the host Linux shell prompt:

```
*.egrep'^flags.*(vmx|svm)'/proc/cpuinfo*
<!--NeedCopy-->
```

If the BIOS settings for the above extension are disabled, you must enable them in BIOS.

- Provide at least 2 CPU cores to Host Linux.
- There is no specific recommendation for processor speed, but higher the speed, the better the performance of the VM application.

Memory (RAM) requirement:

Minimum 4 GB for the host Linux kernel. Add additional memory as required by the VMs.

Hard disk requirement:

Calculate the space for Host Linux kernel and VM requirements. A single NetScaler VPX VM requires 20 GB of disk space.

Software requirements

The Host kernel used must be a 64-bit Linux kernel, release 2.6.20 or later, with all virtualization tools. Citrix recommends newer kernels, such as 3.6.11-4 and later.

Many Linux distributions such as Red Hat, Centos, and Fedora, have tested kernel versions and associated virtualization tools.

Guest VM hardware requirements

NetScaler VPX supports IDE and virtIO hard disk type. The Hard Disk Type has been configured in the XML file, which is a part of the NetScaler package.

Networking requirements

NetScaler VPX supports virtIO para-virtualized, SR-IOV, and PCI Passthrough network interfaces.

For more information about the supported network interfaces, see:

- Provision the NetScaler VPX instance by using the Virtual Machine Manager
- Configure a NetScaler VPX instance to use SR-IOV network interfaces
- Configure a NetScaler VPX instance to use PCI passthrough network interfaces

Source Interface and Modes

The source device type can be either Bridge or MacVTap. In case of MacVTap, four modes are possible - VEPA, Bridge, Private and Pass-through.
Check the types of interfaces that you can use and the supported traffic types, as given below.

Bridge:

- Linux Bridge.
- Ebtables and iptables settings on host Linux might filter the traffic on the bridge if you do not choose the correct setting or disable IPtable services.

MacVTap (VEPA mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same
- lower device is possible only if upstream or downstream switch supports VEPA mode.

MacVTap (private mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.

- Inter-VM communication using the same lower device is not possible.

MacVTap (bridge mode):

- Better as compared to bridge.
- Interfaces out of same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible, if lower device link is UP.

MacVTap (Pass-through mode):

- Better as compared to bridge.
- Interfaces out of same lower device cannot be shared across the VMs.
- Only one VM can use the lower device.

> Note: For best performance by the VPX instance, ensure that the gro and lro capabilities are switched off on the source interfaces.

Properties of source interfaces

Make sure that you switch off the generic-receive-offload (gro) and large-receive-offload (lro) capabilities of the source interfaces. To switch off the gro and lro capabilities, run the following commands at the host Linux shell prompt.

ethtool -K eth6 gro off

ethool -K eth6 lro off

Example:

```
    [root@localhost ~]# ethtool -K eth6

                    Offload parameters for eth6:

                                    rx-checksumming: on

                                    tx-checksumming: on

                    scatter-gather: on

                    tcp-segmentation-offload: on

                    udp-fragmentation-offload: off

                    generic-segmentation-offload: on

                    generic-receive-offload: off

```

```
                     large-receive-offload: off

                     rx-vlan-offload: on

                     tx-vlan-offload: on

                     ntuple-filters: off

                     receive-hashing: on

    [root@localhost ~]#
<!--NeedCopy-->
```

Example:

If the host Linux bridge is used as a source device, as in the following example, gro and lro capabilities must be switched off on the vnet interfaces, which are the virtual interfaces connecting the host to the guest VMs.

```
    [root@localhost ~]# brctl show eth6_br

    bridge name     bridge  id               STP enabled interfaces

    eth6_br         8000.00e0ed1861ae          no          eth6

                                                          vnet0

                                                          vnet2

    [root@localhost ~]#
<!--NeedCopy-->
```

In the above example, the two virtual interfaces are derived from the eth6_br and are represented as vnet0 and vnet2. Run the following commands to switch off gro and lro capabilities on these interfaces.

```
    ethtool -K vnet0 gro off
            ethtool -K vnet2 gro off
            ethtool -K vnet0 lro off
                     ethtool -K vnet2 lro off
<!--NeedCopy-->
```

Promiscuous mode

The promiscuos mode has to be enabled for the following features to work:

- L2 mode
- Multicast traffic processing
- Broadcast
- IPV6 traffic
- Virtual MAC
- Dynamic routing

Use the following command to enable the promicuous mode.

```
    [root@localhost ~]# ifconfig eth6 promisc
    [root@localhost ~]# ifconfig eth6
    eth6       Link encap:Ethernet  HWaddr 78:2b:cb:51:54:a3
              inet6 addr: fe80::7a2b:cbff:fe51:54a3/64 Scope:Link
              UP BROADCAST RUNNING PROMISC MULTICAST  MTU:9000  Metric:1
              RX packets:142961 errors:0 dropped:0 overruns:0 frame:0
              TX packets:2895843 errors:0 dropped:0 overruns:0 carrier:0
              collisions:0 txqueuelen:1000
              RX bytes:14330008 (14.3 MB)  TX bytes:1019416071 (1.0 GB)

    [root@localhost ~]#
<!--NeedCopy-->
```

Module required

For better network performance, make sure the vhost_net module is present in the Linux host. To check the existence of vhost_net module, run the following command on the Linux host :

```
lsmod | grep "vhost\_net"
<!--NeedCopy-->
```

If vhost_net is not yet running, enter the following command to run it:

```
modprobe vhost\_net
<!--NeedCopy-->
```

Provision the NetScaler VPX instance by using OpenStack

September 21, 2020

You can provision a NetScaler VPX instance in an Openstack environment either by using the Nova boot command (OpenStack CLI) or Horizon (OpenStack dashboard) .

Provisioning a VPX instance, optionally involves using data from the config drive. Config drive is a special configuration drive that attaches to the instance as a CD-ROM device when it boots. This configuration drive can be used to pass networking configuration such as management IP address, network mask, default gateway, and to inject customer scripts.

In a NetScaler appliance, the default authentication mechanism is password based. Now, SSH keypair authentication mechanism is supported for NetScaler VPX instances on OpenStack environment.

The key-pair (public key and private key) needs to be generated before using Public Key Cryptography mechanism. You can use different mechanisms, such as Horizon, Puttygen.exe for Windows, and ssh-keygen for Linux environment, to generate the key pair. Refer to online documentation of respective mechanisms for more information about generating key pair.

Once a key pair is available, copy the private key to a secure location to which authorized persons will have access. In OpenStack, public key can be deployed on a VPX instance by using Horizon or Nova boot command. When a VPX instance is provisioned by using OpenStack, it first detects that the instance is booting in an OpenStack environment by reading a specific BIOS string. This string is "OpenStack Foundation" and for Red Hat Linux distributions it is stored in /etc/nova/release. This is a standard mechanism that is available in all OpenStack implementations based on KVM hypervisor platform. The drive should have a specific OpenStack label.

If the config drive is detected, the instance attempts to read the network configuration, custom scripts, and SSH key pair if provided.

Userdata file

The NetScaler VPX instance uses a customized OVF file, also known as userdata file, to inject network configuration, custom scripts. This file is provided as part of config drive. Here is an example of a customized OVF file.

```
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
oe:id=""
xmlns="http://schemas.dmtf.org/ovf/environment/1"
xmlns:cs="http://schemas.citrix.com/openstack">
<PlatformSection>
```

```
<Kind></Kind>
<Version>2016.1</Version>
<Vendor>VPX</Vendor>
<Locale>en</Locale>
</PlatformSection>
<PropertySection>
<Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
<Property oe:key="com.citrix.netscaler.platform" oe:value="NSVPX"/>
<Property oe:key="com.citrix.netscaler.orch_env" oe:value="openstack-orch-env"/>
<Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.1.2.22"/>
<Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="255.255.255.0"/>
<Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.1.2.1"/>
</PropertySection>
 <cs:ScriptSection>
   <cs:Version>1.0</cs:Version>
     <ScriptSettingSection xmlns="http://schemas.citrix.com/openstack" xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
         <Scripts>
           <Script>
                 <Type>shell</Type>
                 <Parameter>X Y</Parameter>
                <Parameter>Z</Parameter>
                <BootScript>before</BootScript>
                  <Text>
                        #!/bin/bash
                        echo "Hi, how are you" $1 $2 >> /var/sample.txt
                  </Text>
           </Script>
           <Script>
                 <Type>python</Type>
                 <BootScript>after</BootScript>
                  <Text>
                       #!/bin/python
 print("Hello");
                  </Text>
           </Script>
   <Script>
                 <Type>perl</Type>
                 <BootScript>before</BootScript>
                  <Text>
                       !/usr/bin/perl
 my $name = "VPX";
 print "Hello, World $name !\n" ;
                  </Text>
           </Script>
           <Script>
                <Type>nscli</Type>
                <BootScript>after</BootScript>
                <Text>
                 add vlan 33
 bind vlan 33 -ifnum 1/2
                </Text>
           </Script>
         </Scripts>
     </ScriptSettingSection>
 </cs:ScriptSection>
</Environment>
```

In the OVF file above "PropertySection" is used for NetScaler networking configuration while <cs:ScriptSection> is used to enclose all scripts. <Scripts></Scripts> tags are used to bundle all scripts together. Each script is defined in between <Script> </Script> tags. Each script tag has following fields/tags:

a) <Type>: Specifies value for script type. Possible values: Shell/Perl/Python/NSLCI (for NetScaler CLI scripts)

b) <Parameter>: Provides parameters to the script. Each script can have multiple <Parameter> tags.

c) <BootScript>: Specifies script execution point. Possible values for this tag: before/after. "before" specifies script will be executed before PE comes up. "after" specifies that the script will be executed after PE comes up.

d) <Text>: Pastes content of a script.

> **Note**
>
> Currently the VPX instance does not take care of sanitization of scripts. As an administrator, you should check the validity of the script.
>
> Not all sections need to be present. Use an empty "PropertySection" to only define scripts to execute on first boot or an empty <cs:ScriptSection> to only define networking configuration.
>
> After the required sections of the OVF file (userdata file) are populated, use that file to provision the VPX instance.

Network configuration

As part of network configuration, the VPX instance reads:

- Management IP address
- Network mask
- Default gateway

After the parameters are successfully read, they are populated in the NetScaler configuration, to allow managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16).

Customer script

The VPX instance allows to execute a custom script during initial provisioning. The appliance supports script of type Shell, Perl, Python, and NetScaler CLI commands.

SSH key pair authentication

The VPX instance copies public key, available within the configuration drive as part of instance meta data, into its "authorized_keys" file. This allows the user to access the instance with private key.

> **Note**
>
> When an SSH key is provided, the default credentials (nsroot/nsroot) no longer work. If password-based access is needed, log on with the respective SSH private key and manually set a password.

Before you begin

Before you provision a VPX instance on OpenStack environment, extract the .qcow2 file from the .tgz file and build

an OpenStack image from the qcow2 image. Follow these steps:

1. Extract the. qcow2 file from the .tqz file by typing the following command.

```
tar xvzf <TAR file>

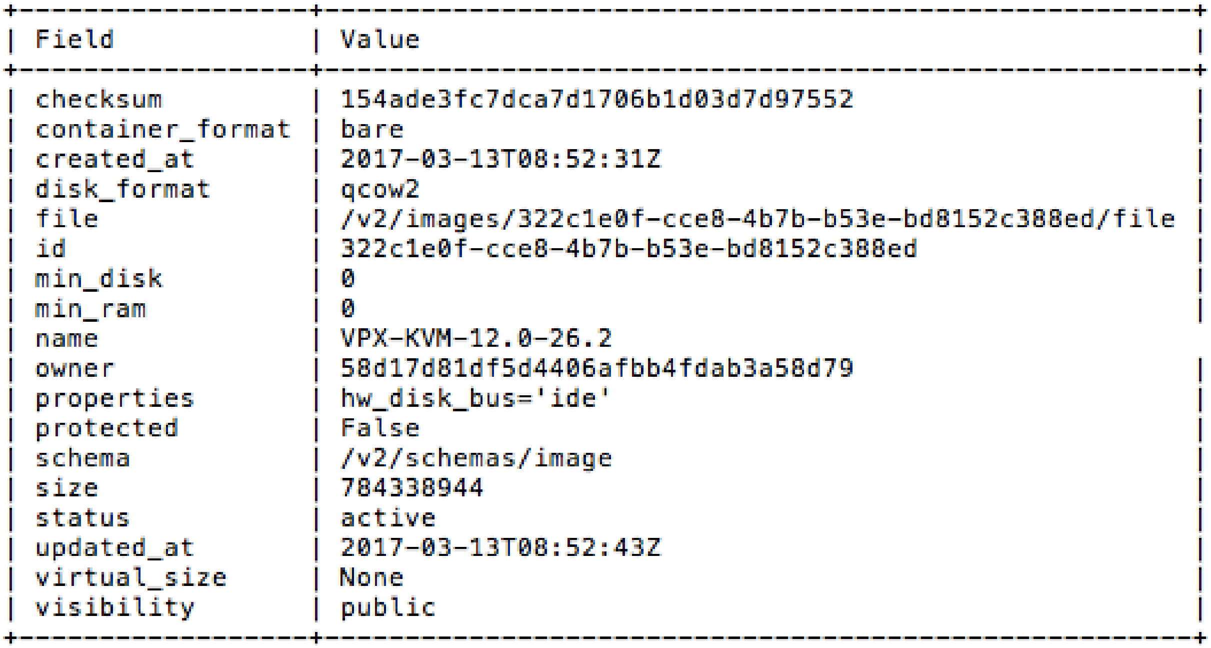
tar xvzf <NSVPX-KVM-12.0-26.2_nc.tgz>
NSVPX-KVM.xml
NSVPX-KVM-12.0-26.2_nc.qcow2
```

2. Build an OpenStack image using the .qcoz2 file extracted in step 1 by typing the following command.

```
openstack image create --container-format bare --property hw_disk_bus=ide --disk-format qcow2 --file <path to qcow2 file> --public <name of the OpenStack image>

glance image-create --name="NS-VPX-12-0-26-2" --property hw_disk_bus=ide --ispublic=
true --container-format=bare --disk-format=qcow2< NSVPX-KVM-12.0-26.2_nc.qcow2
```

Figure 1: The following illustration provides a sample output for the glance image-create command.



```
+------------------+------------------------------------------------------+
| Field            | Value                                                |
+------------------+------------------------------------------------------+
| checksum         | 154ade3fc7dca7d1706b1d03d7d97552                     |

```

Provisioning the VPX instance

You can provision a VPX instance in two ways by using one of the options:

- Horizon (OpenStack dashboard)
- Nova boot command (OpenStack CLI)

Provision a VPX instance by using the OpenStack dashboard

Follow these steps to provision the VPX instance by using Horizon:

1. Log on to the OpenStack dashboard.
2. In the Project panel on the left hand side of the dashboard, select **Instances**.
3. In the Instances panel, click **Launch Instance** to open the Instance Launching wizard.

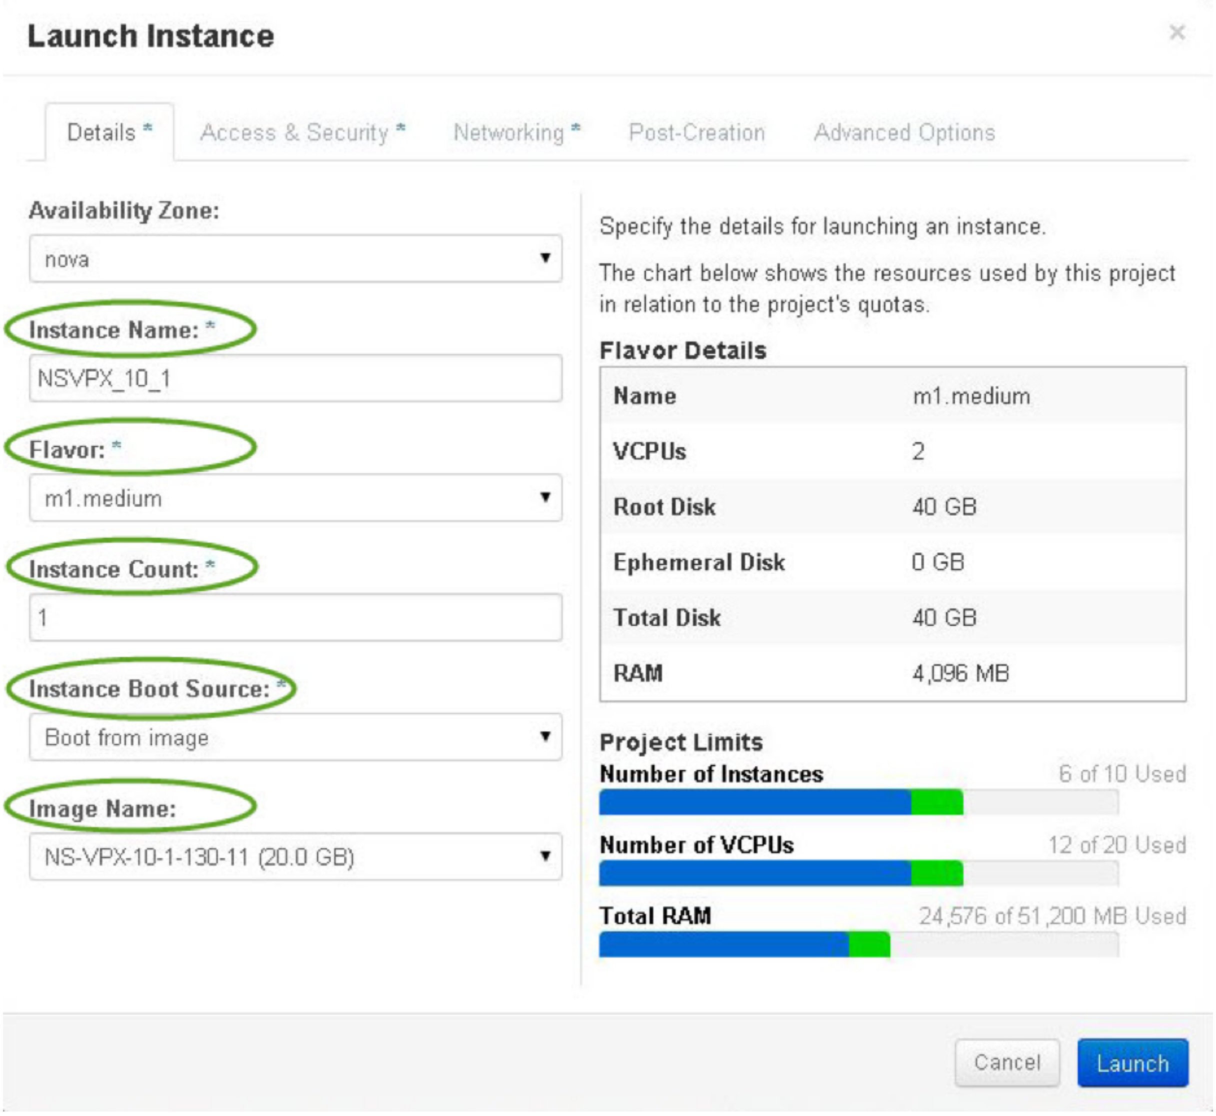
Displaying 3 items

4. In the Launch Instance wizard, fill in the details, like:

   1. Instance Name
   2. Instance Flavor
   3. Instance Count
   4. Instance Boot Source
   5. Image Name



Availability Zone: nova

Instance Name: * NSVPX_10_1

Flavor: * m1.medium

Instance Count: * 1

Instance Boot Source: * Boot from image

Image Name: NS-VPX-10-1-130-11 (20.0 GB)

Specify the details for launching an instance.

The chart below shows the resources used by this project in relation to the project's quotas.

Flavor Details

Name	m1.medium
VCPUs	2
Root Disk	40 GB
Ephemeral Disk	0 GB
Total Disk	40 GB
RAM	4,096 MB

Project Limits

Number of Instances 6 of 10 Used

Number of VCPUs 12 of 20 Used

Total RAM 24,576 of 51,200 MB Used

5. Deploy a new key pair or an existing key pair through Horizon by completing the following steps:

a) If you don't have an existing key pair, create the key by using any existing mechanisms. If you've an existing key, skip this step.

b) Copy the content of public key.

c) Go to **Horizon > Instances > Create New Instances**.

d) Click **Access & Security**.

e) Click the + sign next to the **Key Pair** drop-down menu and provide values for shown parameters.

f) Paste public key content in *Public key* box, give a name to the key and click **Import Key Pair**.

apRVOT6FB//yknwu+BSVF4v0oq3
```

Key Pairs are how you login to your instance after it is launched.

Choose a key pair name you will recognise and paste your SSH public key into the space provided.

SSH key pairs can be generated with the ssh-keygen command:

```
ssh-keygen -t rsa -f cloud.key
```

This generates a pair of keys: a key you keep private (cloud.key) and a public key (cloud.key.pub). Paste the contents of the public key file here.

After launching an instance, you login using the private key (the username might be different depending on the image you launched):

```
ssh -i cloud.key <username>@<instance_ip>
```

6. Click the **Post Creation** tab in the wizard. In Customization Script, add the content of the userdata file. The userdata file contains the IP address, Netmask and Gateway details, and customer scripts of the VPX instance.

7. After a key pair is selected or imported, check config-drive option and click **Launch**.

Provision the VPX instance by using OpenStack CLI

Follow these steps to provision a VPX instance by using OpenStack CLI.

1. To create an image from qcow2, type the following command:

```
openstack image create --container-format bare --property hw_disk_bus=ide --diskformat  qcow2 --file NSVPX-OpenStack.qcow2 --public VPX-ToT-Image
```

2. To select an image for creating an instance, type the following command:

```
openstack image list | more
```

3. To create an instance of a particular flavor, type the following command to choose a flavor ID/Name of from a list:

```
openstack flavor list
```

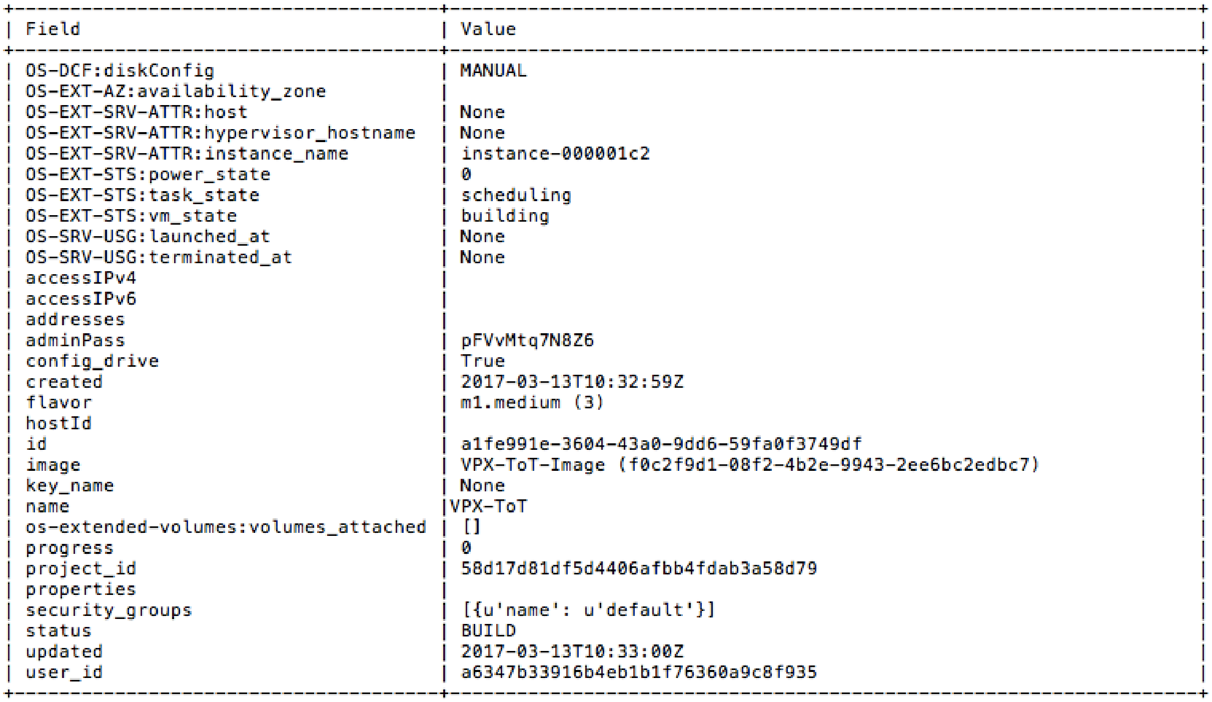
4. To attach a NIC to a particular network, type the following command to choose a network ID from a network list:

```
openstack network list
```

5. To create an instance, type the following command:

```
openstack server create --flavor FLAVOR_ID --image IMAGE_ID --key-name KEY_NAME
--user-data USER_DATA_FILE_PATH --config-drive True --nic net-id=net-uuid
INSTANCE_NAME
openstack server create --image VPX-ToT-Image --flavor m1.medium --user-data
ovf.xml --config-drive True --nic net-id=2734911b-ee2b-48d0-a1b6-3efd44b761b9
VPX-ToT
```

Figure 2: The following illustration provides a sample output.



```
+--------------------------------------+----------------------------------------------------------------------+
| Field                                | Value                                                                |

Provisioning the NetScaler Virtual Appliance by using the Virtual Machine Manager

September 21, 2020

The Virtual Machine Manager is a desktop tool for managing VM Guests. It enables you to create new VM Guests and various types of storage, and manage virtual networks. You can access the graphical console of VM Guests with the built-in VNC viewer and view performance statistics, either locally or remotely.

After installing your preferred Linux distribution, with KVM virtualization enabled, you can proceed with provisioning virtual machines.

Provisioning the NetScaler Virtual Appliance using the RAW Image

Using the Virtual Machine Manager, you can provision the NetScaler VPX using the RAW image.

To provision a NetScaler VPX by using Virtual Machine Manager, follow these steps.

1. Open the Virtual Machine Manager (**Application** > **System Tools** > **Virtual Machine Manager**) and enter the logon credentials in the **Authenticate** window.
2. Click the icon or right-click **localhost (QEMU)** to create a new NetScaler VPX instance.

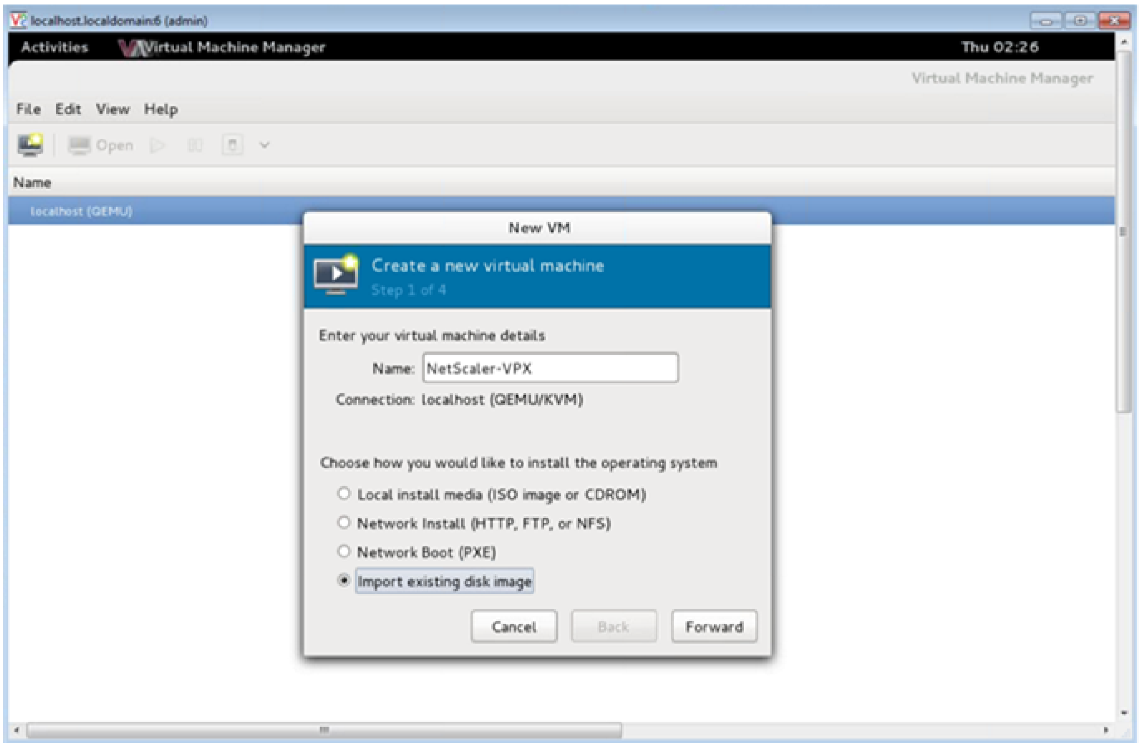
Disconnect
Delete
Details

3. In the **Name** text box, enter a name for the new VM (for example, NetScaler-VPX).
4. In the **New VM** window, under "Choose how you would like to install the operating system," select **Import existing disk image**, and then and click **Forward**.



localhost.localdomain6 (admin)

Device model: virtio

MAC address: 52:54:00:0d:22:cb

Source mode: Bridge

9. Click **Apply**, and then click **Begin Installation**. After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces

Provisioning the NetScaler Virtual Appliance by using the QCOW2 Image

Using the Virtual Machine Manager, you can provision the NetScaler VPX using the QCOW2 image.

Note: You can also convert the NetScaler VPX RAW image to QCOW2 image and provision the NetScaler VPX. For instructions to convert the RAW image to QCOW2, see Converting the RAW Image Format to a QCOW2 Image Format.

To provision the NetScaler VPX using QCOW2 image:

1. Follow **step 1** to **step 8** in Provisioning the NetScaler Virtual Appliance by using the RAW Image.
   Note: Make sure that you select **qcow2** image in **step 5**.
2. Select **Disk 1** and click **Advanced options**. Select **qcow2** from the Storage format drop-down list.

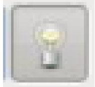
4. Click **Apply**, and then click **Begin Installation**. After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

Adding Additional Interfaces to NetScaler VPX by using Virtual Machine Manager

After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps:

1. Shut down the NetScaler VPX instance running on the KVM.
2. Right-click the VPX instance and choose **Open** from the pop-up menu.
3. Click the following icon in the header to view the virtual hardware details.



4/. Click **Add Hardware**. In the **Add New Virtual Hardware window**, select **Network** from the navigation menu

```
![image](/en-us/netscaler/media/hardware-network.png)
```

5/. In **Host Device** field, select the physical interface type. The host device type can be either Bridge or MacVTap. In case of MacVTap, four modes possible are VEPA, Bridge, Private and Pass-through.

```
1.  For Bridge
    1.  Host device – Select the "Specify shared device name" option.

    2.  Provide the Bridge name that is configured in the KVM host.

        Note: Make sure that you have configured a Linux bridge in the
            KVM host, bound the physical interface to the bridge, and
            put the bridge in the UP state.

        ![image](/en-us/netscaler/media/network-host-device.png)

    3.  Device model – virtio.

    4.  Click Finish.
2.  For MacVTap
    1.  Host device – Select the physical interface from the menu.

    2.  Device model – virtio.

        ![image](/en-us/netscaler/media/macvtap_image.jpg)

    3.  Click Finish. You can view the newly added NIC in the
       navigation pane.

        ![image](/en-us/netscaler/media/nic-finish.png)

    4.  Select the newly added NIC and select the Source mode for this
       NIC. The available modes are VEPA, Bridge, Private, and
       Passthrough. For more details on the interface and modes, see
       Source Interface and Modes.

    5.  Click Apply.
```

6/. Start the NetScaler VPX VM.

> **Important**
>
> Limition: Interface parameter configurations such as speed, duplex, and autonegotiation are not supported.

Converting the RAW Image Format to a QCOW2 Image Format

You can convert the NetScaler VPX RAW image to QCOW2 image and provision the NetScaler VPX. To convert the RAW image to QCOW2 image. At the command prompt, enter the following command:

qemu-img convert -O qcow2 original-image.raw image-converted.qcow

For example:
qemu-img convert -O qcow2 NSVPX-KVM-11.1-12.5_nc.raw NSVPX-KVM-11.1-12.5_nc.qcow

Configure a NetScaler VPX instance to use SR-IOV network interfaces

September 21, 2020

You can use the Virtual Machine Manager to configure a NetScaler VPX instance running on Linux-KVM to use single root I/O virtualization (SR-IOV) network interfaces with Intel 82599 10G NIC and X710 10G and XL710 40G NICs.

This section describes how to:

- Configure a NetScaler VPX Instance to Use SR-IOV Network Interface
- Configure Static LA/LACP on the SR-IOV Interface
- Configure VLAN on the SR-IOV Interface

Limitations

Keep the limitations in mind while using Intel 82599, X710, XL710 NICs. The following features not supported.

Limitations for Intel 82599 NICs:

- L2 mode switching
- Admin partitioning (shared VLAN mode)
- High availability (active-active mode
- Jumbo Frames.
- IPv6: You can configure only up to 30 unique IPv6 addresses in a VPX instance if you've alteast one SR-IOV interface.
- VLAN configuration on Hypervisor for SRIOV VF interface through "ip link" command is not supported.
- Interface parameter configurations such as speed, duplex, and autonegotiations are not supported.

Limitations for X710 10G and XL710 40G NICs:

- L2 mode switching.
- In a cluster, Jumbo Frames are not supported when the XL710 NIC is used as a data interface.
- Interface list re-orders when interfaces are disconnected and reconnected.
- Interface parameter configurations such as speed, duplex, and auto negotiations are not supported.
- Interface name is 40/X for both XL710 and X710 NICs
- Up to 16 Intel XL710/X710 SRIOV or PCI Passthrough interfaces can be supported on a VPX instance.

> Note: For IPv6 to work with X710 10G and XL710 40G NICs, you need to enable trust mode on the Virtual Functions (VFs) by typing the following command on the KVM host:

```
## ip link set <PNIC> <VF> trust on
```

For example:

```
## ip link set ens785f1 vf 0 trust on
```

Prerequisites

Before you configure a NetScaler VPX instance to use SR-IOV network interfaces, complete the following prerequisite tasks. See the NIC column for details about about how to complete the corresponding tasks.

Task	82599 NIC	X710 and XL710 NICs
1. Add the NIC to the KVM host.	-	-
2. Download and install the latest Intel driver.	IXGBE driver	I40E driver
3. Blacklist the driver on the KVM host.	Add the following entry in the /etc/modprobe.d/blacklist.conf file: *blacklist ixgbevf*. Use IXGBE driver version 4.3.15 (recommended).	Add the following entry in the /etc/modprobe.d/blacklist.conf file: *blacklist i40evf*.Use i40e driver version 2.0.26 (recommended).

Task	82599 NIC	X710 and XL710 NICs
4.Enable SR-IOV Virtual Functions (VFs) on the KVM host. In both the commands in the next two columns: *number_of_VFs* =the number of Virtual VFs that you want to create. *device_name* =the interface name.	If you are using earlier version of kernel 3.8, then add the following entry to the /etc/modprobe.d/ixgbe file and restart the KVM host: *options ixgbe max_vfs=*.If you are using kernel 3.8 version or later, create VFs using the following command: *echo > /sys/class/net//device/sriov_numvfs*. See example in figure 1.	If you are using earlier version of kernel 3.8, then add the following entry to the /etc/modprobe.d/i40e.conf file and restart the KVM host:*options i40e max_vfs=*.If you are using kernel 3.8 version or later, create VFs using the following command: *echo > /sys/class/net//device/sriov_numvfs*.See example in figure 2.
5. Make the VFs persistent by adding the commands that you used to create VFs, to the rc.local file.	See example in figure 3.	See example in figure 3.

> **Important**
>
> When you are create the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

Configure static LA/LACP on the SR-IOV interface

> **Important**
>
> When you are creating the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

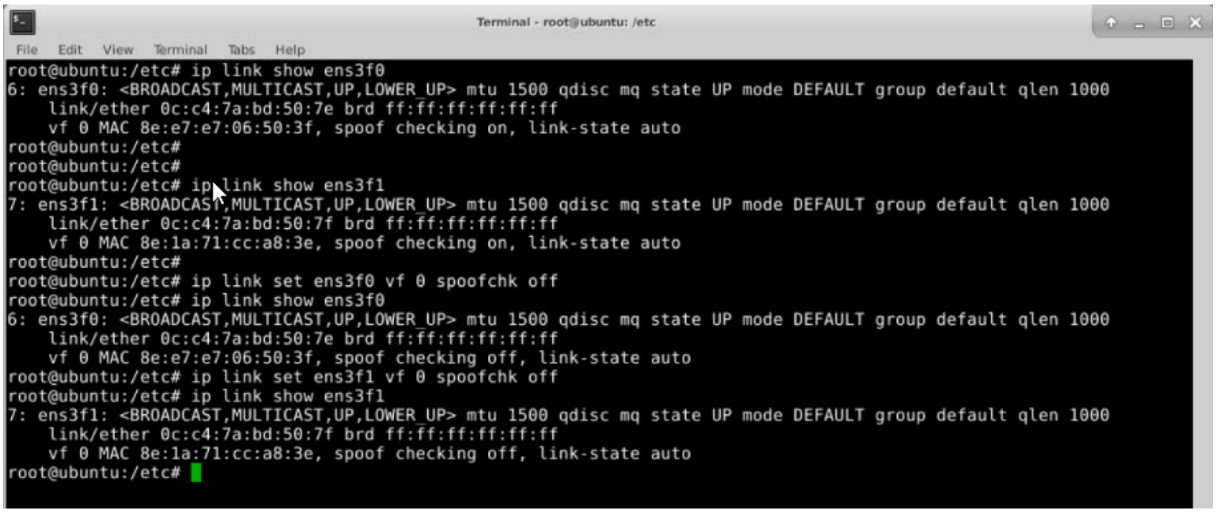
To use the SR-IOV VFs in link aggregation mode, disable spoof checking for VFs that you have created. On the KVM host, use the following command to disable spoof checking:

`*ip link set \<interface\\_name\> vf \<VF\\_id\> spoofchk off*`

Where:

- Interface_name – is the interface name.
- VF_id – is the Virtual Function id.

For example:



```
root@ubuntu:/etc# ip link show ens3f0
6: ens3f0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP mode DEFAULT group default qlen 1000
    link/ether 0c:c4:7a:bd:50:7e brd ff:ff:ff:ff:ff:ff
    vf 0 MAC 8e:e7:e7:06:50:3f, spoof checking on, link-state auto
root@ubuntu:/etc#
root@ubuntu:/etc#
root@ubuntu:/etc# ip link show ens3f1
7: ens3f1: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP mode DEFAULT group default qlen 1000
    link/ether 0c:c4:7a:bd:50:7f brd ff:ff:ff:ff:ff:ff
    vf 0 MAC 8e:1a:71:cc:a8:3e, spoof checking on, link-state auto
root@ubuntu:/etc#
root@ubuntu:/etc# ip link set ens3f0 vf 0 spoofchk off
root@ubuntu:/etc# ip link show ens3f0
6: ens3f0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP mode DEFAULT group default qlen 1000
    link/ether 0c:c4:7a:bd:50:7e brd ff:ff:ff:ff:ff:ff
    vf 0 MAC 8e:e7:e7:06:50:3f, spoof checking off, link-state auto
root@ubuntu:/etc# ip link set ens3f1 vf 0 spoofchk off
root@ubuntu:/etc# ip link show ens3f1
7: ens3f1: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP mode DEFAULT group default qlen 1000
    link/ether 0c:c4:7a:bd:50:7f brd ff:ff:ff:ff:ff:ff
    vf 0 MAC 8e:1a:71:cc:a8:3e, spoof checking off, link-state auto
root@ubuntu:/etc#
```

After you disable spoof checking for all the VFs that you have created. Restart the NetScaler VPX instance and configure link aggregation. For detailed instructions, see Configure Link Aggregation.

Configuring VLAN on the SR-IOV Interface

You can configure VLAN on SR-IOV VFs. For detailed instructions, see Configuring a VLAN.

> **Important**
>
> Ensure that the KVM host does not contain VLAN settings for the VF interface.

Configure a NetScaler VPX instance to use PCI passthrough network interfaces

September 21, 2020

After you have installed and configured a NetScaler VPX instance on the Linux-KVM platform, you can use the Virtual Machine Manager to configure the virtual appliance to use PCI passthrough network interfaces.

Prerequisites

- The firmware version of the Intel XL710 Network Interface Card (NIC) on the KVM Host is 5.04.
- The KVM Host supports input–output memory management unit (IOMMU) and Intel VT-d, and they are enabled in the BIOS of the KVM Host. On the KVM Host, to enable IOMMU, add the following entry to the **/boot/grub2/grub.cfg** file:
  intel_iommu=1

- Execute the following command and reboot the KVM Host:
  Grub2-mkconfig –o /boot/grub2/grub.cfg

To configure NetScaler VPX instances to use PCI passthrough network interfaces by using the Virtual Machine Manager:

1. Power off the NetScaler VPX instance.

2. Select the NetScaler VPX instance and click **Open**.

Provision the NetScaler VPX instance by using the virsh program

September 21, 2020

The virsh program is a command line tool for managing VM Guests. Its functionality is similar to that of Virtual Machine Manager. It enables you to change a VM Guest's status (start, stop, pause, and so on), to set up new Guests and devices, and to edit existing configurations. The virsh program is also useful for scripting VM Guest management operations.

To provision NetScaler VPX by using the virsh program, follow these steps:

1. Use the tar command to untar the the NetScaler VPX package. The NSVPX-KVM-*_nc.tgz package contains following components:

   - The Domain XML file specifying VPX attributes [NSVPX-KVM-*_nc.xml]
   - Check sum of NS-VM Disk Image [Checksum.txt]
   - NS-VM Disk Image [NSVPX-KVM-*_nc.raw]

   Example:

   ```
   tar -xvzf NSVPX-KVM-10.1-117_nc.tgz
   NSVPX-KVM-10.1-117_nc.xml
   NSVPX-KVM-10.1-117_nc.raw
   checksum.txt
   <!--NeedCopy-->
   ```

2. Copy the NSVPX-KVM-*_nc.xml XML file to a file named <DomainName>-NSVPX-KVM-*_nc.xml. The <DomainName> is also the name of the virtual machine. Example:

```
cp NSVPX-KVM-10.1-117_nc.xml NetScaler-VPX-NSVPX-KVM-10.1-117_nc.
   xml
<!--NeedCopy-->
```

3. Edit the <DomainName>-NSVPX-KVM-*_nc.xml file to specify the following parameters:

   - name— Specify the name.
   - mac— Specify the MAC address.
     Note: The domain name and the MAC address have to be unique.
   - sourcefile— Specify the absolute disk-image source path. The file path has to be absolute. You can specify the path of the RAW image file or a QCOW2 image file.
     If you want to specify a RAW image file, specify the disk image source path as shown in the following example:

   Example:
<name>NetScaler-VPX</name>
<mac address='52:54:00:29:74:b3'/>
<source file='/root/NSVPX-KVM-10.1-117_nc.raw'/>

   Specify the absolute QCOW2 disk-image source path and define the driver type as **qcow2**, as shown in the following example:

   Example:
<name>NetScaler-VPX</name>
<mac address='52:54:00:29:74:b3'/>
<driver name ='qemu' type='qcow2'/>
<source file='/root/NSVPX-KVM-10.1-117_nc.qcow'/>

4. Edit the <DomainName>-NSVPX-KVM-*_nc.xml file to configure the networking details:

   - source dev— specify the interface.
   - mode— specify the mode. The default interface is **Macvtap Bridge**.

   Example: Mode: MacVTap Bridge Set target interface as ethx and mode as bridge Model type as virtio

```
  <interface type='direct'>
      <mac address='52:54:00:29:74:b3'/>
      <source dev='eth0' mode='bridge'/>
      <target dev='macvtap0'/>
      <model type='virtio'/>
      <alias name='net0'/>
      <address type='pci' domain='0x0000' bus='0x00' slot='0x03'
         function='0x0'/>
```

```
    </interface>
<!--NeedCopy-->
```

Here, eth0 is the physical interface attached to the VM.

5. Define the VM attributes in the <DomainName>-NSVPX-KVM-*_nc.xml file by using the following command: virsh define <DomainName>-NSVPX-KVM-*_nc.xml Example:

```
virsh define NS-VPX-NSVPX-KVM-10.1-117_nc.xml
<!--NeedCopy-->
```

Start the VM by entering following command: virsh start [<DomainName>	<DomainUUID>] Example:

```
virsh start NetScaler-VPX
<!--NeedCopy-->
```

Connect the Guest VM through the console virsh console [<DomainName>	<DomainUUID>	<DomainID>] Example:

```
virsh console NetScaler-VPX
<!--NeedCopy-->
```

Add additional interfaces to NetScaler VPX instance using virsh program

After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps:

1. Shut down the NetScaler VPX instance running on the KVM.

Edit the <DomainName>-NSVPX-KVM-*_nc.xml file using the command: virsh edit [<DomainName>	<DomainUUID>]

2.

3. In the <DomainName>-NSVPX-KVM-*_nc.xml file, append the following parameters:

a) **For MacVTap**

- Interface type— Specify the interface type as 'direct'.
- Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
- source dev— Specify the interface name.
- mode— Specify the mode; the modes supported are - Bridge, VEPA, Private, and Pass-through
- model type— Specify the model type as virtio

Example:

Mode: MacVTap Pass-through

Set target interface as
ethx, Mode as
bridge, and model type as
virtio

```
<interface type='direct'>
      <mac address='52:54:00:29:74:b3'/>
      <source dev='eth1' mode='passthrough'/>
      <model type='virtio'/>
 </interface>
<!--NeedCopy-->
```

Here eth1 is the physical interface attached to the VM.

b) **For Bridge Mode**

Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

- Interface type— Specify the interface type as 'bridge'.
- Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
- source bridge— Specify the bridge name.
- model type— Specify the model type as virtio

Example: Bridge Mode

```
<interface type='bridge'>
      <mac address='52:54:00:2d:43:a4'/>
      <source bridge='br0'/>
      <model type='virtio'/>
 </interface>
<!--NeedCopy-->
```

Manage the NetScaler VPX guest VMs

September 21, 2020

You can use the Virtual Machine Manager and the virsh program to perform management tasks such as starting or stopping a VM Guest, setting up new guests and devices, editing existing configurations, and connecting to the graphical console through Virtual Network Computing (VNC).

Manage the VPX guest VMs by using Virtual Machine Manager

- List the VM guests

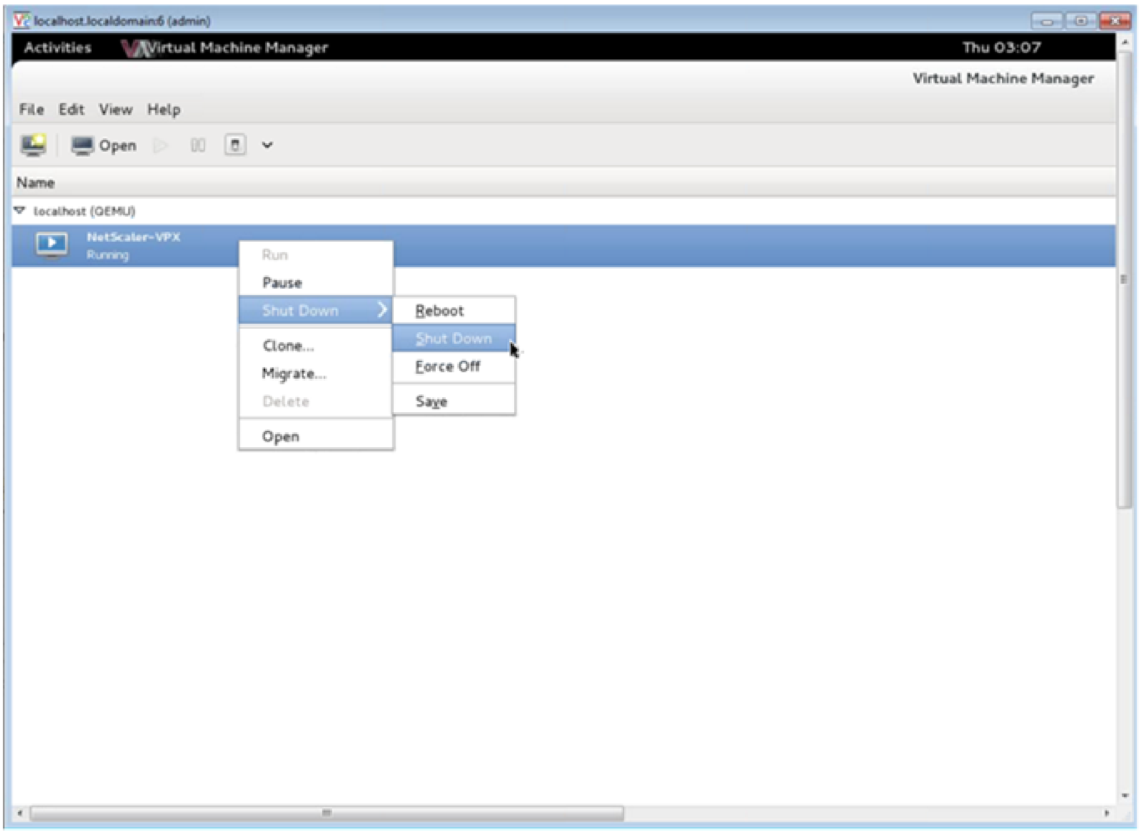
  The main Window of the Virtual Machine Manager displays a list of all the VM Guests for each VM host server it is connected to. Each VM Guest entry contains the virtual machine's name, along with its status (Running, Paused, or Shutoff) displayed as icon.

- Open a graphical console

  Opening a Graphical Console to a VM Guest enables you to interact with the machine like you would with a physical host through a VNC connection. To open the graphical console in the Virtual Machine Manager, right-click the VM Guest entry and select the Open option from the pop-up menu.

- Start and shut down a guest

  You can start or stop a VM Guest from the Virtual Machine Manager. To change the state of the VM, right-click the VM Guest entry and select Run or one of the Shut Down options from the pop-up menu.



localhost.localdomain6 (admin)

Open
Name
localhost (QEMU)
NetScaler-VPX
Running
Run
Pause
Shut Down
Clone...
Migrate...
Delete
Open
Reboot
Shut Down
Force Off
Save

- Reboot a guest

  You can reboot a VM Guest from the Virtual Machine Manager. To reboot the VM, right-click the VM Guest entry, and then select Shut Down > Reboot from the pop-up menu.

- Delete a guest

  Deleting a VM Guest removes its XML configuration by default. You can also delete a guest's storage files. Doing so completely erases the guest.

  1. In the Virtual Machine Manager, right-click the VM Guest entry.
  2. Select Delete from the pop-up menu. A confirmation window opens.
     Note: The Delete option is enabled only when the VM Guest is shut down.
  3. Click Delete.
  4. To completely erase the guest, delete the associated .raw file by selecting the Delete Associated Storage Files check box.

Manage the NetScaler VPX guest VMs using the virsh program

- List the VM Guests and their current states.

  To use virsh to display information about the Guests
  virsh list –all

The command output displays all domains with their states.
Example output:

```
Id Name                     State
----------------------------------
  0 Domain-0              running
  1 Domain-1              paused
  2 Domain-2              inactive
  3 Domain-3              crashed
<!--NeedCopy-->
```

- Open a virsh console.

  Connect the Guest VM through the console
  virsh console [<DomainID> | <DomainName> | <DomainUUID>]
  Example:
  virsh console NetScaler-VPX

- Start and shut down a guest.

  Guests can be started using the DomainName or Domain-UUID.
  virsh start [<DomainName> | <DomainUUID>]
  Example
  virsh start NetScaler-VPX

  To shut down a guest:
  virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
  Example:
  virsh shutdown NetScaler-VPX

- Reboot a guest

  virsh reboot [<DomainID> | <DomainName> | <DomainUUID>]
  Example:
  virsh reboot NetScaler-VPX

  Delete a guest

  To delete a Guest VM you need to shut-down the Guest and un-define the <DomainName>-NSVPX-KVM-*_nc.xml before you run the delete command.

```
virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
virsh undefine [<DomainName> | <DomainUUID>]

<!--NeedCopy-->
```

  Example:

```
virsh shutdown NetScaler-VPX
virsh undefine NetScaler-VPX

<!--NeedCopy-->
```

Note: The delete command doesn't remove disk image file which needs to be removed manually.

Deploy a NetScaler VPX instance on AWS

September 21, 2020

You can launch a Citrix NetScaler VPX instance on Amazon Web Services (AWS). The NetScaler VPX appliance is available as an Amazon Machine Image (AMI) in AWS marketplace. A NetScaler VPX instance on AWS enables customer like you to leverage AWS Cloud computing capabilities and use NetScaler load balancing and traffic management features for their business needs. The VPX instance supports all the traffic management features of a physical NetScaler appliance, and they can be deployed as standalone instances or in HA pairs.

This section includes the following topics:

- AWS terminology
- How a NetScaler VPX instance on AWS works
- Supported instance type, ENI, and IP addresses

AWS terminology

Here is a brief description of the terms used in this document. For more information, see AWS Glossary.

Term	Defintion
Amazon Machine Image (AMI)	A machine image, which provides the information required to launch an instance, which is a virtual server in the cloud.
Elastic Block Store	Provides persistent block storage volumes for use with Amazon EC2 instances in the AWS Cloud.
Simple Storage Service (S3)	Storage for the Internet. It is designed to make web-scale computing easier for developers.

Term	Defintion
Elastic Compute Cloud (EC2)	A web service that provides secure, resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers.
Elastic Load Balancing (ELB)	Distributes incoming application traffic across multiple EC2 instances, in multiple Availability Zones. This increases the fault tolerance of your applications.
Elastic network interface (ENI)	A virtual network interface that you can attach to an instance in a VPC.
Elastic IP (EIP) address	A static, public IPv4 address that you have allocated in Amazon EC2 or Amazon VPC and then attached to an instance. Elastic IP addresses are associated with your account, not a specific instance. They are elastic because you can easily allocate, attach, detach, and free them as your needs change.
Instance type	Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instance types comprise varying combinations of CPU, memory, storage, and networking capacity and give you the flexibility to choose the appropriate mix of resources for your applications.
Identity and Access Management (IAM)	An AWS identity with permission policies that determine what the identity can and cannot do in AWS. You can use an IAM role to enable applications running on an EC2 instance to securely access your AWS resources.IAM role is required for deploying VPX instances in a high-availability setup.
Internet Gateway	Connects a network to the Internet. You can route traffic for IP addresses outside your VPC to the Internet gateway.

Term	Defintion
Key pair	A set of security credentials that you use to prove your identity electronically. A key pair consists of a private key and a public key.
Route tables	A set of routing rules that controls the traffic leaving any subnet that is associated with the route table. You can associate multiple subnets with a single route table, but a subnet can be associated with only one route table at a time.
Security groups	A named set of allowed inbound network connections for an instance.
Subnets	A segment of the IP address range of a VPC that EC2 instances can be attached to. You can create subnets to group instances according to security and operational needs.
Virtual Private Cloud (VPC)	A web service for provisioning a logically isolated section of the AWS cloud where you can launch AWS resources in a virtual network that you define.
Auto Scaling	A web service to launch or terminate Amazon EC2 instances automatically based on user-defined policies, schedules, and health checks.
CloudFormation	A service for writing or changing templates that create and delete related AWS resources together as a unit.

How a NetScaler VPX instance on AWS works

The NetScaler VPX instance is available as an AMI in AWS marketplace, and it can be launched as an EC2 instance within an AWS VPC. The NetScaler VPX AMI instance requires a minimum of 2 virtual CPUs and 2 GB of memory. An EC2 instance launched within an AWS VPC can also provide the multiple interfaces, multiple IP addresses per interface, and public and private IP addresses needed for VPX configuration. Each VPX instance requires at least three IP subnets:

- A management subnet
- A client-facing subnet (VIP)

- A back-end facing subnet (SNIP,MIP, etc.)

Citrix recommends three network interfaces for a standard VPX instance on AWS installation.

AWS currently makes multi-IP functionality available only to instances running within an AWS VPC. A VPX instance in a VPC can be used to load balance servers running in EC2 instances. An Amazon VPC allows you to create and control a virtual networking environment, including your own IP address range, subnets, route tables, and network gateways.

Note: By default, you can create up to 5 VPC instances per AWS region for each AWS account. You can request higher VPC limits by submitting Amazon's request form http://aws.amazon.com/contact-us/vpc-request.

Figure 1. A Sample NetScaler VPX Instance Deployment on AWS Architecture

NSIP Subnet
Server Subnet

Figure 1 shows a simple topology of an AWS VPC with a NetScaler VPX deployment. The AWS VPC has:

1. A single Internet gateway to route traffic in and out of the VPC.
2. Network connectivity between the Internet gateway and the Internet.
3. Three subnets, one each for management, client, and server.

4. Network connectivity between the Internet gateway and the two subnets (management and client).
5. A standalone NetScaler VPX instance deployed within the VPC. The VPX instance has three ENIs, one attached to each subnet.

Supported instance type, ENI, and IP addresses

For more information about Amazon EC2 instances and IP addresses supported per NIC per instance type:

- Instance types
- IP addresses per network interface per instance type

For higher bandwidth, Citrix recommends the following instance types:

Instance type	Bandwidth	Enhanced networking (SR-IOV)
M4.10x large	3 Gbps and 5 Gbps	Yes
C4.8x large	3 Gbps and 5 Gbps	Yes

Limitations and usage guidelines

September 21, 2020

The following limitations and usage guidelines apply when deploying a NetScaler VPX instance on AWS:

- Before you start, read the AWS terminology section in Deploy a NetScaler VPX instance on AWS.
- The clustering feature is not supported for VPX.
- For the high availability setup to work effectively, associate a dedicated NAT device to management Interface or associate EIP to NSIP. For more information on NAT, in the AWS documentation, see NAT Instances.
- Data traffic and management traffic must be segregated with ENIs belonging to different subnets.
- Only the NSIP address must be present on the management ENI.
- If a NAT instance is used for security instead of assigning an EIP to the NSIP, appropriate VPC level routing changes are required. For instructions on making VPC level routing changes, in the AWS documentation, see Scenario 2: VPC with Public and Private Subnets.

- A VPX instance can be moved from one EC2 instance type to another (for example, from m3.large to an m3.xlarge).
- For storage options for VPX on AWS, Citrix recommends EBS, because it is durable and the data is available even after it is detached from instance.
- Dynamic addition of ENIs to VPX is not supported. Restart the VPX instance to apply the update. Citrix recommends you to stop the standalone or HA instance, attach the new ENI, and then restart the instance.
- You can assign multiple IP addresses to an ENI. The maximum number of IP addresses per ENI is determined by the EC2 instance type, see the section "IP Addresses Per Network Interface Per Instance Type" in Elastic Network Interfaces. You must allocate the IP addresses in AWS before you assign them to ENIs. For more information, see Elastic Network Interfaces.
- Citrix recommends that you avoid using the enable and disable interface commands on NetScaler VPX interfaces.
- The NetScaler `set ha node \<NODE\\_ID\> -haStatus STAYPRIMARY` and `set ha node \<NODE\\_ID\> -haStatus STAYSECONDARY` commands are disabled by default.
- IPv6 is not supported for VPX.
- Due to AWS limitations, these features are not supported:
  - Gratuitous ARP(GARP)
  - L2 mode
  - Tagged VLAN
  - Dynamic Routing
  - Virtual MAC
- For RNAT to work, ensure **Source/Destination Check is** disabled. For more information, see "Changing the Source/Destination Checking" in Elastic Network Interfaces.
- In a NetScaler VPX deployment on AWS, in some AWS regions, the AWS infrastructure might not be able to resolve AWS API calls. This happens if the API calls are issued through a nonmanagement interface on the NetScaler VPX instance.
  As a workaround, restrict the API calls to the management interface only. To do that, create an NSVLAN on the VPX instance and bind the management interface to the NSVLAN by using the appropriate command.
  For example:
  set ns config -nsvlan <vlan id> -ifnum 1/1 -tagged NO
  save config
  Restart the VPX instance at the prompt. For more information about configuring NSVLAN, see Configuring NSVLAN.

- In the AWS console, the vCPU usage shown for a VPX instance under the **Monitoring** tab might be high (up to 100 percent), even when the actual usage is much lower. To see the actual vCPU usage, use the VPX GUI or CLI.

Deploy a NetScaler VPX standalone instance on AWS

September 21, 2020

You can deploy a Citrix
NetScaler VPX standalone instance on AWS by using the following options:

1. AWS web console
2. Citrix-authored CloudFormation template
3. AWS CLI

This topic describes the procedure for deploying a NetScaler VPX instance on AWS.

Before you start your deployment, read the following topics:

- Prerequisites
- Limitation and usage guidelines

Deploy a NetScaler VPX instance on AWS by using the AWS web console

You can deploy a NetScaler VPX instance on AWS through the AWS web console. The deployment process includes the following steps:

1. Create a Key Pair
2. Create a Virtual Private Cloud (VPC)
3. Add additional subnets
4. Create security groups and security rules
5. Add route tables
6. Create an internet gateway
7. Create a NetScaler VPX instance
8. Create and attach additional network interfaces
9. Attach elastic IPs to the management NIC
10. Connect to the VPX instance

Step 1: Create a key pair.

Amazon EC2 uses a key pair to encrypt and decrypt logon information. To log on to your instance, you must create a key pair, specify the name of the key pair when you launch the instance, and provide the private key when you connect to the instance.

When you review and launch an instance by using the AWS Launch Instance wizard , you are prompted to use an existing key pair or create a new key pair. More more information about how to create a key pair, see Amazon EC2 Key Pairs.

Step 2: Create a VPC.

A NetScaler VPC instance is deployed inside an AWS VPC. A VPC allows you to define virtual network dedicated to your AWS account. For more information about AWS VPC, see Getting Started With Amazon VPC.

While creating a VPC for your NetScaler VPX instance, keep the following points in mind.

- Use the VPC with a Single Public Subnet Only option to create a new AWS VPC in an AWS availability zone.
- Citrix recommends that you create at least **three subnets**, of the following types:
  - One subnet for management traffic. You place the management IP(NSIP) on this subnet. By default elastic network interface (ENI) eth0 is used for management IP.
  - One or more subnets for client-access (user-to-NetScaler VPX) traffic, through which clients connect to one or more virtual IP (VIP) addresses assigned to NetScaler load balancing virtual servers.
  - One or more subnets for the server-access (VPX-to-server) traffic, through which your servers connect to VPX-owned subnet IP (SNIP) addresses. For more information about NetScaler load balancing and virtual servers, virtual IP addresses (VIPs), and subnet IP addresses (SNIPs), see:
  - All subnets must be in the same availability zone.

Step 3: Add subnets.

When you used the VPC wizard, only one subnet was created. Depending on your requirement, you might want to create additional subnets. For more information about how to create additional subnets, see Adding a Subnet to Your VPC.

Step 4: Create security groups and security rules.

To control inbound and outbound traffic, create security groups and add rules to the groups. For more information how to create groups and add rules, see Security Groups for Your VPC.

For NetScaler VPX instances, the EC2 wizard gives default security groups, which are generated by AWS Marketplace and is based on recommended settings by Citrix. However, you can create additional security groups based on your requirements.

> **Note**
>
> Port 22, 80, 443 to be opened on the Security group for SSH, HTTP, and HTTPS access respectively.

Step 5: Add route tables.

Route table contains a set of rules, called routes, that are used to determine where network traffic is directed. Each subnet in your VPC must be associated with a route table. For more information about how to create a route table, see Route Tables.

Step 6: Create an internet gateway.

An internet gateway serves two purposes: to provide a target in your VPC route tables for internet-routable traffic, and to perform network address translation (NAT) for instances that have been assigned public IPv4 addresses.

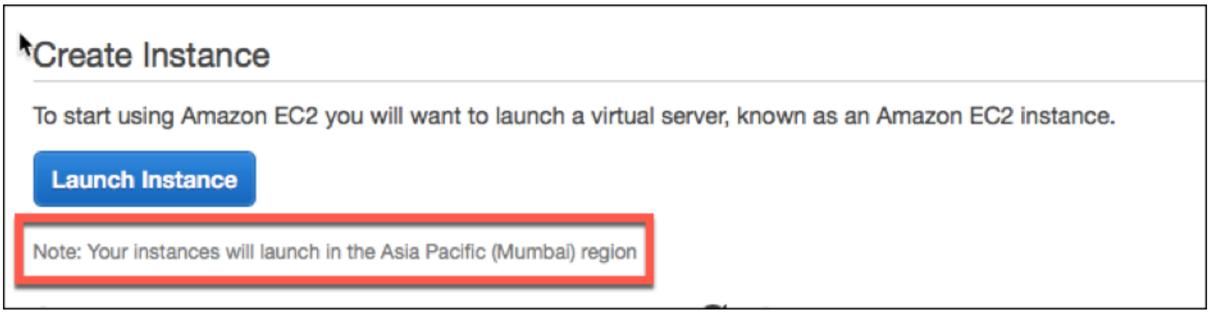
Create an internet gateway for internet traffic. For more information about how to create an Internet Gateway, see the section Attaching an Internet Gateway.

Step 7: Create a NetScaler VPX instance by using the AWS EC2 service.

To create a NetScaler VPX instance by using the AWS EC2 service, complete the following steps.

1. From the AWS dashboard, go to Compute > EC2 > Launch Instance > AWS Marketplace.

Before you click **Launch Instance**, ensure your region is correct by checking the note that appears under Launch Instance.



Create Instance

To start using Amazon EC2 you will want to launch a virtual server, known as an Amazon EC2 instance.

Note: Your instances will launch in the Asia Pacific (Mumbai) region

2. In the Search AWS Marketplace bar, search with the keyword NetScaler VPX.

3. Select the version you want to deploy and then click **Select**. For the NetScaler VPX version, you the following options:

- A licensed version
- NetScaler VPX Express appliance (This is a free virtual appliance, which is available from NetScaler 12.0 56.20.)
- Bring your own device

The Launch Instance wizard starts. Follow the wizard to create an instance. The wizard prompts you to:

- Choose Instance Type
- Configure Instance
- Add Storage
- Add Tags
- Configure Security Group

- Review

Services
Resource Groups
1. Choose AMI
2. Choose Instance Type
3. Configure Instance
4. Add Storage
5. Add Tags
6. Configure Security Group
7. Review

Step 8: Create and attach additional network interfaces.

Create two additional network interfaces for VIP and SNIP. For more information about how to create additional network interfaces, see the Creating a Network Interface section.

After you've created the network interfaces, you must attach them to the VPX instance. Before attaching the interface, shut down the VPX instance, attach the interface, and power on the instance. For more information about how to attach network interfaces, see the Attaching a Network Interface When Launching an Instance section.

Step 9: Allocate and associate elastic IPs.

If you assign a public IP address to an EC2 instance, it remains assigned only until the instance is stopped. After that, the address is released back to the pool. When you restart the instance, a new public IP address is assigned.

In contrast, an elastic IP (EIP) address remains assigned until the address is disassociated from an instance.

Allocate and associate an elastic IP for the management NIC. For more information about how to allocate and associate elastic IP addresses, see these topics:

- Allocating an Elastic IP Address
- Associating an Elastic IP Address with a Running Instance

These steps complete the procedure to create a NetScaler VPX instance on AWS. It can take a few minutes for the instance to be ready. Check that your instance has passed its status checks. You can view this information in the Status Checks column on the Instances page.

Step 10: Connect to the VPX instance.

After you've created the VPX instance, you connect the instance by using the GUI and an SSH client.

- GUI

The following are the default administrator credentials to access a NetScaler VPX instance

User name: nsroot

Password: The default password for the nsroot account is set to the AWS instance-ID of the NetScaler VPX instance.

- SSH client

From the AWS management console, select the NetScaler VPX instance and click **Connect**. Follow the instructions given on the **Connect to Your Instance** page.

For more information about how to deploy a NetScaler VPX standalone instance on AWS by using the AWS web console, see:

- Scenario: standalone instance
- How to configure a Citrix NetScaler VPX instance on AWS by using Citrix CloudFormation template

Configure a NetScaler VPX instance by using the Citrix CloudFormation template

You can use the Citrix-provided CloudFormation template to automate VPX instance launch. The template provides functionality to launch a single NetScaler VPX instance, or to create a high availability environment with a pair of NetScaler VPX instances.

You can launch the template from AWS Marketplace or GitHub.

The CloudFormation template requires an existing VPC environment, and it launches a VPX instance with three elastic network interfaces (ENIs). Before you start the CloudFormation template, ensure that you complete the following requirements:

- An AWS virtual private cloud (VPC)
- Three subnets within the VPC: one for management, one for client traffic, and one for back-end servers
- An EC2 key pair to enable SSH access to the instance
- A security group with UDP 3003, TCP 3009-3010, HTTP, SSH ports open

See the "Deploy a NetScaler VPX Instance on AWS by Using the AWS Web Console" section or AWS documentation for more information about how to complete the prerequisites.

Watch this video to learn about how to configure and launch a NetScaler VPX standalone instance by using the Citrix CloudFormation template available in the AWS Marketplace.

Further, you configure and launch a NetScaler VPX Express standalone instance by using the Citrix CloudFormation template available in GitHub:

https://github.com/citrix/netscaler-aws-cloudformation

An IAM role is not mandatory for a standalone deployment. However, Citrix recommends that you create and attach an IAM role with the required privileges to the instance, for future need. The IAM role ensures that the standalone instance is easily converted to a high availability node with SR-IOV, when required.

For more information about the required privileges, see Configuring NetScaler VPX instances to Use SR-IOV Network Interface.

Configure a NetScaler VPX instance by using the AWS CLI

You can use the AWS CLI to launch instances. For more information, see the AWS Command Line Interface Documentation.

Download a NetScaler VPX license

September 21, 2020

After the launch of Citrix ADC VPX-customer licensed instance from the AWS marketplace, a license is required. For more information on VPX licensing, see Licensing overview.

You have to:

1. Use the licensing portal within Citrix website to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance will activate automatically.

If you use a NetScaler VPX instance with a model number higher than VPX 5000, the network throughput might not be the same as specified by the instance's license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

5 Gbps network bandwidth is observed in c4.8xlarge instance type.

Load balancing servers in different availability zones

September 21, 2020

A VPX instance can be used to load balance servers running in the same availability zone, or in:

- A different availability zone (AZ) in the same AWS VPC
- A different AWS region
- AWS EC2 in a VPC

To enable a VPX instance to load balance servers running outside the AWS VPC that the VPX instance is in, configure the instance to use EIPs to route traffic through the Internet gateway, as follows:

1. Configure a SNIP on the NetScaler VPX instance by using the NetScaler CLI or the GUI.
2. Enable traffic to be routed out of the AZ, by creating a public facing subnet for the server-side traffic.

3. Add an Internet gateway route to the routing table, using the AWS GUI console.
4. Associate the routing table you just updated with the server-side subnet.
5. Associate an EIP with the server-side private IP address that is mapped to a NetScaler SNIP address.

Deploy a high availability pair on AWS

September 21, 2020

You can configure two NetScaler VPX instances on AWS as a high availability active-passive pair. With one instance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

For more information on HA, see High availability.

Before you start your deployment, read the following topics:

- Prerequisites for the required IAM role privileges.
- Limitations and usage guidelines

The following figure shows an example of the HA deployment architecture for
NetScaler VPX instances on AWS.

Figure 1. A NetScaler VPX HA Pair on AWS

To deploy HA for two VPX instances on AWS, you either create the instances with IAM Role manually by using the AWS Management Console and then configure HA on them, or you can automate the HA deployment by using the Citrix CloudFormation template.

The CloudFormation template significantly decreases the number of steps involved for creating an HA pair, and it automatically creates an IAM Role. This section shows how to deploy a NetScaler VPX HA (active-passive) pair by using the Citrix CloudFormation template.

Keep the following points in mind while deploying two NetScaler VPX instances as an HA pair.

Points to note

- HA on AWS requires the primary node to have at least two ENIs (one for management and the other for data traffic), and the secondary node to have one management ENI. However, for security purposes, create three ENIs on the primary node, because this setup allows you to segregate private and public network (recommended).
- The secondary node always has one ENI interface (for management) and the primary node can have up to four ENIs.

- The NSIP addresses for each VPX instance in a high availability pair must be configured on the default ENI of the instance.
- Because Amazon does not allow any broadcast/multicast packets in AWS, HA is implemented by migrating data-plane ENIs from the primary to the secondary (new primary) VPX instance when the primary VPX instance fails.
- Because the default (management) ENI cannot be moved to another VPX instance, do not use the default ENI for client and server traffic (data-plane traffic).
- The message AWSCONFIG IOCTL NSAPI_HOTPLUG_INTF success output 0 in the /var/log/ns.log indicates that the two data ENIs have successfully attached to the secondary instance (the new primary).
- Failover might take up to 20 seconds due to the AWS detach/attach ENI mechanism.
- Upon failover, the failed instance always restarts.
- The heartbeat packets are received only on the management interface.
- The configuration file of the primary and secondary VPX instances is synchronized, including the `nsroot` password. The `nsroot` password of the secondary node is set to that of the primary node after the HA configuration synchronization.
- To have access to the AWS API servers, either the VPX instance must have a public IP address assigned or routing must be set up correctly at VPC subnet level pointing to internet gateway of the VPC
- Nameservers/DNS servers are configured at VPC level using DHCP options.
- The Citrix CloudFormation template does not create an HA setup between different availability zones.
- The Citrix CloudFormation template does not create an INC mode.
- The AWS debug messages are available in the log file, /var/log/ns.log, on the VPX instance.

Deploy a high availability pair by using the Citrix CloudFormation template

Before starting the CloudFormation template, ensure that you complete the following requirements:

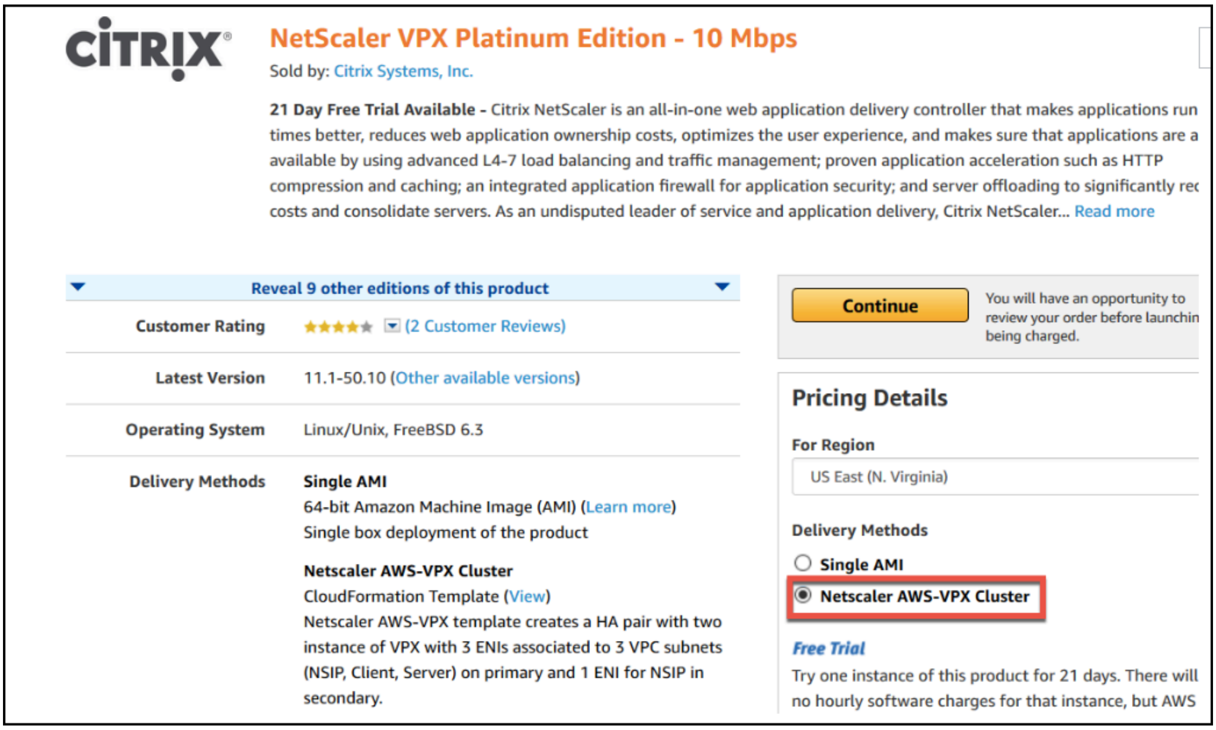
- A VPC
- Three subnets within the VPC
- A security group with UDP 3003, TCP 3009–3010, HTTP, SSH ports open
- A key pair

> **Note**
>
> The Citrix CloudFormation template automatically creates an IAM Role. The template has no option to select an existing IAM Role.

To launch the Citrix CloudFormation template:

1. Log on to the AWS marketplace by using your AWS credentials.
2. In the search field, type **NetScaler VPX** to search for the NetScaler AMI, and click **Go**.

3. On the search result page, click the desired NetScaler VPX offering.
4. Under **For Region**, select your region.
5. Select the **Delivery Methods** as **Netscaler AWS-VPX Cluster** and click **Continue**.



NetScaler VPX Platinum Edition - 10 Mbps

Sold by: Citrix Systems, Inc.

21 Day Free Trial Available - Citrix NetScaler is an all-in-one web application delivery controller that makes applications run times better, reduces web application ownership costs, optimizes the user experience, and makes sure that applications are a available by using advanced L4-7 load balancing and traffic management; proven application acceleration such as HTTP compression and caching; an integrated application firewall for application security; and server offloading to significantly rec costs and consolidate servers. As an undisputed leader of service and application delivery, Citrix NetScaler... Read more

6. On the **Launch on EC2** page, under **Version**, select the correct NetScaler. Ensure that the **Region** and **Deployment Options** are correct. Check pricing details.

7. Click **Launch with CloudFormation Console** to launch the Citrix CloudFormation template.

8. The **Select Template** page appears. Click **Next**.

9. The **Specify Details** appears. Enter the following details.

a. Type a **Stack name.** The name must be within 25 characters.

b. Under **High Availability Configuration**

Select **Yes** from the menu for **Create HA pair?**.

c. Under **Virtual Private Network Configuration**

Select the VPC that you've already created for **VPC ID.**

Type **Remote SSH CIDR IP**.

Type **Remote HTTP CIDR IP**.

Type **Remote HTTPS CIDR IP.**

Select the key pair that you've already created from the drop-down menu for **Key Pair**.

d. Under **Network Interface Configuration**

Select **Management Subnetwork**, **Client Subnetwork**, and **Server Subnetwork**. Ensure that you select the correct subnetworks you created within the VPC that you selected under VPC ID in step c.

Add **Primary Management IP**, **Secondary Management IP**, **Client IP**, and **Server IP.** The IP addresses must belong to the same subnets of the respective subnetworks. Alternatively, you can let the template assign the IP addresses automatically.

e. Under **Other Parameters**

Select **m4.large** for **Instant Type**.

Select **default** for **Tenancy Type**.

f. Click **Next**.

8. The **Options** page appears. (This is an optional page.). Click **Next**.

9. The **Review** page appears. Take a moment to review the settings and make necessary changes if necessary.

10. Select the **I acknowledge that AWS CloudFormation might create IAM resources.** check box, and then click **Create**.

11. The **CREATE-IN-PROGRESS** status appears. Wait until the status is **CREATE-COMPLETE**. If the status does not change to "COMPLETE," check the **Events** tab for the reason of failure and recreate the instance with proper configurations.

The secondary node is created with one private IP address and one network interface.

> **Note**
>
> The secondary node is created with one interface by default in AWS. During failover, the interface from the primary node gets attached to the secondary node (the new primary node) and gets detached from the original primary node (the new secondary node).

13. Log on to the primary node with user name `nsroot` and the instance ID as the password. From the GUI, go to **System > High Availability**. The NetScaler VPX HA pair appears.

Next, configure the HA pairing on both the instances. Configure the instance with three ENIs before configuring HA on the instance with one ENI). Use the add HA node command, from within the VPX CLI, or from the GUI.

add HA node <private IP of the first instance>

add HA node <private IP of the second instance>

After you run the "add HA node" commands, the two nodes form an HA pair, and configuration information is synchronized between the two VPX instances.

Configuring SR-IOV on a high availability setup

Support for SR-IOV interfaces in a high availability setup is available from NetScaler release 12.0 57.19 onwards. For more information about how to configure SR-IOV, see Configuring NetScaler VPX instances to Use SR-IOV Network Interface.

Upgrade a NetScaler VPX instance on AWS

September 21, 2020

You can upgrade the EC2 instance type, throughput, software edition, and the system software of a NetScaler VPX running on AWS. For certain types of upgrades, Citrix recommends using the High Availability Configuration method to minimize downtime.

> **Note:**
>
> - NetScaler software release 10.1.e-124.1308.e or later for a NetScaler VPX AMI (including both utility license and customer license) does not support the M1 and M2 instance families.
> - Because of changes in VPX instance support, downgrading from 10.1.e-124 or a later release to 10.1.123.x or an earlier release is not supported.
> - Most of the upgrades do not require the launch of a new AMI, and the upgrade can be done on the current NetScaler AMI instance. If you do want to upgrade to a new NetScaler AMI instance, use the high availability configuration method.

Change the EC2 instance type of a NetScaler VPX instance on AWS

If your NetScaler VPX instances are running release 10.1.e-124.1308.e or later, you can change the EC2 instance type from the AWS console as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

You can also use the above procedure to change the EC2 instance type for a release, earlier than 10.1.e-124.1308.e, unless you want to change the instance type to M3. In that case, you must first follow the standard NetScaler upgrade procedure, at , to upgrade the NetScaler software to 10.1.e-124 or a later release, and then follow the above steps.

Upgrade the throughput or software edition of a NetScaler VPX instance on AWS

To upgrade the software edition (for example, to upgrade from Standard to Platinum edition) or throughput (for example, to upgrade from 200 mbps to 1000mbps), the method depends on the instance's license.

Using a customer license (Bring-Your-Own-License)

If you are using a customer license, you can purchase and download the new license from the Citrix website, and then install the license on the VPX instance. For more information about downloading and installing a license from the Citrix website, see the VPX Licensing Guide.

Using a utility license (Utility license with hourly fee)

AWS does not support direct upgrades for fee-based instances. To upgrade the software edition or throughput of a fee based NetScaler VPX instance, launch a new AMI with the desired license and capacity and migrate the older instance configuration to the new instance. This can be achieved by using a NetScaler high availability configuration as described in Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration subsection in this page.

Upgrade the system software of a NetScaler VPX instance on AWS

If you need to upgrade a VPX instance running 10.1.e-124.1308.e or a later release, follow the procedure at Upgrade and downgrade a NetScaler appliance.

If you need to upgrade a VPX instance running a release older than 10.1.e-124.1308.e to 10.1.e-124.1308.e or a later release, first upgrade the system software, and then change the instance type to M3 as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration

To use the high availability method of upgrading to a new NetScaler AMI instance, perform the following tasks:

- Create a new instance with the desired EC2 instance type, software edition, throughput, or software release from the AWS marketplace.
- Configure high availability between the old instance (to be upgraded) and the new instance. After high availability is configured between the old and the new instance, configuration from the old instance is synchronized to the new instance.
- Force an HA failover from the old instance to the new instance. As a result, the new instance becomes primary and starts receiving traffic.
- Stop, and reconfigure or remove the old instance from AWS.

Prerequisites and points to consider

- Ensure you understand how high availability works between two NetScaler VPX instances on AWS. For more information about high availability configuration between two NetScaler VPX instances on AWS, see Deploy a high availability pair on AWS.

- You must create the new instance in the same availability zone as the old instance, having the exact same security group and subnet.
- High availability setup requires access and secret keys associated with the user's AWS Identity and Access Management (IAM) account for both instances. If the correct key information is not used when creating VPX instances, the HA setup fails. For more information about creating an IAM account for a VPX instance, see Prerequisites.
  - You must use the EC2 console to create the new instance. You cannot use the AWS 1-click launch, because it does not accept the access and secret keys as the input.
  - The new instance should have only one ENI interface.

To upgrade a NetScaler VPX Instance by using a high availability configuration, follow these steps:

1. Configure high availability between the old and the new instance. To configure high availability between two NetScaler VPX instances, at the command prompt of each instance, type:

   - add ha node <nodeID> <IPaddress of the node to be added>
   - save config

   Example:

   At the command prompt of the old instance, type:

   ```
   add ha node 30 192.0.2.30
   Done
   <!--NeedCopy-->
   ```

   At the command prompt of the new instance, type:

   ```
   add ha node 10 192.0.2.10
   Done
   <!--NeedCopy-->
   ```

   Note the following:

   - In the HA setup, the old instance is the primary node and the new instance is the secondary node.
   - The NSIP IP address is not copied from the old instance to the new instance. Therefore, after the upgrade, your new instance has a different management IP address from the previous one.
   - The nsroot account password of the new instance is set to that of the old instance after HA synchronization.

   For more information about high availability configuration between two NetScaler VPX instances on AWS, see Deploy a high availability pair on AWS.

2. Force an HA failover. To force a failover in a high availability configuration, at the command prompt of either of the instances, type:

```
force HA failover
<!--NeedCopy-->
```

As the result of forcing a failover, the ENIs of the old instance are migrated to the new instance and traffic flows through the new instance (the new primary node). The old instance (the new secondary node) restarts.
If the following warning message appears, type N to abort the operation:

```
[WARNING]:Force Failover may cause configuration loss, peer health
    not optimum. Reason(s):
HA version mismatch
HA heartbeats not seen on some interfaces
Please confirm whether you want force-failover (Y/N)?
<!--NeedCopy-->
```

The warning message appears because the system software of the two VPX instances is not HA compatible. As a result, the configuration of the old instance cannot be automatically synced to the new instance during a forced failover.

Following is the workaround for this issue:

1. At the NetScaler shell prompt of the old instance, type the following command to create a backup of the configuration file (ns.conf):
   copy /nsconfig/ns.conf to /nsconfig/ns.conf.bkp
2. Remove the following line from the backup configuration file (ns.conf.bkp):

   ```
   set ns config -IPAddress \<IP\> -netmask \<MASK\>
   ```

   For example, set ns config -IPAddress 192.0.2.10 -netmask 255.255.255.0
3. Copy the old instance's backup configuration file (ns.conf.bkp) to the /nsconfig directory of the new instance.
4. At the NetScaler shell prompt of the new instance, type the following command to load the old instance's configuration file (ns.conf.bkp) on the new instance:

   ```
   batch -f /nsconfig/ns.conf.bkp
   ```

5. Save the configuration on the new instance.

   ```
   Save conifg
   ```

6. At the command prompt of either of the nodes, type the following command to force a failover. Then type Y, for the warning message to confirm the force failover operation:

`force ha failover`

Example:

```
force ha failover

[WARNING]:Force Failover may cause configuration loss, peer health
     not optimum.
Reason(s):
HA version mismatch
HA heartbeats not seen on some interfaces
Please confirm whether you want force-failover (Y/N)? Y
<!--NeedCopy-->
```

7. Remove the HA configuration, so that the two instances are no longer in an HA configuration. First remove the HA configuration from the secondary node and then remove the HA configuration from the primary node.

To remove an HA configuration between two NetScaler VPX instances, at the command prompt of each instance, type:

```
         > remove ha node \<nodeID\>
         >  save config
<!--NeedCopy-->
```

For more information about high availability configuration between two VPX instances on AWS, see Deploy a high availability pair on AWS.

Example:

At the command prompt of the old instance (new secondary node), type:

```
         > remove ha node 30
           Done
         > save config
           Done
<!--NeedCopy-->
```

At the command prompt of the new instance (new primary node), type:

```
         > remove ha node 10
           Done
         > save config
           Done
<!--NeedCopy-->
```

Troubleshoot a VPX instance on AWS

September 21, 2020

Amazon does not provide console access to a NetScaler VPX instance. To troubleshoot, you have to use the AWS GUI to view the activity log. You can debug only if the network is connected. To view an instance's system log, right-click the instance and select system log.

Citrix provides support for fee based NetScaler VPX instances (utility license with hourly fee) on AWS. To file a support case, find your AWS account number and support PIN code, and call Citrix support. You will also be asked for your name and email address. To find the support PIN, log on to the VPX GUI and navigate to the System page.

Here is an example of a system page showing the support PIN.

Deploying Citrix NetScaler VPX on Microsoft Azure

April 16, 2021

Jun 29, 2017

Microsoft Azure Resource Manager (ARM) is a management framework that allows administrators to deploy, manage, and monitor Azure resources. Azure Resource Manager can handle these tasks as a group, rather than individually, in a single operation.

The NetScaler VPX virtual appliance is available as an image in the Microsoft Azure Marketplace. When you deploy NetScaler VPX on Microsoft Azure Resource Manager (ARM), you can use the Azure cloud computing capabilities and use NetScaler load balancing and traffic management features for your business needs. You can deploy NetScaler VPX instances on Azure Resource Manager either as standalone instances or as high availability pairs in active-active or active-standby modes.

> **Note**
>
> This document describes how NetScaler VPX works when deployed with Azure Resource Manager (ARM). For information about NetScaler VPX deployment and architecture in Azure Cloud Services, see the details provided in Deploying NetScaler VPX on Azure 10.5 release.

This document assumes that you are familiar with Azure terminology and network details. For information about Microsoft Azure services, see Microsoft Azure Documentation Center.

This document also assumes that you have basic knowledge of a NetScaler appliance. For detailed information about NetScaler appliances, see:

- NetScaler
- NetScaler Gateway

This document provides information about:

- Network Architecture
- How NetScaler VPX Works on Azure
- Traffic Flow through Port Address Translation
- Traffic Flow through Network Address Translation
- Port Usage Guidelines
- Limitations

For information about NetScaler Gateway configuration for Citrix XenApp and XenDesktop in Azure cloud, see https://www.citrix.com/content/dam/citrix/en_us/documents/products-solutions/netscaler-vpx-deployment-with-xendesktop-and-xenapp-on-microsoft-azure.pdf.

> **Note**
>
> The Citrix XenApp and XenDesktop NetScaler Gateway configuration is based on the Azure Service Management mode and not on the Azure Resource Management mode.

Network Architecture

In ARM, a NetScaler VPX virtual machine (VM) resides in a virtual network. A virtual NIC is created on each NetScaler VM. The network security group (NSG) configured in the virtual network is bound to the NIC, and together they control the traffic flowing into the VM and out of the VM.

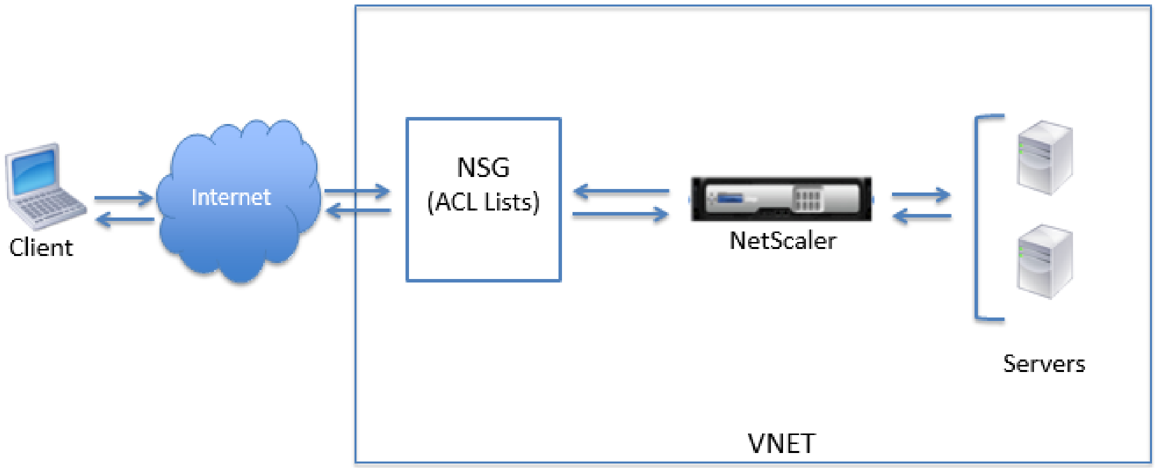
The NSG forwards the requests to the NetScaler VPX instance, and the VPX instance sends them to the servers. The response from a server follows the same path in reverse. The NSG can be configured to control a single VPX VM, or, with subnets and virtual networks, can control traffic in multiple VPX VM deployments.

The NIC contains network configuration details such as the virtual network, subnets, internal IP address, and Public IP address.

While on ARM, it is good to know the following IP addresses used to access the VMs:

- Public IP (PIP) address is the Internet-facing IP address configured directly on the virtual NIC of the NetScaler VM. This allows you to directly access a VM from the external network without the need to configure inbound and outbound rules on the NSG.
- NetScaler IP (NSIP) address is internal IP address configured on the VM. It is non-routable.
- Virtual IP address (VIP) is configured by using the NSIP and a port number. Clients access NetScaler services through the PIP address, and when the request reaches the NIC of the NetScaler VPX VM or the Azure load balancer, the VIP gets translated to internal IP (NSIP) and internal port number.
- Internal IP address is the private internal IP address of the VM from the virtual network's address space pool. This IP address cannot be reached from the external network. This IP address is by default dynamic unless you set it to static. Traffic from the internet is routed to this address according to the rules created on the NSG. The NSG works with the NIC to selectively send the right type of traffic to the right port on the NIC, which depends on the services configured on the VM.

The following figure shows how traffic flows from a client to a server through a NetScaler VPX instance provisioned in ARM.



How NetScaler VPX Works on Azure

In an on-premises deployment, a NetScaler VPX instance requires at least three IP addresses:

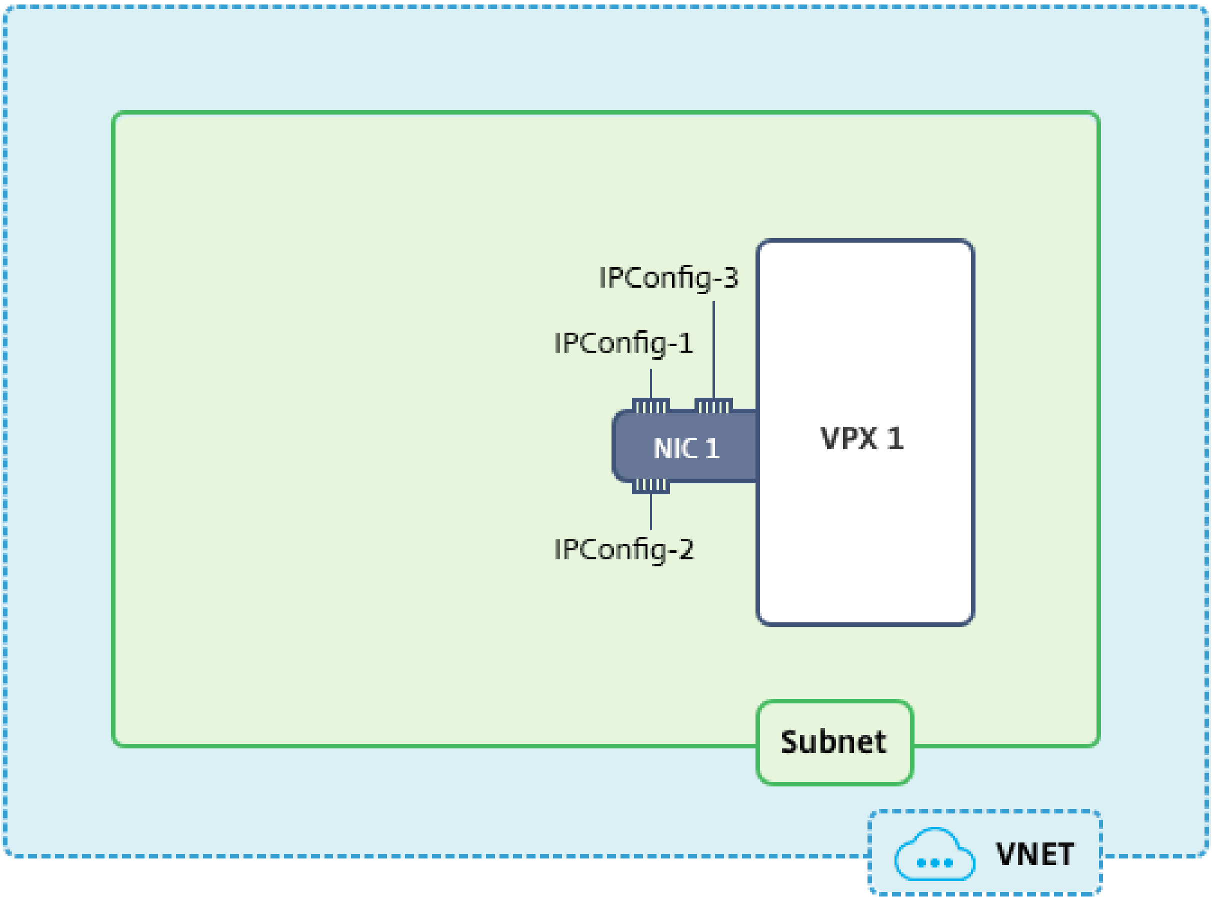
- Management IP address, called the NetScaler IP (NSIP) address
- Subnet IP (SNIP) address for communicating with the server farm
- Virtual server IP (VIP) address for accepting client requests

In an Azure deployment, you can provision a NetScaler VPX instance in Azure in two ways:

- With a multi-NIC, multi-IP architecture
- With a single-IP architecture

> **Note**
>
> VPX virtual appliances can be deployed on any instance type that has two or more Intel VT-X cores and more than 2 GB memory. For more information on system requirements, see Citrix ADC VPX data sheet. Currently, NetScaler VPX instance supports only the Intel processors.

The following image illustrates how multiple IP addresses are used to perform the functions of NSIP, SNIP, and VIP, with a single NIC in a standalone deployment. According to your requirement, you can configure multiple NICs with different IP addresses.

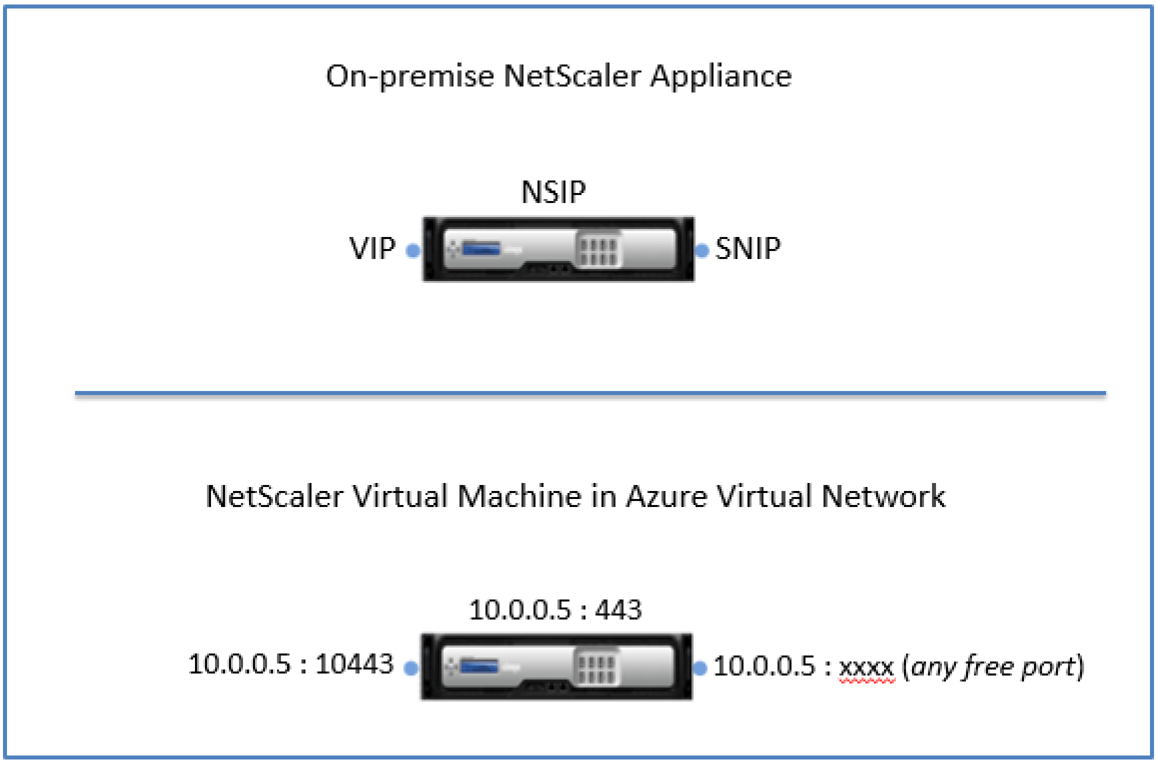


For more information about NetScaler multi-NIC, multi-IP deployment on Azure, see the following links:

- Configure multiple IP addresses for a NetScaler standalone instance
- Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands

In single IP mode the three IP functions of a NetScaler appliance are multiplexed onto one IP address. This single IP address is assigned to an instance during provisioning through DHCP, and it is a private (internal) address and it uses different port numbers to function as the NSIP, SNIP, and VIP.

The following image illustrates how a single IP address is used to perform the functions of NSIP, SNIP, and VIP.



On-premise NetScaler Appliance
NSIP
VIP
SNIP
NetScaler Virtual Machine in Azure Virtual Network
10.0.0.5 : 443
10.0.0.5 : 10443
10.0.0.5 : xxxx (*any free port*)

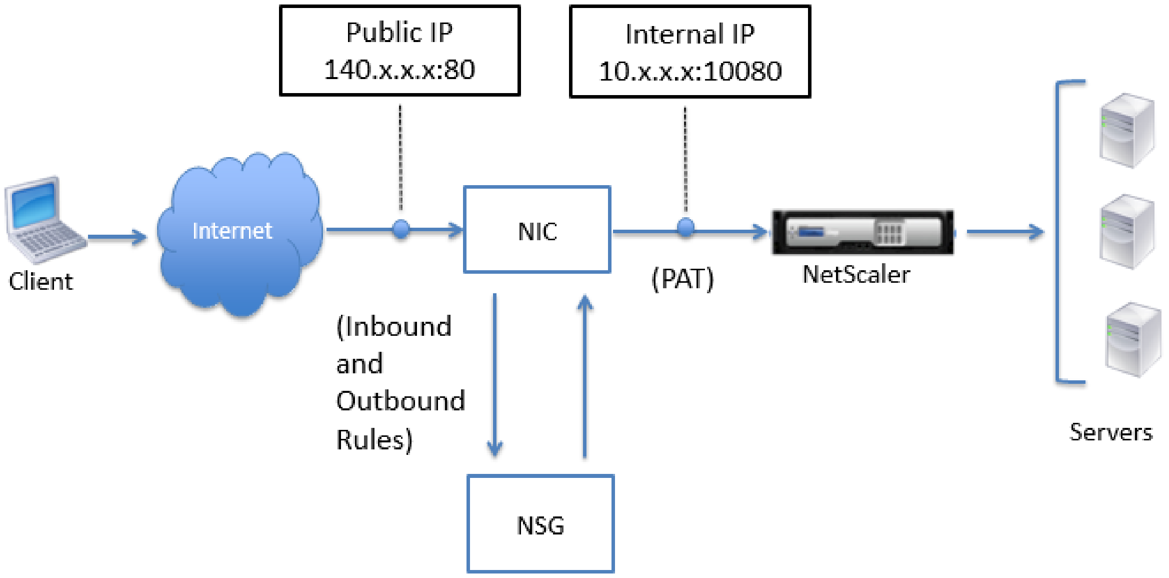
> **Note**
>
> The single IP mode is available only in Azure deployments. This mode is not available for a NetScaler VPX instance on your premises, on AWS, or in other type of deployment.

Traffic Flow through Port Address Translation

In an Azure deployment, when you provision the NetScaler VPX instance as a virtual machine (VM), Azure assigns a public IP (PIP) address and an internal IP address (non-routable) to the NetScaler virtual machine. Inbound and Outbound rules are defined on the NSG for the NetScaler instance, along with a public port and a private port for each rule defined. The NetScaler instance listens on the internal IP address and private port.

Any external request is received on the NetScaler VPX VM's virtual NIC. The NIC is bound to the NSG, which specifies the private IP and private port combination into which to translate the request's destination address and port (the public IP address and port). ARM performs port address translation (PAT) to map the Public IP address and port to the internal IP address and private port of the NetScaler virtual machine, and forwards the traffic to the virtual machine.

The following figure shows how Azure performs port address translation to direct traffic to the NetScaler internal IP address and private port.



In this example, the Public IP address assigned to the VM is 140.x.x.x, and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler virtual machine listens. The client request is received on the Public IP address 140.x.x.x at port 80. Azure performs port address translation to map this address and port to internal IP address 10.x.x.x on private port 10080 and forwards the client request.

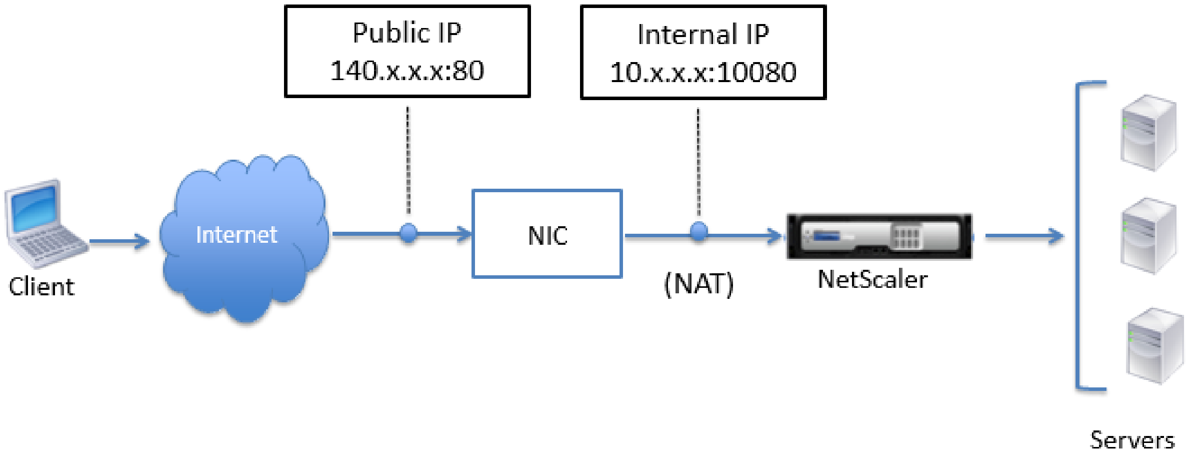
For information about port usage guidelines while, see Port Usage Guidelines.

For information about NSG and access control lists, see What is a Network Security Group?

Traffic Flow Through Network Address Translation

You can also request a Public IP (PIP) address for your NetScaler virtual machine (instance level). If you use this direct PIP at the VM level, you need not define inbound and outbound rules to intercept the network traffic. The incoming request from the Internet is received on the VM directly. Azure performs network address translation (NAT) and forwards the traffic to the internal IP address of the NetScaler instance.

The following figure shows how Azure performs network address translation to map the NetScaler internal IP address.



In this example, the Public IP assigned to the NSG is 140.x.x.x and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler virtual machine listens. The client request is received on the Public IP address (140.x.x.x). Azure performs network address translation to map the PIP to the internal IP address 10.x.x.x on port 10080, and forwards the client request.

> **Note**
>
> NetScaler VPX VMs in high availability are controlled by external or internal load balancers that have inbound rules defined on them to control the load balancing traffic. The external traffic is first intercepted by these load balancers and the traffic is diverted according to the load balancing rules configured, which has back-end pools, NAT rules, and health probes defined on the load balancers.

Port Usage Guidelines

You can configure more inbound and outbound rules n NSG while creating the NetScaler virtual machine or after the virtual machine is provisioned. Each inbound and outbound rule is associated with a public port and a private port.

Before configuring NSG rules, note the following guidelines regarding the port numbers you can use:

1. The following ports are reserved by the NetScaler virtual machine. You cannot define these as

private ports when using the Public IP address for requests from the Internet.
Ports 21, 22, 80, 443, 8080, 67, 161, 179, 500, 520, 3003, 3008, 3009, 3010, 3011, 4001, 5061, 9000, 7000.
However, if you want Internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the NSG. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.
For example, a VIP service might be running on port 8443 on the NetScaler instance but be mapped to public port 443. So, when the user accesses port 443 through the Public IP, the request is directed to private port 8443. However, if you want internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the NSG. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.
Note: If you access the NetScaler instance in Network Access mode (Full SSL VPN), you need to map the private port 8443 to the public port 8443.

2. Public IP address does not support protocols in which port mapping is opened dynamically, such as passive FTP or ALG.
3. High availability does not work for traffic that uses a public IP address (PIP) associated with a VPX instance, instead of a PIP configured on the Azure load balancer. For more information about configuring NetScaler VPX HA in ARM, see Configuring Multiple Azure NICs and IP Addresses for NetScaler VPX Instances in HA Mode.
4. In a NetScaler Gateway deployment, you need not configure a SNIP address, because the NSIP can be used as a SNIP when no SNIP is configured.
   You must configure the VIP address by using the NSIP address and some nonstandard port number. For call-back configuration on the back end server, the VIP port number has to be specified along with the VIP URL (for example, url:port).

> **Note**
>
> In Azure Resource Manager, a NetScaler VPX instance is associated with two IP addresses - a public IP address (PIP) and an internal IP address. While the external traffic connects to the PIP, the internal IP address or the NSIP is non-routable. To configure VIP in VPX, use the internal IP address (NSIP) and any of the free ports available. Do not use the PIP to configure VIP.
>
> Example: If NSIP of a NetScaler VPX is 10.1.0.3 and an available free port is 10022, then you can configure VIP by providing the 10.1.0.3:10022 (NSIP address+port) combination.

Limitations

Running the NetScaler VPX load balancing solution on ARM imposes the following limitations:

1. The Azure architecture does not accommodate support for the following NetScaler features:

Clustering

IPv6

Gratuitous ARP (GARP)

L2 Mode

Tagged VLAN

Dynamic Routing

Virtual MAC

USIP

CloudBridge Connector

- If you expect that you might have to shut down and temporarily deallocate the NetScaler VPX virtual machine at any time, assign a static Internal IP address while creating the virtual machine. If you do not assign a static internal IP address, Azure might assign the virtual machine a different IP address each time it restarts, and the virtual machine might become inaccessible.
- Citrix ADC VPX instances lower than D16sv3 that are configured for ICA Proxy can experience a high degree of latency. Hence, Citrix recommends you to use the instance size of D16sv3 or D32sv3.
- In an Azure deployment, only the following NetScaler VPX models are supported: VPX 10, VPX 25, VPX 200, VPX 1000, and VPX 3000. For for information, see the NetScaler VPX Data Sheet.
  If you use a NetScaler VPX instance with a model number higher than VPX 3000, the network throughput might not be the same as specified by the instance's license. However, other features, such as SSL throughput and SSL transactions per second, might improve.
- The "deployment ID" that is generated by Azure during virtual machine provisioning is not visible to the user in ARM. You cannot use the deployment ID to deploy NetScaler VPX appliance on ARM.
- Active-passive or active-standy HA mode is not supported for VPX configured with multiple NICs and multiple IP addresses.
- The NetScaler VPX appliance supports 5 Mb/s throughput and standard edition features when it's initialized.
- For a XenApp and XenDesktop deployment, a VPN virtual server on a NetScaler appliance can be configured in the following modes:
- Basic mode, where the ICAOnly VPN virtual server parameter is set to ON. The Basic mode works fully on an unlicensed NetScaler VPX instance.
- SmartAccess mode, where the ICAOnly VPN virtual server parameter is set to OFF. The SmartAccess mode works for only 5 AAA session users on an unlicensed NetScaler VPX instance.

> **Note**
>
> To configure the SmartControl feature, you must apply a platinum license to the NetScaler VPX instance.

Configure a NetScaler VPX standalone instance

September 21, 2020

You can provision a single NetScaler VPX instance in Azure Resource Manager (ARM) portal in a standalone mode by creating the virtual machine and configuring other resources.

Before you begin

Make sure that you have the following:

- A Microsoft Azure user account
- Access to Microsoft Azure Resource Manager
- Microsoft Azure SDK
- Microsoft Azure PowerShell

On the Microsoft Azure Portal page, log on to the Azure Resource Manager portal by providing your user name and password.

> **Note**
>
> In ARM portal, clicking an option in one pane opens a new pane to the right. Navigate from one pane to another to configure your device.

Summary of configuration steps

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a NetScaler VPX instance

Configure a resource group

Create a new resource group that is a container for all your resources. Use the resource group to deploy, manage, and monitor your resources as a group.

1. Click **New** > **Management** > **Resource group**.
2. In the **Resource group** pane, enter the following details:
   - Resource group name
   - Resource group location
3. Click **Create**.

Configure a network security group

Create a network security group (NSG) to assign inbound and outbound rules to control the incoming and outgoing traffic within the virtual network. NSG allows you to define security rules for a single virtual machine and also to define security rules for a virtual network subnet.

1. Click **New** > **Networking** > **Network security group**.
2. In the **Create network security group** pane, enter the following details, and then click **Create**.
   - Name - type a name for the security group
   - Resource group - select the resource group from the drop-down list

> **Note**
>
> Ensure that you have selected the correct location. The list of resources that appear in the drop-down list is different for different locations.

Create

Virtual network gateway: The VPN device in your Azure virtual network and used with site-to-site and VNet-to-VNet VPN connections.

Local network gateway: Represents the VPN device in your local network and used to set up a site-to-site VPN connection.

Network security group: A virtual firewall to control inbound and outbound traffic for virtual machines and subnets.

Route table: Use route tables to control how traffic is directed in a virtual network.

Load Balancer: A load balancer that distributes incoming traffic among backend virtual machine instances.

DNS zone (preview): A DNS zone hosts DNS records for a domain.

A network security group is a layer of security that acts as a virtual firewall for controlling traffic in and out of virtual machines (via network interfaces) and subnets. It contains a set of security rules that allow or deny inbound and outbound traffic using the following 5-tuple: protocol, source IP address range, source port range, destination IP address range, and destination port range. A network security group can be associated to multiple network interfaces and subnets, but each network interface or subnet can be associated to only one network security group.

Security rules are evaluated in priority-order, starting with the lowest number rule, to determine whether traffic is allowed in or out of the network interfaces or subnets associated with the network security group. A network security group has separate inbound and outbound rules, and each rule can allow or deny traffic. Each network security group has a set of default security rules, which allows all traffic within a virtual network and outbound traffic to the internet. There is also a rule to allow traffic originating from Azure's load balancer probe. All other traffic is automatically denied. These default rules can be overriden by specifying rules with a lower priority number.

In the Classic deployment model, endpoints - with access control lists (ACLs) - were used to control traffic in and out of virtual machines. In the Resource Manager deployment model, traffic can be controlled by using either network security groups or load balancers with inbound NAT rules. While inbound NAT rules are functionally equivalent to endpoints, Azure recommends using network security groups for new deployments where NAT features (like port translation) are not required.

There are no additional charges for creating network security groups in Microsoft Azure.

Select a deployment model: Resource Manager

Configure a virtual network and subnets

Virtual networks in ARM provide a layer of security and isolation to your services. VMs and services that are part of the same virtual network can access each other.

For these steps to create a virtual network and subnets.

1. Click **New** > **Networking** > **Virtual Network**.
2. In the **Virtual Network** pane, ensure the deployment mode is **Resource Manager** and click **Create**.

Configure a storage account

The ARM IaaS infrastructure storage includes all services where we can store data in the form of blobs, tables, queues, and files. You can also create applications using these forms of storage data in ARM.

Create a storage account to store all your data.

1. Click **+New** > **Data + Storage** > **Storage account**.
2. In the **Create storage account** pane, enter the following details:
    - Name of the account
    - Deployment mode - make sure to select **Resource Manager**
    - Account kind - select **General purpose** from the drop-down list
    - Replication - select **Locally redundant storage** from the drop-down list
    - Resource group - select the newly created resource group from the drop-down list
3. Click **Create**.

Configure an availability set

An availability set guarantees that at least one VM is kept up and running in case of planned or unplanned maintenance. Two or more VMs under the same 'availability set' are placed on different fault domains to achieve redundant services.

1. Click **+New**.
2. Click **See all** in the MARKETPLACE pane and click **Virtual Machines**.
3. Search for availability set, and then select **Availability set** entity from the list displayed.

Configure a NetScaler VPX instance

Create an instance of NetScaler VPX in the virtual network. Obtain the NetScaler VPX image from the Azure marketplace, and then use the Azure Resource Manager portal to create a NetScaler VPX instance.

Before you begin creating the NetScaler VPX instance, make sure that you have created a virtual network with required subnets in which the instance will reside. You can create virtual networks during

VM provisioning, but without the flexibility to create different subnets. For information about creating virtual networks, see http://azure.microsoft.com/en-us/documentation/articles/create-virtual-network/.

Optionally, configure DNS server and VPN connectivity that allows a virtual machine to access Internet resources.

> **Note**
>
> Citrix recommends that you create resource group, network security group, virtual network, and other entities before you provision the NetScaler VPX VM, so that the network information is available during provisioning.

1. Click **+New** > **Networking**.
2. Click **See All** and in the Networking pane, click **Citrix NetScaler VPX Bring Your Own License**.

As a quick way to find any entity on ARM portal, you can also type the name of the entity in the Azure Marketplace search box and press <Enter>. Type NetScaler in the search box to find the Citrix NetScaler images.

NetScaler 11.1 VPX Bring Your ...

5 Buy

Basics

* Name: Citrix-NetScaler-User

VM disk type: SSD

* User name: CitrixUser1

* Authentication type: SSH public key | **Password**

* Password: ••••••••••••••

* Confirm password: ••••••••••••••

Subscription: Microsoft Azure Enterprise

* Resource group: ○ Create new ● Use existing

NetScalerResGroup

Location: Southeast Asia

4. In the **Create virtual machine** pane, specify the required values in each section to create a virtual machine. Click **OK** in each section to save your configuration.

Basic

- Name - specify a name for the NetScaler VPX instance
- VM disk type - select SSD (default value) or HDD from the drop-down menu

- User name and Password - specify a user name and password to access the resources in the resource group that you have created
- Authentication Type - select SSH Public Key or Password
- Resource group - select the resource group you have created from the drop-down list

You can create a resource group here, but Citrix recommends that you create a resource group from Resource groups in Azure Resource Manager and then select the group from the drop-down list.

Size

Depending on the VM disk type, SDD or HDD, you selected in Basic settings, the disk sizes are displayed.

- Select a disk size according to your requirement and click **Select**.

Settings

- Select the default (Standard) disk type
- Storage account - select the storage account
- Virtual network - select the virtual network
- Subnet - set the subnet address
- Public IP address - select the type of IP address assignment
- Network security group - select the security group that you have created. Ensure that inbound and outbound rules are configured in the security group.
- Availability Set - select the availability set from the drop-down box

Summary

The configuration settings are validated and the Summary page displays the result of the validation. If the validation fails, the Summary page displays the reason of the failure. Go back to the particular section and make changes as required. If the validation passes, click **OK**.

Buy

Review the offer details and legal terms on the Purchase page and click **Purchase**.

For high availability deployment, create two independent instances of NetScaler VPX in the same availability set and in the same resource group to deploy them in active-standby and active-active configuration.

Configure multiple IP addresses for a NetScaler VPX standalone instance

September 21, 2020

This section explains how to configure a standalone NetScaler VPX instance with multiple IP addresses, in Azure Resource Manager (ARM). The VPX instance can have one or more NIC attached to it,

and each NIC can have one or more static or dynamic public and private IP addresses assigned to it. You can assign multiple IP addresses as NSIP, VIP, SNIP, and so on.
In a NetScaler instance on Azure, you can assign multiple IP addresses as NSIP, VIP, SNIP, and so on.

For more information, see the Azure documentationAssign multiple IP addresses to virtual machines using the Azure portal.

If you want to use PowerShell commands, see Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands.

Use Case

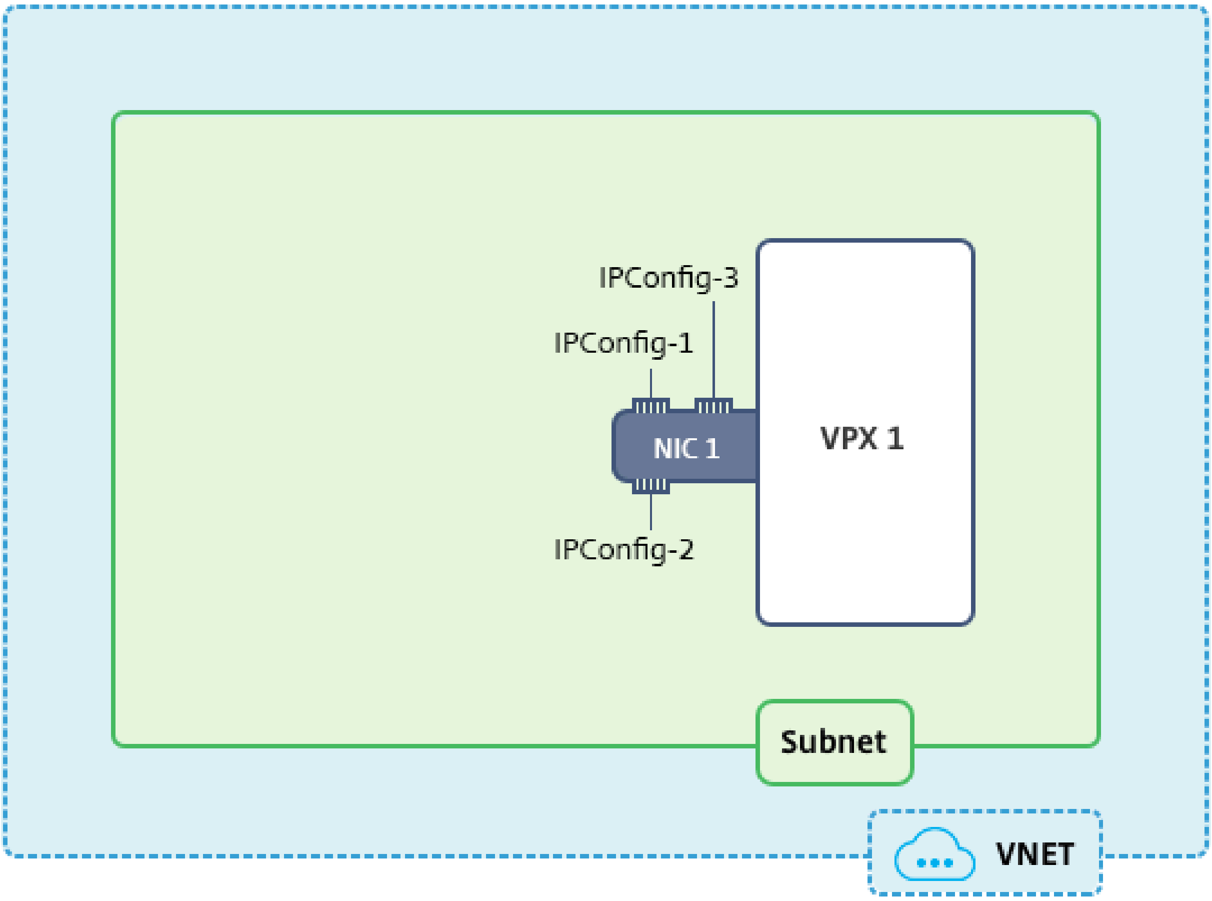
In this use case, a standalone NetScaler VPX appliance is configured with a single NIC that is connected to a virtual network (VNET). The NIC is associated with three IP configurations (ipconfig), each servers a different purpose - as shown in the table.

IPConfig	Assocaited with
IPConfig-1	Static public IP address; static private IP address
IPConfig-2	Static public IP address; static private address
IPConfig-3	Static private IP addres

> **Note**
>
> IPConfig-3 is not associated with any public IP address.

Diagram: Topology

Here is the visual representation of the use case.



> **Note**
>
> In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP of the appliance. The remaining private IP addresses associated with IPConfigs need to be added in the NetScaler appliance as a VIP or SNIP by using the "add ns ip" command, according to your requirement.

Before you begin

Before you begin, create a VPX instance by following the steps given at this link:

Configure a NetScaler VPX standalone instance

For this use case, the NSDoc0330VM NetScaler instance is created.

Procedure to configure multiple IP addresses for a NetScaler VPX instance in standalone mode.

For configuring multiple IP addresses for a NetScaler VPX appliance in standalone mode:

1. Add IP addresses to the VM
2. Configure NetScaler-owned IP addresses

Step 1: Add IP addresses to the VM

1. In the portal, click **More services > type virtual machines** in the filter box, and then click **Virtual machines**.

2. In the **Virtual machines** blade, click the VM you want to add IP addresses to. Click **Network interfaces** in the virtual machine blade that appears, and then select the network interface.

NAME	PUBLIC IP ADDRE...	PRIVATE IP ADDR...	SECURITY GROUP
nsdoc0330vm923	13.78.187.150	192.0.0.4	NSDoc0330VM-nsg

In the blade that appears for the NIC you selected, click **IP configurations**. The existing IP configuration that was assigned when you created the VM, **ipconfig1**, is displayed. For this use case, make sure the IP addresses associated with ipconfig1 are static. Next, create two more IP configurations: ipconfig2 (VIP) and ipconfig3 (SNIP).

To create additional ipconfigs, create **Add**.

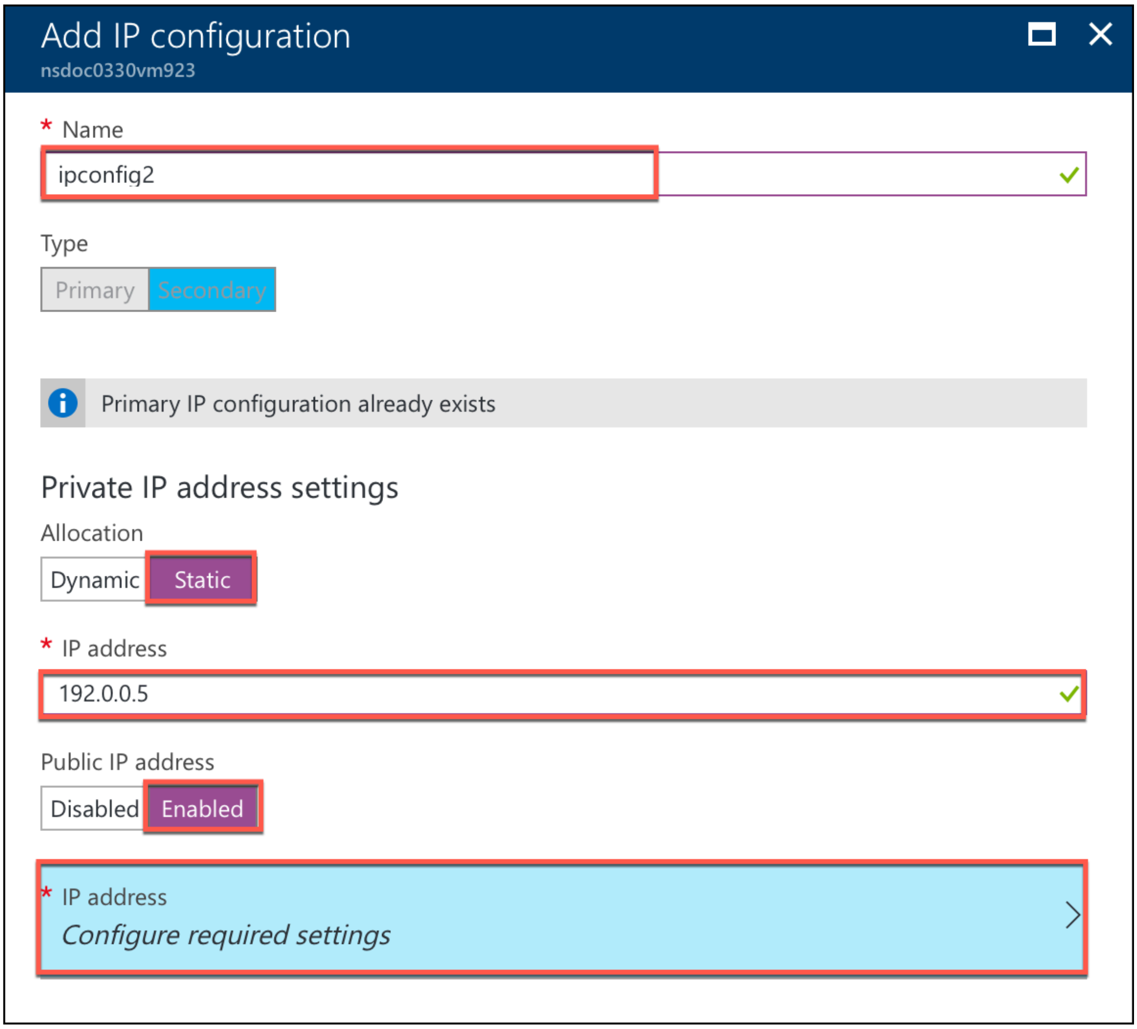
NAME
IP VERSION
ipconfig1
IPv4

In the **Add IP configuration** window, enter a **Name**, specify allocation method as **Static**, enter an IP address (192.0.0.5 for this use case), and enable **Public IP address**.

> **Note**
>
> Before adding a static private IP address, check for IP address availability and make sure the IP address belongs to the same subnet to which the NIC is attached.



Add IP configuration
nsdoc0330vm923

* Name
ipconfig2

Type
Primary | Secondary

Primary IP configuration already exists

Private IP address settings

Allocation
Dynamic | Static

* IP address
192.0.0.5

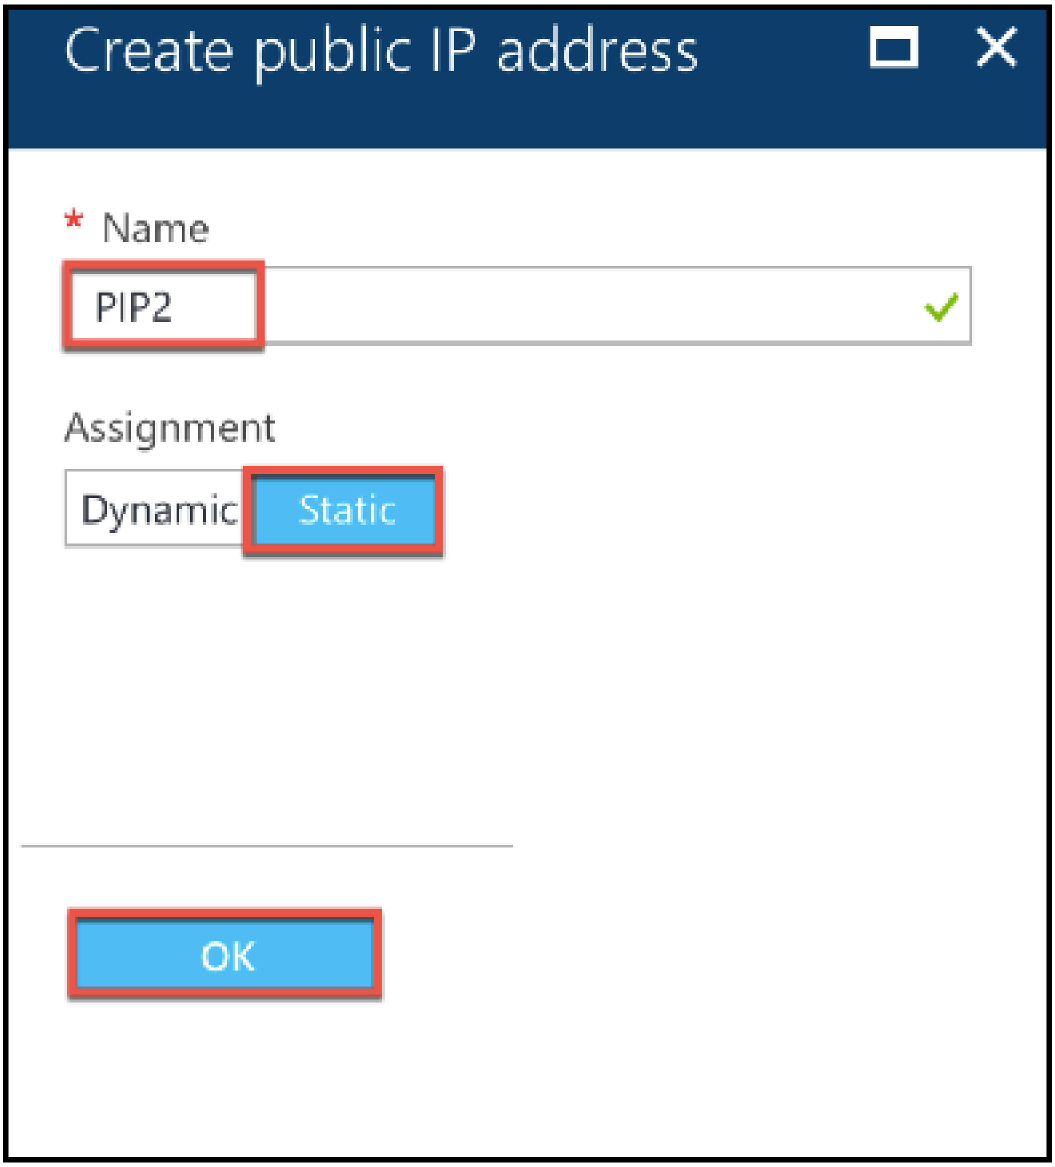
Public IP address
Disabled | Enabled

* IP address
Configure required settings

Next, click **Configure required settings** to create a static public IP addresss for ipconfig2.

By default, public IPs are dynamic. To make sure that the VM always uses the same public IP address, create a static Public IP.

In the Create public IP address blade, add a Name, under Assignment click **Static**. And then click **OK**.



Create public IP address

* Name

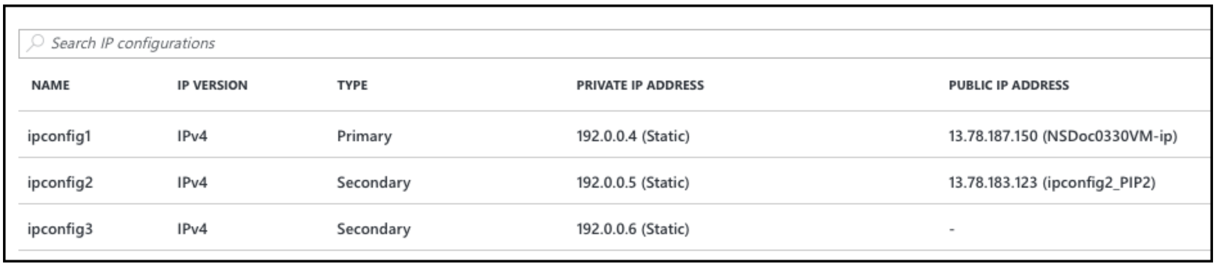
PIP2

Assignment

Dynamic Static

> **Note**
>
> Even when you set the allocation method to static, you cannot specify the actual IP address assigned to the public IP resource. Instead, it gets allocated from a pool of available IP addresses in the Azure location the resource is created in.

Follow the steps to add one more IP configuration for ipconfig3. Public IP is not mandatory.



NAME	IP VERSION	TYPE	PRIVATE IP ADDRESS	PUBLIC IP ADDRESS
ipconfig1	IPv4	Primary	192.0.0.4 (Static)	13.78.187.150 (NSDoc0330VM-ip)
ipconfig2	IPv4	Secondary	192.0.0.5 (Static)	13.78.183.123 (ipconfig2_PIP2)
ipconfig3	IPv4	Secondary	192.0.0.6 (Static)	-

Step 2: Configure NetScaler-owned IP addresses

Configure the NetScaler-owned IP addresses by using the NetScaler GUI or the command "add ns ip." For more information, see https://docs.citrix.com/en-us/netscaler/11-1/networking/ip-addressing/configuring-netscaler-owned-ip-addresses.html

You've now configured multiple IP addresses for a NetScaler VPX instance in standalone mode.

Configure GSLB on NetScaler VPX instances

September 21, 2020

NetScaler appliances configured for global server load balancing (GSLB) provide disaster recovery and continuous availability of applications by protecting against points of failure in a wide area network (WAN). GSLB can balance the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers in case of an outage.

This section describes how to enable GSLB on VPX instances on two sites in a Microsoft Azure environment, by using Windows PowerShell commands.

> **Note**
>
> For more information about GSLB, see Global Server Load Balancing.

You can configure GSLB on a NetScaler VPX instances on Azure, in two steps:

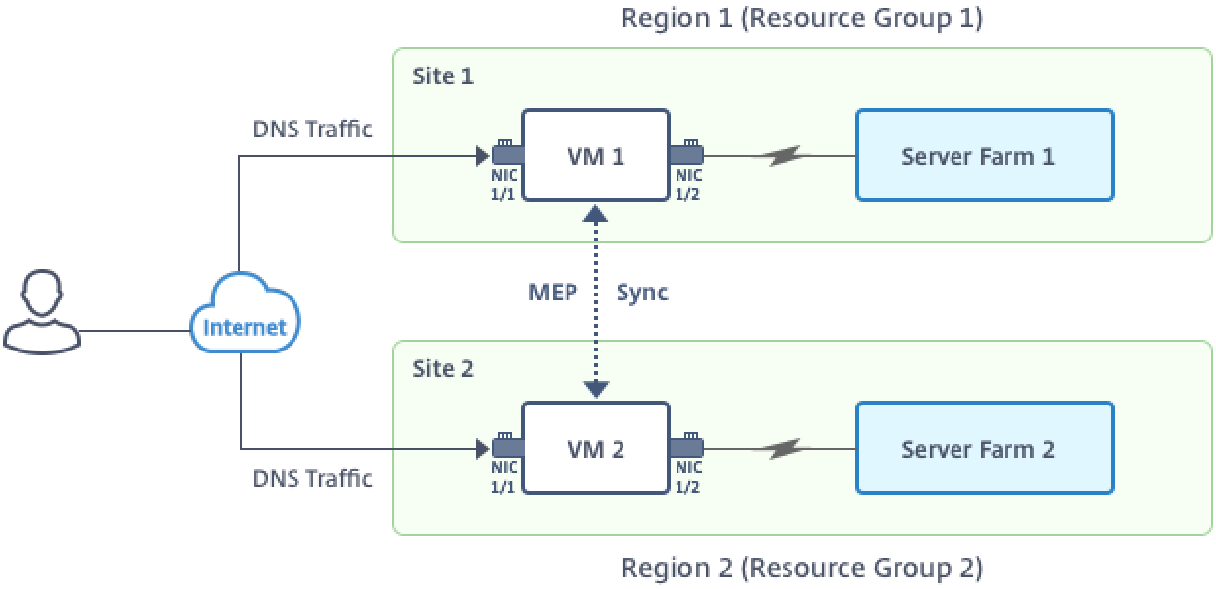
1. Create a VPX instance with multiple NICs and multiple IP addresses, on each site.
2. Enable GSLB on the VPX instances.

> **Note**
>
> For more information about configuring multiple NICs and IP addresses see:
>
> Configuring Multiple IPs for a NetScaler VPX Appliance in Standalone Mode.

Use Case

This use case includes two sites - Site 1 and Site 2. Each site has a VM (VM1 and VM2) configured with multiple NICs, multiple IP addresses, and GSLB.

Figure. GSLB setup implemented across two sites - Site 1 and Site 2.



Region 1 (Resource Group 1)
Site 1
DNS Traffic
NIC 1/1
VM 1
NIC 1/2
Server Farm 1
MEP
Sync
Internet
Site 2
NIC 1/1
VM 2
NIC 1/2
Server Farm 2
DNS Traffic
Region 2 (Resource Group 2)

In this use case, each VM has three NICs - NIC 0/1, 1/1, and 1/2. Each NIC can have multiple private and public IP addresses. The NICs are configured for the following purposes.

- NIC 0/1: to serve management traffic
- NIC 1/1: to serve client-side traffic
- NIC 1/2: to communicate with back-end servers

For information about the IP addresses configured on each NIC in this use case, see the IP Configuration Details section.

Parameters

Following are sample parameters settings for this use case in this document. You can use different settings if you wish.

$location=”West Central US”

$vnetName=”NSVPX-vnet”

$RGName=”multiIP-RG”

$prmStorageAccountName=”multiipstorageaccnt”

$avSetName=”MultiIP-avset”

$vmSize=”Standard_DS3_V2”

Note: The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

$publisher=”citrix”

$offer=”netscalervpx111”

```
$sku=”netscalerbyol”
$version=”latest”
$vmNamePrefix=”MultiIPVPX”
$nicNamePrefix=”MultiipVPX”
$osDiskSuffix=”osdiskdb”
$numberOfVMs=1
$ipAddressPrefix=”10.0.0.”
$ipAddressPrefix1=”10.0.1.”
$ipAddressPrefix2=”10.0.2.”
$pubIPName1=”MultiIP-pip1”
$pubIPName2=”MultiIP-pip2”
$IpConfigName1=”IPConfig1”
$IPConfigName2=”IPConfig-2”
$IPConfigName3=”IPConfig-3”
$IPConfigName4=”IPConfig-4”
$frontendSubnetName=”default”
$backendSubnetName1=”subnet_1”
$backendSubnetName2=”subnet_2”
$suffixNumber=10
```

1. Create a multi-NIC, multi-IP VM by Using PowerShell commands

Follow steps 1-10 to create VM1 with multiple NICs and multi IP addresses, by using PowerShell commands:

1. Create resource group
2. Create storage account
3. Create availability set
4. Create virtual network
5. Create public IP address
6. Create NICs
7. Create VM config object

8. Get credentials and set OS properties for the VM

9. Add NICs

10. Specify OS disk and create VM

After you complete all the steps and commands to create VM1, repeat these steps to create VM2 with parameters specific to it.

Create Resource Group

```
New-AzureRMResourceGroup -Name $RGName -Location $location
```

Create Storage Account

```
$prmStorageAccount=New-AzureRMStorageAccount -Name
    $prmStorageAccountName -ResourceGroupName $RGName -Type Standard_LRS
     -Location $location
```

Create Availability Set

```
$avSet=New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName
    $RGName -Location $location
```

Create Virtual Network

1. Add subnets.

```
$subnet1=New-AzureRmVirtualNetworkSubnetConfig -Name
    $frontendSubnetName -AddressPrefix "10.0.0.0/24"
$subnet2=New-AzureRmVirtualNetworkSubnetConfig -Name
    $backendSubnetName1 -AddressPrefix "10.0.1.0/24"
$subnet3=New-AzureRmVirtualNetworkSubnetConfig -Name
    $backendSubnetName2 -AddressPrefix "10.0.2.0/24"
```

2. Add virtual network object.

```
$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName
    $RGName -Location $location -AddressPrefix 10.0.0.0/16 -Subnet
    $subnet1, $subnet2, $subnet3
```

3. Retrieve subnets.

```
$frontendSubnet=$vnet.Subnets|?{
 $_.Name -eq $frontendSubnetName }

$backendSubnet1=$vnet.Subnets|?{
 $_.Name -eq $backendSubnetName1 }

$backendSubnet2=$vnet.Subnets|?{
 $_.Name -eq $backendSubnetName2 }
```

Create Public IP Address

```
$pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName $RGName -Location $location -AllocationMethod Dynamic
$pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName $RGName -Location $location -AllocationMethod Dynamic
```

Create NICs

NIC 0/1

```
$nic1Name=$nicNamePrefix + $suffixNumber + "-Mgmnt"
$ipAddress1=$ipAddressPrefix + $suffixNumber
$IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -SubnetId $frontendSubnet.Id -PublicIpAddress $pip1 -PrivateIpAddress $ipAddress1 -Primary
$nic1=New-AzureRMNetworkInterface -Name $nic1Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IpConfig1
```

NIC 1/1

```
$nic2Name $nicNamePrefix + $suffixNumber + "-frontend"
$ipAddress2=$ipAddressPrefix1 + ($suffixNumber)
$ipAddress3=$ipAddressPrefix1 + ($suffixNumber + 1)
$IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -PublicIpAddress $pip2 -SubnetId $backendSubnet1.Id  -PrivateIpAddress $ipAddress2  -Primary
$IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -SubnetId $backendSubnet1.Id  -PrivateIpAddress $ipAddress3
nic2=New-AzureRMNetworkInterface -Name $nic2Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IpConfig2, $IpConfig3
```

NIC 1/2

```
$nic3Name=$nicNamePrefix + $suffixNumber + "-backend"
$ipAddress4=$ipAddressPrefix2 + ($suffixNumber)
$IPConfig4=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName4 -SubnetId $backendSubnet2.Id -PrivateIpAddress $ipAddress4 -Primary
$nic3=New-AzureRMNetworkInterface -Name $nic3Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IpConfig4
```

Create VM config object

```
$vmName=$vmNamePrefix
$vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id
```

Get credentials and set OS properties for the VM

```
$cred=Get-Credential -Message "Type the name and password for VPX login."
$vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -ComputerName $vmName -Credential $cred
$vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName $publisher -Offer $offer -Skus $sku -Version $version
```

Add NICs

```
$vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -Primary
$vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic2.Id
$vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic3.Id
```

Specify OS disk and create VM

```
$osDiskName=$vmName + "-" + $osDiskSuffix
$osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/" +$osDiskName + ".vhd"
$vmConfig=Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri $osVhdUri -CreateOption fromImage
Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -Name $sku
```

```
New-AzureRMVM -VM $vmConfig -ResourceGroupName $RGName -Location
    $location
```

> **Note**
>
> Repeat steps 1-10 listed in "Create Multi-NIC VMs by Using PowerShell Commands" to create VM2 with parameters specific to VM2.

IP Configuration details

In this use case, the following IP addresses are used.

Table 1. IP addresses used in VM1

NIC	Private IP	Public IP (PIP)	Description
0/1	10.0.0.10	PIP1	Configured as NSIP (management IP)
1/1	10.0.1.10	PIP2	Configured as SNIP/GSLB Site IP
1/1	10.0.1.11		Configured as LB server IP; public IP is not mandatory
1/2	10.0.2.10		Configured as SNIP for sending monitor probes to services; public IP is not mandatory

Table 2. IP addresses used in VM2

NIC	Private IP	Public IP (PIP)	Description
—	—	—	—
0/1	20.0.0.10	PIP4	Configured as NSIP (management IP)
1/1	20.0.1.10	PIP5	Configured as SNIP/GSLB Site IP
1/1	20.0.1.11		Configured as LB server IP; public IP is not mandatory
1/2	20.0.2.10		Configured as SNIP for sending monitor probes to services; public IP is not mandatory

Here are sample configurations for this use case, showing the IP addresses and intial LB configurations as created through the NetScaler CLI for VM1 and VM2.

```
add ns ip 10.0.1.10 255.255.255.0 -mgmtAccess ENABLED
Add nsip 10.0.2.10 255.255.255.0
```

```
add service svc1 10.0.1.10 ADNS 53
add lb vserver v1 HTTP 10.0.1.11 80
add service s1 10.0.2.120 http 80
Add service s2 10.0.2.121 http 80
Bind lb vs v1 s[1-2]

add ns ip 20.0.1.10 255.255.255.0  -mgmtAccess ENABLED
Add nsip 20.0.2.10 255.255.255.0
add service svc1 20.0.1.10 ADNS 53
add lb vserver v1 HTTP 20.0.1.11 80
Add service s1 20.0.2.90 http 80
Add service s2 20.0.2.91 http 80
Bind lb vs v1 s[1-2]
```

2. Configure GSLB sites and other necessary GSLB settings

Perform the tasks described in the following topic to configure the two GSLB sites and other necessary settings:

Configuring Global Server Load Balancing (GSLB)

For more information, see this support article:
`https://support.citrix.com/article/CTX110348`

Here is a sample GSLB configuration for this use case.

```
enable ns feature LB  GSLB
add gslb site site1 10.0.1.10 -publicIP PIP2
add gslb site site2 20.0.1.10 -publicIP PIP5
add gslb service site1_gslb_http_svc1 10.0.1.11 HTTP 80 -publicIP PIP3
    -publicPort 80 -siteName site1
add gslb service site2_gslb_http_svc1 20.0.1.11 HTTP 80 -publicIP PIP6
    -publicPort 80 -siteName site2
add gslb vserver gslb_http_vip1 HTTP
bind gslb vserver gslb_http_vip1 -serviceName site2_gslb_http_svc1
bind gslb vserver gslb_http_vip1 -serviceName site1_gslb_http_svc1
bind gslb vserver gslb_http_vip1 -domainName www.gslbindia.com -TTL 5
```

You've configured GSLB on NetScaler VPX instances running on Azure. For additional information about how to configure GSLB on NetScaler VPX instances, see the Configuring Citrix NetScaler GSLB in Microsoft Azure video.

Configure address pools (IIP) for a Citrix Gateway appliance

September 21, 2020

In some situations, users who connect with the NetScaler Gateway Plug-in need a unique IP address for NetScaler Gateway. When you enable address pools (also known as IP pooling) for a group, NetScaler Gateway can assign a unique IP address alias to each user. You configure address pools by using intranet IP (IIP) addresses.

You can configure address pools on a NetScaler Gateway deployed on Azure by following this two-step procedure:

- Registering the private IP addresses that will be used in the address pool, in Azure
- Configuring address pools in the NetScaler Gateway appliance

Register a private IP address in the Azure portal

In Azure , you can deploy a NetScaler virtual instance with multiple IP addresses. You can add IP addresses to a VPX instance in two ways:

a. While provisioning a VPX instance

For more information about how to add multiple IP addresses while provisioning a VPX instance, see Configuring Multiple IP Addresses for a NetScaler VPX Appliance in Azure Resource Manager. To add IP addresses by using PowerShell commands while provisioning a VPX instance, see Configuring Multiple IP Addresses for a NetScaler VPX Instance in Standalone Mode.

b. After provisioning a VPX instance.

After you've provisioned a VPX instance, follow these steps to register a private IP address in the Azure portal, which you configure as an address pool in the NetScaler Gateway appliance.

1. From Azure Resource Manager (ARM), go to the already created NetScaler VPX instance > **Network interfaces**. Choose the network interface which is bound to a subnet to which the IIP that you want to register belongs.

IP forwarding settings

IP forwarding: Disabled | Enabled

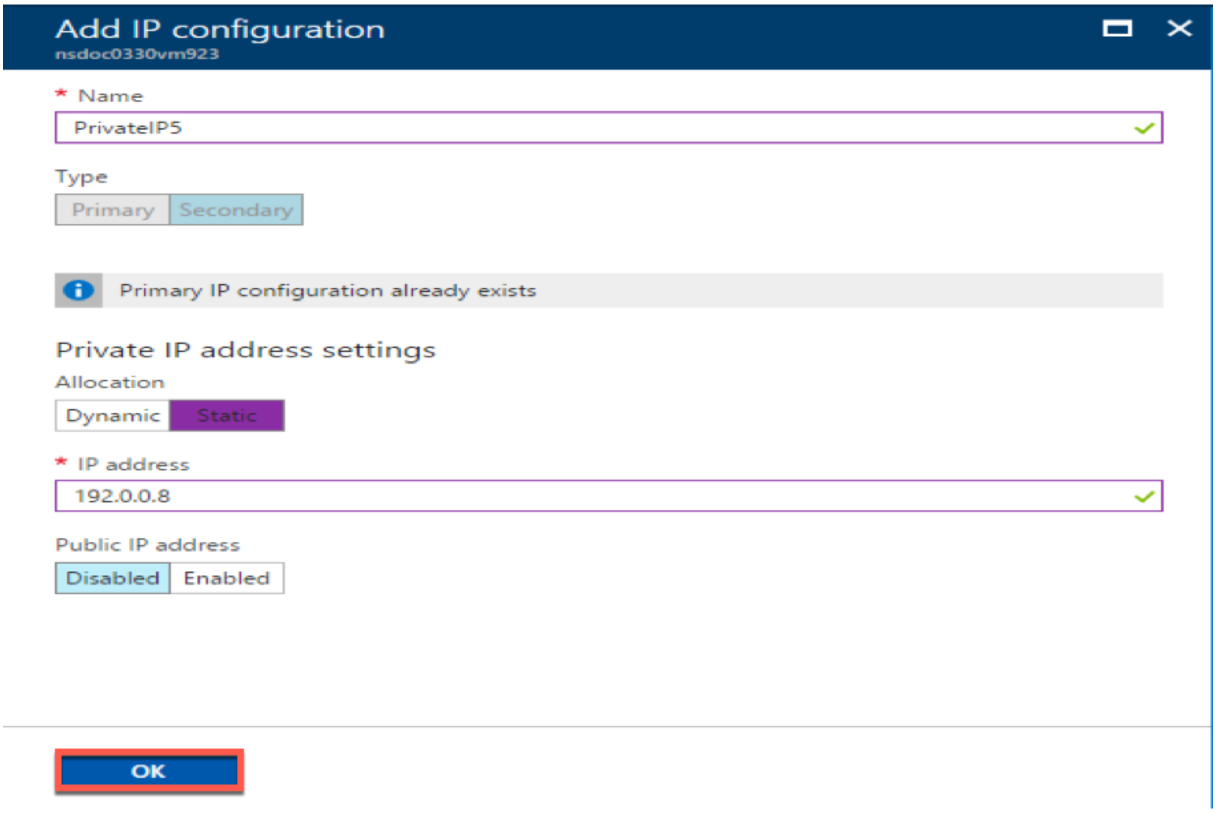
Virtual network: NSDoc0330VNET

IP configurations

* Subnet: Frontend (192.0.0.0/24)

NAME	IP VERSION	TYPE	PRIVATE IP ADDRE
ipconfig1	IPv4	Primary	192.0.0.4 (Static)
ipconfig2	IPv4	Secondary	192.0.0.5 (Static)
ipconfig3	IPv4	Secondary	192.0.0.6 (Static)

3. Provide the required details as shown in the example below and click **OK**.



* Name
PrivateIP5

Type: Secondary

Primary IP configuration already exists

Private IP address settings

Allocation: Static

* IP address
192.0.0.8

Public IP address: Disabled

Configure address pools in the Citrix Gateway appliance

For more information about how to configure address pools on the NetScaler Gateway, see this page.

Limitation: You can not bind a range of IIP addresses to users. Every IIP address that is used in an address pool should be registered.

Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands

September 21, 2020

Overview

In an Azure environment, a NetScaler VPX virtual appliance can be deployed with multiple NICs. Each NIC can have multiple IP addresses. This section describes how to deploy a Netscaler VPX instance with a single NIC and multiple IP addresses, by using PowerShell commands. You can use the same script for multi-NIC and multi-IP deployment.

> **Note**
>
> In this document, IP-Config refers to a pair of IP addresses, public IP and private IP, that is associated with an inidivual NIC. For more information, see the Azure Resource Manager Terminology section.

Use case

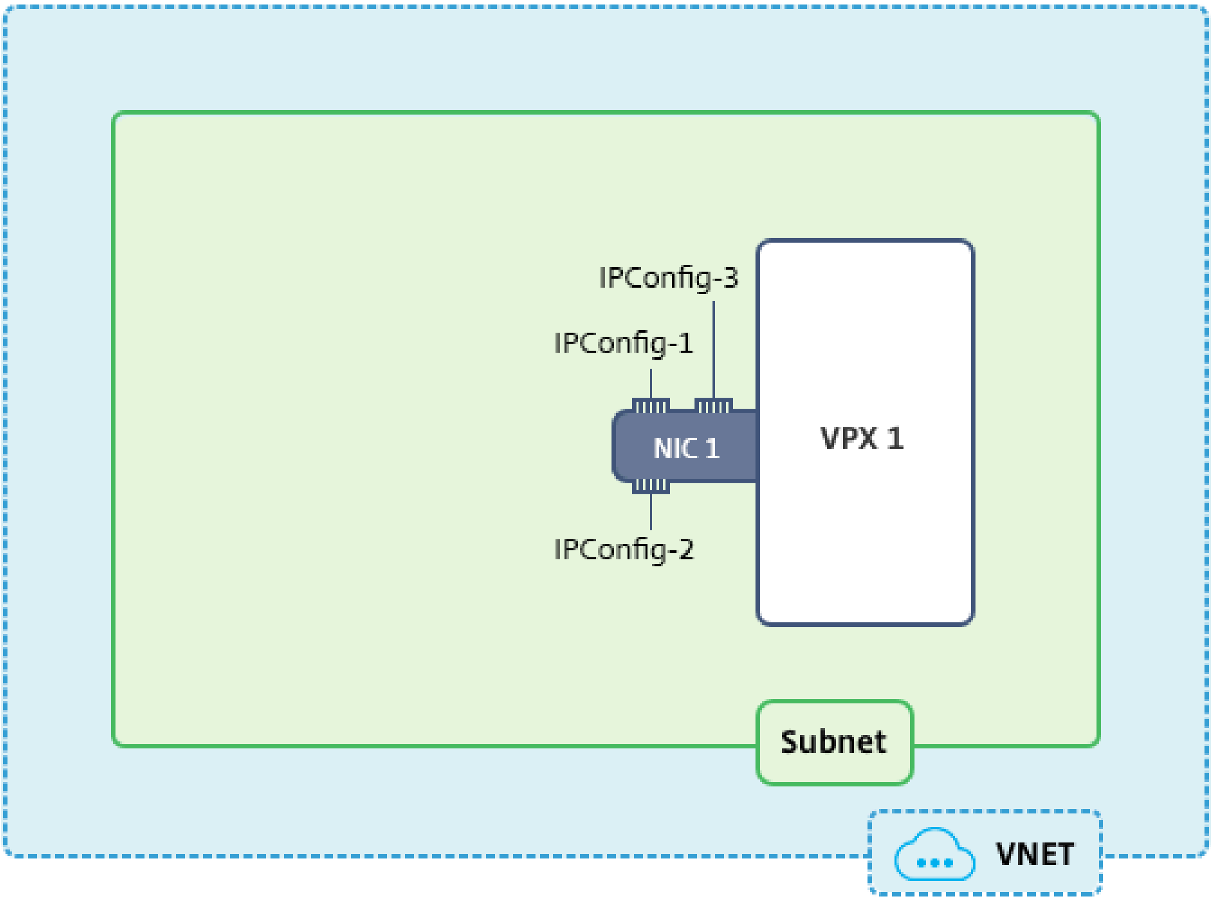
In this use case, a single NIC is connected to a virtual network (VNET). The NIC is associated with three IP configurations, as shown in the following table.

IPConfig	Assocaited with
IPConfig-1	Static public IP address; static private IP address
IPConfig-2	Static public IP address; static private address
IPConfig-3	Static private IP addres

> **Note**
>
> IPConfig-3 is not associated with any public IP address.

Diagram: Topology

Here is the visual representation of the use case.



> **Note**
>
> In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP address associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP address of the appliance. The remaining private IP addresses associated with IPConfigs must be added in the NetScaler appliance as VIPs or SNIPs by using the "add ns ip" command, as determined by your requirements.

Here is the summary of the steps required for configuring multiple IP addresses for a NetScaler VPX virtual appliance in standalone mode:

1. Create Resource Group
2. Create Storage Account
3. Create Availability Set
4. Create NSG
5. Create Virtual Network
6. Create Public IP Address
7. Assign IP Configuration
8. Create NIC
9. Create NetScaler VPX Instance

10. Check NIC Configurations
11. Check VPX-side Configurations

Script

Parameters

Following are sample parameters settings for the use case in this document. You can use different settings if you wish.

$locName=”westcentralus”

$rgName=”Azure-MultiIP”

$nicName1=”VM1-NIC1”

$vNetName=”Azure-MultiIP-vnet”

$vNetAddressRange=”11.6.0.0/16”

$frontEndSubnetName=”frontEndSubnet”

$frontEndSubnetRange=”11.6.1.0/24”

$prmStorageAccountName=”multiipstorage”

$avSetName=”multiip-avSet”

$vmSize=”Standard_DS4_V2” (This parameter creates a VM with upto four NICs.)

Note: The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

$publisher=”citrix”

$offer=”netscalervpx110-6531” (You can use different offers.)

$sku=”netscalerbyol” (According to your offer, the SKU can be different.)

$version=”latest”

$pubIPName1=”PIP1”

$pubIPName2=”PIP2”

$domName1=”multiipvpx1”

$domName2=”multiipvpx2”

$vmNamePrefix=”VPXMultiIP”

$osDiskSuffix=”osmultiipalbdiskdb1”

Network Security Group (NSG)-related information:

$nsgName=”NSG-MultiIP”

$rule1Name=”Inbound-HTTP”

$rule2Name=”Inbound-HTTPS”

$rule3Name=”Inbound-SSH”

$IpConfigName1=”IPConfig1”

$IPConfigName2=”IPConfig-2”

$IPConfigName3=”IPConfig-3”

1. Create Resource Group

```
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2. Create Storage Account

```
$prmStorageAccount = New-AzureRMStorageAccount -Name $prmStorageAccountName -ResourceGroupName $rgName -Type Standard_LRS -Location $locName
```

3. Create Availability Set

```
$avSet = New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName $rgName -Location $locName
```

4. Create Network Security Group (NSG)

1. Add rules. You must add a rule to the NSG for any port that serves traffic.

```
$rule1=New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name -Description "Allow HTTP" -Access Allow -Protocol Tcp -Direction Inbound -Priority 101  -SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 80
$rule2=New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name -Description "Allow HTTPS" -Access Allow -Protocol Tcp -Direction Inbound -Priority 110  -SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 443
```

```
$rule3=New-AzureRmNetworkSecurityRuleConfig -Name $rule3Name -
    Description "Allow SSH" -Access Allow -Protocol Tcp -Direction
    Inbound -Priority 120 -SourceAddressPrefix Internet -SourcePortRange
     * -DestinationAddressPrefix * -DestinationPortRange 22
```

2. Create NSG object.

```
$nsg=New-AzureRmNetworkSecurityGroup -ResourceGroupName $rgName -
    Location $locName -Name $nsgName -SecurityRules $rule1,$rule2,$rule3
```

5. Create Virtual Network

1. Add subnets.

```
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
    $frontEndSubnetName -AddressPrefix $frontEndSubnetRange
```

2. Add virtual network object.

```
$vnet=New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName
    $rgName -Location $locName -AddressPrefix $vNetAddressRange -Subnet
    $frontendSubnet
```

3. Retrieve subnets.

```
$subnetName="frontEndSubnet"
$subnet1=$vnet.Subnets|?{
 $_.Name -eq $subnetName }
```

6. Create Public IP Address

```
$pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName
    $rgName -DomainNameLabel $domName1 -Location $locName -
    AllocationMethod Static
$pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName
    $rgName -DomainNameLabel $domName2 -Location $locName -
    AllocationMethod Static
```

> **Note**
>
> Check availability of domain names before using.
>
> Allocation method for IP addresses can be dynamic or static.

7. Assign IP Configuration

In this use case, consider the following points before assigning IP addresses:

- IPConfig-1 belongs to subnet1 of VPX1.
- IPConfig-2 belongs to subnet 1 of VPX1.
- IPConfig-3 belongs to subnet 1 of VPX1.

> **Note**
>
> When you assign multiple IP configurations to a NIC, one configuration must be assigned as primary.

```
$IPAddress1="11.6.1.27"
$IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress1 -PublicIpAddress $pip1
      - Primary
$IPAddress2="11.6.1.28"
$IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress2 -PublicIpAddress $pip2
$IPAddress3="11.6.1.29"
$IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress3 -Primary Use a valid
    IP address that meets your subnet requirements and check its
    availability.
```

8. Create NIC

```
$nic1=New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig1,$IpConfig2,
    $IPConfig3 -NetworkSecurityGroupId $nsg.Id
```

9. Create NetScaler VPX Instance

1. Initialize variables.

```
$suffixNumber = 1
$vmName = $vmNamePrefix + $suffixNumber
```

2. Create VM config object.

```
$vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avSet.Id
```

3. Set credentials, OS, and image.

```
$cred=Get-Credential -Message "Type the name and password for VPX login
    ."
$vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -
    ComputerName $vmName -Credential $cred
$vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName
    $publisher -Offer $offer -Skus $sku -Version $version
```

4. Add NIC.

```
$vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -
    Primary
```

> **Note**
>
> In a multi-NIC VPX deployment, one NIC should be primary. So, "-Primary" needs to be appended while adding that NIC to the VPX instance.

5. Specify OS disk and create VM.

```
$osDiskName=$vmName + "-" + $osDiskSuffix1
$osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/"
     + $osDiskName + ".vhd"
$vmConfig=Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri
    $osVhdUri -CreateOption fromImage
Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -
    Name $sku
New-AzureRMVM -VM $vmConfig -ResourceGroupName $rgName -Location
    $locName
```

10. Check NIC Configurations

After the VPX instance starts, you can check the IP addresses allocated to IPConfigs of the VPX NIC by using the following command.

```
$nic.IPConfig
```

11. Check VPX-side Configurations

When the Netscaler VPX instance starts, a private IP address associated with primary IPconfig of the primary NIC is added as the NSIP address. The remaining private IP addresses must be added as VIP or SNIP addresses, as determined by your requirements. Use the following command.

```
add nsip <Private IPAddress><netmask> -type VIP/SNIP
```

You've now configured multiple IP addresses for a NetScaler VPX instance in standalone mode. For additional information about how to configure multiple IP addresses for a NetScaler VPX instance in standalone mode, see the Citrix NetScaler deployments in Microsoft Azure video.

PowerShell scripts for Azure deployment

September 21, 2020

This topic provides the PowerShell cmdlets with which you can perform the following configurations in Azure PowerShell:

- Provision NetScaler VPX in Standalone Mode
- Configure NetScaler VPX HA with Azure External Load Balancer
- Configure NetScaler VPX HA with Azure Internal Load Balance

Provision NetScaler VPX in Standalone Mode

1. **Creating a resource group**

The resource group can include all the resources for the solution, or only those resources that you want to manage as a group. The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

$rgName="<resource group name>"

$locName="<location name, such as West US>"

New-AzureRmResourceGroup -Name $rgName -Location $locName

For example:

$rgName = "ARM-VPX"

$locName = "West US"

New-AzureRmResourceGroup -Name $rgName -Location $locName

2. **Creating a storage account**

Choose a unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"

$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

For example:

```
$saName=”vpxstorage”

$saType=”Standard_LRS”

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3. **Creating an availability set**

Availability set helps to keep your virtual machines available during downtime, such as during maintenance. A load balancer configured with an availability set ensures that your application is always available.

```
$avName=”<availability set name>”

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

4. **Creating a virtual network**

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```
$FrontendAddressPrefix=”10.0.1.0/24”

$BackendAddressPrefix=”10.0.2.0/24”

$vnetAddressPrefix=”10.0.0.0/16”

$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix

New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

For example:

```
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix

New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

5. **Creating a NIC**

Create a NIC and associate the NIC with the NetScaler VPX instance. The front end Subnet created in the above procedure is indexed at 0 and the back end Subnet is indexed at 1. Now create NIC in one of the three following ways:

a) *NIC with Public IP address*

```
$nicName=”<name of the NIC of the VM>”
```

```
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -Location $locName -AllocationMethod Dynamic
```

```
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id
```

b) *NIC with Public IP and DNS label*

```
$nicName=”<name of the NIC of the VM>”
```

```
$domName=”<domain name label>”
```

```
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod Dynamic
```

Before assigning $domName, check it is available or not by using command:

```
Test-AzureRmDnsAvailability -DomainQualifiedName $domName -Location $locName
```

```
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id
```

For example:

```
$nicName=”frontendNIC”
```

```
$domName=”vpxazure”
```

```
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod Dynamic
```

```
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[0].Id -PublicIpAddressId $pip.Id
```

c) *NIC with Dynamic Public Address and Static Private IP address*

Make sure that the private (static) IP address you add to the VM should be the same range as that of the subnet specified.

```
$nicName=”<name of the NIC of the VM>”
```

```
$staticIP=”<available static IP address on the subnet>”
```

```
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -Location $locName -AllocationMethod Dynamic
```

```
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id -PrivateIpAddress $staticIP
```

6. **Creating a virtual object**

```
$vmName=”<VM name>”
```

```
$vmSize=”<VM size string>”
```

```
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
```

```
$vm=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
```

7. **Getting the NetScaler VPX image**

```
$pubName=”<Image publisher name>”
```

```
$offerName=”<Image offer name>”
```

```
$skuName=”<Image SKU name>”
```

```
$cred=Get-Credential -Message “Type the name and password of the local administrator account.”
```

Provide your credentials that is used to login into VPX

```
$vm=Set-AzureRmVMOperatingSystem -VM $vm -Linux -ComputerName $vmName -Credential $cred -Verbose
```

```
$vm=Set-AzureRmVMSourceImage -VM $vm -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
```

```
$vm=Add-AzureRmVMNetworkInterface -VM $vm -Id $nic.Id
```

For example:

```
$pubName=”citrix”
```

The following command is used for displaying all offers from Citrix:

Get-AzureRMVMImageOffer -Location $locName -Publisher $pubName	Select Offer

```
$offerName=”netscalervpx110-6531”
```

The following command is used to know sku offered by publisher for specific offer name:

Get-AzureRMVMImageSku -Location $locName -Publisher $pubName -Offer $offerName	Select Skus

8. **Creating a virtual machine**

```
$diskName=”<name identifier for the disk in Azure storage, such as OSDisk>”
```

For example:

```
$diskName=”dynamic”

$pubName=”citrix”

$offerName=”netscalervpx110-6531”

$skuName=”netscalerbyol”

$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName

$osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds/” + $diskName  + “.vhd”

$vm=Set-AzureRmVMOSDisk -VM $vm -Name $diskName -VhdUri $osDiskUri -CreateOption fromImage
```

When you create VM from Images present in marketplace, use the following command to specify the VM plan:

```
Set-AzureRmVMPlan -VM $vm -Publisher $pubName -Product $offerName -Name $skuName

New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm
```

Provision NetScaler VPX in HA with Azure External Load Balancer

Log on to AzureRmAccount using your Azure user credentials.

1) **Creating a resource group**

The location specified here is the default location for resources in that resource group. Make sure that all commands used to create a load balancer use the same resource group.

```
$rgName=”<resource group name>”

$locName=”<location name, such as West US>”

New-AzureRmResourceGroup -Name $rgName -Location $locName
```

For example:

```
$rgName = “ARM-LB-NS”

$locName = “West US”

New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2) **Creating a storage account**

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```
$saName=”<storage account name>”

$saType=”<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>”

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

For example:

```
$saName=”vpxstorage”

$saType=”Standard_LRS”

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3) **Creating an availability set**

A load balancer configured with an availability set ensures that your application is always available.

```
$avName=”<availability set name>”

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

4) **Creating a virtual network**

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```
$vnetName = “LBVnet”

$FrontendAddressPrefix=”10.0.1.0/24”

$BackendAddressPrefix=”10.0.2.0/24”

$vnetAddressPrefix=”10.0.0.0/16”

$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix

$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet‘
```

Note: Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array vnet, subnetId should be $vnet.Subnets[0].Id.

If the front end subnet is the second element in the array, the subnetId should be $vnet.Subnets[1].Id, and so on..

5) Configuring front end IP address and creating back end address pool

Configure a front end IP address for the incoming load balancer network traffic and create a back end address pool to receive the load balanced traffic.

```
$pubName=”PublicIp1”
```

```
$publicIP1 = New-AzureRmPublicIpAddress -Name $pubName -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel nsvpx
```

Note: Check for the availability of the value for DomainNameLabel.

```
$FIPName = “ELBFIP”
```

```
$frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName -PublicIpAddress $publicIP1
```

```
$BEPool = “LB-backend-Pool”
```

```
$beaddresspool1= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool
```

8) Creating a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

```
$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
```

9) Creating a load balancing rule

Create a LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance http service.

```
$lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP-LB” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool  $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 80
```

10) Creating inbound NAT rules

Create NAT rules for services that you are not load balancing.

For example, when creating a SSH access to a NetScaler VPX instance.

Note: Protocol-FrontEndPort-BackendPort triplet should not be the same for two NAT rules.

```
$inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22
```

```
$inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 10022 -BackendPort 22
```

11) **Creating a load balancer entity**

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

$lbName=”ELB”

$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1, $inboundNATRule2 -FrontendIpConfiguration $frontendIP1 -LoadBalancingRule $lbrule1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe

12) **Creating a NIC**

Create two NICs and associate each NIC with each VPX instance

a) NIC1 with VPX1

For example:

$nicName=”NIC1”

$lbName=”ELB”

$bePoolIndex=0

* Rule indexes starts from 0.

$natRuleIndex=0

$subnetIndex=0

* Frontend subnet index

$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName

$nic1=New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location
$locName -Subnet $vnet.Subnets[$subnetIndex] -LoadBalancerBackendAddressPool $lb.BackendAddressPools[$
-LoadBalancerInboundNatRule $lb.InboundNatRules[$natRuleIndex]

b) NIC2 with VPX2

*For example***:**

$nicName=”NIC2”

$lbName=”ELB”

$bePoolIndex=0

$natRuleIndex=1

* Second Inbound NAT (SSH) rule we need to use

$subnetIndex=0

* Frontend subnet index

```
$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName

$nic2=New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -Subnet $vnet.Subnets[$subnetIndex] -LoadBalancerBackendAddressPool $lb.BackendAddressPools[$
-LoadBalancerInboundNatRule $lb.InboundNatRules[$natRuleIndex]
```

13) **Creating NetScaler VPX instances**

Create two NetScaler VPX instances as part of the same resource group and availability set, and attach it to the external load balancer.

a) NetScaler VPX instance 1

For example:

```
$vmName=”VPX1”

$vmSize=”Standard_A3”

$pubName=”citrix”

$offerName=”netscalervpx110-6531”

$skuName=”netscalerbyol”

$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName

$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id

$cred=Get-Credential -Message “Type Credentials which will be used to login to VPX instance”

$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose

$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”

$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id

$diskName=”dynamic”

$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName

$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds1/” + $diskName + “.vhd”

$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage

Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName

New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
```

b) NetScaler VPX instance 2

For example:

```
$vmName=”VPX2”
$vmSize=”Standard_A3”
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message “ Type Credentials which will be used to login to VPX instance “
$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id
$diskName=”dynamic”
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds2/” + $diskName + “.vhd”
$vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2
```

14) **Configuring the virtual machines**

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) Active-Active: Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) Active-Passive: Run this command on the command line of both the NetScaler VPX instances.

```
add ha node #nodeID <nsip of other NetScaler VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

Provision NetScaler VPX in HA with Azure Internal Load Balancer

Log on to AzureRmAccount using your Azure user credentials.

1) **Creating a resource group**

The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

```
$rgName="<resource group name>"
```

```
$locName="<location name, such as West US>"
```

```
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

For example:

```
$rgName = "ARM-LB-NS"
```

```
$locName = "West US"
```

```
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2) **Creating a storage account**

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```
$saName="<storage account name>"
```

```
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"
```

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

For example:

```
$saName="vpxstorage"
```

```
$saType="Standard_LRS"
```

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3) **Creating an availability set**

A load balancer configured with an availability set ensures that your application is always available..

```
$avName="<availability set name>"
```

```
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

4) **Creating a virtual network**

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```
$vnetName = "LBVnet"
```

```
$vnetAddressPrefix="10.0.0.0/16"
```

```
$FrontendAddressPrefix="10.0.1.0/24"
```

$BackendAddressPrefix=”10.0.2.0/24”

$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet‘

$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix

Note: Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array vnet, subnetId should be $vnet.Subnets[0].Id.

If the front end subnet is the second element in the array, the subnetId should be $vnet.Subnets[1].Id, and so on..

5) **Creating an back end address pool**

$beaddresspool= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name “LB-backend”

6) **Creating NAT rules**

Create NAT rules for services that you are not load balancing.

$inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name “Inboundnatrule1” -FrontendIpConfiguration $frontendIP -Protocol TCP -FrontendPort 3441 -BackendPort 3389

$inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name “RDP2” -FrontendIpConfiguration $frontendIP -Protocol TCP -FrontendPort 3442 -BackendPort 3389

Use front end and back end ports as per your requirement.

7) **Creating a health probe**

Create a TCP health probe with port 9000 and interval 5 seconds.

$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name “HealthProbe” ” -Protocol tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2

8) **Creating a load balancing rule**

Create a LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance http service.

$lbrule = New-AzureRmLoadBalancerRuleConfig -Name “lbrule1” -FrontendIpConfiguration $frontendIP -BackendAddressPool $beAddressPool -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 80

Use front end and back end ports as per your requirement.

9) **Creating a load balancer entity**

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```
$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgname -Name “InternalLB” -Location $locName -FrontendIpConfiguration $frontendIP -InboundNatRule $inboundNATRule1,$inboundNatRule2 -LoadBalancingRule $lbrule -BackendAddressPool $beAddressPool -Probe $healthProbe
```

10) **Creating a NIC**

Create two NICs and associate each NIC with each NetScaler VPX instance

```
$backendnic1= New-AzureRmNetworkInterface -ResourceGroupName $rgName -Name lb-nic1-be -Location $locName -PrivateIpAddress 10.0.2.6 -Subnet $backendSubnet -LoadBalancerBackendAddressPool $nrplb.BackendAddressPools[0] -LoadBalancerInboundNatRule $nrplb.InboundNatRules[0]
```

This NIC is for NetScaler VPX 1. The Private IP should be in same subnet as that of subnet added.

```
$backendnic2= New-AzureRmNetworkInterface -ResourceGroupName $rgName -Name lb-nic2-be -Location $locName -PrivateIpAddress 10.0.2.7 -Subnet $backendSubnet -LoadBalancerBackendAddressPool $nrplb.BackendAddressPools[0] -LoadBalancerInboundNatRule $nrplb.InboundNatRules[1].
```

This NIC is for NetScaler VPX 2.The parameter Private IPAddress can have any private IP as per your requirement.

11) **Creating NetScaler VPX instances**

Create two VPX instances part of same resource group and availability set and attach it to the internal load balancer.

a) NetScaler VPX instance 1

For example:

```
$vmName=”VPX1”

$vmSize=”Standard_A3”

$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName

$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id

$cred=Get-Credential -Message “Type Credentials which will be used to login to VPX instance”

$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose

$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
```

```
$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $backendnic1.Id

$diskName=”dynamic”

$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName

$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds1/” + $diskName  + “.vhd”

$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage

Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName

New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
```

b) NetScaler VPX instance 2

For example:

```
$vmName=”VPX2”

$vmSize=”Standard_A3”

$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName

$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id

$cred=Get-Credential -Message “ Type Credentials which will be used to login to VPX instance “

$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose

$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”

$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $backendnic2.Id

$diskName=”dynamic”

$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName

$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds2/” + $diskName  + “.vhd”

$vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage

Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName

New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2
```

12) **Configuring the virtual machines**

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) Active-Active: Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) Active-Passive: Run this command on the command line of both the NetScaler VPX instances.

```
add ha node #nodeID <nsip of other NetScaler VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

Azure terminology

September 21, 2020

Some of the new terms used in Azure Resource Manager are listed below. This list helps you relate to the terms and concepts used in Azure Service Management or classical mode of deployment.

1. Azure Load Balancer – Azure load balancer is a resource that distributes incoming traffic among computers in a network. Traffic is distributed among virtual machines defined in a load-balancer set. A load balancer can be external or internet-facing, or it can be internal.

2. Azure Resource Manager (ARM) – ARM is the new management framework for services in Azure. Azure Load Balancer is managed using ARM-based APIs and tools.

3. Back-End Address Pool – These are IP addresses associated with the virtual machine Network Interface Card (NIC) to which load will be distributed.

4. BLOB - Binary Large Object – Any binary object like a file or an image that can be stored in Azure storage.

5. Front-End IP Configuration – An Azure Load balancer can include one or more front-end IP addresses, also known as a virtual IPs (VIPs). These IP addresses serve as ingress for the traffic.

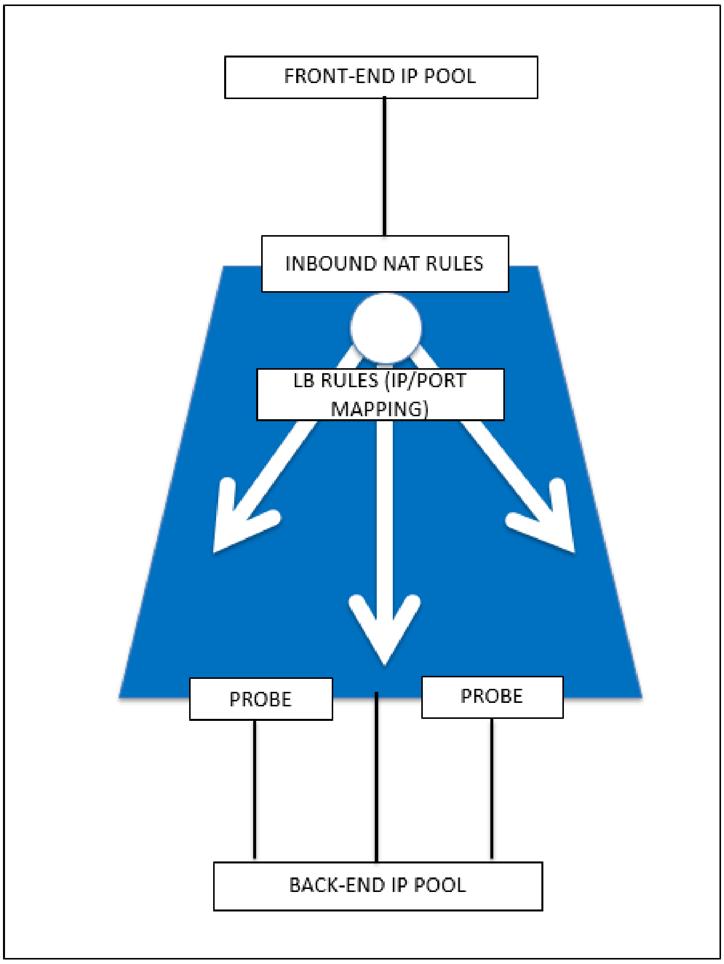
6. Instance Level Public IP (ILPIP) – An ILPIP is a public IP address that you can assign directly to your virtual machine or role instance, rather than to the cloud service that your virtual machine or role instance resides in. This does not take the place of the VIP (virtual IP) that is assigned to your cloud service. Rather, it's an additional IP address that you can use to connect directly to your virtual machine or role instance.

Note: In the past, an ILPIP was referred to as a PIP, which stands for public IP.

7. Inbound NAT Rules – This contains rules mapping a public port on the load balancer to a port for a specific virtual machine in the back end address pool.

8. IP-Config - It can be defined as an IP address pair (public IP and private IP) associated with an individual NIC. In an IP-Config, the public IP address can be NULL. Each NIC can have multiple IP-Config associated with it, which can be upto 255.

9. Load Balancing Rules – A rule property that maps a given front-end IP and port combination to a set of back-end IP addresses and port combination. With a single definition of a load balancer resource, you can define multiple load balancing rules, each rule reflecting a combination of a front end IP and port and back end IP and port associated with virtual machines.



10. Network Security Group (NSG) – NSG contains a list of Access Control List (ACL) rules that allow or deny network traffic to your virtual machine instances in a virtual network. NSGs can be associated with either subnets or individual virtual machine instances within that subnet. When a NSG is associated with a subnet, the ACL rules apply to all the virtual machine instances in that subnet. In addition, traffic to an individual virtual machine can be restricted further by associating a NSG directly to that virtual machine.

11. Private IP addresses – Used for communication within an Azure virtual network, and your on-premises network when you use a VPN gateway to extend your network to Azure. Private IP addresses allow Azure resources to communicate with other resources in a virtual network or an on-premises network through a VPN gateway or ExpressRoute circuit, without using an Internet-reachable IP address. In the Azure Resource Manager deployment model, a private IP address is associated with the following types of Azure resources – virtual machines, internal load balancers (ILBs), and application

gateways.

12. Probes – This contains health probes used to check availability of virtual machines instances in the back end address pool. If a particular virtual machine does not respond to health probes for some time, then it is taken out of traffic serving. Probes enable you to keep track of the health of virtual instances. If a health probe fails, the virtual instance will be taken out of rotation automatically.

13. Public IP Addresses (PIP) – PIP is used for communication with the Internet, including Azure public-facing services and is associated with virtual machines, Internet-facing load balancers, VPN gateways, and application gateways.

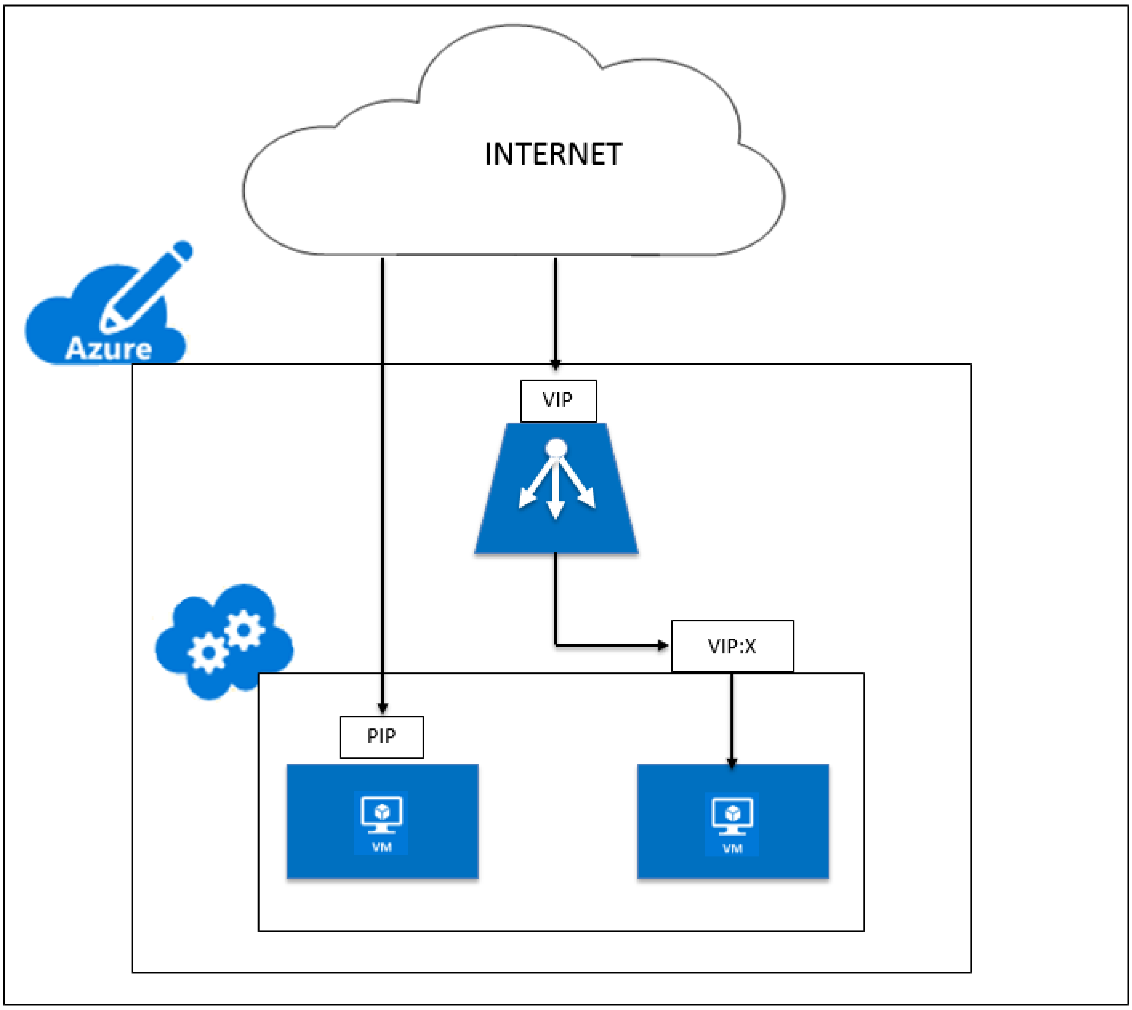
14. Region - An area within a geography that does not cross national borders and that contains one or more datacenters. Pricing, regional services, and offer types are exposed at the region level. A region is typically paired with another region, which can be up to several hundred miles away, to form a regional pair. Regional pairs can be used as a mechanism for disaster recovery and high availability scenarios. Also referred to generally as location.

15. Resource Group - A container in Resource Manager holds related resources for an application. The resource group can include all of the resources for an application, or only those resources that are logically grouped together

16. Storage Account – An Azure storage account gives you access to the Azure blob, queue, table, and file services in Azure Storage. Your storage account provides the unique namespace for your Azure storage data objects.

17. Virtual Machine – The software implementation of a physical computer that runs an operating system. Multiple virtual machines can run simultaneously on the same hardware. In Azure, virtual machines are available in a variety of sizes.

18. Virtual Network - An Azure virtual network is a representation of your own network in the cloud. It is a logical isolation of the Azure cloud dedicated to your subscription. You can fully control the IP address blocks, DNS settings, security policies, and route tables within this network. You can also further segment your VNet into subnets and launch Azure IaaS virtual machines and cloud services (PaaS role instances). Additionally, you can connect the virtual network to your on-premises network using one of the connectivity options available in Azure. In essence, you can expand your network to Azure, with complete control on IP address blocks with the benefit of enterprise scale Azure provides.



Deploy a NetScaler VPX instance on Oracle Public Cloud

September 21, 2020

> **Important**
>
> > NetScaler VPX instance on Oracle is in Limited Availability. If you'd like to participate, contact your local sales team or request a call at `https://www.citrix.com/products/netscaler-adc/form/inquiry/`.
>
> The NetScaler VPX virtual appliance (release 11.1 build 52.126) is available as a downloadable image with which you can create an instance in Oracle Public Cloud (OPC) environment. NetScaler VPX in OPC enables you to leverage cloud computing capabilities of OPC and use NetScaler load balancing and traffic management features for your business needs. You can deploy NetScaler

> VPX instances in OPC as standalone instances.

This section includes the following topics:

- Supported Features
- Hardware Requirements
- The Create Instance Wizard
- Terminology
- Limitations

Supported Features

A NetScaler VPX instance running in an Oracle Public Cloud deployment supports the following NetScaler features:

- Load Balancing
- ICA Proxy
- Content Switching
- AAA
- Rewrite
- Responder
- RDP Proxy
- nFactor
- LDAP
- VPN (CVPN/Full)
- GSLB

Hardware Requirements

VPX virtual appliances can be deployed in OPC as any instance type that has two or more cores and more than 2GB memory.

The Create Instance Wizard

You can create an instance on Oracle Public Cloud by using the **Create Instance** wizard. The wizard takes you through these pages. Use the forward and back button to move between pages or click the required page.

- Image: choose a template of a virtual hard disk of a specific size with an installed operating system. You can use images to create virtual machine instances in Oracle Compute Cloud Service.
- Shape: specify the OCPU and memory for your instance.
- Instance: enter details of your instance such as name, label, description, tags, customer attributes, and add SSH public key.

- Network: configure network settings for your instance such as IP networks, security lists, and so on.
- Storage: attach existing storage volumes, or create and attach a storage volume to the instance.
- Review: verify the settings for the new instance.

Terminology

This section describes the key terms that are used in this section.

- Instance: A virtual machine in Oracle Compute Cloud Service, created by using a specific machine image, with CPU and memory resources defined by a shape.
- IP Network: An IP subnet in your account. The address range of the IP network is determined by the IP address prefix that you specify while creating the IP network. These IP addresses aren't part of the common pool of Oracle-provided IP addresses used by the shared network. When you add an instance to an IP network, the instance is assigned an IP address in that subnet. You can assign IP addresses to instances either statically or dynamically, depending on your business needs. So you have complete control over the IP addresses assigned to your instances.
- Security Protocol: A protocol with which you can specify a transport protocol and the source and destination ports to use with the specified protocol. When you create a security rule, you can specify the security protocols that you want to use to permit traffic. Traffic is enabled by a security rule when the protocol in the packet matches the protocol specified here. If no protocol is specified, all protocols are allowed.
- Security Rule: A firewall rule that you can define to control network access to Oracle Compute Cloud Service instances through a specified security application.

For more information, see Oracle Compute Cloud Service Terminology.

Limitations

- You can't upgrade or downgrade a NetScaler VPX instance running on OPC.
- Only two-arm topology is supported.

Prerequisites

September 21, 2020

> **Important**
>
> NetScaler VPX instance on Oracle is in Limited Availability. If you'd like to participate, contact

> your local sales team or request a call at: https://www.citrix.com/products/netscaler-adc/form/inquiry/.

Before attempting to create a NetScaler instance in OPC, make sure you have the following:

- An Oracle Cloud Account
- An SSH key pair

Take the following steps to meet the above requirements:

1. Create and configure your account on Oracle Cloud.

   You must have an Oracle.com account to request a trial or purchase a subscription to an Oracle Cloud service. For more information about setting up your Oracle account, see Overview of Oracle Cloud Subscriptions.

2. Create an SSH key pair

   Before you create an instance in Oracle Public Cloud, you need to create and configure at least one SSH key pair, because after your instance is created, SSH key exchange is the first and only method of accessing the instance.

   a. Generate an SSH key pair by following the procedure described Generating an SSH Key Pair.

   Following is an example of creating an SSH key pair in RSA format.

   ssh-keygen -b 2048 -t rsa

   b. Upload the public key to the Oracle Public Cloud interface by following procedure described at Uploading the SSH Public Key. Once uploaded, you can assign the SSH key to any instance. You can also upload the key later while creating the instance.

Configure a NetScaler VPX standalone instance on Oracle Public Cloud

September 21, 2020

NetScaler VPX configuration on Oracle Public Cloud involves the following tasks:

1. Upload a NetScaler VPX Image and Associate It with the Oracle Cloud Web Console.
2. Configure the VPX instance.
3. Configure NetScaler owned IP Addresses and an LB virtual server.

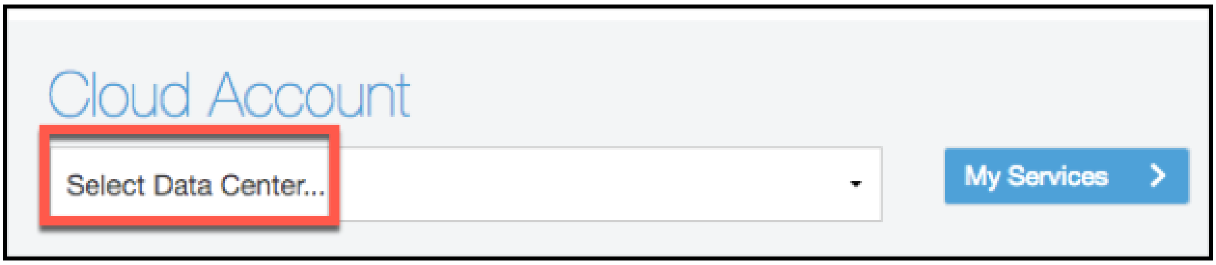
> **Note**
>
> Before you start configuring a NetScaler instance, see the Prerequisites.

Upload a NetScaler VPX image and associate it with the Oracle Cloud Web console

After obtaining the raw.tar.gz file image from Citrix, associate it with the Oracle Web console as follows:

1. Launch cloud.oracle.com and click **Sign In** in the upper-right corner.

2. From the **Cloud Account** drop-down menu, select the appropriate data center and click **My Services**.



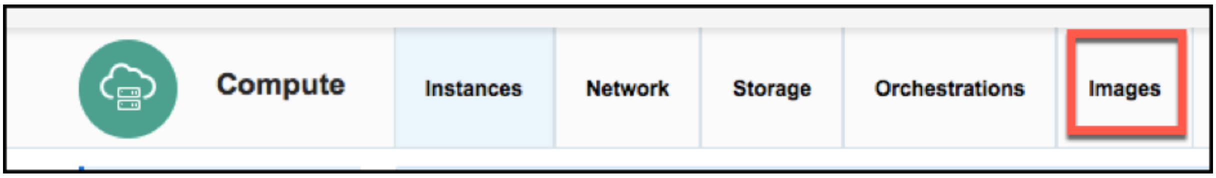
Cloud Account
Select Data Center...
My Services

3. In the **Enter your Identity Domain** field, enter the identity domain that Oracle assigned to your account, and click **Go.**

4. Enter your user name and password and click **Sign In**.

5. From the Dashboard, click **Compute > Open Service Console.**

6. Click **Images.**

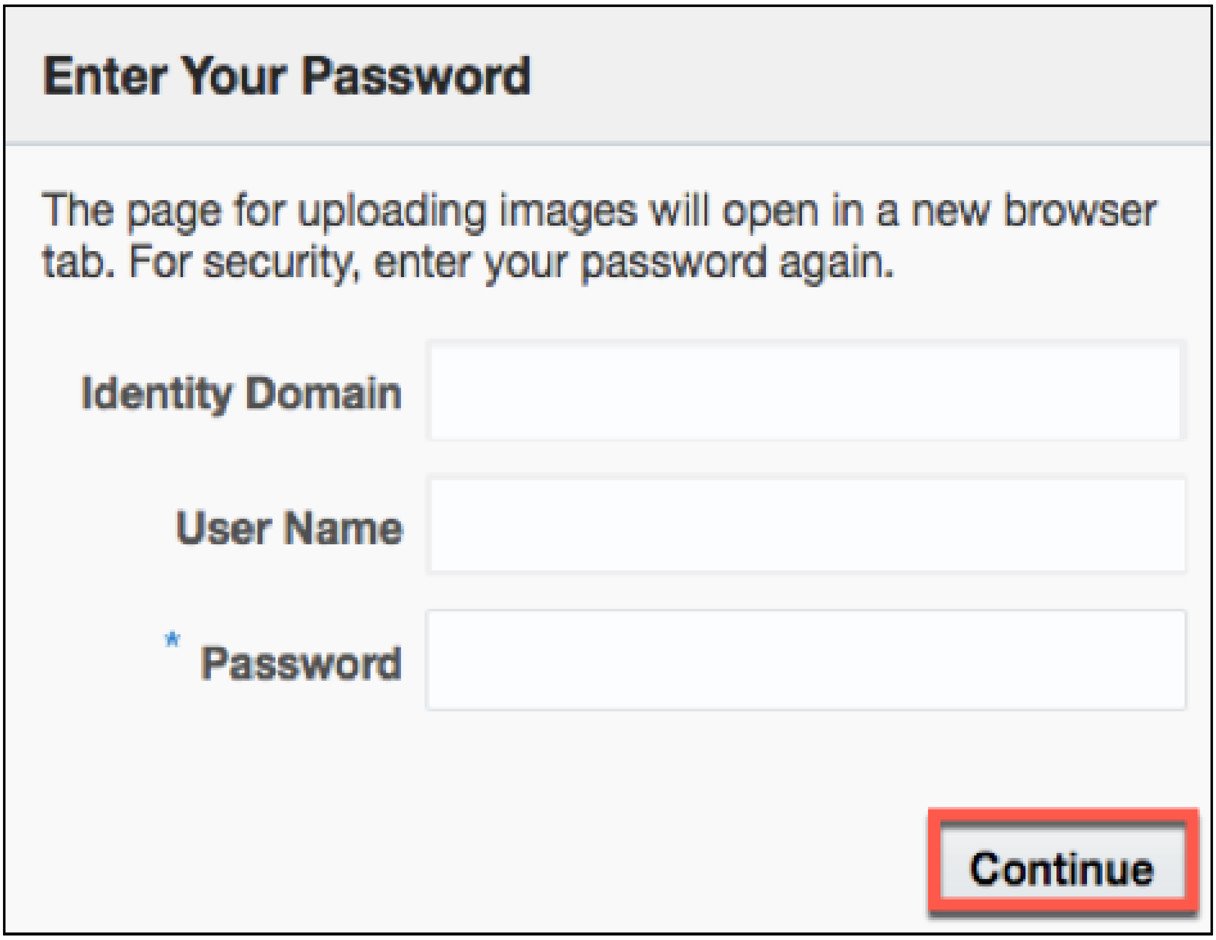


Compute
Instances
Network
Storage
Orchestrations
Images

7. The **Private Images** page appears.

8. Click **Upload Image**.

9. Enter your password, and then click **Continue**.

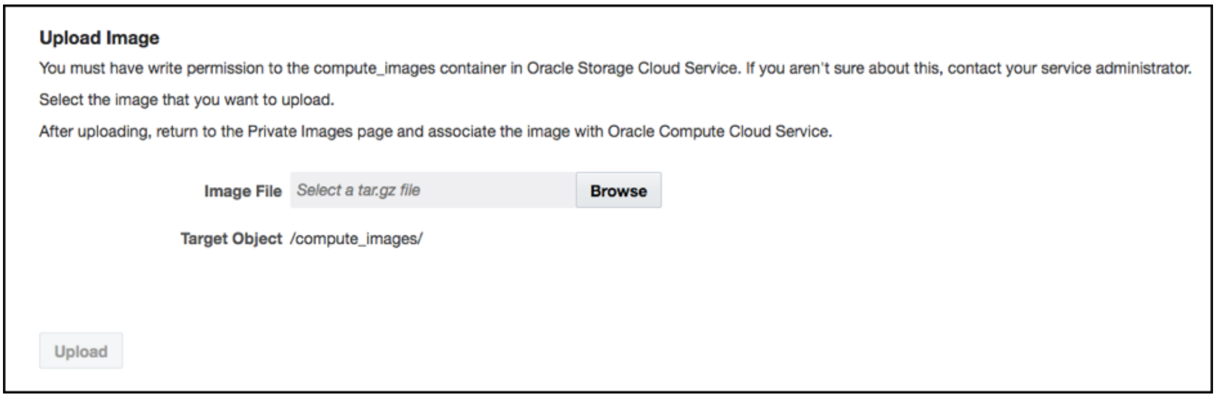


Enter Your Password

The page for uploading images will open in a new browser tab. For security, enter your password again.

10. The **Upload Image** page appears in a new tab.

11. In the **Image File** field, browse to select the raw.tar.gz image file that you want to upload.



Upload Image

You must have write permission to the compute_images container in Oracle Storage Cloud Service. If you aren't sure about this, contact your service administrator.

Select the image that you want to upload.

After uploading, return to the Private Images page and associate the image with Oracle Compute Cloud Service.

Target Object /compute_images/

12. In the **Target Object** field, enter the name of the object that the image file should be stored as in Oracle Storage Cloud Service.

13. Click **Upload**.

14. After the image is uploaded, it appears under **Private Images**.

15. Click the image and click **Associate Image**.
16. The **Associate Image** window appears.
17. Specify a name and description for the image that is being created.
18. Click **Select File** to select the file.
19. Click **OK** to associate the new image with the file.

Configure a NetScaler instance

Complete these steps to a VPX instance.

1. Launch the Create Instance wizard to create instances. Select and enter the details in the **Shape** and **Instance** pages. You can find more information about how to create an instance on the Oracle docs site.
2. In the **Network** page, clear the **Shared Network** check box and click **Configure Interface** > **Create IP Network** to create an IP network for the management IP (NIC 1/1) and click **Create**. Specify the other details in the **Configure IP Network Interface** window and click **Save**. Repeat the steps for NIC 1/2 and NIC 1/3. You can find more information about IP Network Options on the Oracle docs site.

   > **Note**
   >
   > In **Configure IP Network Interface**, select the **Default Gateway** check box.
   >
   > Set Public IP Address to **Auto Generated** for NIC 1/1 and 1/2 and specify private IP addresses for all three NICs.

3. On the **Storage** page, you can attach existing storage volumes to your instance, if necessary, or create storage volumes and attach them to the instance. In this example, select the default storage.
4. On the **Review** page, verify the information that you've entered, and then click **Create**.

   Monitor the status of the instance. When the status is shown as "Running," the instance is ready

5. Create an **IP Address Prefix Set**. You can find more information about how to create an IP address prefix set on the Oracle docs site.
6. Create **Security Protocols**. You can find more information about how to create a security protocol on the Oracle docs site.
7. Create **Security Rules**. You can find more information about how to create a security rule for IP networks on the Oracle docs site.

Configure NetScaler owned IP addresses and an LB virtual server

1. Configure the NetScaler owned IP addresses by using the NetScaler GUI or the command "add ns ip." For more information, see Configuring NetScaler-Owned IP Addresses.
2. Configure the NetScaler instance as a load balancing virtual server. For more information, see Set up basic load balancing.

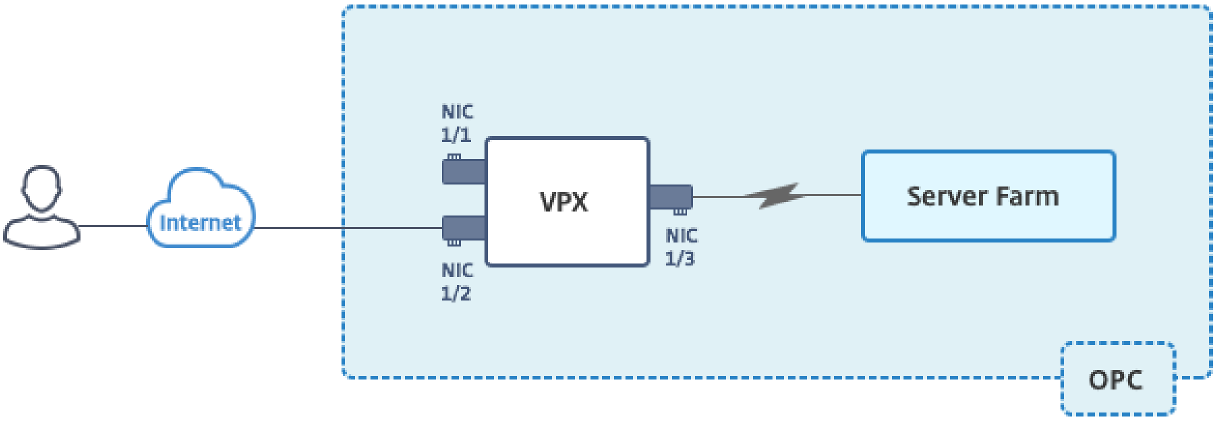
Scenario

September 21, 2020

> **Important**
>
> NetScaler VPX instance on Oracle is in Limited Availability. If you'd like to participate, contact your local sales team or request a call at `https://www.citrix.com/products/netscaler-adc/form/inquiry/`.

This scenario illustrates how to deploy a NetScaler VPX standalone instance in Oracle Public Cloud (OPC). The user creates a standalone VPX instance with multiple NICs. The instance, which is configured as a load balancing virtual server, communicates with back-end servers (the server farm). For this configuration, you have to set up the required communication routes between the instance and the back-end servers, and between the instance and the external hosts on the public Internet.

This scenario illustrates how to deploy a NetScaler VPX standalone instance in Oracle Public Cloud (OPC). As a user, create a standalone VPX instance with multiple NICs. The instance, which is configured as a load balancing virtual server, communicates with back-end servers (the server farm). For this configuration, you have to set up the required communication routes:



You create three NICs. Each NIC can be configured with a pair of IP addresses (public and private). The NICs serve the following purposes.

NIC	Purpose	Associated with
NIC 1/1	Serves management traffic (NSIP)	Public IP address and private IP address
NIC 1/2	Serves client-side traffic (VIP)	Public IP address and private IP address
NIC 1/3	Communicates with back-end servers (SNIP)	Private IP address(Public IP is not mandatory)

The following public IP addresses are used in this example.

Entity	Public IP address
NSIP	192.168.30.2
VIP	192.168.10.2
SNIP	192.168.20.2
Back-end server1	192.168.20.10
Back-end server2	192.168.20.11

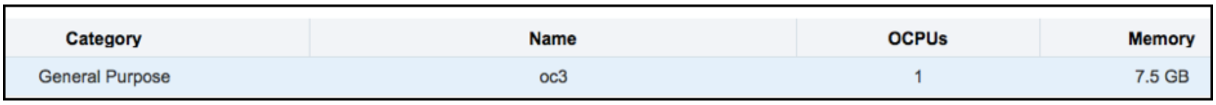
> **Note**
>
> Oracle assigns a static public IP address and a dynamic private IP address. For more information on Network Settings, see the Oracle docs site.

To create the required instances and set up the required security rules for this scenario, complete the following tasks:

1. From the Oracle Web Console, click **Create Instance** and click **Private Images**.
2. Select the required image and click **Review and Create**. The **Create Instance** wizard starts, displaying the default settings.

> **Note**
>
> If you click **Create** without going through the pages in the wizard, an image with the default settings is created. No SSH keys are associated with it. So make sure you enter the necessary details on each page of the wizard.
>
> While deploying a NetScaler VPX instance on Oracle Public Cloud, an SSH key pair is mandatory. However, the user cannot use the key pair to log on to the VPX instance. The user must use nsroot as the user name and as the password to log on.

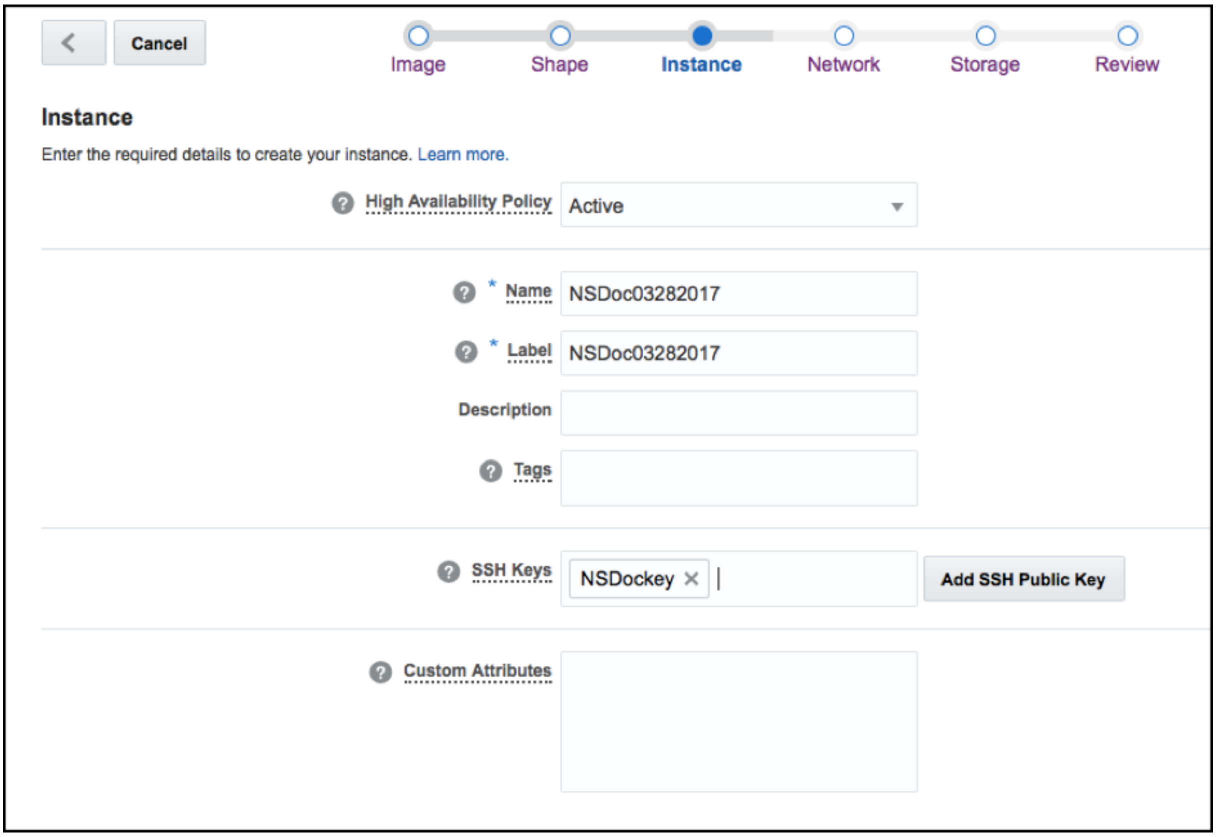
3. On the **Shape** page, select the shape that you want to use. The shape specifies the OCPU and memory resources to be allocated to the instance. Click the arrow next to the Review and Create tab on the upper right corner to go to the Instance page. In this scenario, you create an instance with 1 OCPU.



Category	Name	OCPUs	Memory
General Purpose	oc3	1	7.5 GB

4. On the Instance page, select or enter the following, and then go to the next page:

- High Availability Policy: Active
- `Name: \<Instance name\>`
- Label: default value
- Description: None
- Tags: None
- SSH Keys: Add the SSH key that you created in the Prerequisites section.
- Custom Attributes: None



Instance

Enter the required details to create your instance. Learn more.

High Availability Policy: Active

* Name: NSDoc03282017

* Label: NSDoc03282017

Description:

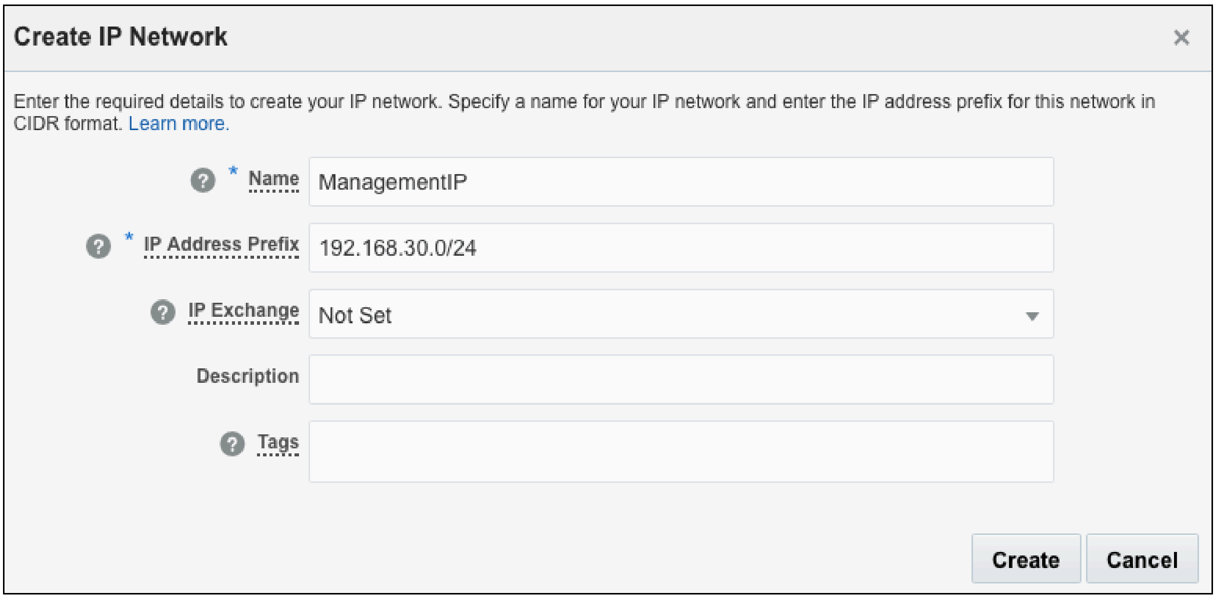
Tags:

SSH Keys: NSDockey ×

Custom Attributes:

5. On the **Network** page, clear the **Shared Network** check box and click **Configure Interface**.

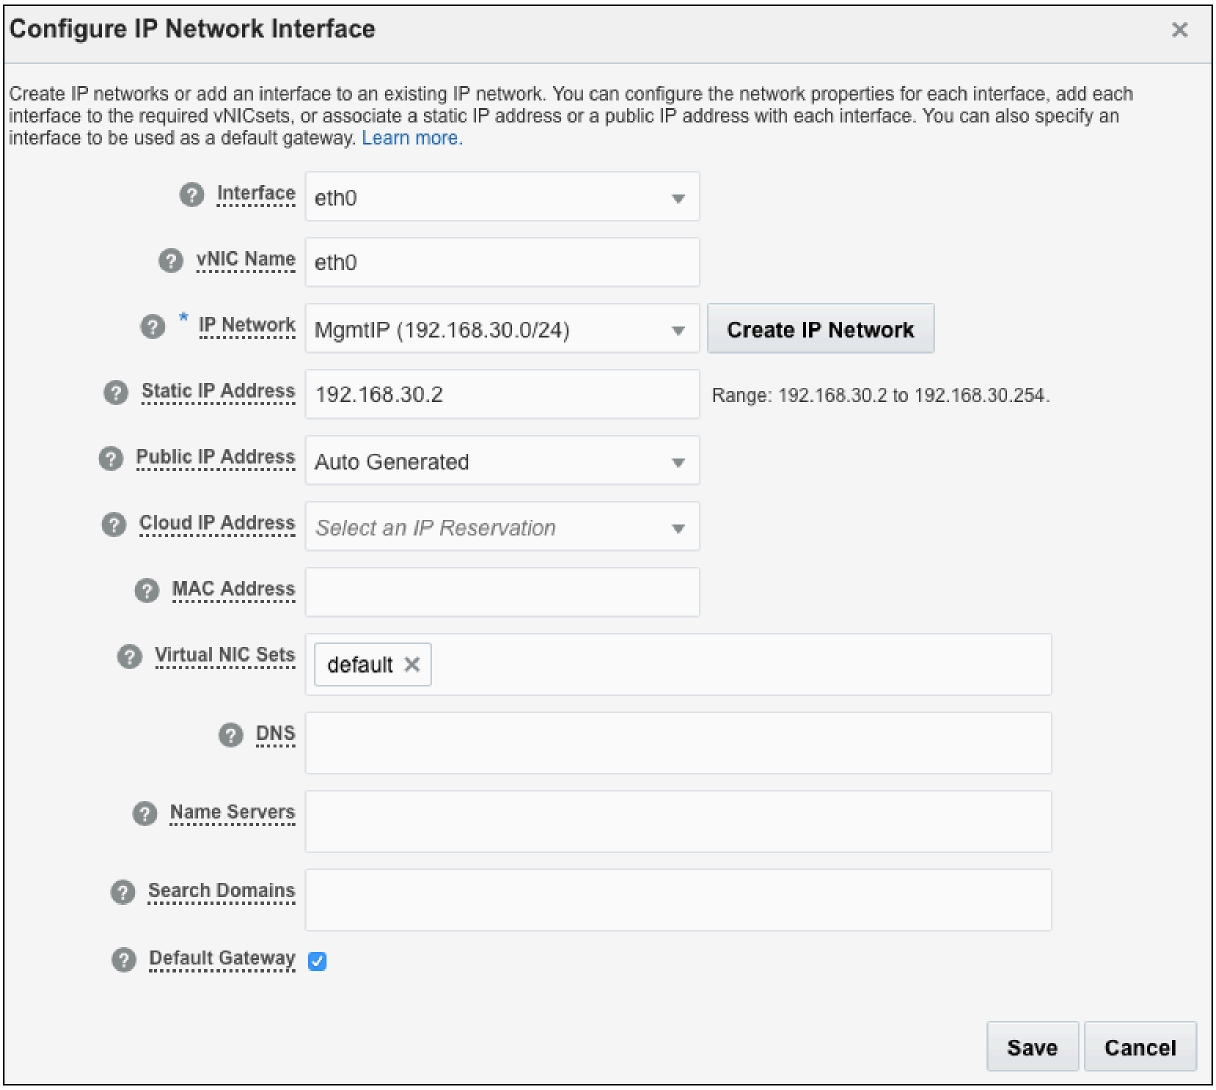
6. In the Configure IP Network Interface window, click **Create IP Network** to create an IP network for the management IP (NSIP). Add an IP Address Prefix (192.168.30.0/24), a name, and a description. Click **Create**



Enter the required details to create your IP network. Specify a name for your IP network and enter the IP address prefix for this network in CIDR format. Learn more.

* Name	ManagementIP
* IP Address Prefix	192.168.30.0/24
IP Exchange	Not Set
Description	
Tags	

7. In the Configure IP Network Interface window, select the IP Network that you've just created, add a static IP address, and select an auto-generated public IP address. Make sure the **Default Gateway** check box is selected.



Create IP networks or add an interface to an existing IP network. You can configure the network properties for each interface, add each interface to the required vNICsets, or associate a static IP address or a public IP address with each interface. You can also specify an interface to be used as a default gateway. Learn more.

Interface: eth0

vNIC Name: eth0

* IP Network: MgmtIP (192.168.30.0/24)

Static IP Address: 192.168.30.2

Range: 192.168.30.2 to 192.168.30.254.

Public IP Address: Auto Generated

Cloud IP Address: *Select an IP Reservation*

MAC Address:

Virtual NIC Sets: default ×

DNS:

Name Servers:

Search Domains:

Default Gateway: ☑

8. Similary create IP networks for NIC 1/2 and NIC 1/3 as follows.

NIC 1/2

- Name: IPConfig1 (for NIC 1/2)
- IP Address Prefix: 192/168.10.0/24

NIC 1/3

- Name: IPConfig2 (for NIC 1/3)
- IP Address Prefix: 192.168.20.0/24

9. Configure IP Network Interface as follows:

NIC 1/2

- Interface: eth1
- IP Network: IPConfig1
- Static IP Addresses: 192.168.10.2

- Public IP Address: Auto Generated

NIC 1/3

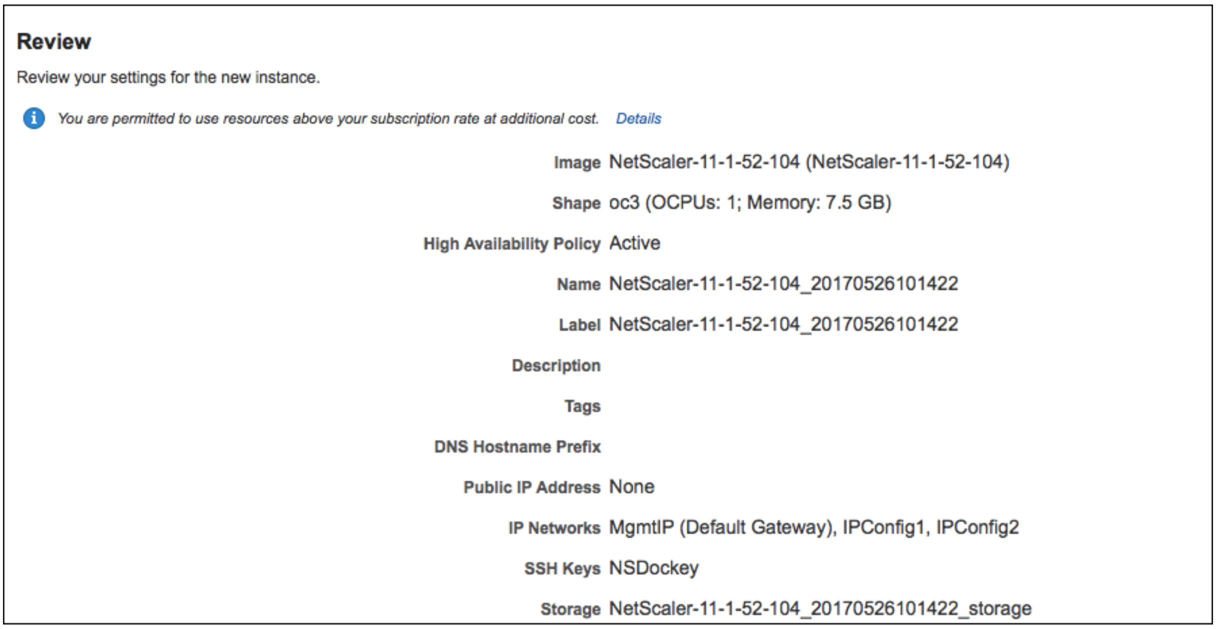
- Interface: eth2
- IP Network: IPConfig2
- Static IP Addresses: 192.168.20.2

Next, click the arrow to go to the **Storage** page.

> **Note**
>
> For NIC 1/2 and 1/3, do not select the **Default Gateway** check box.

8. On the Storage page, you can attach existing storage volumes to your instance, if necessary, or create storage volumes and attach them to the instance. In this example, select the default storage.

9. On the Review page, verify the information that you've entered, and then click **Create**.



Review

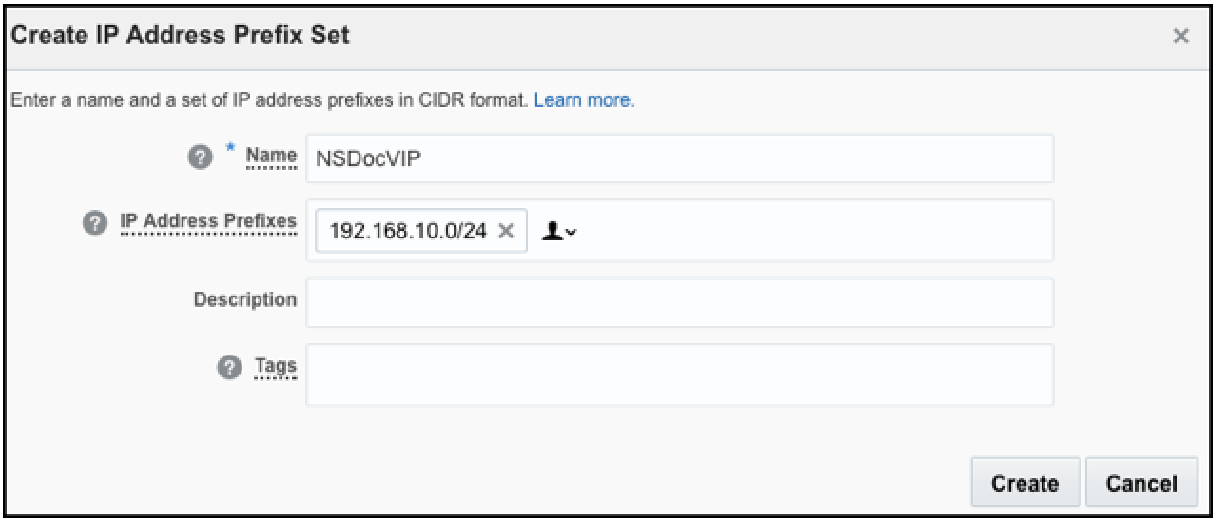
Review your settings for the new instance.

You are permitted to use resources above your subscription rate at additional cost. Details

Image	NetScaler-11-1-52-104 (NetScaler-11-1-52-104)
Shape	oc3 (OCPUs: 1; Memory: 7.5 GB)
High Availability Policy	Active
Name	NetScaler-11-1-52-104_20170526101422
Label	NetScaler-11-1-52-104_20170526101422
Description	
Tags	
DNS Hostname Prefix	
Public IP Address	None
IP Networks	MgmtIP (Default Gateway), IPConfig1, IPConfig2
SSH Keys	NSDockey
Storage	NetScaler-11-1-52-104_20170526101422_storage

10. Monitor the status of the instance. When the status is shown as "Running," the instance is ready. Follow the same steps to create two back-end servers.

11. From the Oracle web console, click **IP Network** > **IP Address Prefix Sets** > **Create IP Network**. Specify the name and the IP Address Prefix Set.

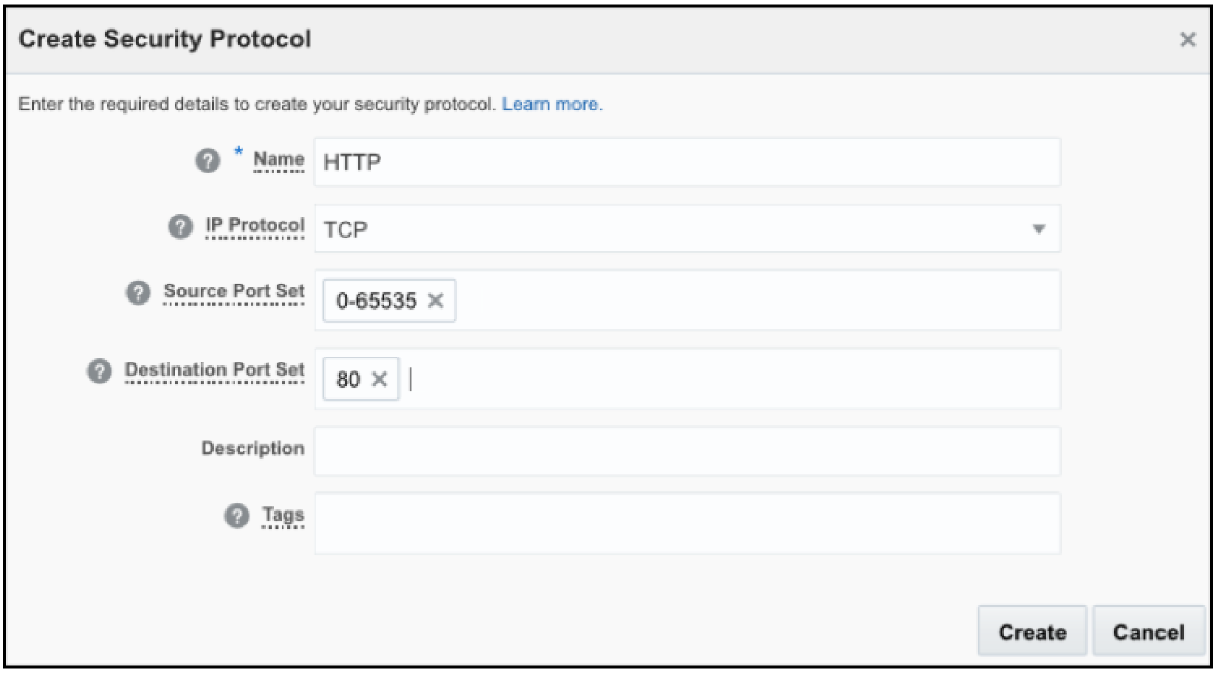


Create IP Address Prefix Set

Enter a name and a set of IP address prefixes in CIDR format. Learn more.

* Name	NSDocVIP
IP Address Prefixes	192.168.10.0/24
Description	
Tags	

12. Create a security protocol with which to create security rules. You'll create a security protocol for HTTP.

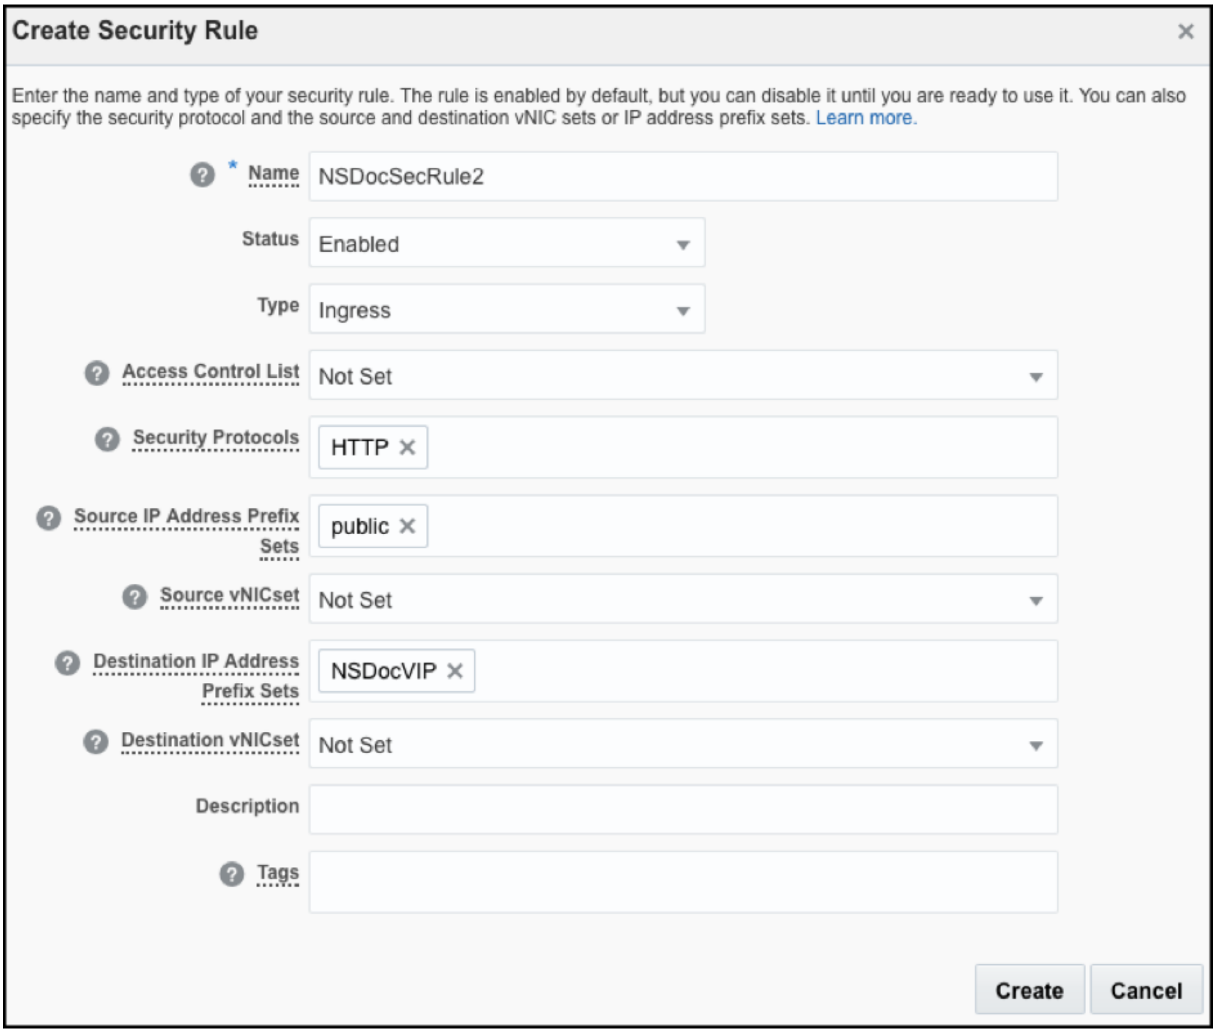


Create Security Protocol

Enter the required details to create your security protocol. Learn more.

* Name	HTTP
IP Protocol	TCP
Source Port Set	0-65535
Destination Port Set	80
Description	
Tags	

13. Create a security rule to allow external traffic to access the NetScaler Instance. For this scenario, create a rule to allow HTTP requests from external traffic to the NetScaler instance.



Enter the name and type of your security rule. The rule is enabled by default, but you can disable it until you are ready to use it. You can also specify the security protocol and the source and destination vNIC sets or IP address prefix sets. Learn more.

* Name	NSDocSecRule2
Status	Enabled
Type	Ingress
Access Control List	Not Set
Security Protocols	HTTP ×
Source IP Address Prefix Sets	public ×
Source vNICset	Not Set
Destination IP Address Prefix Sets	NSDocVIP ×
Destination vNICset	Not Set
Description	
Tags	

Now you can log on to your instance by using either GUI or SSH and complete the initial configuration. To find the oracle-assigned NetScaler management IP address, in the Oracle web console, click **Instances**. To the find the NetScaler management IP address pair, click the instance details icon for the instance that you created.

You can use SSH to log on to your instance as an nsroot user, by using the following command:

ssh -i ./<private key> nsroot@<ip address>

When prompted, type the password nsroot.

Next, configure the NetScaler-owned IP addresses and the NetScaler instance as a load balancing virtual server:

- Configure the NetScaler-owned IP addresses by using the NetScaler GUI or the command “add ns ip.” For more information, see https://docs.citrix.com/en-us/netscaler/11-1/networking/ip-addressing/configuring-netscaler-owned-ip-addresses.html
- Configure the NetScaler instance as a load balancing virtual server. For more information, see https://docs.citrix.com/en-us/netscaler/11-1/load-balancing/load-balancing-setup.html .

Example: Here's a sample LB configuration done by using the NetScaler CLI.

```
Add nsip 192.168.20.2 255.255.255.0

Add lb vs v1 http 192.168.10.2 80

Add service s[1-2] 192.168.20.[10-11] http 80

Bind lb vs v1 s[1-2]

Add vlan 10

Bind vlan 10 -Ifnum 1/3 -Ipaddress 192.168.20.2 255.255.255.0
```

The preceding configuration is based on the following assumptions:

Entity	Private IP address
VIP	192.168.10.2
SNIP	192.168.20.2
Back-end server1	192.168.20.10
Back-end server2	192.168.20.11

Deploy a NetScaler VPX Instance on Cisco CSP 2100

September 21, 2020

You can deploy an SR-IOV-enabled NetScaler VPX instance on Cisco Cloud Services Platform (CSP) 2100 to configure network functions virtualization (NFV) for your environment. The Cisco CSP 2100 is a turnkey, open, x86 Linux Kernel-based virtual machine (KVM) software and hardware platform for data center NFV.

This section describes how to deploy a NetScaler VPX instance on Cisco CSP 2100 and enable SR-IOV on the instance.

Points to Note

- Supported NetScaler version: From release 11.1 56.x and later
- Qualified on CSP version 2.2.3 build 32

Deploy a NetScaler VPX Instance on Cisco CSP 2100

Deploy a NetScaler VPX instance on Cisco CSP 2100 is a 2-step process:

1. Upload the NetScaler VPX qcow image.
2. Enable SR-IOV on the VPX instance.

Complete the following steps:

1. Download the NetScaler VPX 11.1 56.x qcow image from the Citrix download site.
2. Log on to Cisco CSP 2100 with your logon credentials.
3. From the dashboard, select **Configuration > Repository**.
4. From the Repository window, select the plus sign.
5. Select **Browse** to browse to the downloaded NetScaler VPX qcow image.
6. Select **Upload** to upload the VPX image to CSP 2100.

Next, provision the VPX instance and add SR-IOV interfaces to it.

1. From the CSP dashboard, select **Configuration** > **Services**
2. Select the plus sign. The **Create Service** template appears. Enter the following specifications:
    - Name
    - Target Host Name
    - Image Name: qcow image that you've already downloaded
    - Number of cores: minimum two
    - Disk Space: Minimum 20 GB
    - RAM: Minimum 2,048 GB
3. To add an SR-IOV interface, select the plus sign next to VNIC. The **VNIC Configuration** window appears.
4. For **Interface Type**, select **Passthrough**.
5. Specify the VLAN range.
6. For **Passthrough Mode**, select **SR-IOV**.
7. For **Network Name**, select an SR-IOV supported NIC. Click **Submit**.
8. Click **Deploy** to complement the process. It might take a moment for the NetScaler VPX instance to be deployed on Cisco CSP 2100.
9. Next, log on to the NetScaler VPX instance to complete the initial configuration.

Limitations

The following are CSP 2100-related limitations:

- If you power off the NetScaler VPX instance by using the CSP 2100 GUI , the NetScaler VPX configuration might get lost.
- In host VLAN mode, the VPX Niantic SR-IOV interfaces must be configured to 9k MTU size.
- Due to vCPU scheduling issues on the CSP 2100 platform, latency, transmit stall, and transmit queue overflow might be observed on the NetScaler VPX instance.
- The "Tag-all" command is not supported on a VPX Niantic SR-IOV interface.
- The LACP feature is not supported on a VPX Niantic SR-IOV interface.

Jumbo frames on NetScaler VPX instances

September 21, 2020

NetScaler VPX appliances support receiving and transmitting jumbo frames containing up to 9216 bytes of IP data. Jumbo frames can transfer large files more efficiently than it is possible with the standard IP MTU size of 1500 bytes.

A NetScaler appliance can use jumbo frames in the following deployment scenarios:

- Jumbo to Jumbo. The appliance receives data as jumbo frames and sends it as jumbo frames.
- Non-Jumbo to Jumbo. The appliance receives data as regular frames and sends it as jumbo frames.
- Jumbo to Non-Jumbo. The appliance receives data as jumbo frames and sends it as regular frames.

For more information, seeConfiguring Jumbo Frames Support on a NetScaler Appliance.

Jumbo Frames support is available on NetScaler VPX appliances running on the following virtualization platforms:

- VMware ESX
- Linux-KVM Platform
- NetScaler XenServer
- Amazon Web Services (AWS)

Jumbo frames on VPX appliances works similar to Jumbo frames on MPX appliances. For more information on Jumbo Frames and its use cases, see Configuring Jumbo Frames on MPX appliances. The use cases of Jumbo Frames on MPX appliances also apply to VPX appliances.

Configure jumbo frames for a VPX instance running on VMware ESX

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on VMware ESX server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9000. Use the CLI or GUI to set the MTU size. Note that NetScaler VPX appliances running on VMware ESX support receiving and transmitting jumbo frames containing up to only 9000 bytes of IP data.
2. Set the same MTU size on the corresponding physical interfaces of the VMware ESX server by using its management applications. For more information about setting the MTU size on the physical interfaces of VMware ESX, see http://vmware.com/.

Configure jumbo frames for a VPX instance running on Linux-KVM server

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on a Linux-KVM Server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9216. Use the NetScaler VPX CLI or GUI to set the MTU size.
2. Set the same MTU size on the corresponding physical interfaces of a Linux-KVM Server by using its management applications. For more information about setting the MTU size on the physical interfaces of Linux-KVM, see http://www.linux-kvm.org/.

Configure jumbo frames for a VPX instance running on NetScaler XenServer

Perform the following tasks to configure jumbo frames on a NetScaler VPX appliance running on NetScaler XenServer:

1. Connect to the XenServer using XenCenter.
2. Shut down all the VPX instances that use the Networks for which the MTU must be changed.
3. On the **Networking** tab, select the network - network 0/1/2.
4. Select **Properties** and edit MTU.

After configuring jumbo frames on the XenServer, you can configure the jumbo frames on the NetScaler appliance. For more information, see Configuring Jumbo Frames Support on a NetScaler Appliance.

Configure jumbo frames for a VPX instance running on AWS

Host-level configuration is not required for VPX on Azure. To configure Jumbo Frames on VPX, follow the steps given in Configuring Jumbo Frames Support on a NetScaler Appliance.

Hardware Installation

September 21, 2020

> **Note**
>
> For the latest content, see NetScaler MPX.

The following sections describe the hardware installation and initial configuration for all NetScaler hardware platforms.

Hardware Platforms	Describes the NetScaler hardware platforms and provides detailed information about each platform and its components.
Preparing for Installation	Describes how to unpack the NetScaler appliance and prepare the site and rack for installing the appliance. Lists the cautions and warnings that you should review before you install the appliance.
Installing the Hardware	Describes the steps to install the rails, mount the hardware, connect the cables, and turn on the appliance.
Initial Configuration	Describes how to perform initial configuration of your NetScaler appliance and assign management and network IP addresses.
Lights Out Management Port of the NetScaler Appliance	Describes the different operations you can perform on your NetScaler appliance by using the Lights Out Management Port.

For information about NetScaler hardware and software compatibility and the supported upgrade and downgrade paths, see http://support.citrix.com/article/CTX113357.

Licensing

September 21, 2020

The following topics describe the migration instructions for setting up a new version of a NetScaler appliance with a list of all new and deprecated commands, parameters, and SNMP OIDs.

This document includes the following information:

- NetScaler Licensing Overview

NetScaler licensing overview

September 21, 2020

The process of allocating your NetScaler licenses has been greatly simplified. The new licensing framework allows you to focus on getting maximum value from Citrix products.

In the NetScaler GUI, you can use your hardware serial number (HSN) or your license access code to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

For all other functionality, such as returning or reallocating your license, you must use the licensing portal. Optionally, you can still use the licensing portal for license allocation. For more information about the licensing portal, see http://support.citrix.com/article/CTX131110.

Note: Purchase separate licenses for each appliance in a high availability pair. Ensure that the same types of licenses are installed on both the appliances. For example, if you purchase a platinum license for one appliance, you must purchase another platinum license for the other appliance.

Prerequisites

To use the hardware serial number or license access code to allocate your licenses:

- You must be able to access public domains through the appliance. For example, the appliance should be able to access www.citrix.com. The license allocation software internally accesses the Citrix licensing portal for your license. To access a public domain:
  - Use a proxy server or set up a DNS server.
  - Configure a NetScaler IP (NSIP) address or a subnet IP (SNIP) address on your NetScaler appliance.
- Your license must be linked to your hardware, or you must have a valid license access code. Citrix sends your license access code by email when you purchase a license.

Allocate a license by using the GUI

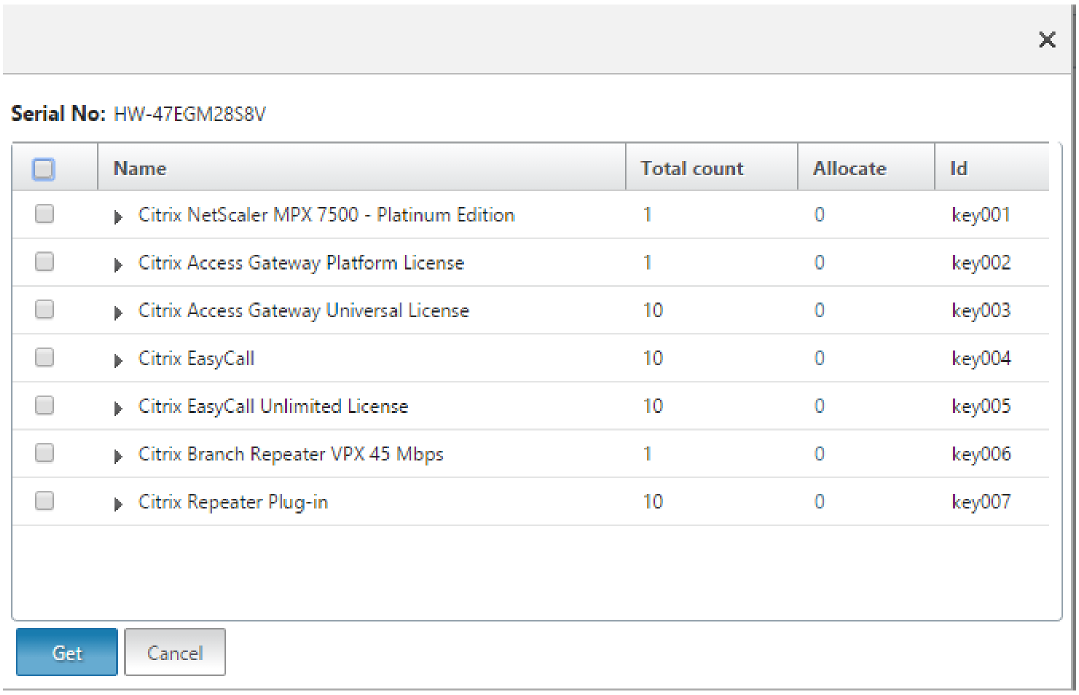
If your license is already linked to your hardware, the license allocation process can use the hardware serial number. Otherwise, you must type the license access code.

You can partially allocate licenses as required for your deployment. For example, if your license file contains 10 licenses, but your current requirement is for only six licenses, you can allocate six licenses now, and allocate more licenses later. You cannot allocate more than the total number of licenses present in your license file.

To allocate your license

1. In a web browser, type the IP address of the NetScaler appliance (for example, `http://192.168.100.1`).
2. In User Name and Password, type the administrator credentials.
3. On the **Configuration** tab, navigate to **System \ > Licenses**.
4. In the details pane, click **Manage Licenses**, click **Add New License**, and then select one of the following options:
    - **Use Serial Number.** The software internally fetches the serial number of your appliance and uses this number to display your licenses.
    - **Use license access code.** Citrix emails the license access code for the license that you purchased. Enter the license access code in the text box.

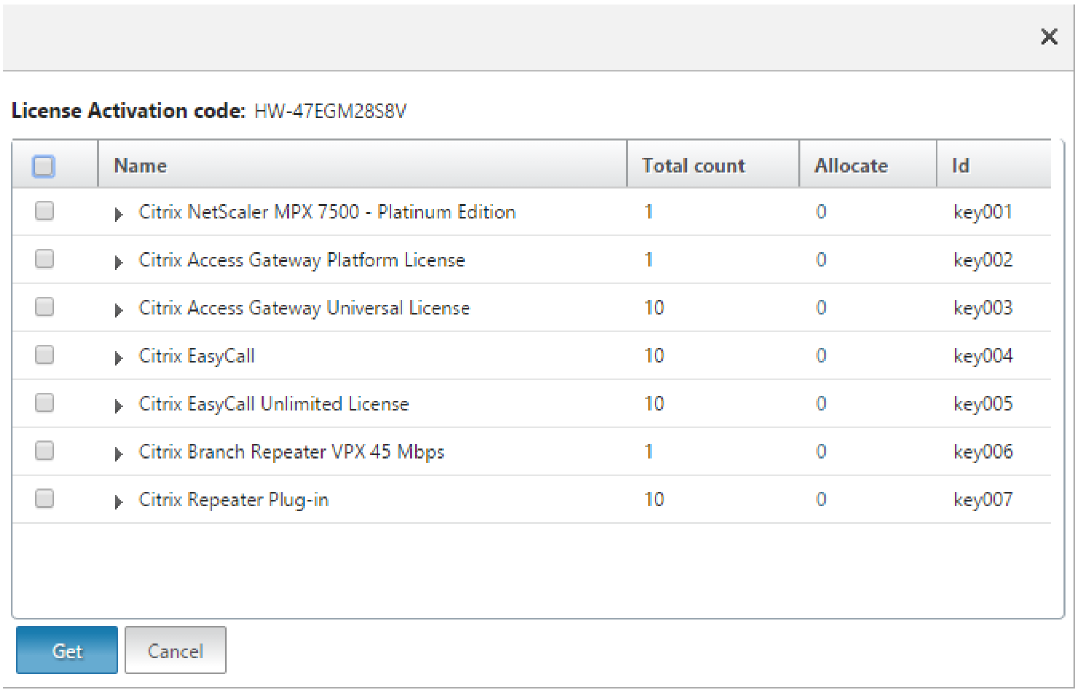
      If you do not want to configure internet connectivity on the NetScaler appliance, you can use a proxy server. Select the **Connect through Proxy Server** check box and specify the IP address and port of your proxy server.
5. Click **Get Licenses**. Depending on the option that you selected, one of the following dialog boxes appears.
    - The following dialog box appears if you selected Hardware Serial Number.



Serial No: HW-47EGM28S8V

☐	Name	Total count	Allocate	Id
☐	Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
☐	Citrix Access Gateway Platform License	1	0	key002
☐	Citrix Access Gateway Universal License	10	0	key003
☐	Citrix EasyCall	10	0	key004
☐	Citrix EasyCall Unlimited License	10	0	key005
☐	Citrix Branch Repeater VPX 45 Mbps	1	0	key006
☐	Citrix Repeater Plug-in	10	0	key007

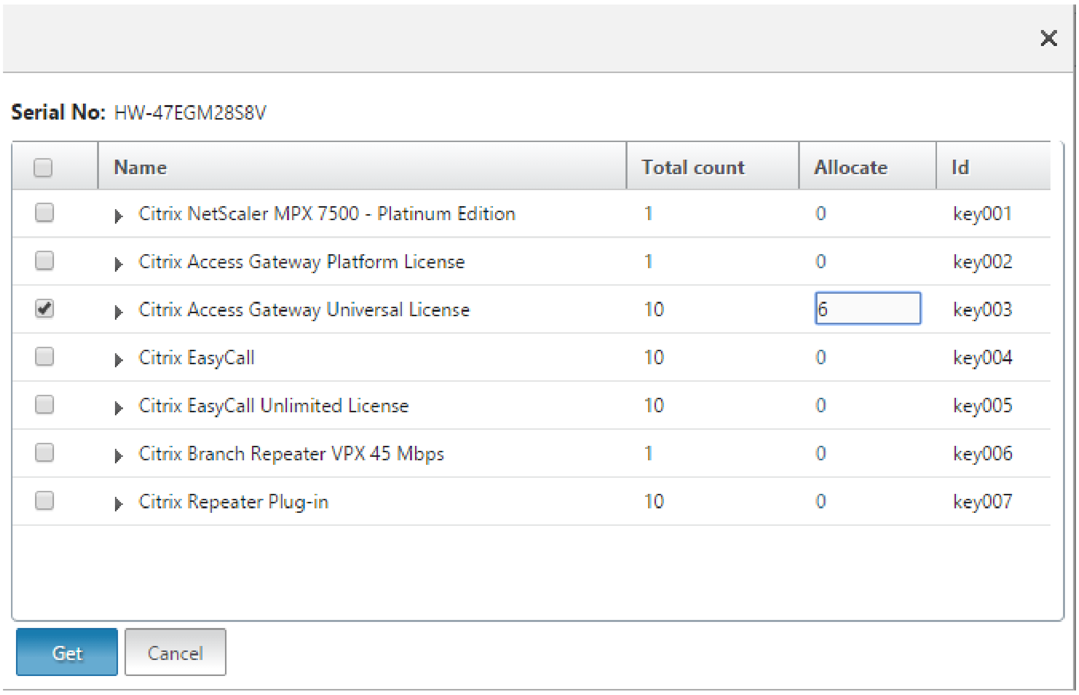
- The following dialog box appears if you selected license access code.



License Activation code: HW-47EGM28S8V

☐	Name	Total count	Allocate	Id
☐	Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
☐	Citrix Access Gateway Platform License	1	0	key002
☐	Citrix Access Gateway Universal License	10	0	key003
☐	Citrix EasyCall	10	0	key004
☐	Citrix EasyCall Unlimited License	10	0	key005
☐	Citrix Branch Repeater VPX 45 Mbps	1	0	key006
☐	Citrix Repeater Plug-in	10	0	key007

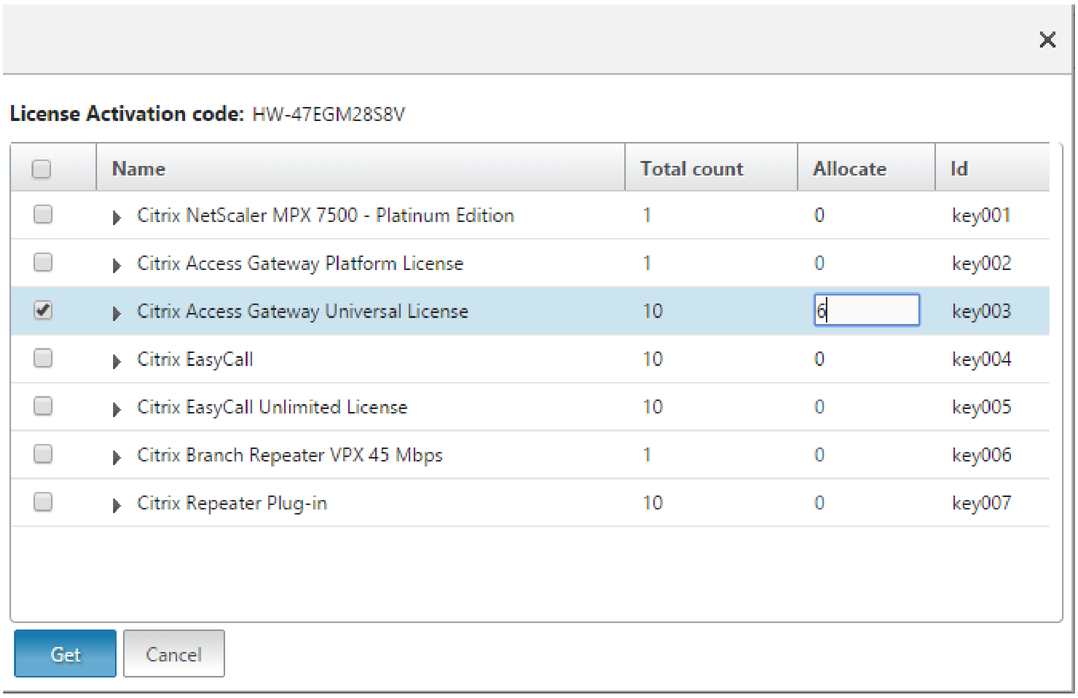
6. Select the license file that you want to use to allocate your licenses.
7. In the **Allocate** column, enter the number of licenses to be allocated. Then click **Get**.
    - If you selected **Hardware Serial Number**, enter the number of licenses, as shown in the following screenshot.



Serial No: HW-47EGM28S8V

☐	Name	Total count	Allocate	Id
☐	Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
☐	Citrix Access Gateway Platform License	1	0	key002
☑	Citrix Access Gateway Universal License	10	6	key003
☐	Citrix EasyCall	10	0	key004
☐	Citrix EasyCall Unlimited License	10	0	key005
☐	Citrix Branch Repeater VPX 45 Mbps	1	0	key006
☐	Citrix Repeater Plug-in	10	0	key007

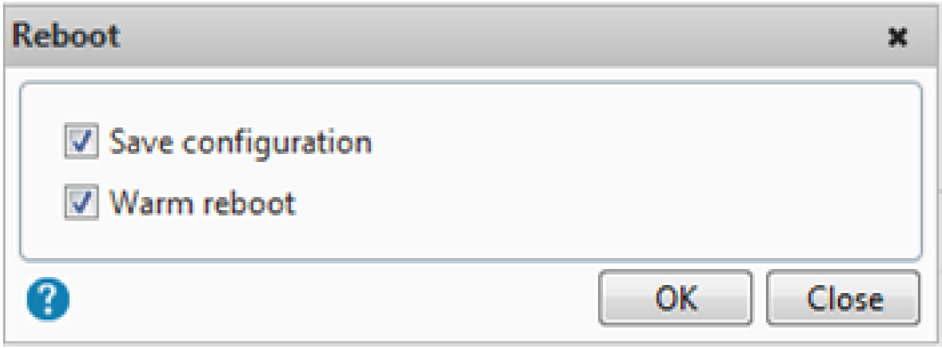
- If you selected **license access code**, enter the number of licenses, as shown in the following screenshot.



License Activation code: HW-47EGM28S8V

☐	Name	Total count	Allocate	Id
☐	Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
☐	Citrix Access Gateway Platform License	1	0	key002
☑	Citrix Access Gateway Universal License	10	6	key003
☐	Citrix EasyCall	10	0	key004
☐	Citrix EasyCall Unlimited License	10	0	key005
☐	Citrix Branch Repeater VPX 45 Mbps	1	0	key006
☐	Citrix Repeater Plug-in	10	0	key007

8. Click restart for the license to take effect.
9. In the restart dialog box, click **OK** to proceed with the changes, or click **Close** to cancel the changes.



☑ Save configuration
☑ Warm reboot

Install a license

If you downloaded your license file to your local computer by accessing the licensing portal, you must upload the license to the appliance.

To install a license file by using the GUI

1. In a web browser, type the IP address of the NetScaler appliance (for example, `http://192.168.100.1`).
2. In User Name and Password, type the administrator credentials.
3. On the **Configuration** tab, navigate to System Licenses.
4. In the details pane, click **Manage Licenses**.
5. Click **Add New License**, then select **Upload license files from a local computer**.
6. Click **Browse**. Navigate to the location of the license files, select the license file, and then click **Open**.
7. Click restart to apply the license.
8. In the restart dialog box, click **OK** to proceed with the changes, or click **Close** to cancel the changes.

To install the licenses by using the CLI:

1. Open an **SSH connection** to the ADC appliance by using an SSH client, such as PuTTY.

2. Log on to the ADC appliance by using the administrator credentials.

3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy one or more new license files to this directory.

   Example

   ```
   login: nsroot
   Password: nsroot
   Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
   Done
   > shell
   ```

```
Last login: Mon Aug  4 03:51:42 from 10.103.25.64
root@ns# mkdir /nsconfig/license
root@ns# cd /nsconfig/license
<!--NeedCopy-->
```

Copy one or more new license files to this directory.

Note: The NetScaler appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the
reboot -w command to warm restart the system, or run the
restart command to restart the system normally.

Verify licensed features

Before using a feature, ensure that your license supports the feature.

To verify the licensed features by using the CLI

1. Open an **SSH connection** to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.
3. At the command prompt, enter the sh ns license command to display the features supported by the license.

   Example

   ```
   sh ns license
           License status:
                              Web Logging: YES
                         Surge Protection: YES
                           .......

                           HTML Injection: YES
    Done
   <!--NeedCopy-->
   ```

To verify the licensed features by using the GUI

1. In a web browser, type the IP address of the ADC appliance, such as `http://192.168.100.1`.
2. In User Name and Password, type the administrator credentials.
3. Provide the User name and Password and click **Login**.
4. In the navigation pane, expand **System**, and then click **Licenses**. You see a green check mark next to the licensed features.

Enable or disable a feature

When you use the NetScaler appliance for the first time, you must enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it applies only after the feature is enabled.

To enable a feature by using the CLI

At the command prompt, type the following commands to enable a feature and verify the configuration:

- enable feature <FeatureName>
- show feature

  Example

  ```
  enable feature lb cs
  done
   >show feature

          Feature                        Acronym                Status
          -------                        -------                ------
   1)     Web Logging                    WL                     OFF
   2)     Surge Protection               SP                     ON
   3)     Load Balancing                 LB                     ON
   4)     Content Switching              CS                     ON
   5)     Cache Redirection              CR                     ON
   .
   .
   .
   24)    NetScaler Push                 push                   OFF
   Done
  <!--NeedCopy-->
  ```

  The example shows how to enable load balancing (lb) and content switching (cs).

  If the license key is not available for a particular feature, the following error message appears for that feature:

  ERROR: feature(s) not licensed

  Note: To enable an optional feature, you must have a feature-specific license. For example, you have purchased and installed the Citrix NetScaler Enterprise Edition license. However, to enable the Integrated Caching feature, you must purchase and install the AppCache license.

To disable a feature by using the CLI

At the command prompt, type the following commands to disable a feature and verify the configuration:

- disable feature <FeatureName>
- show feature

  Example

  The following example shows how to disable load balancing (LB).

  ```
  > disable feature lb
   Done
  > show feature

          Feature                        Acronym              Status

NetScaler Pooled Capacity

September 21, 2020

NetScaler pooled capacity is a licensing framework that comprises a common bandwidth and instance pool that is hosted on and served by Citrix Application Delivery Management.

For complete information, see NetScaler Pooled Capacity "NetScaler Pooled Capacity".

Upgrade and downgrade a NetScaler appliance

September 21, 2020

NetScaler 11.1 offers new and updated features with increased functionality. A comprehensive list of enhancements is documented in the release notes accompanying the release announcement. Read the release notes before you upgrade your software.

This section provides information about upgrading and downgrading a NetScaler appliance (MPX and VPX) firmware. For information about upgrading a NetScaler SDX appliance, see Single Bundle Upgrade.

Note: For upgrading or downgrading the nodes in a cluster setup, see Upgrading or Downgrading the Cluster Software.

Upgrading from release 10.1 build 121.10 or any earlier releases to release 10.1 build 122.17 and later involves some location changes of user monitor script files. For details, see the **Directory locations of script files for user monitors** section in Upgrade a Citrix NetScaler standalone appliance.

> **Note**
>
> For best practices for upgrading NetScaler appliances, read the article CTX126793.

Before you begin

September 21, 2020

Before you start the upgrade or downgrade process, make sure you check the following:

- The licensing framework and types of licenses. A software edition upgrade might require new licenses, such as upgrading from the standard edition to the enterprise edition, the standard edition to the platinum edition, or the enterprise edition to the platinum edition. Existing Citrix NetScaler licenses continue to work when you upgrade to version 11.1. For more information, see Licensing
- Check for New and deprecated commands, parameters, and SNMP OIDs.
- Check forCitrix NetScaler Hardware and Software Compatibility Matrix.
- If the Citrix NetScaler Gateway logon page is customized, then make sure that the UI theme is set to default.
- Review the LOM Firmware Upgrade page, if you are upgrading LOM.

- Download the Citrix NetScaler firmware from the download page. For the detailed steps to download the Citrix NetScaler firmware, see the "How to download and update the NetScaler Firmware" section in this article CTX205476.
- Perform a back up of the configuration file, customization file, certificates, monitor scripts, license files, and so on either manually or refer to the following documentation for back up using Citrix NetScaler CLI or GUI - Backup and restore.
- Validate the integrity of the Citrix NetScaler and check available space before performing an upgrade. For more information about how to free up storage space, see https://support.citrix.com/article/CTX133588
- Check the Citrix ADC VPX Support matrix and usage guidelines.
- Check the FAQ section.

For more information about prerequisites for upgrading or downgrading the Citrix NetScaler firmware, see these support articles:

- CTX126793: Best Practices for Upgrading Citrix NetScaler or Citrix NetScaler Gateway Appliances
- CTX220371: Must Read Articles Before and After Upgrading Citrix NetScaler

Upgrade considerations - SNMP configuration

September 21, 2020

The timeout parameter for an SNMP alarm is an internal option that has no impact on the alarm configuration.

Timeout parameter might appear in the SNMP alarm configurations in the running configuration (sh running) and the saved configuration (ns.conf) even if you have not made any changes to these SNMP alarm configurations.

On upgrading to a release build with the fix for the timeout setting issue, the SNMP configurations are erroneously reset to default values.

The following SNMP alarms (if configured) are impacted during an upgrade:

- APPFW-BUFFER-OVERFLOW
- APPFW-COOKIE
- APPFW-CSRF-TAG
- APPFW-DENY-URL
- APPFW-FIELD-CONSISTENCY
- APPFW-FIELD-FORMAT

- APPFW-POLICY-HIT
- APPFW-REFERER-HEADER
- APPFW-SAFE-COMMERCE
- APPFW-SAFE-OBJECT
- APPFW-SQL
- APPFW-START-URL
- APPFW-VIOLATIONS-TYPE
- APPFW-XML-ATTACHMENT
- APPFW-XML-DOS
- APPFW-XML-SCHEMA-COMPILE
- APPFW-XML-SOAP-FAULT
- APPFW-XML-SQL
- APPFW-XML-VALIDATION
- APPFW-XML-WSI
- APPFW-XML-XSS
- APPFW-XSS
- CLUSTER-BACKPLANE-HB-MISSING
- CLUSTER-NODE-HEALTH
- CLUSTER-NODE-QUORUM
- CLUSTER-VERSION-MISMATCH
- COMPACT-FLASH-ERRORS
- CONFIG-CHANGE
- CONFIG-SAVE
- HA-BAD-SECONDARY-STATE
- HA-NO-HEARTBEATS
- HA-SYNC-FAILURE
- HA-VERSION-MISMATCH
- HARD-DISK-DRIVE-ERRORS
- HA-STATE-CHANGE
- HA-STICKY-PRIMARY
- PORT-ALLOC-FAILED
- SYNFLOOD

These SNMP alarms configurations are impacted when you upgrade the Citrix ADC (NetScaler) appliance to the following release builds:

- Release 11.1 build 61.2 or later
- Release 12.0 build 61.0 or later
- Release 12.1 build 30.1 or later
- Release 13.0 build 51.4 or later

Example

Let’s consider an example of CLUSTER-NODE-HEALTH SNMP alarm.

```
CLUSTER-NODE-HEALTH SNMP alarm is set up by using the Citrix ADC (NetScaler) command line:

> set snmp alarm CLUSTER-NODE-HEALTH -time 111 -state DISABLED -severity Major

> save config
<!--NeedCopy-->
```

This SNMP alarm configuration appears in the saved configuration file (`ns.conf`) as:

```
set snmp alarm CLUSTER-NODE-HEALTH -time 111 -state DISABLED -severity Major -timeout 86400

<!--NeedCopy-->
```

During an upgrade to any of the release builds mentioned above, the following error appears in ns.log file:

```
May 23 09:14:46 <local0.err> ns nsconfigd: __init_config_filter(): (null) line 0: No such argument [-timeout]>> set snmp alarm CLUSTER-NODE-HEALTH -time 111 -state DISABLED -severity Major -timeout 86400.
<!--NeedCopy-->
```

After the upgrade, the SNMP alarm configurations are reset to the default values.

Workaround

Use one of the following workarounds:

- Before the upgrade, remove the timeout setting from the SNMP configurations in the saved configuration file (ns.conf).
- After the upgrade, reconfigure the SNMP alarms without the timeout parameter.

Upgrade a Citrix NetScaler standalone appliance

September 21, 2020

Before upgrading the system software, ensure that you read the Before you begin section. Also, complete the prerequisites such as backing up the necessary files and downloading the Citrix NetScaler firmware.

When upgrading from 10.0 and higher releases, you can use the GUI or the CLI.

You cannot upgrade to release 11.1 from the following builds by using the GUI Upgrade Wizard:

- All builds of release 10.1
- Any build before Build 57.x of release 10.5

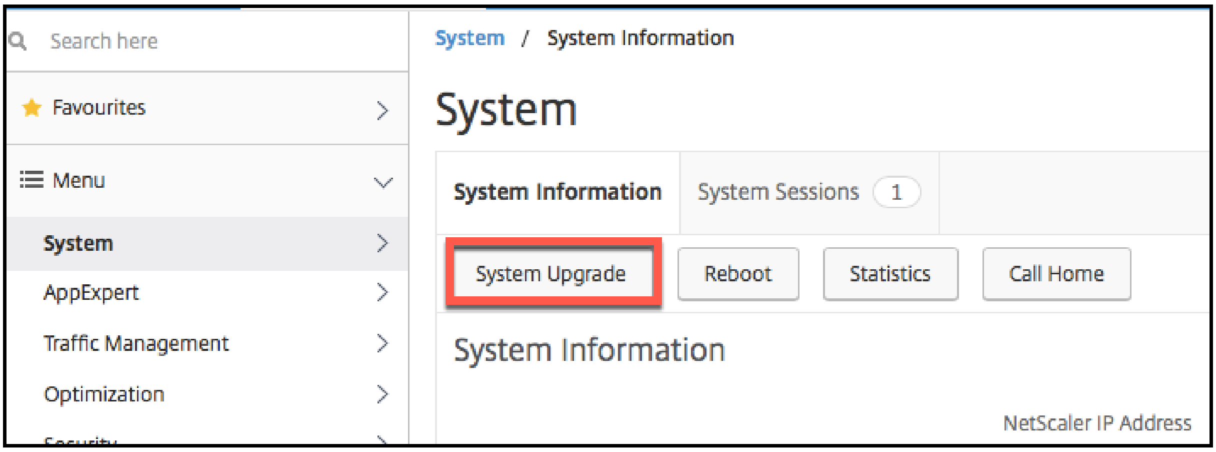
If your Citrix NetScaler runs any 9.x or lower release, visit the Product Matrix site for more information.

.

Upgrade a Citrix NetScaler standalone appliance by using the GUI

Follow these steps to upgrade a standalone Citrix NetScaler instance by using the GUI.

1. In a web browser, type the IP address of the Citrix NetScaler, for example `http://10.102.29.50`.
2. In User Name and Password, type the administrator credentials (nsroot/nsroot) and then click **Log On**.
3. From the GUI, click **System Upgrade**.



Search here
Favourites
Menu
System
AppExpert
Traffic Management
Optimization
Security
System / System Information
System
System Information
System Sessions 1
System Upgrade
Reboot
Statistics
Call Home
System Information
NetScaler IP Address

4. From the **Choose File** menu choose the appropriate option: **Local** or **Appliance**. If you want to use the Appliance option, the firmware needs to be uploaded to the Citrix NetScaler first. You can use any file transfer method such as WinSCP to upload the Citrix NetScaler firmware to the appliance.

5. Select the correct file and click **Upgrade**.

6. Follow the instructions to upgrade the software.

7. When prompted, select **Reboot**.

After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Upgrade a Citrix NetScaler standalone appliance by using the CLI

Follow these steps to upgrade a standalone Citrix NetScaler instance by using the CLI:

In the following procedure, <release> and <releasenumber> represent the release version you are upgrading to, and <targetbuildnumber> represents the build number that you are upgrading to. The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.

1. Use an SSH client, such as PuTTy, to open an SSH connection to the appliance.
2. Log on to the appliance by using the administrator credentials. Save the running configuration. At the prompt, type:

   ```
   save config
   ```

3. Switch to the shell prompt by running the following command:

   ```
   shell
   ```

4. Create a copy of the ns.conf file. At the shell prompt, type:

   a) `cd /nsconfig`
   b) `cp ns.conf ns.conf.NS<currentreleasenumber><currentbuildnumber>`

   You should backup the configuration file to another computer.

5. (Optional) If you have modified some of the following files in the /etc directory, and copied them to /nsconfig to maintain persistency, any updates that are pushed to the /etc directory during the upgrade might be lost:

   - `ttys`
   - `resolv.conf`
   - `sshd\\_config`
   - `host.conf`
   - `newsyslog.conf`
   - `host.conf`
   - `httpd.conf`
   - `rc.conf`
   - `syslog.conf`
   - `crontab`
   - `monitrc`

   To avoid losing these updates, create a /var/nsconfig_backup directory, and move the customized files to this directory. That is, move any files that you modified in /etc directory and copied to /nsconfig by running the following command:

   ```
   cp /nsconfig/\<filename\> /var/nsconfig\\_backup
   ```

Example:

cp /nsconfig/syslog.conf /var/nsconfig_backup

6. Create a location for the installation package. At the shell prompt type:

- `cd /var/nsinstall`
- `mkdir \<releasenumber\>nsinstall`
- `cd \<releasenumber\>nsinstall`
- `mkdir build\\_\<targetbuildnumber\>`
- `cd build\\_\<targetbuildnumber\>`

1. Copy the already downloaded Citrix NetScaler firmware to the directory that you created for it in step 5, by using any file transferring method such as WinSCP. See the Before You Begin section for more information about downloading the Citrix NetScaler firmware.

2. Extract the contents of the installation package. Example:

```
tar -xvzf build-11.1-47.1_nc.tgz
```

1. Run the installns script to install the new version of the system software.

   ```
   ./installns
   ```

2. When prompted, restart the Citrix NetScaler.

3. (Optionally) If you've created a copy of the ns.conf file in the **Before You Begin** section, do the following:

   a) Manually compare the files in /var/nsconfig_backup and /etc and make appropriate changes in /etc.
   b) To maintain persistency, move the updated files in /etc to /nsconfig.
   c) Restart the appliance to put the changes into effect.

Following is an example of Citrix NetScaler firmware upgrade.

```
login: nsroot

Password: nsroot

Last login: Thu Jun 23 15:05:05 2016 from 10.252.243.134

Done

> save config
```

```

> shell

Last login:Thu Jun 23 15:05:05 2016 from 10.252.243.134

root@NSnnn# cd /var/nsinstall

root@NSnnn# cd 11.1nsinstall

root@NSnnn# mkdir build_47.10

root@NSnnn# cd build_47.10

root@NSnnn# ftp <FTP server IP address>

ftp> mget build-11.1-47.10_nc.tgz

```

Upgrade a Citrix NetScaler standalone appliance by using NITRO API

To use NITRO API to upgrade or downgrade a Citrix NetScaler, see Automate Citrix NetScaler Upgrade and Downgrade with a Single API.

Directory locations of script files for user monitors

In release 10.1 build 122.17, the script files for user monitors are at a new location. If you upgrade an appliance or virtual appliance to release 10.1 build 122.17 or later, the changes are as follows:

- A new directory named conflicts is created in /nsconfig/monitors/ and all the built-in scripts of the previous builds are moved to this directory.
- All new built-in scripts are available in the /netscaler/monitors/ directory. All custom scripts are available in the /nsconfig/monitors/ directory.
- You must save a new custom script in the /nsconfig/monitors/ directory.
- After the upgrade is completed, if a custom script is created and saved in the /nsconfig/monitors/ directory with the same name as that of a built-in script, the script in the /netscaler/monitors/ directory takes priority. That is, the custom script is not run.

If you provision a virtual appliance running release 10.1 build 122.17 or later, the changes are as follows:

- All built-in scripts are available in the /netscaler/monitors/ directory
- The directory /nsconfig/monitors/ is empty.
- If you create a custom script, you must save it in the /nsconfig/monitors/ directory.

For more information about user monitors, see Understanding user monitors.

Check and install a Citrix NetScaler software update

Update the Citrix NetScaler software when an update is available, for a better performance. A Citrix NetScaler update can include feature improvements, performance fixes, or enhancements. Make sure you read the release notes to see what fixes and enhancements are available in the update. To check and install a software update, do the following.

1. In the Citrix NetScaler home page, click **Check for Update** from the **nsroot** menu at the top right corner of the page.
2. In the **Latest System Software Updates Available** page, check the available software update that you can install.
3. Click **Download** to download the installation package from the Citrix download website.
4. After you have downloaded the software package, install the update through either CLI or GUI procedure.

> **Note**
>
> The **Check for Update** link is accessible only if you log into the GUI through the HTTP protocol and not through the HTTPS protocol.

Downgrade a Citrix NetScaler standalone appliance

September 21, 2020

You can downgrade to any earlier release on a standalone Citrix NetScaler by using the CLI. Downgrading using the GUI is not supported.

> **Note**
>
> Loss in configuration might occur when downgrading. You should compare the configurations before and after the downgrade, and then manually reenter any missing entries.

Procedure to downgrade a standalone Citrix NetScaler

Follow the steps given below to downgrade a Citrix NetScaler standalone appliance running release 11.1 to an earlier release.

In this procedure, <release> and <releasenumber> represent the release version you are downgrading to, and <targetbuildnumber> represents the build number that you are downgrading to.

1. Open an SSH connection to the Citrix NetScaler by using an SSH client, such as PuTTY.

2. Log on to the Citrix NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save config

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a) `cd /nsconfig`
   b) `cp ns.conf ns.conf.NS<currentbuildnumber>`

   You should backup a copy of the configuration file on another computer.

4. Copy the <releasenumber> configuration file (ns.conf.NS<releasenumber>) to ns.conf. At the shell prompt, type:

   cp ns.conf.NS<releasenumber> ns.conf

   Note: ns.conf.NS<releasenumber> is the backup configuration file that is automatically created when the system software is upgraded from release version <releasenumber> to the current release version. There may be some loss in configuration when downgrading. After the appliance restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.

   Important: If routing is enabled, perform step 5. Otherwise, skip to step 6.

5. If routing is enabled, the ZebOS.conf file will contain the configuration. At the shell prompt, type:

   a) cd /nsconfig
   b) cp ZebOS.conf ZebOS.conf.NS
   c) cp ZebOS.conf.NS<targetreleasenumber> ZebOS.conf

6. Change directory to /var/nsinstall/<releasenumber>nsinstall, or create one if it does not exist.

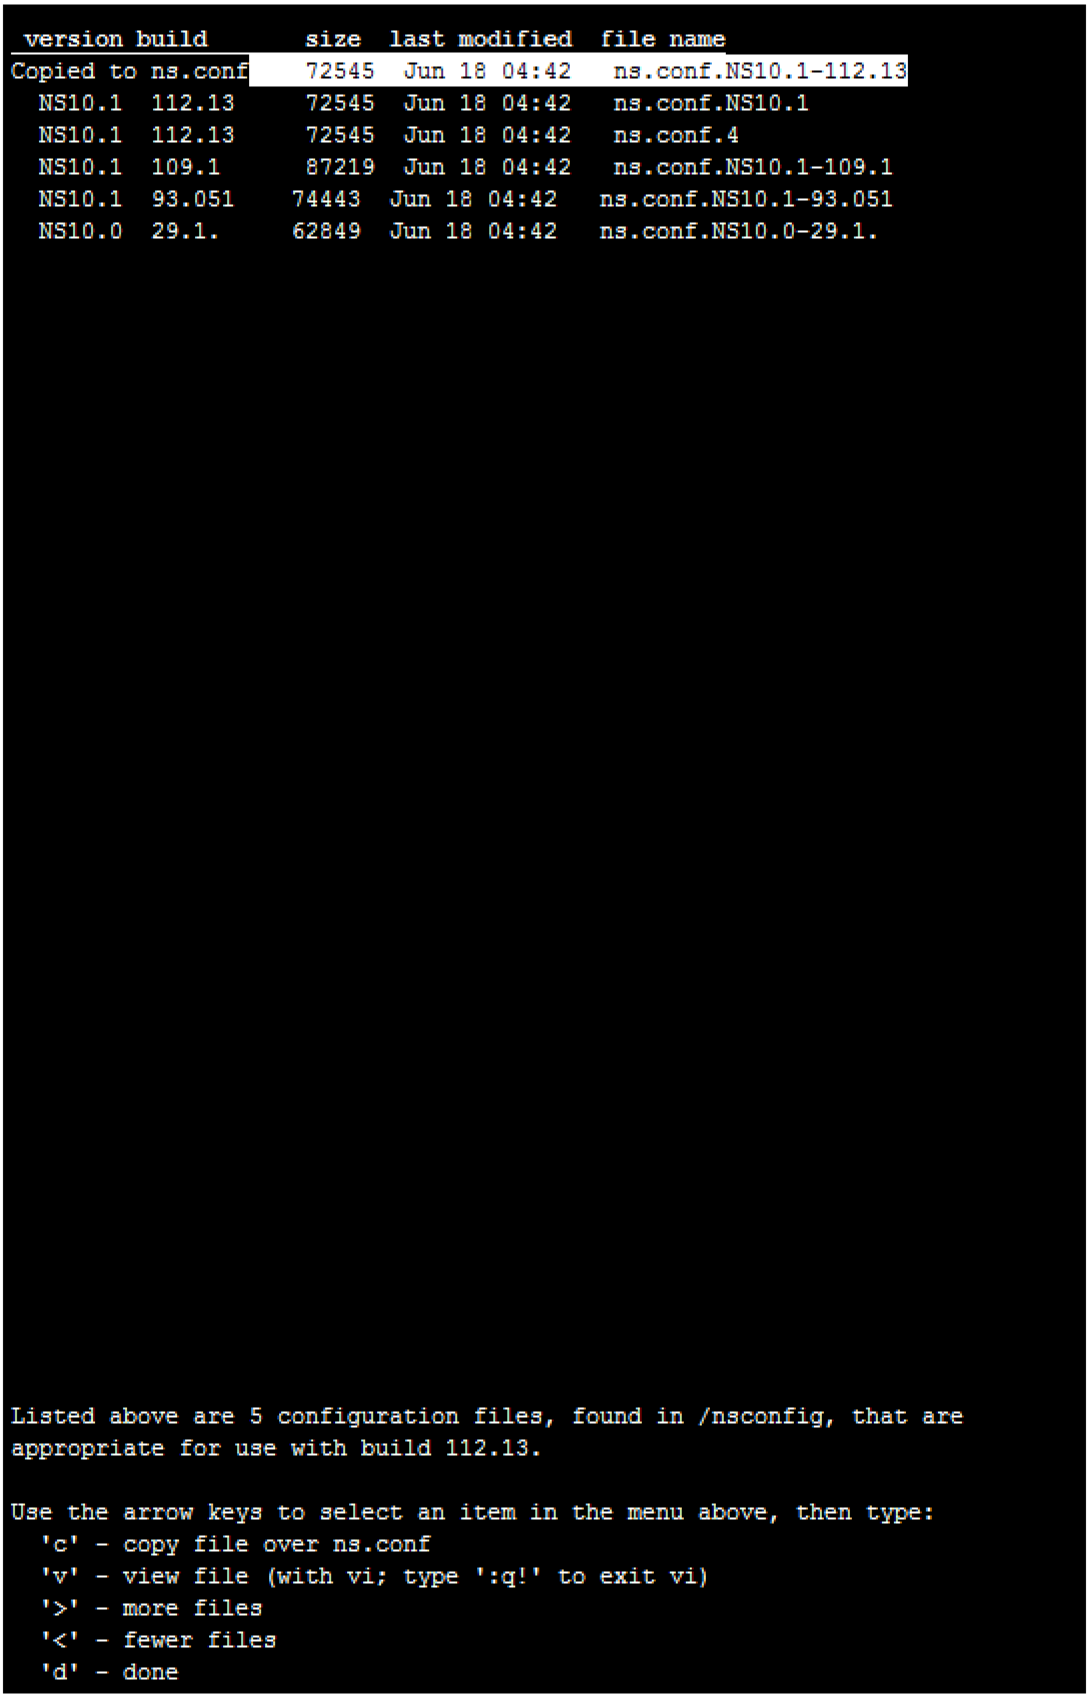
7. Change directory to build_<targetbuildnumber>, or create one if it does not exist.

8. Download or copy the installation package (build-<release>-<targetbuildnumber>.tgz) to this directory and extract the contents of the installation package.

9. Run the installns script to install the new version of the system software. The script updates the /etc directory.

   If the configuration file for the build that you are downgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

   Figure 1. Downgrade menu if configuration file exists



```
 version build          size  last modified  file name
Copied to ns.conf        72545  Jun 18 04:42   ns.conf.NS10.1-112.13
  NS10.1  112.13         72545  Jun 18 04:42   ns.conf.NS10.1
  NS10.1  112.13         72545  Jun 18 04:42   ns.conf.4
  NS10.1  109.1          87219  Jun 18 04:42   ns.conf.NS10.1-109.1
  NS10.1  93.051        74443  Jun 18 04:42   ns.conf.NS10.1-93.051
  NS10.0  29.1.         62849  Jun 18 04:42   ns.conf.NS10.0-29.1.

Listed above are 5 configuration files, found in /nsconfig, that are
appropriate for use with build 112.13.

Use the arrow keys to select an item in the menu above, then type:
  'c' - copy file over ns.conf
  'v' - view file (with vi; type ':q!' to exit vi)
  '>' - more files
  '<' - fewer files
  'd' - done
```

If the free space available on the flash drive is insufficient to install the new build, the Citrix NetScaler aborts the installation. Manually clean up the flash drive and restart the installation.

Example:

```
login: nsroot

Password: nsroot

Last login: Mon Apr 24 02:06:52 2017 from 10.102.29.9

Done

> save config

> shell

root@NSnnn# cp ns.conf.NS10.5 ns.conf

root@NSnnn# cd /var/nsinstall

root@NSnnn# mkdir 10.5nsinstall

root@NSnnn# cd 10.5nsinstall

root@NSnnn# mkdir build_57

root@NSnnn# cd build_57

root@NSnnn# ftp 10.102.1.1

ftp> mget build-10.5-57_nc.tgz

ftp> bye

root@NSnnn# tar -xzvf build-10.1-125_nc.tgz

root@NSnnn# ./installns

installns version (10.5-57) kernel (ns-10.5-57.gz)

...

...

```

```
...

Copying ns-10.5-57.gz to /flash/ns-10.5-57_nc.gz ...

Changing /flash/boot/loader.conf for ns-10.5-57 ...

Installation has completed.

Reboot NOW? [Y/N] Y
```

Upgrade a high availability pair

December 10, 2020

One of the requirements of Citrix NetScaler appliances in a high availability setup is to install the same Citrix NetScaler software release on both appliances of the setup. Therefore, when software on one appliance is upgraded, ensure that the software is upgraded on both the appliances.

You can follow the same procedure to upgrade a standalone appliance or each appliance in a high availability pair, although additional considerations apply to upgrading a high availability pair.

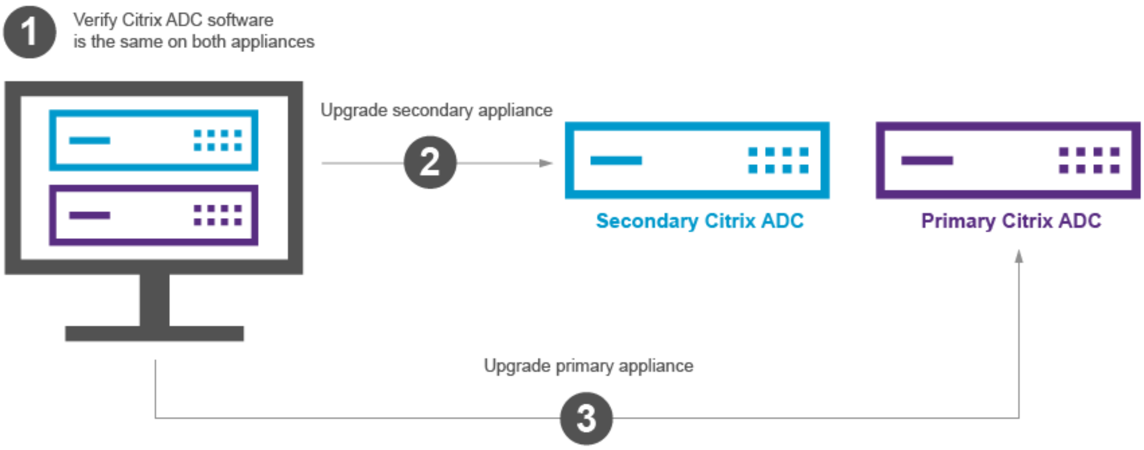
Before you start a Citrix NetScaler firmware upgrade on an HA pair, read the prerequisites mentioned in the Before you begin section. Also, you need to consider a few HA-specific points.

Points to note

- First upgrade the secondary node, and then the primary node. Upgrading software on the secondary appliance before the primary appliance ensures that the upgrade process is completed without any issues.
- If the two nodes in an HA configuration are running different Citrix NetScaler software releases, the following information does not get synchronized on the primary and secondary nodes:
    - Configuration propagation and synchronization
    - States of the services
    - Connection failover sessions
    - Persistence sessions

- The above information might not get synchronized on the primary and secondary nodes if the two nodes are running different builds of the same release. Refer to the Known Issues section of the release notes to check if your Citrix NetScaler build has this issue.
- Synchronization of the files in the All mode of the Sync HA files command works successfully if the two nodes in an HA configuration are running different Citrix NetScaler software releases, or the two nodes are running different builds of the same release. For more information, see Synchronising Configuration Files in High Availability Setup.

Figure. Upgrade a high availability pair



1
Verify Citrix ADC software is the same on both appliances
Upgrade secondary appliance
2
Secondary Citrix ADC
Primary Citrix ADC
Upgrade primary appliance
3

You can upgrade using the Citrix NetScaler CLI or GUI.

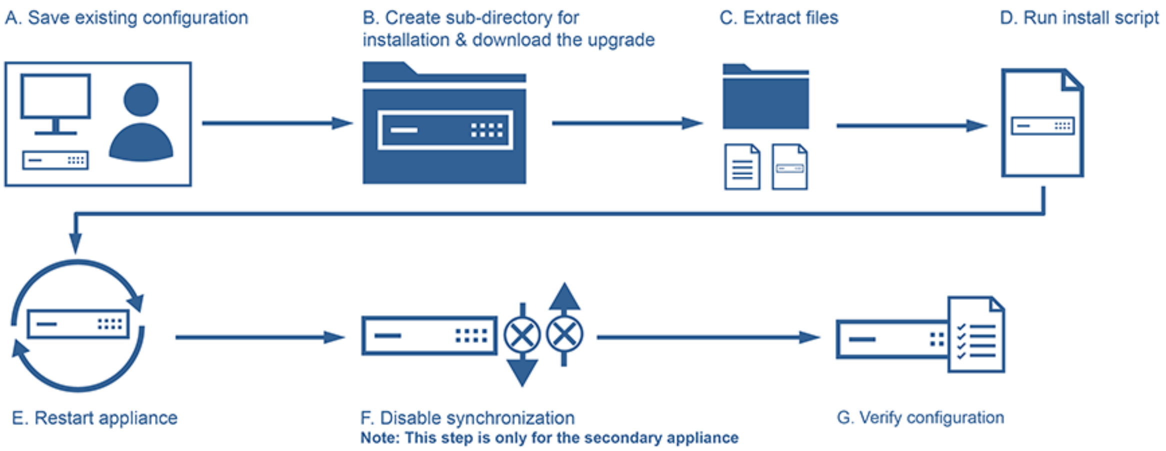
Upgrade a high availability pair by using the CLI

The upgrade process includes the following steps:

1. Upgrade software on the secondary appliance
2. Upgrade software on the upgrade appliance
3. Synchronize secondary appliance

Upgrade software on the secondary appliance

The following illustration depicts the procedure to upgrade software on the secondary appliance:



A. Save existing configuration
B. Create sub-directory for installation & download the upgrade
C. Extract files
D. Run install script
E. Restart appliance
F. Disable synchronization
Note: This step is only for the secondary appliance
G. Verify configuration

1. Log on to the secondary NetScaler appliance using an SSH utility, such as PuTTY and specifying the NetScaler IP (NSIP). Use the nsroot credentials to log on to the appliance.
2. From the command line interface of the appliance, type the following command to save the existing configuration: save config
3. Switch to the shell prompt.

```
login as: username
Using keyboard-interactive authentication.
Password:
Last login: Wed Jun 24 14:59:16 2015 from 10.252.252.65
Done
> shell
Copyright (c) 1992-20

<!--NeedCopy-->
```

4. Run the following command to change to the default installation directory: # cd /var/nsinstall
5. Run the following command to create a temporary subdirectory of the nsinstall directory: **# mkdir x_xnsinstall**

   > Note: The text x_x is used to name the NetScaler version for future configurations. For example, the directory for the installation files of NetScaler 9.3 us called 9_3nsinstall. Do not use a period (.) in the folder name, it can cause failed upgrades.

6. Change to the **x_xnsinstall** directory.
7. Download the required installation package and documentation bundle, such as “ns-x.0-xx.x-doc.tgz,” to the temporary directory created in Step 4.

> **Notes:**
>
> - Some builds do not have a documentation bundle as it does not have to be installed.
> - Click the **Documentation** tab from the GUI to access the documentation.

8. Before you run the install script, the files must be extracted and placed on the appliance. Use the following command to uncompress the bundle downloaded from Citrix website: **tar -zxvf ns-x.0-xx.x-doc.tgz**. The following is a quick explanation of the parameters used.

   x: Extract files

   v: Print the file names as they are extracted one by one

   z: The file is a "gzipped" file

   f: Use the following tar archive for the operation

9. Run the following command to install the downloaded software: # ./installns

   > Note: If the appliance does not have sufficient disk space to install the new kernel files, the installation process performs an automatic cleanup of the flash drive.

10. After the installation process is complete, the process prompts to restart the appliance. Press y to restart the appliance.

11. Log on to the appliance Command Line Interface using the nsroot credentials.

12. Run the following command from to display the state of the NetScaler appliance: **> show ha node** The output of the preceding command should indicate that the appliance is a secondary node and synchronization is disabled.

13. Run the following command to disable synchronization on the appliance if synchronization is not disabled: **> set ha node -hasync disabled**

14. Ensure that the configuration is complete and as expected.

15. Run the following command to perform a force failover and takeover as primary appliance: **> force failover**

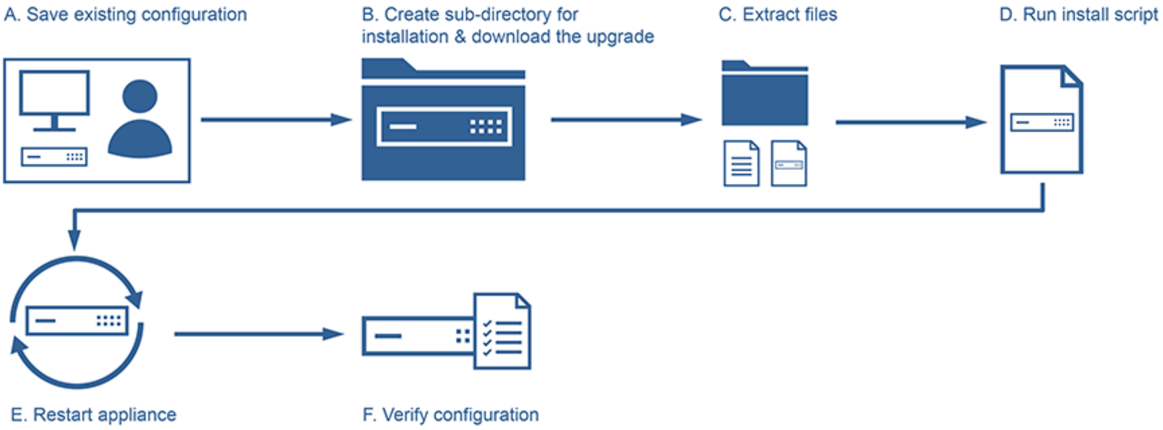
Here's a sample configuration in the new primary node.

```
login: nsroot
    Password: nsroot
    Last login: Monday Apr  17 08:37:26 2017 from 10.102.29.9
    Done
    show ha node
            2 nodes:
    1)      Node ID:      0
            IP:        10.0.4.2
            Node State: UP
```

```
                Master State: Primary
                ...
                Sync State: AUTO DISABLED
                Propagation: AUTO DISABLED
                ...
        Done
<!--NeedCopy-->
```

Upgrade software on the primary appliance

The following illustration depicts the procedure to upgrade software on the primary appliance:



A. Save existing configuration
B. Create sub-directory for installation & download the upgrade
C. Extract files
D. Run install script
E. Restart appliance
F. Verify configuration

> Note: After completing the "Upgrade software on the secondary appliance" procedure, the original primary appliance is now a secondary appliance.

1. Log on to the secondary NetScaler appliance using an SSH utility, such as PuTTY. Use the nsroot credentials to log on to the appliance. Follow the same steps as mentioned in the above section to complete the installation process. We have to follow the same steps as mentioned in step 2 to step 9 in the previous section(Upgrade software of the secondary appliance)
2. After the installation process is complete, the process prompts to restart the appliance. Press y to restart the appliance.
3. Log on to the appliance Command Line Interface using the nsroot credentials.
4. Run the following command to display the state of the NetScaler appliance: **> show ha node**. The output of the preceding command should indicate that the appliance is a secondary node and the status of the node state is marked as UP.
5. If the appliance is not a primary appliance, run the following command to perform a force failover to ensure that the appliance is a primary appliance: **> force failover**
6. Verify that the appliance is a primary appliance.

Enable synchronization on the secondary appliance

To enable synchronization on the secondary appliance, complete the following procedure:

1. Run the following command to verify that the appliance is a secondary appliance: **> show node**
2. Run the following command to enable synchronization on the appliance: **> set ha node -hasync enabled**
3. Run the following command to verify that the configuration of the secondary appliance is synchronized with that of the primary appliance: **> show ns runningconfig**

Here's an example configuration of the new primary node and the new secondary node.

```
show ha node
        Node ID:      0
        IP:   10.0.4.2
        Node State: UP
        Master State: Primary
...
...

Upgrade a high availability pair by using the GUI

Follow these steps to upgrade a Citrix NetScaler pair in a high availability setup, by using the GUI:

1. Log on to the secondary node and perform the upgrade as described in the section "Upgrade a Citrix NetScaler standalone appliance by using the GUI" in Upgrade a Citrix NetScaler standalone appliance.
2. Log on to the primary node and perform the upgrade as described in the section "Upgrade a Citrix NetScaler standalone appliance by using the GUI" in Upgrade a Citrix NetScaler standalone appliance.

Downgrade a high availability pair

September 21, 2020

You can downgrade to any release on a high availability pair by using the command line interface. The GUI does not support the downgrade process.

To downgrade the system software on a Citrix NetScaler pair in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see Downgrade a Citrix NetScaler standalone appliance.

> **Important**
>
> Loss in configuration might occur when downgrading. You should compare the configurations before and after the downgrade, and then manually re-enter any missing entries.

Troubleshooting

September 21, 2020

If the appliance does not work as expected after you complete the installation, upgrade, or downgrade process, the first thing to do is to check for the most common causes of the problem.

Resources for troubleshooting

For best results, use the following resources to troubleshoot an issue related to installing, upgrading, or downgrading a Citrix NetScaler:

- The configuration files from the appliance. In case of a High Availability pair, the configuration files from both appliances.
- The following files from the appliance(s):
  - The relevant newnslog files.
  - The ns.log file.
  - The messages file.
- A network topology diagram.

Troubleshooting issues related to the installation, upgrade, and downgrade processes

Following are the most common installation, upgrade, and downgrade issues, and tips for resolving them:

- **Issue**

  The Citrix NetScaler is not accessible after the software downgrade

  Cause

  During the software downgrade process, if the configuration file of the existing release and build does not match the configuration file of the earlier release and build, the appliance cannot load the configuration, and the default IP address is assigned to the appliance.

  Resolution

  - Verify that the appliance is accessible from the console.
  - Verify the NSIP address and the routes on the appliance.
    * If the IP address has changed to the default 192.168.100.1 IP address, change the IP address as required.
    * Verify that the appliance is accessible.
- **Issue**

  Configuration of the appliance is lost after you upgrade the software across multiple releases.

  Cause

  Some migration commands are built in for upgrading to the next release. Such commands might not be available across releases.

  Resolution

  - Verify the path of the upgrade process. Citrix recommends upgrading by one release at a time. For example, if the software needs to be upgraded from Citrix NetScaler (previously

NetScaler) release 9.2 to release 10.1, the following is the recommended path for the upgrade:
    - Release 9.2 to release 9.3
    - Release 9.3 to release 10
    - Release 10 to release 10.1
  - Verify that the appliance has appropriate license files.
  - Verifying the configuration at each step of the upgrade process can give you pointers to the issue.

- **Issue**

  During an upgrade, if I run the command for synchronizing, the following message appears:

  Command failed on the secondary node but succeeded on the primary node.

  Resolution

  Do not run any dependent commands (set /unset /bind /unbind) when High Availability (HA) synchronization is in progress.

- **Issue**

  During an upgrade process, traffic does not pass through the new primary node when you run the force failover command.

  Resolution

  - Check for problems with the network topology and the switch configurations.
  - Run the set L2param -garpreply ENABLED command to enable the GARP reply.
  - Try using virtual MAC if not already used.
  - Run the sendarp –a command from the primary node.

- **Issue**

  In an HA pair, after you run the force HA failover command the devices keep rebooting. The secondary device does not come up after an upgrade.

  Resolution

  Check to see if the /var directory is full. If so, remove the old installation files. Run the df –h command to show the available disk space.

- **Issue**

  After upgrading an HA pair, one of the nodes is listed as state UNKNOWN.

  Resolution

  - Check to see if both nodes are running the same build. If the builds are not same and HA nodes have a version mismatch, some of the fields are shown as UNKNOWN when you run the show ha node command.

    - Check to see if the secondary appliance is reachable.

- **Issue**

  After you upgrade the Citrix NetScaler, the interface shows most of the load balancing virtual servers and services are DOWN.

  Resolution

  Verify that the SNIP address is active on the secondary appliance. Also, type the show service command to see if the service is running.

- **Issue**

  After performing an upgrade, all virtual servers are down on the secondary appliance.

  Resolution

  Enable the HA state and HA synchronization by running the following commands:

    - set node hastate enable
    - set node hasync enable

  Disabling HA is not recommended.

- **Issue**

  After performing a downgrade, the Citrix NetScaler does not boot up properly.

  Resolution

  Check to see if the correct license has been installed.

- **Issue**

  In an HA pair, some features do not get synchronized after an upgrade is performed.

  Resolution

  Run the sync ha file misc command to synchronize the configurations files from the primary node to secondary node.

- **Issue**

  During reboot, the following error message appears:

  One or more commands in ns.conf failedWhat should I do?

  Resolution

  Make sure that no command in the ns.conf file exceeds the 255 byte limit. In commands that create policies that are too long for the 255-byte limit, you can use pattern sets to shorten the policies.

  Example:

“‘ pre codeblock
add cs policy p11 -rule ‘HTTP.REQ.URL.ENDSWITH_ANY(“ctx_file_extensions”)’
Done

~~~
ctx\_file\_extensions is a default patset that covers a large number of extensions. In addition to the default pattern sets, you can create user-defined pattern sets. Add a patset by running the following command:

``` pre codeblock
add patset <name>
<!--NeedCopy-->
~~~

Note: Patsets are supported only in release 9.3 or later.

- **Issue**

  When upgrading a Citrix NetScaler VPX appliance, I am told to free up space in /var. What files do I remove?

  Resolution

  Remove the old installation files from /var/tmp/ directory. Also remove unwanted files from /flash.

- **Issue**

  There is no connectivity to the graphical user interface (GUI) when you run the force HA failover command on the secondary appliance.

  Resolution

  Log on to the secondary appliance using the command line interface and enable the access to GUI by running the set ns ip <IP> -gui enabled command.

- **Issue**

  After performing an upgrade, and when I click on any link on the GUI that has to load a java applet (Upgrade Wizard or license Wizard), the following error message appears: **GUI version does not match with the kernel version. Please close this instance, clear java plug-in cache and reopen**.

  Resolution

  - Log on to the Citrix NetScaler using the GUI.
  - Navigate to Citrix NetScaler Gateway > Global Settings.
  - Click Change Global Settings under Settings.
  - In the details pane, under Client Experience, select Default from the UI theme list.
  - Click OK.

> **Note**
>
> These troubleshooting steps also apply to issues with configuration loss when downgrading the software across multiple releases.
>
> For any other issue, see the release notes, Knowledge Center articles, and FAQs.

FAQs

September 21, 2020

For answers to the questions that you might have about upgrading the Citrix NetScaler firmware, see the Installing, Upgrading, and Downgrading FAQs.

New and Deprecated Commands, Parameters, and SNMP OIDs

September 21, 2020

Jun 17, 2016

This section lists the new and deprecated commands, parameters, and SNMP OIDS.

New Commands

The following table lists the new commands in release 11.1.

Command Group	Command
Appflow	set appflow collector
Network	set vrID6, set netbridge, bind netProfile, unbind netProfile
NS	flush ns sourceroutecachetable
Protocol	clear protocol httpBand
Router	config router dynamicRouting
SSL	stat ssl vserver
Reputation	set reputation settings, show reputation settings

New Parameters

The following table lists the new parameters in release 11.1.

Command group: Basic

Commands:

- `rm server \[-removeGSLBSvcOnly\]`
- `add service \[-monConnectionClose\]`
- `show service \[-monConnectionClose\]`
- `add serviceGroup \[-monConnectionClose\]`
- `show serviceGroup \[-monConnectionClose\]`
- `start nstrace \[-skipLocalSSH\]`
- `start nstrace \[-capsslkeys\]`
- `show nstrace \[-skipLocalSSH\]`
- `show nstrace \[-capsslkeys\]`

Command group: AAA

Commands:

- `show aaa session \[-aaaUserConnInfo\]`
- `set aaa radiusParams \[-authservRetry\]`
- `show aaa radiusParams \[-authservRetry\]`
- `set aaa parameter \[-aaaSessionLoglevel\]`
- `show aaa parameter \[-aaaSessionLoglevel\]`

Command group: AppFlow

Commands:

- `add appflow action \[-pageTracking\]`
- `add appflow action \[-securityInsight\]`
- `set appflow action \[-pageTracking\]`
- `set appflow action \[-securityInsight\]`
- `show appflow action \[-pageTracking\]`
- `show appflow action \[-securityInsight\]`
- `set appflow param \[-SecurityInsightRecordInterval\]`

- `set appflow param \[-subscriberAwareness\]`
- `set appflow param \[-SecurityInsightTraffic\]`
- `set appflow param \[-cacheInsight\]`
- `show appflow param \[-SecurityInsightRecordInterval\]`
- `show appflow param \[-SecurityInsightTraffic\]`
- `show appflow param \[-subscriberAwareness\]`
- `show appflow param \[-cacheInsight\]`

Command group: Audit

Commands:

- `add audit syslogAction \[-serverDomainName\]`
- `set audit syslogAction \[-serverDomainName\]`
- `set audit syslogAction \[-domainResolveRetry\]`
- `set audit syslogAction \[-domainResolveNow\]`
- `show audit syslogAction \[-serverDomainName\]`
- `show audit syslogAction \[-IP\]`
- `show audit syslogAction \[-domainResolveRetry\]`
- `add audit nslogAction \[-serverDomainName\]`
- `set audit nslogAction \[-serverDomainName\]`
- `set audit nslogAction \[-domainResolveRetry\]`
- `set audit nslogAction \[-domainResolveNow\]`
- `show audit nslogAction \[-serverDomainName\]`
- `show audit nslogAction \[-domainResolveRetry\]`
- `show audit nslogAction \[-IP\]`

Command group: Authentication

Commands:

- `add authentication radiusAction \[-authservRetry\]`
- `set authentication radiusAction \[-authservRetry\]`
- `show authentication radiusAction \[-authservRetry\]`
- `add authentication negotiateAction \[-NTLMPath\]`

- `set authentication negotiateAction \[-NTLMPath\]`
- `show authentication negotiateAction \[-NTLMPath\]`
- `add authentication samlAction \[-skewTime\]`
- `set authentication samlAction \[-skewTime\]`
- `show authentication samlAction \[-skewTime\]`
- `bind authentication vserver \[-portaltheme\]`
- `unbind authentication vserver \[-portaltheme\]`
- `show authentication vserver \[-portaltheme\]`
- `add authentication samlIdPProfile \[-samlBinding\]`
- `add authentication samlIdPProfile \[-skewTime\]`
- `add authentication samlIdPProfile \[-signAssertion\]`
- `add authentication samlIdPProfile \[-keyTransportAlg\]`
- `set authentication samlIdPProfile \[-samlBinding\]`
- `set authentication samlIdPProfile \[-skewTime\]`
- `set authentication samlIdPProfile \[-signAssertion\]`
- `set authentication samlIdPProfile \[-keyTransportAlg\]`
- `show authentication samlIdPProfile \[-samlBinding\]`
- `show authentication samlIdPProfile \[-skewTime\]`
- `show authentication samlIdPProfile \[-signAssertion\]`
- `show authentication samlIdPProfile \[-keyTransportAlg\]`
- `add authentication loginSchema \[-builtin\]`
- `show authentication loginSchema \[-builtin\]`

Command group: Cluster

Commands:

- `show cluster instance \[-validMtu\]`
- `show cluster node \[-routeMonitor\]`
- `show cluster node \[-routeMonState\]`
- `show cluster node \[-netmask\]`
- `bind cluster node \[-routeMonitor\]`

- `unbind cluster node \[-routeMonitor\]`

Command group: DNS

Command:

- `show dns naptrRec \[-vServerName\]`

Command group: GSLB

Commands:

- `add gslb site \[-naptrReplacementSuffix\]`
- `set gslb site \[-naptrReplacementSuffix\]`
- `show gslb site \[-naptrReplacementSuffix\]`
- `add gslb service \[-naptrReplacement\]`
- `add gslb service \[-naptrOrder\]`
- `add gslb service \[-naptrServices\]`
- `add gslb service \[-naptrDomainTTL\]`
- `add gslb service \[-naptrPreference\]`
- `set gslb service \[-naptrOrder\]`
- `set gslb service \[-naptrPreference\]`
- `set gslb service \[-naptrServices\]`
- `set gslb service \[-naptrReplacement\]`
- `show gslb service \[-lastresponse\]`
- `show gslb service \[-naptrOrder\]`
- `show gslb service \[-naptrPreference\]`
- `show gslb service \[-naptrServices\]`
- `show gslb service \[-naptrReplacement\]`
- `show gslb service \[-naptrDomainTTL\]`
- `add gslb vserver \[-ECS\]`
- `add gslb vserver \[-ecsAddrValidation\]`
- `set gslb vserver \[-ECS\]`
- `set gslb vserver \[-ecsAddrValidation\]`
- `show gslb vserver \[-ECS\]`

- `show gslb vserver \[-ecsAddrValidation\]`

Command group: HA

Command:

- `show HA node \[-haHeartbeatifaces\]`

Command group: ICA
Commands:

- `add ica action \[-latencyprofileName\]`
- `set ica action \[-latencyprofileName\]`
- `show ica action \[-latencyprofileName\]`

Command group: IPsec
Commands:

- `add ipsec profile \[-responderOnly\]`
- `show ipsec profile \[-responderOnly\]`
- `set ipsec parameter \[-responderOnly\]`
- `unset ipsec parameter \[-responderOnly\]`
- `show ipsec parameter \[-responderOnly\]`

Command group: Load balancing

Commands:

- `add lb monitor \[-builtin\]`
- `add lb monitor \[-sslProfile\]`
- `set lb monitor \[-sslProfile\]`
- `unset lb monitor \[-sslProfile\]`
- `bind lb monitor \[-certkeyName\]`
- `unbind lb monitor \[-certkeyName\]`
- `show lb monitor \[-builtin\]`
- `show lb monitor \[-sslProfile\]`
- `show lb monitor \[-certkeyName\]`
- `show lb monitor \[-CA\]`
- `show lb monitor \[-crlCheck\]`
- `show lb monitor \[-ocspCheck\]`

- `add lb vserver \[-lbprofilename\]`
- `add lb vserver \[-redirectFromPort\]`
- `add lb vserver \[-httpsRedirectUrl\]`
- `set lb vserver \[-lbprofilename\]`
- `set lb vserver \[-redirectFromPort\]`
- `set lb vserver \[-httpsRedirectUrl\]`
- `unset lb vserver \[-lbprofilename\]`
- `unset lb vserver \[-redirectFromPort\]`
- `unset lb vserver \[-httpsRedirectUrl\]`
- `show lb vserver \[-backupLBMethod\]`
- `show lb vserver \[-preferredLocation\]`
- `show lb vserver \[-lbprofilename\]`
- `show lb vserver \[-redirectFromPort\]`
- `show lb vserver \[-httpsRedirectUrl\]`
- `set lb parameter \[-AllowBoundSvcRemoval\]`
- `set lb parameter \[-retainservicestate\]`
- `show lb parameter \[-AllowBoundSvcRemoval\]`
- `show lb parameter \[-retainservicestate\]`

Command group: LSN

Commands:

- `bind lsn group \[-pcpServer\]`
- `bind lsn group \[-logProfileName\]`
- `unbind lsn group \[-pcpServer\]`
- `unbind lsn group \[-logProfileName\]`
- `show lsn group \[-pcpServer\]`
- `show lsn group \[-logProfileName\]`
- `add lsn logprofile \[-logCompact\]`
- `set lsn logprofile \[-logCompact\]`
- `show lsn logprofile \[-logCompact\]`

- `set lsn parameter \[-subscrSessionRemoval\]`
- `show lsn parameter \[-subscrSessionRemoval\]`
- `show lsn session \[-IPv6Address\]`
- `show lsn deterministicNat \[-network6\]`
- `show lsn deterministicNat \[-natprefix\]`
- `show lsn deterministicNat \[-nattype\]`

Command group: Network
Commands:

- `add channel \[-haHeartbeat\]`
- `set channel \[-haHeartbeat\]`
- `show channel \[-haHeartbeat\]`
- `add vrID \[-preemptiondelaytimer\]`
- `show vrID \[-preemptiondelaytimer\]`
- `add vrID6 \[-priority\]`
- `add vrID6 \[-preemption\]`
- `add vrID6 \[-sharing\]`
- `add vrID6 \[-preemptiondelaytimer\]`
- `add vrID6 \[-trackifNumPriority\]`
- `bind vrID6 \[-trackifNum\]`
- `unbind vrID6 \[-trackifNum\]`
- `show vrID6 \[-preemption\]`
- `show vrID6 \[-sharing\]`
- `show vrID6 \[-preemptiondelaytimer\]`
- `show vrID6 \[-trackifNum\]`
- `show vrID6 \[-trackifNumPriority\]`
- `show vrID6 \[-effectivePriority\]`
- `add inat \[-tcpproxy\]`
- `add inat \[-ftp\]`
- `add inat \[-tftp\]`

Commands:

- `set rewrite param \[-timeout\]`
- `unset rewrite param \[-timeout\]`
- `show rewrite param \[-timeout\]`

Command group: SNMP
Commands:

- `set snmp option \[-snmpTrapLoggingLevel\]`
- `show snmp option \[-snmpTrapLoggingLevel\]`

Command group: SSL
Commands:

- `show ssl certKey \[-CertificateType\]`
- `create ssl certReq \[-digestMethod\]`
- `show ssl profile \[-sslpfobjecttype\]`

Command group: System

Commands:

- `add system user \[-maxsession\]`
- `set system user \[-maxsession\]`
- `show system user \[-maxsession\]`
- `set system parameter \[-totalAuthTimeout\]`
- `set system parameter \[-cliLoglevel\]`
- `show system parameter \[-totalAuthTimeout\]`
- `show system parameter \[-cliLoglevel\]`
- `restore system backup \[-skipbackup\]`
- `show system file \[-filesize\]`

Command group: Subscriber
Commands:

- `set subscriber param \[-idleTTL\]`
- `set subscriber param \[-idleAction\]`
- `set subscriber param \[-ipv6PrefixLookupList\]`
- `set subscriber param \[-builtin\]`
- `show subscriber param \[-idleTTL\]`
- `show subscriber param \[-idleAction\]`
- `show subscriber param \[-ipv6PrefixLookupList\]`
- `show subscriber param \[-builtin\]`
- `set subscriber gxInterface \[-revalidationTimeout\]`
- `show subscriber gxInterface \[-revalidationTimeout\]`

Command group: TM
Commands:

- `add tm sessionPolicy \[-expressionType\]`
- `show tm sessionPolicy \[-stateflag\]`
- `show tm sessionPolicy \[-expressionType\]`
- `show tm sessionPolicy \[-hits\]`
- `show tm sessionPolicy \[-gotoPriorityExpression\]`
- `add tm samlSSOProfile \[-skewTime\]`
- `set tm samlSSOProfile \[-skewTime\]`
- `show tm samlSSOProfile \[-skewTime\]`
- `show tm global \[-gotoPriorityExpression\]`

Command group: Utility

Commands:

- `show callhome \[-proxyAuthService\]`
- `set callhome \[-proxyAuthService\]`

Command group: VPN

Commands:

- `add vpn vserver \[-authnProfile\]`
- `add vpn vserver \[-vserverFqdn\]`
- `set vpn vserver \[-authnProfile\]`

- `set vpn vserver \[-vserverFqdn\]`
- `show vpn vserver \[-authnProfile\]`
- `show vpn vserver \[-vserverFqdn\]`
- `add vpn samlSSOProfile \[-skewTime\]`
- `set vpn samlSSOProfile \[-skewTime\]`
- `show vpn samlSSOProfile \[-skewTime\]`
- `add vpn sessionAction \[-sfGatewayAuthType\]`
- `add vpn sessionAction \[-alwaysONProfileName\]`
- `set vpn sessionAction \[-sfGatewayAuthType\]`
- `set vpn sessionAction \[-alwaysONProfileName\]`
- `show vpn sessionAction \[-sfGatewayAuthType\]`
- `show vpn sessionAction \[-alwaysONProfileName\]`
- `set vpn parameter \[-alwaysONProfileName\]`
- `unset vpn parameter \[-alwaysONProfileName\]`
- `show vpn parameter \[-alwaysONProfileName\]`
- `add vpn alwaysONProfile \[-internetAccess\]`
- `add vpn alwaysONProfile \[-clientControl\]`
- `add vpn alwaysONProfile \[-locationBasedVPN\]`
- `set vpn alwaysONProfile \[-internetAccess\]`
- `set vpn alwaysONProfile \[-clientControl\]`
- `set vpn alwaysONProfile \[-locationBasedVPN\]`
- `show vpn alwaysONProfile \[-internetAccess\]`
- `show vpn alwaysONProfile \[-clientControl\]`
- `show vpn alwaysONProfile \[-locationBasedVPN\]`

Command group: Application firewall

Command:

- `show appfw fieldType \[-all\]`

Deprecated Commands

The following table lists the commands that are deprecated in version 11.1.

Command group: Network

Commands:

- `add vpath`
- `rm vpath`
- `show vpath`
- `stat vpath`
- `set vPathParam`
- `show vPathParam`

Deprecated Parameters

The following table lists the parameters that are deprecated in version 11.1.

Command group: VPB

Commands:

- `add vpn vserver \[-userDomains\]`
- `set vpn vserver \[-userDomains\]`

Deprecated features and functionalities

September 21, 2020

Some of the NetScaler functionalities are deprecated in 12.0 and in its subsequent releases. Citrix recommends that you do not use these features through the NetScaler command interface, NetScaler GUI, or Nitro automation. However, to ease the transition to new alternatives, the deprecated features are usable for a limited time and will be removed in future releases. Citrix recommends you to use the below alternatives for the following set of deprecated functionalities.

Deprecated features and Its alternatives in NetScaler 12.0

A list of NetScaler features and functionalities are deprecated. For complete information, You can refer to Deprecated List pdf.

Using NSPEPI conversion tool

You can use the nspepi tool to convert commands, expressions, and configurations. For more information, see Converting Expressions by Using NSPEPI Tool topic.
Here is a list of conversion from Classic expressions to Advanced expressions.

- ns_true -> true
- ns_false -> false
- REQ.HTTP -> HTTP.REQ
- RES.HTTP -> HTTP.RES

- HEADER “foo” -> HEADER(“foo”)
- CONTAINS ”bar” -> .CONTAINS(“bar”) [Note use of “.”.]
- REQ.IP -> CLIENT.IP
- RES.IP -> SERVER.IP
- SOURCEIP -> SRC
- DESTIP -> DST
- REQ.TCP -> CLIENT.TCP
- RES.TCP -> SERVER.TCP
- SOURCEPORT -> SRCPORT
- DESTPORT -> DSTPORT
- STATUSCODE -> STATUS
- REQ.SSL.CLIENT.CERT -> CLIENT.SSL.CLIENT_CERT

AppQoE Use Cases

When using AppQoE as an alternative for SureConnect feature, you can refer to the following use case configurations.

Use Case 1: To limit simultaneous download of huge files and display loading screen:

```
add appqoe action NS_RESP -respondWith NS -maxConn 50

add appqoe policy POL_DWN_PKG -rule “HTTP.REQ.URL.CONTAINS(\“tar.gz\”)” -action NS_RESP

bind lb vserver v1 -policyName POL_DWN_PKG -priority 8
<!--NeedCopy-->
```

Use Case 2: To limit simultaneous download of huge files and display loading screen with alternate content:

```
add appqoe action ACS_RESP -respondWith ACS -altContentsvcName s2 -altContentPath /netscaler/alt.html -maxConn 50

add appqoe policy POL_DWN_ACS -rule “HTTP.REQ.URL.CONTAINS(\“tar.gz\”)” -action ACS_RESP

bind lb vserver v1 -policyName POL_DWN_ACS -priority 9
<!--NeedCopy-->
```

Use Case 3: Custom loading screen:

```
import appqoCe customResp [http://<location>]|[local:<file>] simple_custom_resp
```

```

add appqoe action CUST_RESP -respondWith NS simple_custom_resp -maxConn 50

add appqoe policy POL_CRESP -rule “HTTP.REQ.URL.CONTAINS(\“tar.gz\”)” -action CUST_RESP

bind lb vserver v1 -policyName POL_CRESP -priority 10
<!--NeedCopy-->
```

AAA application traffic

September 21, 2020

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The AAA feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The AAA feature supports authentication, authorization, and auditing for all application traffic. To use AAA, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring AAA, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance.

How AAA works

September 21, 2020

AAA provides security for a distributed internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of AAA. Authentication enables the NetScaler appliance to verify the client's credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the ADC to verify which content on a protected server it should allow each user to access. Auditing enables the ADC to keep a record of each user's activity on a protected server.

To understand how AAA works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the ADC does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user's credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP.
- Verifies that the user is authorized to access specific intranet content before delivering the user's request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Authentication requires that several entities: the client, the
NetScaler appliance, the external authentication server if one is used, and the application server, respond to each other when prompted by performing a complex series of tasks in the correct order. If you are using an external authentication server, this process can be broken down into the following fifteen steps.

1. The client sends a GET request for a URL on the application server.
2. The NetScaler appliance's traffic management virtual server redirects the request to the application server.
3. The application server determines that the client has not been authenticated, and therefore sends an HTTP 200 OK response via the TM vserver to the client. The response contains a hidden script that causes the client to issue a POST request for /cgi/tm.
4. The client sends a POST request for /cgi/tm.
5. The NetScaler appliance's authentication virtual server redirects the request to the authentication server.
6. The authentication server creates an authentication session, sets and caches a cookie that consists of the initial URL and the domain of the traffic management virtual server, and then sends an HTTP 302 response via the authentication virtual server, redirecting the client to /vpn/index.html.
7. The client sends a GET request for /vpn/index.html.

8. The authentication virtual server redirects the client to the authentication server login page.
9. The client sends a GET request for the login page, enters credentials, and then sends a POST request with the credentials back to the login page.
10. The authentication virtual server redirects the POST request to the authentication server.
11. If the credentials are correct, the authentication server tells the authentication virtual server to log the client in and redirect the client to the URL that was in the initial GET request.
12. The authentication virtual server logs the client in and sends an HTTP 302 response that redirects the client to the initially requested URL.
13. The client sends a GET request for their initial URL.
14. The traffic management virtual server redirects the GET request to the application server.
15. The application server responds via the traffic management virtual server with the initial URL.

If you use local authentication, the process is similar, but the authentication virtual server handles all authentication tasks instead of forwarding connections to an external authentication server. The following figure illustrates the authentication process.

TM Vserver Traffic

When an authenticated client requests a resource, the ADC, before sending the request to the application server, checks the user and group policies associated with the client account, to verify that the client is authorized to access that resource. The ADC handles all authorization on protected application servers. You do not need to do any special configuration of your protected application servers.

AAA traffic management handles password changes for users by using the protocol-specific method for the authentication server. For most protocols, neither the user nor the administrator needs to do anything different than they would without AAA traffic management. Even when an LDAP authentication server is in use, and that server is part of a distributed network of LDAP servers with a single designated domain administration server, password changes are usually handled seamlessly. When an authenticated client of an LDAP server changes his or her password, the client sends a credential modify request to AAA traffic management, which forwards it to the LDAP server. If the user's LDAP server is also the domain administration server, that server responds appropriately and AAA traffic management then performs the requested password change. Otherwise, the LDAP server sends AAA traffic management an LDAP_REFERRAL response to the domain administration server. AAA traffic management follows the referral to the indicated domain administration server, authenticates to that server, and performs the password change on that server.

When configuring AAA traffic management with an LDAP authentication server, the system administrator must keep the following conditions and limitations in mind:

- AAA traffic management assumes that the domain administration server in the referral accepts the same bind credentials as the original server.
- AAA traffic management only follows LDAP referrals for password change operations. In other cases AAA traffic management refuses to follow the referral.
- AAA traffic management only follows one level of LDAP referrals. If the second LDAP server also returns a referral, AAA traffic management refuses to follow the second referral.

The ADC supports auditing of all states and status information, so you can see the details of what each user did while logged on, in chronological order. To provide this information, the appliance logs each event, as it occurs, either to a designated audit log file on the appliance or to a syslog server. Auditing requires configuring the appliance and any syslog server that you use.

Enabling AAA

September 21, 2020

To use the AAA - Application Traffic feature, you must enable it. You can configure AAA entities—such as the authentication and traffic management virtual servers—before you enable the AAA feature, but the entities will not function until the feature is enabled.

To enable AAA by using the command line interface

At the command prompt, type the following commands to enable AAA and verify the configuration:

- enable ns feature AAA

- show ns feature

  Example

- `enable feature AAA<!--NeedCopy-->`

  Done

- `show ns feature<!--NeedCopy-->`

```
Feature                  Acronym              Status
-------                  -------              ------
1)  Web Logging            WL                   OFF
2)  Surge Protection       SP                   ON
 .
 .
 .
15)  AAA                  AAA                   ON
 .
 .
 .
23)    HTML Injection     HTMLInjection         ON
24)    NetScaler Push       push                OFF   Done
```

To enable AAA by using the configuration utility

1. Navigate to **System > Settings**.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Authentication, Authorization and Auditing check box.
4. Click OK.

Setting up an authentication virtual server

December 16, 2020

All authentication requests are redirected by the traffic management virtual server (load balancing or content switching) to the authentication virtual sever. This virtual server processes the associated authentication policies and accordingly provides access to the application.

To set up an authentication virtual server by using the CLI

1. Enable the AAA feature.

ns-cli-prompt> **enable ns feature** AAA

2. Configure an authentication virtual server. It must be of type SSL and make sure to bind SSL certificate-key pair to the virtual server.

   ns-cli-prompt> **add authentication vserver <name> SSL <ipaddress> <port>**

   ns-cli-prompt> **bind ssl certkey <auth-vserver-name> <certkey>**

3. Specify the FQDN of the domain for the authentication virtual server.

   ns-cli-prompt> **set authentication vserver <name>** -**authenticationDomain** <FQDN>

4. Associate the authentication virtual server to the relevant traffic management virtual server.

> **Note:**
>
> The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

On the traffic management virtual server:

- Enable authentication.
- Specify the FQDN of the authentication virtual server as the authentication host of the traffic management virtual server.
- [Optional] Specify the authentication domain on the traffic management virtual server.

> **Note:**
>
> - If you do not configure the authentication domain, the appliance assigns an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is **tm.xyz.bar.com**, the appliance assigns **xyz.bar.com** as the authentication domain.
> - If you have to set a domain wide cookie for an authentication domain, you must enable authentication profile on a load balancing virtual server.

For load balancing:
ns-cli-prompt> **set lb vserver <name>** -**authentication** ON -**authenticationhost** <FQDN> [-**authenticationdomain** <authdomain>]

For content switching:
ns-cli-prompt> **set cs vserver <name> <protocol> <IPAddress> <port>**

1. Verify that both the virtual servers are UP and configure correctly.

   ns-cli-prompt> **show authentication vserver** <name>

To set up an authentication virtual server by using the GUI

1. Enable the AAA feature.

Navigate to **System > Settings**, click **Configure Basic features**, and enable **Authentication, Authorization and Auditing**.

2. Configure the authentication virtual server.

   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and configure as required (refer to the configurations provided in the CLI procedure provided above).

3. Configure the traffic management virtual server for authentication.

   For load balancing:

   Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and configure the virtual server as required (refer to the configurations provided in the CLI procedure provided above).

   For content switching:

   Navigate to **Traffic Management > Content Switching > Virtual Servers**, and configure the virtual server as required (refer to the configurations provided in the CLI procedure provided above).

4. Verify the authentication setup.

   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and check the details of the relevant authentication virtual server.

Configuring the authentication virtual server

September 21, 2020

To configure AAA, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections.
For additional information about configuring SSL and creating a certificate-key pair, see SSL certificates.

To configure an authentication virtual server by using the command line interface

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the order shown:

- `add authentication vserver <name> ssl <ipaddress><!--NeedCopy-->`
- `show authentication vserver <name><!--NeedCopy-->`
- `bind ssl certkey <certkeyName><!--NeedCopy-->`
- `show authentication vserver <name><!--NeedCopy-->`

- `set authentication vserver <name> -authenticationDomain <FQDN><!--NeedCopy-->`
- `show authentication vserver <name><!--NeedCopy-->`

Example

```
> add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443
 Done
> show authentication vserver Auth-Vserver-2
        Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
        State: DOWN[Certkey not bound]
        Client Idle Timeout: 180 sec
        Down state flush: DISABLED
        Disable Primary Vserver On Down : DISABLED
        Authentication : ON
        Current AAA Users: 0
 Done
> bind ssl certkey Auth-Vserver-2 Auth-Cert-1
 Done
> show authentication vserver Auth-Vserver-2
        Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
        State: UP
        Client Idle Timeout: 180 sec
        Down state flush: DISABLED
        Disable Primary Vserver On Down : DISABLED
        Authentication : ON
        Current AAA Users: 0
        Authentication Domain: myCompany.employee.com
 Done
> set authentication vserver Auth-Vserver-2 -AuthenticationDomain myCompany.employee.com
 Done
> show authentication vserver Auth-Vserver-2
        Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
        State: DOWN[Certkey not bound]
        Client Idle Timeout: 180 sec
        Down state flush: DISABLED
        Disable Primary Vserver On Down : DISABLED
        Authentication : ON
        Current AAA Users: 0
        Authentication Domain: myCompany.employee.com
 Done
<!--NeedCopy-->
```

To configure an authentication virtual server by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
2. In the details pane, do one of the following:
    - To create a new authentication virtual server, click **Add**.
    - To modify an existing authentication virtual server, select the virtual server, and then click **Edit**. The Configuration dialog opens with the Basic Settings area expanded.
3. Specify values for the parameters as follows (asterisk indicates a required parameter):
    - Name*—name (Cannot be changed for a previously created virtual server)
    - IP Address*—ipaddress
    - Domain*—authenticationDomain
    - Failed login timeout—failedLoginTimeout (Seconds allowed before login fails and user must start login process again.)
    - Max login attempts—maxLoginAttempts (Number of login attempts allowed before user is locked out)

    > Note: The authentication virtual server uses only the SSL protocol and port 443, so those options are greyed out. Any options that are not mentioned are not relevant and should be ignored.

4. Click **Continue** to display the Certificates area.
5. In the **Certificates** area, configure any SSL certificates you want to use with this virtual server.
    - To configure a CA certificate, click the arrow on the right of CA Certificate to display the CA Cert Key dialog box, select the certificate you want to bind to this virtual server, and click **Save**.
    - To configure a server certificate, click the arrow on the right of Server Certificate, and follow the same process as for CA certificate.
6. Click **Continue** to display the **Advanced Authentication Policies** area.
7. If you want to bind an advanced authentication policy to the virtual server, click the arrow on the right side of the line to display the **Authentication Policy** dialog box, choose the policy that you want to bind to the server, set the priority, and then click **OK**.
8. Click **Continue** to display the **Basic Authentication Policies** area.
9. If you want to create a basic authentication policy and bind it to the virtual server, click the plus sign to display the **Policies** dialog box, and follow the prompts to configure the policy and bind it to this virtual server.
10. Click **Continue** to display the 401-Based Virtual Servers area.

11. In the 401-Based Virtual Servers area, configure any load balancing or content switching virtual servers that you want to bind to this virtual server.
    - To bind a load balancing virtual server, click the arrow to the right of LB virtual server to display the LB Virtual Servers dialog box, and follow the prompts.
    - To bind a content switching virtual server, click the arrow to the right of CS virtual server to display the CS Virtual Servers dialog box, and follow the same process as to bind an LB virtual server.
12. If you want to create or configure a group, in the Groups area click the arrow to display the Groups dialog box, and follow the prompts.
13. Review your settings, and when you are finished, click **Done**. The dialog box closes. If you created a new authentication virtual server, it now appears in the **Configuration** window list.

Configuring a traffic management virtual server

September 21, 2020

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual sever with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the *Citrix Traffic Management Guide* at Traffic Management.

> Note
>
> The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for AAA by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server at this time. If you do not configure this option, the NetScaler appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is tm.xyz.bar.com, the appliance assigns xyz.bar.com. as the authentication domain.

To configure a TM virtual server for AAA by using the command line interface

At the command prompt, type one of the following sets of commands to configure a TM virtual server and verify the configuration:

- `set lb vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]<!--NeedCopy-->`
- `show lb vserver <name><!--NeedCopy-->`
- `set cs vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]<!--NeedCopy-->`
- `show cs vserver <name><!--NeedCopy-->`

  Example

```
> set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost
   mywiki.index.com
 Done
> show lb vserver vs-cont-sw
        vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS
        State: DOWN
        Last state change was at Wed Aug 19 10:03:15 2009 (+410 ms)
        Time since last state change: 5 days, 20:00:40.290
        Effective State: DOWN
        Client Idle Timeout: 9000 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Connection Failover: DISABLED
        Authentication: ON      Host: mywiki.index.com
 Done
<!--NeedCopy-->
```

To configure a TM virtual server for AAA by using the configuration utility

1. In the navigation pane, do one of the following.
    - Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
    - Navigate to **Traffic Management > Content Switching > Virtual Servers**
    - In the details pane, select the virtual server on which you want to enable authentication, and then click **Edit**.
    - In the Domain text box, type the authentication domain.
    - In the **Advanced** menu on the right, select **Authentication**.
    - Choose either **Form Based Authentication** or **401 Based Authentication**, and fill in the Authentication information.

  - For Form Based Authentication, enter the Authentication FQDN (the fully-qualified domain name of the authentication server), the Authentication VServer (the IP address of the authentication virtual server), and the Authentication Profile (the profile to use for authentication).
  - For 401 Based Authentication, enter the Authentication VServer and the Authentication Profile only.
- Click **OK**. A message appears in the status bar, stating that the vserver has been configured successfully.

Simplified login protocol support for AAA

The login protocol between AAA traffic management virtual servers and AAA virtual servers is simplified to use internal mechanisms as opposed to sending the encrypted data through query parameters. By leveraging this feature, the replay of requests is prevented.

Configuring DNS

September 21, 2020

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to the configure DNS address records, see Domain Name System.

Verifying your setup for AAA

September 21, 2020

After you configure authentication and traffic management virtual servers and before you create user accounts, you should verify that both virtual servers are configured correctly and are in the UP state.

To verify authentication virtual server setup by using the command line interface

At the command prompt, type the following command:

"‘show authentication vserver

```
> show authentication vserver Auth-Vserver-2
Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
State: UP
Client Idle Timeout: 180 sec
Down state flush: DISABLED
Disable Primary Vserver On Down : DISABLED
Authentication : ON
Current AAA Users: 0
Authentication Domain: myCompany.employee.com  Done
```

“‘

To verify your AAA virtual server setup by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
2. Review the information in the AAA Virtual Servers pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

Creating an authentication profile

September 21, 2020

When you want the same authentication settings to be used by multiple traffic management virtual servers, you can create an authentication profile which specifies the authentication virtual server, the authentication host, the authentication domain, and authentication level.

This authentication profile can be associated with the relevant traffic management virtual servers.

To configure an authentication profile by using the CLI

- Create the authentication profile and set the required parameters.

  For example, to create a profile with an authentication virtual server named “authVS”.

  ns-cli-prompt> **add authentication authnProfile** authProfile1 -authnVsName authVS -authenticationHost authnVS.example.com -authenticationDomain example.com -authenticationLevel

> **Note:**
>
> The authentication weight or level will depend on the virtual server to which the traffic will bound. A session that is created by authenticating against traffic management virtual

> server at given level cannot be used to access traffic management virtual server at a higher level.

- Bind the authentication profile to the relevant traffic management virtual servers.

  For example, to bind authProfile1 to a load balancing virtual server named "vserver1".

  ns-cli-prompt> **set lb vserver** vserver1 -authnProfile authProfile1

To configure an authentication profile by using the GUI

In the **Configuration** tab, navigate to **Security > AAA - Application Traffic > Authentication Profile**, and configure the authentication profile as required.

Configuring users and groups

September 21, 2020

After configuring the AAA basic setup, you create users and groups. You first create a user account for each person who will authenticate via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the NetScaler appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create on the NetScaler appliance. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the NetScaler appliance if, for example, you want to allow temporary users (such as visitors) to log in but do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts.

Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

To create a local AAA user account by using the command line interface

At the command prompt, type the following commands to create a local AAA user account and verify the configuration:

- `add aaa user <username> [-password <password>]<!--NeedCopy-->`

- `show aaa user<!--NeedCopy-->`

  Example

```
> add aaa user user-2 -password emptybag
 Done
> show aaa user
1) UserName: user-1
2) UserName: user-2
 Done
<!--NeedCopy-->
```

To change the password for an existing AAA local user account by using the command line interface

At the command prompt, type the following command and, when prompted, type the new password:

```
set aaa user <username>
```

Example

```
> set aaa user user-2
Enter password:
Done
<!--NeedCopy-->
```

To configure AAA local users by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Users**
2. In the details pane, do one of the following:
   - To create a new user account, click **Add**.
   - To modify an existing user account, select the user account, and then click **Open**.
3. In the **Create AAA User** dialog box, in the **User Name** text box, type a name for the user.
4. If creating a locally authenticated user account, clear the **External Authentication** check box and provide a local password that the user will use to log on
5. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the user has been configured successfully.

To create AAA local groups and add users to them by using the command line interface

At the command prompt, type the following commands. Type the first command one time, and type the second command once for each user:

- `add aaa group <groupname><!--NeedCopy-->`
- “‘show aaa group

  ```
  **Example**
  ```

  > add aaa group group-2
  > Done
  > show aaa group
  > 1) GroupName: group-1
  > 2) GroupName: group-2
  > Done
  > “‘

- “‘bind aaa group -username

  ```
  **Example**
  ```

  > bind aaa group group-2 -username user-2
  > Done
  > show aaa group group-2
  > GroupName: group-2

  ```
              UserName: user-2    Done  <!--NeedCopy--> ```
  ```

To remove users from an AAA group by using the command line interface

At the command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:

- “‘unbind aaa group -username

  ```
  **Example**
  ```

  unbind aaa group group-hr -username user-hr-1
  Done
  “‘

To remove an AAA group by using the command line interface

First remove all users from the group. Then, at the command prompt, type the following command to remove an AAA group and verify the configuration:

- `rm aaa group <groupname><!--NeedCopy-->`

- “‘show aaa group

  ```
  **Example**
  ```

  ```
  rm aaa group group-hr
  Done
  show aaa group
  1) GroupName: group-1
  2) GroupName: group-finance
  Done
  ```

  “‘

To configure AAA local groups and add users to them by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Groups**
2. In the details pane, do one of the following:
   - To create a new group, click **Add**.
   - To modify an existing group, select the group, and then click **Edit**.
3. If you are creating a new group, in the **Create AAA Group** dialog box, in the **Group Name** text box, type a name for the group.
4. In the **Advanced** area to the right, click **AAA Users**.
   - To add a user to the group, select the user, and then click **Add**.
   - To remove a user from the group, select the user, and then click **Remove**.
   - To create a new user account and add it to the group, click the **Plus** icon, and then follow the instructions in “To configure AAA local users by using the configuration utility.”
5. Click **Create** or **OK**. The group that you created appears in the **AAA Groups** page.

Configuring AAA policies

September 21, 2020

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail AAA will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler appliance operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The AAA feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler appliance, see the *Citrix Traffic Management Guide* at Traffic Management.

Authentication policies

September 21, 2020

The NetScaler appliance can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

- **LOCAL**

  Authenticates to the NetScaler appliance by using a password, without reference to an external authentication server. User data is stored locally on the NetScaler appliance.

- **RADIUS**

  Authenticate to an external Radius server.

- **LDAP**

  Authenticates to an external LDAP authentication server.

- **TACACS**

  Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

After a user authenticates to a TACACS server, the NetScaler appliance connects to the same TACACS server for all subsequent authorizations. When a primary TACACS server is unavailable, this feature prevents delays while the ADC waits for the first TACACS server to time out before resending the authorization request to the second TACACS server.

> Note
>
> When authenticating through a TACACS server, AAA traffic management logs only successfully executed TACACS commands, to prevent the logs from showing TACACS commands that were entered by users who were not authorized to execute them.

Starting from NetScaler 12.0 Build 57.x, the Terminal Access Controller Access-Control System (TACACS) is not blocking the AAA daemon while sending the TACACS request. The AAA daemon allows LDAP, and RADIUS authentication to proceed with the request. The TACACS authentication request resumes once TACACS server acknowledges the TACACS request.

- **CERT**

  Authenticates to the NetScaler appliance by using a client certificate, without reference to an external authentication server.

- **NEGOTIATE**

  Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, NetScaler appliance uses NTLM authentication.

- **SAML**

  Authenticates to a server that supports the Security Assertion Markup Language (SAML).

- **SAML IDP**

  Configures the NetScaler appliance to serve as a Security Assertion Markup Language (SAML) Identity Provider (IdP).

- **WEB**

  Authenticates to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful.

An authentication policy is comprised of an expression and an action. Authentication policies use NetScaler appliance expressions.

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies intended to handle authentication for any user accounts that do not meet the more specific criteria.

To add an authentication action by using the command line interface

If you do not use LOCAL authentication, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

"'add authentication tacacsAction -serverip [-serverPort][-authTimeout][…]

```
Example
```

> add authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812 -authtimeout 15 -tacacsSecret "minotaur" -authorization OFF -accounting ON -auditFailedCmds OFF -defaultAuthenticationGroup "users"
> Done

~~~
## To configure an authentication action by using the command line
    interface

To configure an existing authentication action, at the command prompt,
    type the following command:

```set authentication tacacsAction <name> -serverip <IP> [-serverPort <
    port>][-authTimeout <positive_integer>][ ... ]<!--NeedCopy-->
~~~

Example

```
> set authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -
    serverport 1812                    -authtimeout 15 -tacacsSecret "
    minotaur" -authorization OFF -accounting ON -auditFailedCmds OFF -
    defaultAuthenticationGroup "users"
Done

<!--NeedCopy-->
```

To remove an authentication action by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

"'rm authentication radiusAction

```
Example
```

> rm authentication tacacsaction Authn-Act-1
> Done

````
## To configure an authentication server by using the configuration utility

> Note
>
> In the configuration utility, the term server is used instead of action, but refers to the same task.

1.  Navigate to **Security > AAA - Application Traffic > Policies > Authentication**.
1.  In the details pane, on the **Servers** tab, do one of the following:
    -  To create a new authentication server, click **Add**.
    -  To modify an existing authentication server, select the server, and then click **Open**.
1.  In the **Create Authentication Server** or **Configure Authentication Server** dialog box, type or select values for the parameters.
    -  Name\* — radiusActionName (Cannot be changed for a previously configured action)
    -  Authentication Type\* — authtype (Set to RADIUS, cannot be changed)
    -  IP Address\* — serverip </IP>
    -  IPV6\* — Select the checkbox if the server IP is an IPv6 IP. (No command line equivalent.)
    -  Port\* — serverPort
    -  Time-out (seconds)\* — authTimeout
1.  Click **Create** or **OK**, and then click **Close**. The policy that you created appears in the **Authentication Policies** and **Servers** page.

## To create and bind an authentication policy by using the command line interface

At the command prompt, type the following commands in the order shown to create and bind an authentication policy and verify the configuration:

- ```add authentication negotiatePolicy <name> <rule> <reqAction><!--NeedCopy-->
````

- “‘show authentication localPolicy
- “‘bind authentication vserver -policy [-priority][-secondary]]

- `show authentication vserver <name><!--NeedCopy-->`

Example

```
  > add authentication localPolicy Authn-Pol-1 ns_true   Done
  > show authentication localPolicy
  1)      Name: Authn-Pol-1       Rule: ns_true          Request action
      : LOCAL    Done
  > bind authentication vserver Auth-Vserver-2 -policy Authn-Pol-1
  Done
  > show authentication vserver Auth-Vserver-2          Auth-Vserver-2
      (10.102.29.77:443) - SSL Type: CONTENT State: UP Client Idle
      Timeout: 180 sec Down state flush: DISABLED          Disable
      Primary Vserver On Down : DISABLED         Authentication : ON
               Current AAA Users: 0          Authentication Domain:
      myCompany.employee.com
  1)  Primary authentication policy name: Authn-Pol-1 Priority: 0
  Done

<!--NeedCopy-->
```

To modify an existing authentication policy by using the command line interface

At the command prompt, type the following commands to modify an existing authentication policy:

"'set authentication localPolicy [-reqaction]

```
Example
```

> set authentication localPolicy Authn-Pol-1 'ns_true' Done
> "'

To remove an authentication policy by using the command line interface

At the command prompt, type the following command to remove an authentication policy:

"'rm authentication localPolicy

```
Example
```

> rm authentication localPolicy Authn-Pol-1
>
> Done

"'

To configure and bind authentication policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication**, and then select the type of policy that you want to create.
2. In the details pane, on the **Policies** tab, do one of the following:
    - To create a new policy, click **Add**.
    - To modify an existing policy, select the action, and then click **Edit**.
3. In the Create Authentication Policy or Configure Authentication Policy dialog, type or select values for the parameters.
    - Name*—policyname (Cannot be changed for a previously configured action)
    - Authentication Type*—authtype
    - Server*—authVsName
    - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click **Create** or **OK**. The policy that you created appears in the Policies page.
5. Click the **Servers** tab, and in the details pane do one of the following:
    - To use an existing server, select it, and then click .
    - To create a new server, click Add, and follow the instructions.
6. If you want to designate this policy as a secondary authentication policy, on the Authentication tab, click Secondary. If you want to designate this policy as a primary authentication policy, skip this step.
7. Click **Insert Policy**.
8. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
9. In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
10. Click **OK**. A message appears in the status bar, stating that the policy has been configured successfully.

LDAP authentication policies

September 21, 2020

As with other types of authentication policies, a Lightweight Directory Access Protocol (LDAP) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. In addition to standard authentication functions, LDAP can search other active directory (AD) servers for user accounts for users that do not exist locally. This function is called referral support or referral chasing.

Normally you configure the NetScaler appliance to use the IP address of the authentication server during authentication. With LDAP authentication servers, you can also configure the ADC to use the FQDN of the LDAP server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you use the **serverName** parameter instead of the **serverIP** parameter, and substitute the server's FQDN for its IP address.

Before you decide whether to configure the ADC to use the IP or the FQDN of your LDAP server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

LDAP referral support is disabled by default and cannot be enabled globally. It must be explicitly enabled for each LDAP action. You must also make sure that the AD server accepts the same binddn credentials that are used with the referring (GC) server. To enable referral support, you configure an LDAP action to follow referrals, and specify the maximum number of referrals to follow.

If referral support is enabled, and the NetScaler appliance receives an LDAP_REFERRAL response to a request, AAA follows the referral to the active directory (AD) server contained in the referral and performs the update on that server. First, AAA looks up the referral server in DNS, and connects to that server. If the referral policy requires SSL/TLS, it connects via SSL/TLS. It then binds to the new server with the binddn credentials that it used with the previous server, and performs the operation which generated the referral. This feature is transparent to the user.

> Note
>
> These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

For more information about setting up authentication policies in general, see Authentication Policies. For more information about NetScaler appliance expressions, which are used in the policy rule, see Policies and Expressions.

To enable LDAP referral support by using the command line interface

At the command prompt, type the following commands:

- `set authentication ldapAction <name> -followReferrals ON<!--NeedCopy-->`
- `set authentication ldapAction <name> -maxLDAPReferrals <integer><!--NeedCopy-->`

Example

```
> set authentication ldapAction ldapAction-1 -followReferrals ON
> set authentication ldapAction ldapAction-1 -maxLDAPReferrals 2
<!--NeedCopy-->
```

To enable LDAP referral support by using the configuration utility

> Note
>
> In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > LDAP**.
2. In the details pane, on the **Servers** tab, select the LDAP server that you want to configure, and then click **Edit**.
3. In the **Configure Authentication Server** dialog, scroll down to the **Referrals** check box, and select it.
4. In the **Maximum Referral Level** text box, type the maximum number of referrals to allow.
5. Click **OK**, and then click **Close**.

Negotiate authentication policies

September 21, 2020

As with other types of authentication policies, a Negotiate authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

In addition to standard authentication functions, the Negotiate Action command can now extract user information from a keytab file instead of requiring you to enter that information manually. If a keytab has more than one SPN, AAA selects the correct SPN. You can configure this feature at the command line, or by using the configuration utility.

Note: These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

To configure AAA to extract user information from a keytab file by using the command line interface

At the command prompt, type the appropriate command:

- `add authentication negotiateAction <name> [-keytab <string>]<!--NeedCopy -->`
- `set authentication negotiateAction <name> [-keytab <string>]<!--NeedCopy -->`

Example

```
> set authentication negotiateAction negotiateAction-1 -keytab keytab-1

<!--NeedCopy-->
```

To configure AAA to extract user information from a keytab file by using the configuration utility

> Note
>
> In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > Negotiate**.
2. In the details pane, on the **Servers** tab, do one of the following:
    - If you want to create a new **Negotiate** action, click **Add**.
    - If you want to modify an existing **Negotiate** action, in the data pane select the action, and then click **Edit**.
3. If you are creating a new **Negotiate** action, in the **Name** text box, type a name for your new action. The name can be from one to 127 characters in length and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing Negotiate action, skip this step. The name is read-only; you cannot change it.
4. Under **Negotiate**, if the Use Keytab file check box is not already checked, check it.
5. In the Keytab file path text box, type the full path and filename of the keytab file that you want to use.
6. In the Default authentication group text box, type the authentication group that you want to set as default for this user.
7. Click **Create** or **OK** to save your changes.

RADIUS authentication policies

October 5, 2020

As with other types of authentication policies, a Remote Authentication Dial In User Service (RADIUS) authentication policy comprises of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. However, setting up a RADIUS authentication policy has certain special requirements that are described in the following section.

Normally you configure the NetScaler appliance to use the IP address of the authentication server during authentication. With RADIUS authentication servers, you can now configure the ADC to use the FQDN of the RADIUS server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you substitute the **serverName** parameter for the **serverIP** parameter.

Before you decide whether to configure the NetScaler appliance to use the IP or the FQDN of your RADIUS server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

> **Note**
>
> These instructions assume that you are already familiar with the RADIUS protocol and have already configured your chosen RADIUS authentication server.

For more information about setting up authentication policies in general, see Authentication Policies. For more information about NetScaler appliance expressions, which are used in the policy rule, see Policies and Expressions.

To add an authentication action for a RADIUS server by using the command line interface

If you authenticate to a RADIUS server, you need to add an explicit authentication action. At the command prompt, type the following command:

"'add authentication radiusAction [-serverip | -serverName]][-serverPort] [-authTimeout] {-radKey } [-radNASip (ENABLED | DISABLED)][-radNASid] [-radVendorID][-radAttributeType][-radGroupsPrefix] [-radGroupSeparator][-passEncoding][-ipVendorID] [-ipAttributeType][-accounting (ON | OFF)][-pwdVendorID [-pwdAttributeType]] [-defaultAuthenticationGroup] [-callingstationid (ENABLED | DISABLED)]

```
The following example adds a RADIUS authentication action named **Authn
    -Act-1**, with the server IP **10.218.24.65**, the server port
    **1812**, the authentication timeout **15** minutes, the RADIUS key
    **WareTheLorax**, NAS IP disabled, and NAS ID **NAS1**.
```

> add authentication radiusaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
> Done

```
The following example adds the same RADIUS authentication action, but
    using the server FQDN **rad01.example.com** instead of the IP.
```

> add authentication radiusaction Authn-Act-1 -serverName rad01.example.com -serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
> Done

```
RADIUS authentication might fail if both authentication and accounting
    actions are configured on the same server port in “radiusAction”
    command.

To overcome the preceding conditions, Citrix recommends you to use
    different commands for RADIUS authentication and accounting.

-  For RADIUS authentication, configure the **authservRetry** parameter
     with default value 3.

    -  ```set authentication radiusAction Authn-Act-1 -serverip
       10.218.24.65 - serverport 1812 -authservRetry 3<!--NeedCopy-->
```

- For RADIUS accounting, configure the **authservRetry** parameter with the value 1.
  - `set authentication radiusAction Authn-Act-1 -serverip 10.218.24.65 -serverport 1813 -authservRetry 1<!--NeedCopy-->`

To configure an authentication action for an external RADIUS server by using the command line

To configure an existing RADIUS action, at the command prompt, type the following command:

“‘set authentication radiusAction [-serverip | -serverName]][-serverPort] [-authTimeout] {-radKey } [-radNASip (ENABLED | DISABLED)][-radNASid] [-radVendorID][-radAttributeType][-radGroupsPrefix] [-radGroupSeparator][-passEncoding][-ipVendorID] [-ipAttributeType][-accounting (ON | OFF)][-pwdVendorID [-pwdAttributeType]] [-defaultAuthenticationGroup] [-callingstationid (ENABLED | DISABLED)]

```
## To remove an authentication action for an external RADIUS server by
    using the command line interface

To remove an existing RADIUS action, at the command prompt, type the
    following command:
```

```rm authentication radiusAction <name><!--NeedCopy-->
```

Example

```
> rm authentication radiusaction Authn-Act-1
Done

<!--NeedCopy-->
```

To configure a RADIUS server by using the configuration utility

> Note
>
> In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Radius**
2. In the details pane, on the **Servers** tab, do one of the following:
    - To create a new RADIUS server, click **Add**.
    - To modify an existing RADIUS server, select the server, and then click **Edit**.
3. In the **Create Authentication RADIUS Server** or **Configure Authentication RADIUS Server** dialog, type or select the values for the parameters. To fill out parameters that appear beneath Send Calling Station ID, expand Details.
    - Name*—radiusActionName (Cannot be changed for a previously configured action)
    - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
    - Server Name / IP Address*—Choose either Server Name or Server IP
        - Server Name*—serverName <FQDN>
        - IP Address*—serverIp <IP> If the server is assigned an IPv6 IP address, select the IPv6 check box.
    - Port*—serverPort
    - Time-out (seconds)*—authTimeout
    - Secret Key*—radKey (RADIUS shared secret.)
    - Confirm Secret Key*—Type the RADIUS shared secret a second time. (No command line equivalent.)
    - Send Calling Station ID—callingstationid
    - Group Vendor Identifier—radVendorID
    - Group Attribute Type—radAttributeType
    - IP Address Vendor Identifier—ipVendorID
    - pwdVendorID—pwdVendorID
    - Password Encoding—passEncoding
    - Default Authentication Group—defaultAuthenticationGroup
    - NAS ID—radNASid

  - Enable NAS IP address extraction—radNASip
  - Group Prefix—radGroupsPrefix
  - Group Separator—radGroupSeparator
  - IP Address Attribute Type—ipAttributeType
  - Password Attribute Type—pwdAttributeType
  - Accounting—accounting

4. Click **Create** or **OK**. The policy that you created appears in the Servers page.

SAML authentication policies

September 21, 2020

For information on NetScaler appliance as a SAML SP and IdP, see SAML Authentication.

Web authentication policies

September 21, 2020

AAA is now able to authenticate a user to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful. As with other types of authentication policies, a Web authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

To set up web-based authentication with a specific web server, first you create a web authentication action. Since authentication to web servers does not use a rigid format, you must specify exactly which information the web server requires and in which format when creating the action. To do this, you create an expression in NetScaler appliance default syntax that contains the following items:

- **Server IP**—The IP address of the authentication Web server.
- **Server Port**—The port of the authentication Web server.
- **Authentication Rule**—An expression in NetScaler appliance default syntax that contains the user's credentials in the format that the Web server expects.
- **Scheme**—HTTP (for unencrypted web authentication) or HTTPS (for encrypted web authentication).
- **Success Rule**—An expression in NetScaler appliance default syntax that matches the web server response string that signifies that the user authenticated successfully.

For all other parameters, follow the normal rules for the add authentication action command.

Next you create a policy associated with that action. The policy is similar to an LDAP policy, and like LDAP policies uses NetScaler appliance syntax.

> Note
>
> These instructions assume that you are already familiar with the authentication requirements of the web server(s) to which you want to authenticate, and have already configured the web authentication server.

To configure a Web authentication action by using the command line interface

To create a web authentication action at the command line, at the command line type the following command:

“‘add authentication webAuthAction -serverIP <ip_addr|ipv6_addr|*> -serverPort <port|*> [-fullReqExpr] -scheme (http | https) -successRule [-defaultAuthenticationGroup][-Attribute1][-Attribute2] [-Attribute3][-Attribute4] [-Attribute5][-Attribute6] [-Attribute7][-Attribute8] [-Attribute9][-Attribute10] [-Attribute11][-Attribute12] [-Attribute13][-Attribute14] [-Attribute15][-Attribute16]

```
Example
```

> add authentication webAuthAction webauth1 -serverIP 10.214.56.31 -serverPort 80 -

“‘

To configure a Web authentication action by using the configuration utility

> **Note**
>
> In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > LDAP**.
2. In the details pane, on the **Servers** tab, do one of the following:
    - If you want to create a new web authentication action, click **Add**.
    - If you want to modify an existing web authentication action, in the data pane select the action, and then click **Edit**.
3. If you are creating a new web authentication action, in the **Create Authentication Web** server dialog box, **Name** text box, type a name for the new web authentication action. The name can be from one to 127 characters in length, and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing web authentication action, skip this step. The name is read-only; you cannot change it.
4. In the **Web Server IP Address** text box, type the IPv4 or IPv6 IP address of the authentication web server. If the address is an IPv6 IP address, select the IPv6 check box first.

5. In the Port text box, type the port number on which the web server accepts connections.
6. Select **HTTP** or **HTTPS** in the **Protocol** drop-down list.
7. In the HTTP Request Expression text area, type a PCRE-format regular expression that creates the web server request that contains the user's credentials in the exact format expected by the authentication web server.
8. In the Expression to validate the Authentication text area, type a NetScaler appliance default syntax expression that describes the information in the web server response that indicates that user authentication was successful.
9. Fill out the remaining fields as described in the general authentication action documentation.
10. Click **OK**.

Configuring advanced authentication policies

September 21, 2020

If you know exactly how you want an authentication policy to be configured, you can use the advanced authentication policy dialog to create the policy quickly.

To configure an advanced authentication policy by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies**, and then select Policy.
2. In the details pane do one of the following:
    - To create a new policy, click **Add**.
    - To modify an existing policy, select the policy, and then click **Edit**.
3. In the **Create Authentication Policy** or **Configure Authentication Policy** dialog box, type or select values for the parameters.
    - Name*—The policy name. Cannot be changed for a previously configured policy.
    - Action Type*—The policy type: Cert, Negotiate, LDAP, RADIUS, SAML, SAMLIDP, TACACS, or WEBAUTH.
    - Action*—The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create a new action of the proper type.
    - Log Action—The audit action to associate with the policy. You can choose an existing audit action, or click the plus and create a new action.
    - Expression*—The rule that selects connections to which you want to apply the action that you specified. The rule can be simple ("true" selects all traffic) or complex. You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression

    text area, or by clicking Add to open Add Expression dialog box and using the drop-down lists in it to construct your expression.)
    - Comment—You can type a comment that describes the type of traffic that this authentication policy will apply to. Optional.
4. Click **Create** or **OK**, and then click **Close**. If you created a policy, that policy appears in the Authentication Policies and Servers page.

Authorizing user access to application resources

September 21, 2020

You can control the resources that an authenticated user can access within an application.

To do this, associate an authorization policy to each of the users, either individually or by associating the policy to a group of users. The authorization policy must specify the following:

- **Rule.** The resource to which access must be authorized. This can be specified by using basic or advanced expressions.
- **Action.** Whether access to the resource must be allowed or denied.

By default, access to all resources within an application is **DENIED** to all users. However, you can change this default authorization action to **ALLOW** access to all users (by setting the session parameters in session profile or by setting the global session parameters).

> **Warning**
>
> For optimum security, Citrix recommends that you do not to change the default authorization action from DENY to ALLOW. Instead, it is advised to create specific authorization policies for users who need access to specific resources.

To configure authorization by using the CLI

1. Configure the authorization policy.

   ns-cli-prompt> **add authorization policy <name> <rule> <action>**

2. Associate the policy with the appropriate user or group.

    - Bind the policy to a specific user.
      ns-cli-prompt> **bind aaa user <username>** -**policy** <policyname>

    - Bind the policy to a specific group.
      ns-cli-prompt> **bind aaa group <groupName> -policy** <policyname>

To configure authorization by using the GUI (Configuration tab)

1. Create the authorization policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authorization**, click **Add** and then define the policy as required.

2. Associate the policy with the appropriate user or group.

   Navigate to **Security > AAA - Application Traffic > Users** or **Groups**, and edit the relevant user or group to associate it with the authorization policy.

Sample authorization configurations

Here are some example configurations to authorize user access to some application resources. Note that these are CLI commands. You can do similar configurations using the GUI, although you must not enclose the expression within quotes (").

- `add authorization policy authzpol1 "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")" ALLOW<!--NeedCopy-->`
- `bind aaa user user1 -policy authzpol1<!--NeedCopy-->`
- `add authorization policy authzpol2 "HTTP.REQ.URL.SUFFIX.EQ(\"png\")" DENY<!--NeedCopy-->`
- `bind aaa group group1 -policy authzpol2<!--NeedCopy-->`

Auditing authenticated sessions

September 21, 2020

You can configure the NetScaler appliance to keep a log of all the events that are triggered in an authenticated session. Using this information, you can audit state and status information, to see the history for users in chronological order.

To do this, define an audit policy that specifies the following:

- **Log type.** The logs can be stored remotely (syslog) or locally on the NetScaler appliance (nslog).
- **Rule.** The conditions on which the logs are stored.
- **Action.** Details of the log server and other details for creating the log entries.

This audit policy can be configured at different levels: user-level, group-level, AAA virtual server, and global system level. The policies configured at the user-level have the highest priority.

> **Note**
>
> This topic details steps for using syslog. Make necessary changes to use nslog.

To configure syslog auditing by using the CLI

1. Configure the audit server with the relevant log settings.

   ns-cli-prompt> **add audit syslogAction <name> <serverIP> …**

2. Configure the audit policy by associating the audit server.

   ns-cli-prompt> **add audit syslogPolicy <name> <rule> <action>**

3. Associate the audit policy with one of the following entities:

   - Bind the policy to a specific user.

     ns-cli-prompt> **bind aaa user <userName>**-**policy** <policyname> …

   - Bind the policy to a specific group.

     ns-cli-prompt> **bind aaa group <groupName>**-**policy** <policyname> …

   - Bind the policy to a AAA virtual server.

     ns-cli-prompt> **bind authentication vserver <name>** -**policy** <policyname> …

   - Bind the policy globally to the NetScaler appliance.

     ns-cli-prompt> **bind tm global** -**policyName** <policyname> …

To configure syslog auditing by using the GUI (Configuration tab)

1. Configure the audit server and policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Auditing > Syslog**, and configure the server and the policy in the relevant tabs.

2. Associate the policy with one of the following:

   - Bind the policy to a specific user.

     Navigate to **Security > AAA - Application Traffic > Users**, and associate the authorization policy with the relevant user.

   - Bind the policy to a specific group.

     Navigate to **Security > AAA - Application Traffic > Groups**, and associate the authorization policy with the relevant group.

- Bind the policy to a AAA virtual server.

  Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the authorization policy with the relevant virtual server.

- Bind the policy globally to the NetScaler appliance.

  Navigate to **Security > AAA - Application Traffic > Policies > Auditing > Syslog** or **Nslog**, select the authorization policy, and click **Action > Global Bindings** to bind the policy globally.

Session settings

September 21, 2020

After you configure your AAA profiles, you configure session settings to customize your user sessions. The session settings are:

- **The session timeout.**

  Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

- **The default authorization setting.**

  Determines whether the
  NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

- **The single sign-on setting.**

  Determines whether the
  NetScaler appliance will log users onto all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

- **The credential index setting.**

  Determines whether the
  NetScaler appliance will use primary or the secondary authentication credentials for single signon.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.

Session profiles

September 21, 2020

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

> **Note**
>
> The terms "session profile" and "session action" mean the same thing.

To create a session profile by using the command line interface

At the command prompt, type the following commands to create a session profile and verify the configuration:

- `add tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>][-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]<!--NeedCopy-->`
- `show tm sessionAction <name><!--NeedCopy-->`

Example

```
> add tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
 Done
> show tm sessionAction session-profile
1)      Name: session-profile
        Authorization action : ALLOW
        Session timeout: 30 minutes
 Done
<!--NeedCopy-->
```

To modify a session profile by using the command line interface

At the command prompt, type the following commands to modify a session profile and verify the configuration:

- `set tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>][-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]<!--NeedCopy-->`
- `show tm sessionAction<!--NeedCopy-->`

Example

```
> set tm sessionAction session-profile -sessTimeout 30 -
   defaultAuthorization ALLOW
 Done
> show tm sessionAction session-profile
1)      Name: session-profile
        Authorization action : ALLOW
        Session timeout: 30 minutes
 Done
<!--NeedCopy-->
```

To remove a session profile by using the command line interface

At the command prompt, type the following command to remove a session profile:

`rm tm sessionAction <name><!--NeedCopy-->`

To configure session profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Session.**
2. Navigate to **Security > AAA - Application Traffic > Policies > Session.**
3. In the details pane, click the **Profiles** tab.
4. On the **Profiles** tab, do one of the following:
   - To create a new session profile, click **Add.**
   - To modify an existing session profile, select the profile, and then click **Edit.**
5. In the Create TM Session Profile or Configure TM Session Profile dialog, type or select values for the parameters.
   - Name*—actionname (Cannot be changed for a previously configured session action.)
   - Session Time-out—sesstimeout
   - Single Signon to Web Applications—sso

   - Default Authorization Action—defaultAuthorizationAction
   - Credential Index—ssocredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity—persistentCookieValidity

6. Click **Create** or **OK**. The session profile that you created appears in the Session Policies and Profiles pane.

Session policies

September 21, 2020

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

To create a session policy by using the command line interface

At the command prompt, type the following commands to create a session policy and verify the configuration:

```
-  add tm sessionPolicy <name> <rule> <action>
-  show tm sessionPolicy <name>
<!--NeedCopy-->
```

Example

```
> add tm sessionPolicy session-pol "URL == /*.png" session-profile
Done
> show tm sessionPolicy session-pol
1)      Name: session-pol       Rule: URL == '/*.png'
        Action: session-profile
 Done
<!--NeedCopy-->
```

To modify a session policy by using the command line interface

At the command prompt, type the following commands to modify a session policy and verify the configuration:

```
-  set tm sessionPolicy <name> [-rule <expression>] [-action <action>]
-  show tm sessionPolicy <name>
<!--NeedCopy-->
```

Example

```
> set tm sessionPolicy session-pol "URL == /*.png" session-profile
 Done
> show tm sessionPolicy session-pol
1)      Name: session-pol       Rule: URL == '/*.png'
        Action: session-profile
 Done
<!--NeedCopy-->
```

To globally bind a session policy by using the command line interface

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:

"'bind tm global -policyName [-priority]

```
Example
```

> bind tm global -policyName session-pol
> Done

> show tm sessionPolicy session-pol
> 1) Name: session-pol Rule: URL == '/*.png'
> Action: session-profile
> Policy is bound to following entities
> 1) TM GLOBAL PRIORITY : 0
> Done

~~~
## To bind a session policy to an authentication virtual server by
   using the command line interface

At the command prompt, type the following command to bind a session
   policy to an authentication virtual and verify the configuration:

```bind authentication vserver <name> -policy <policyname> [-priority <
   priority>]<!--NeedCopy-->
~~~

Example

```
> bind authentication vserver auth-vserver-1 -policyName Session-Pol-1
    -priority 1000
Done
<!--NeedCopy-->
```

To unbind a session policy from an authentication virtual server by using the command line interface

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:

"'unbind authentication vserver -policy

```
Example
```

> unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1
> Done

~~~
## To unbind a globally bound session policy by using the command line
    interface

At the command prompt, type the following commands to unbind a globally
    -bound session policy:

```unbind tm global -policyName <policyname><!--NeedCopy-->
~~~

Example

```
> unbind tm global -policyName Session-Pol-1
Done
<!--NeedCopy-->
```

To remove a session policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:

"'rm tm sessionPolicy

```
Example
```

```
rm tm sessionPolicy Session-Pol-1
Done
```

“‘

To configure and bind session policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Session**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Session**.
3. In the details pane, on the **Policies** tab, do one of the following:
   - To create a new session policy, click **Add**.
   - To modify an existing session policy, select the policy, and then click **Edit**.
4. In the **Create Session Policy** or **Configure Session Policy** dialog, type or select values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured session policy.)
   - Request Profile*—actionname
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking **Add** to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.
6. To globally bind a session policy, in the details pane, select **Global Bindings** from the **Action** drop-down list, and fill in the dialog.
   - Select the name of the session policy you want to globally bind.
   - Click **OK**.
7. To bind a session policy to an authentication virtual server, in the navigation pane, click **Virtual Servers**, and add that policy to the policies list.
   - In the details pane, select the virtual server, and then click **Edit**.
   - In the **Advanced Selections** to the right of the detail area, click **Policies**.
   - Select a policy, or click the **plus** icon to add a policy.
   - In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   - Click **OK**.
     A message appears in the status bar, stating that the policy has been configured successfully.

Global session settings

September 21, 2020

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

To configure the session settings by using the command line interface

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

“‘set tm sessionParameter [-sessTimeout][-defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-ssoCredential (PRIMARY | SECONDARY)][-ssoDomain][-httpOnlyCookie (YES | NO)][-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity]

```
Example
```

> set tm sessionParameter -sessTimeout 30
> Done
> set tm sessionParameter -defaultAuthorizationAction DENY
> Done
> set tm sessionParameter -SSO ON
> Done
> set tm sessionParameter -ssoCredential PRIMARY
> Done

“‘

To configure the session settings by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic**
2. In the details pane, under **Settings**, click Change global settings.
3. In the **Global Session Settings** dialog, type or select values for the parameters.
    - Session Time-out—sessTimeout
    - Default Authorization Action—defaultAuthorizationAction
    - Single Sign-on to Web Applications—sso
    - Credential Index—ssoCredential
    - Single Sign-on Domain—ssoDomain
    - HTTPOnly Cookie—httpOnlyCookie

    - Enable Persistent Cookie—persistentCookie
    - Persistent Cookie Validity (minutes)—persistentCookieValidity
    - Home Page—homepage
4. Click **OK**.

Traffic Settings

September 21, 2020

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put you company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one NetScaler appliance or virtual appliance instance to authenticate to another NetScaler appliance on behalf of users who have authenticated with the first appliance.

To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

Traffic profiles

September 21, 2020

After creating at least one forms or SAML sso profile, you must next create a traffic profile.

> **Note**
>
> In this feature, the terms "profile" and "action" mean the same thing.

To create a traffic profile by using the command line interface

At the command prompt, type:

"'add tm trafficAction [-appTimeout][-SSO (ON | OFF) [-formSSOAction]][-persistentCookie (ENABLED | DISABLED)][-InitiateLogout (ON | OFF)]

```
### Example
```

add tm trafficAction Traffic-Prof-1 –appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1

~~~
## To modify a session profile by using the command line interface

At the command prompt, type:

```set tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF )
    [-formSSOAction <string>]] [-persistentCookie ( ENABLED | DISABLED )
    ] [-InitiateLogout ( ON | OFF )]<!--NeedCopy-->
~~~

Example

```
set tm trafficAction Traffic-Prof-1  - appTimeout 10 -SSO ON -
    formSSOAction SSO-Prof-1
<!--NeedCopy-->
```

To remove a session profile by using the command line interface

At the command prompt, type:

"'rm tm trafficAction

```
### Example
```

rm tm trafficAction Traffic-Prof-1

"'

To configure traffic profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Traffic.**
2. Navigate to **Security > AAA - Application Traffic > Policies > Traffic.**
3. In the details pane, click the Profiles tab.
4. On the Profiles tab, do one of the following:
    - To create a new traffic profile, click **Add.**
    - To modify an existing traffic profile, select the profile, and then click **Edit.**
5. In the **Create Traffic Profile** or **Configure Traffic Profile** dialog box, specify values for the parameters.
    - Name*—name (Cannot be changed for a previously configured session action.)

    - AppTimeout—appTimeout
    - Single Sign-On—SSO
    - Form SSO Action—formSSOAction
    - SAML SSO Action—samlSSOAction
    - Enable Persistent Cookie—persistentCookie
    - Initiate Logout—InitiateLogout
6. Click **Create** or **OK**. The traffic profile that you created appears in the Traffic Policies, Profiles, and either the Form SSO Profiles or SAML SSO Profiles pane, as appropriate.

Traffic policies

September 21, 2020

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to a traffic management virtual server, to put them into effect.

To create a traffic policy by using the command line interface

At the command prompt, type:

“‘add tm trafficPolicy

```
### Example
```

add tm trafficPolicy Traffic-Pol-1 “HTTP.REQ.HEADER(“Cookie”).CONTAINS(“login=true”)” Traffic-Prof-1

~~~
## To modify a traffic policy by using the command line interface

At the command prompt, type:

```set tm trafficPolicy <name> <rule> <action><!--NeedCopy-->
~~~

Example

```
set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS(
    "login=true")" Traffic-Prof-1
<!--NeedCopy-->
```

To globally bind a traffic policy by using the command line interface

At the command prompt, type:

"‘bind tm global -policyName [-priority]

~~~
### Example

```bind tm global -policyName Traffic-Pol-1<!--NeedCopy-->
~~~

To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

- `bind lb vserver <name> -policy <policyName> [-priority <priority>]<!--NeedCopy-->`
- `bind cs vserver <name> -policy <policyName> [-priority <priority>]<!--NeedCopy-->`

Example

```
bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -
    priority 1000
<!--NeedCopy-->
```

To unbind a globally bound traffic policy by using the command line interface

At the command prompt, type:

"‘unbind tm global -policyName

```
### Example
```

unbind tm global -policyName Traffic-Pol-1

```
## To unbind a traffic policy from a load balancing or content
    switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

-  ```unbind lb vserver <name> -policy <policyname><!--NeedCopy-->
```

- `unbind cs vserver <name> -policy <policyname><!--NeedCopy-->`

Example

```
unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1

<!--NeedCopy-->
```

To remove a traffic policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type:

"'rm tm trafficPolicy

```
### Example
```

rm tm trafficPolicy Traffic-Pol-1
"'

To configure and bind traffic policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Traffic.**
2. Navigate to **Security > AAA - Application Traffic > Policies > Traffic.**
3. In the details pane, do one of the following:
    - To create a new session policy, click **Add.**
    - To modify an existing session policy, select the policy, and then click **Edit.**
4. In the **Create Traffic Policy** or **Configure Traffic Policy** dialog, specify values for the parameters.
    - Name*—policyName (Cannot be changed for a previously configured session policy.)
    - Profile*—actionName
    - Expression—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.

Form SSO profiles

September 21, 2020

To enable and configure forms-based SSO, you first create an SSO profile.

> **Note**
>
> - Forms-based single sign-on does not work if the form is customized to include Javascript.
> - In this feature, the terms "profile" and "action" mean the same thing.

To create a form SSO profile by using the command line interface

At the command prompt, type:

- `add tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>][-nvtype ( STATIC | DYNAMIC )][-submitMethod ( GET | POST )]<!--NeedCopy-->`
- `show tm formSSOAction [<name>]<!--NeedCopy-->`

Example

```
add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
-userField "loginID" -passwdField "passwd"
-nameValuePair "loginID passwd" -responsesize "9096"
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
-nvtype STATIC -submitMethod GET
 – sessTimeout 10 -defaultAuthorizationAction ALLOW
<!--NeedCopy-->
```

To modify a form SSO by using the command line interface

At the command prompt, type:

"'set tm formSSOAction -actionURL -userField -passwdField -ssoSuccessRule [-nameValuePair] [-responsesize][-nvtype (STATIC | DYNAMIC)][-submitMethod (GET | POST)]

```
### Example
```

set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
-userField "loginID" -passwdField "passwd"
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
-nameValuePair "loginID passwd" -responsesize "9096"
-nvtype STATIC -submitMethod GET
–sessTimeout 10 -defaultAuthorizationAction ALLOW

```
## To remove a form SSO profile by using the command line interface

```

~~~
At the command prompt, type:

```rm tm formSSOAction <name><!--NeedCopy-->
~~~

Example

```
rm tm sessionAction SSO-Prof-1
<!--NeedCopy-->
```

To configure form SSO profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
2. In the details pane, click the **Form SSO Profiles** tab.
3. On the Form SSO Profiles tab, do one of the following:
    - To create a new form SSO profile, click **Add**.
    - To modify an existing form SSO profile, select the profile, and then click Edit.
4. In the **Create Form SSO Profile** or **Configure Form SSO Profile** dialog, specify values for the parameters:
    - Name*—name (Cannot be changed for a previously configured session action.)
    - Action URL*—actionURL
    - User Name Field*—userField
    - Password Field*—passField
    - Expression*—ssoSuccessRule
    - Name Value Pair—nameValuePair
    - Response Size—responsesize
    - Extraction—nvtype
    - Submit Method—submitMethod
5. Click **Create** or **OK**, and then click **Close**. The form SSO profile that you created appears in the **Traffic Policies**, **Profiles**, and **Form SSO Profiles** pane.

SAML SSO profiles

September 21, 2020

To enable and configure SAML-based SSO, you first create a SAML SSO profile.

To create a SAML SSO profile by using the command line interface

At the command prompt, type:

"'add tm samlSSOProfile -samlSigningCertName -assertionConsumerServiceURL -relaystateRule -sendPassword (ON | OFF) [-samlIssuerName]

```
### Example
```

add tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc." -assertionConsumerServiceURL "https://service.example.com" -relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example, Inc."

~~~
## To modify a SAML SSO by using the command line interface

At the command prompt, type:

```set tm samlSSOProfile <name> -samlSigningCertName <string> -
    assertionConsumerServiceURL <URL> -relaystateRule <expression> -
    sendPassword (ON | OFF) [-samlIssuerName <string>]<!--NeedCopy-->
~~~

Example

```
set tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example,
    Inc."  -assertionConsumerServiceURL "https://service.example.com" -
    relaystateRule "true"  -sendPassword "ON" -samlIssuerName "Example,
    Inc."
<!--NeedCopy-->
```

To remove a SAML SSO profile by using the command line interface

At the command prompt, type:

"'rm tm samlSSOProfile

```
### Example
```

rm tm sessionAction saml-SSO-Prof-1

"'

To configure a SAML SSO profile by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Traffic.**

2. In the details pane, click the **SAML SSO Profiles** tab.
3. On the **SAML SSO Profiles** tab, do one of the following:
    - To create a new SAML SSO profile, click **Add.**
    - To modify an existing SAML SSO profile, select the profile, and then click **OpenEdit**.
4. In the **Create SAML SSO Profiles** or the **Configure SAML SSO Profiles** dialog box, set the following parameters:
    - Name*
    - Signing Certificate Name*
    - ACS URL*
    - Relay State Rule*
    - Send Password
    - Issuer Name
5. Click **Create** or **OK**, and then click **Close.** The SAML SSO profile that you created appears in the Traffic Policies, Profiles, and SAML SSO Profiles pane.

Session timeout for OWA 2010

September 21, 2020

You can now force OWA 2010 connections to time out after a specified period of inactivity. OWA sends repeated keepalive requests to the server to prevent timeouts. Keeping the connections open can interfere with single sign-on.

To force OWA 2010 to timeout after a specified period by using the command line interface

At the command prompt, type the following commands:

-
  ```
  add tm trafficAction <actname> [-forcedTimeout <forcedTimeout> -forcedTimeoutVal
   <mins>]<!--NeedCopy-->
  ```

  For <actname>, substitute a name for your traffic policy. For <mins>, substitute the number of minutes after which to initiate a forced timeout. For <forcedTimeout>, substitute one of the following values:

    - **START**—Starts the timer for forced timeout if a timer has not already been started. If a running timer exists, has no effect.
    - **STOP**—Stops a running timer. If no running timer is found, has no effect.
    - **RESET**—Restarts a running timer. If no running timer is found, starts a timer just as if the START option had been used.

- `add tm trafficPolicy <polname> <rule> <actname><!--NeedCopy-->`

  For <polname>, substitute a name for your traffic policy. For <rule>, substitute a rule in NetScaler appliance default syntax.

- `bind lb vserver <vservername> -policyName <name> -priority <number><!--NeedCopy-->`

  For <vservername>, substitute the name of the AAA traffic management virtual server. For <priority>, substitute an integer that designates the policy's priority.

Example

```
add tm trafficAction act-owa2010timeout -forcedTimeout RESET -
    forcedTimeoutVal 10
add tm trafficPolicy pol-owa2010timeout true act-owa2010timeout
bind lb vserver vs-owa2010 -policyName pol-owa2010timeout -priority 10
<!--NeedCopy-->
```

Authenticating with client certificates

September 21, 2020

Web sites that contain sensitive content, such as online banking websites or websites with employee personal information, sometimes require client certificates for authentication. To configure AAA to authenticate users on the basis of client-side certificate attributes, you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the NetScaler appliance must do to authenticate users on the basis of a client certificate. In either case, your authentication server must support CRLs. You configure the ADC to extract the user name from the SubjectCN field or another specified field in the client certificate.

When the user tries to log on to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the ADC presents a logon page to the user.

The following procedures assume that you have already created a functioning AAA configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the ADC in the /nsconfig/ssl directory.

To configure the AAA client certificate parameters by using the command line interface

At the command prompt, type the following commands, in the order shown, to configure the certificate and verify the configuration:

- `add ssl certKey <certkeyName> -cert <certFile> -key <keyFile> -password -inform <inform> -expiryMonitor <expiryMonitor> -notificationPeriod <notificationPeriod><!--NeedCopy-->`
- `bind ssl certKey <certkeyName> -vServer <certkeyName> -CA -crlCheck Mandatory<!--NeedCopy-->`
- `show ssl certKey [<certkeyName>]<!--NeedCopy-->`
- `set aaa parameter -defaultAuthType CERT<!--NeedCopy-->`
- `show aaa parameter<!--NeedCopy-->`
- `set aaa certParams -userNameField "Subject:CN"<!--NeedCopy-->`
- `show aaa certParams<!--NeedCopy-->`

To configure the AAA client certificate parameters by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers.**
2. In the details pane, select the virtual server that you want to configure to handle client certificate authentication, and then click **Edit.**
3. On the **Configuration** page, under **Certificates**, click the right arrow (>) to open the CA Cert Key installation dialog.
4. In the **CA Cert Key** dialog box, click **Insert.**
5. In the **CA Cert Key - SSL Certificates** dialog box, click **Install.**
6. In the **Install Certificate** dialog box, set the following parameters, whose names correspond to the CLI parameter names as shown:
   - Certificate-Key Pair Name*—certkeyName
   - Certificate File Name—certFile
   - Key File Name—keyFile
   - Certificate Format—inform
   - Password—password
   - Certificate Bundle—bundle
   - Notify When Expires—expiryMonitor
   - Notification Period—notificationPeriod

7. Click **Install**, and then click **Close**.
8. In the **CA Cert Key** dialog box, in the **Certificate** list, select the root certificate.
9. Click **Save**.
10. Click **Back** to return to the main configuration screen.
11. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > CERT**.
12. In the details pane, select the policy you want to configure to handle client certificate authentication, and then click **Edit**.
13. In the **Configure Authentication CERT Policy** dialog, Server drop-down list, select the virtual server you just configured to handle client certificate authentication.
14. Click **OK**. A message appears in the status bar, stating that the configuration completed successfully.

Support to notify number of unsuccessful login attempts

The NetScaler appliance can now log the number of unsuccessful login attempts made from the last successful log on. The feature works only if the persistentLoginAttempts option is enabled on the appliance. By default, the option is disabled on the NetScaler appliance.

A NetScaler administrator can use this information to verify if any unauthorized attempts have occurred on a secured external user account.

To use this feature, at the NetScaler appliance command prompt, type:

“‘set aaa parameter [–maxloginAttempts [-failedLoginTimeout]] -persistentLoginAttempts (ENABLED | DISABLED)

~~~
**Example:**

```set aaa parameter  - maxLoginAttempts 4  - failedLoginTimeout 3  - persistentLoginAttempts ENABLED<!--NeedCopy-->
~~~

Client certificate pass-through

September 21, 2020

The NetScaler appliance can now be configured to pass client certificates through to protected applications that require client certificates for user authentication. The ADC first authenticates the user, then inserts the client certificate into the request and sends it to the application. This feature is configured by adding appropriate SSL policies.

The exact behavior of this feature when a user presents a client certificate depends upon the configuration of the VPN virtual server.

- If the VPN virtual server is configured to accept client certificates but not require them, the ADC inserts the certificate into the request and then forwards the request to the protected application.
- If the VPN virtual server has client certificate authentication disabled, the ADC renegotiatiates the authentication protocol and reauthenticates the user before it inserts the client certificate in the header and forwards the request to the protected application.
- If the VPN virtual server is configured to require client certificate authentication, the ADC uses the client certificate to authenticate the user, then inserts the certificate in the header and forwards the request to the protected application.

In all of these cases, you configure client certificate pass-through as follows.

To create and configure client certificate pass-through by using the command line interface

At the command prompt, type the following commands:

-
  ```
  add vpn vserver <name> SSL <IP> 443<!--NeedCopy-->
  ```

  For *name*, substitute a name for the virtual server. The name must contain from one to 127 ASCII characters, beginning with a letter or underscore (_), and containing only letters, numbers, and the underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. For <IP>, substitute the IP address assigned to the virtual server.“‘

-
  ```
  set ssl vserver <name> -clientAuth ENABLED -clientCert <clientcert>
  ```

  For <name>, substitute the name of the virtual server that you just created. For <clientCert>, substitute one of the following values:

  - disabled—disables client certificate authentication on the VPN virtual server.
  - mandatory—configures the VPN virtual server to require client certificates to authenticate.
  - optional—configures the VPN virtual server to allow client certificate authentication, but not to require it.

-
  ```
  bind vpn vserver \<name\> -policy local
  ```

  For <name>, substitute the name of the VPN virtual server that you created.

-
  ```
  bind vpn vserver \<name> -policy cert
  ```

  For <name>, substitute the name of the VPN virtual server that you created.

-
  ```
  bind ssl vserver \<name> -certkeyName \<certkeyname>
  ```

  For <name>, substitute the name of the virtual server that you created. For <certkeyName>, substitute the client certificate key.

-
  ```
  bind ssl vserver \<name> -certkeyName \<cacertkeyname> -CA -ocspCheck Optional
  ```

For <name>, substitute the name of the virtual server that you created. For <cacertkeyName>, substitute the CA certificate key.

- `add ssl action \<actname\> -clientCert ENABLED -certHeader CLIENT-CERT`
  For <actname>, substitute a name for the SSL action.
- `add ssl policy \<polname\> -rule true -action \<actname\>`
  For <polname>, substitute a name for your new SSL policy. For <actname>, substitute the name of the SSL action that you just created.
- `bind ssl vserver \<name\> -policyName \<polname\> -priority 10`
  For <name>, substitute the name of the VPN virtual server.

Example

‘‘‘

add vpn vserver vs-certpassthru SSL 10.121.250.75 443
set ssl vserver vs-certpassthru -clientAuth ENABLED -clientCert optional
bind vpn vserver vs-certpassthru -policy local
bind vpn vserver vs-certpassthru -policy cert
bind ssl vserver vs-certpassthru -certkeyName mycertKey
bind ssl vserver vs-certpassthru -certkeyName mycertKey -CA -ocspCheck Optional
add ssl action act-certpassthru -clientCert ENABLED -certHeader CLIENT-CERT
add ssl policy pol-certpassthru -rule true -action act-certpassthru
bind ssl vserver vs-certpassthru -policyName pol-certpassthru -priority 10

Configuring AAA with commonly used protocols

September 21, 2020

Configuring the NetScaler appliance for AAA needs a specific setup on the NetScaler appliance and clients’ browsers. The configuration varies with the protocol used for AAA.

For more information about configuring the NetScaler appliance for Kerberos authentication, see Handling Authentication, Authorization and Auditing with Kerberos/NTLM.

Handling authentication, authorization and auditing with Kerberos/NTLM

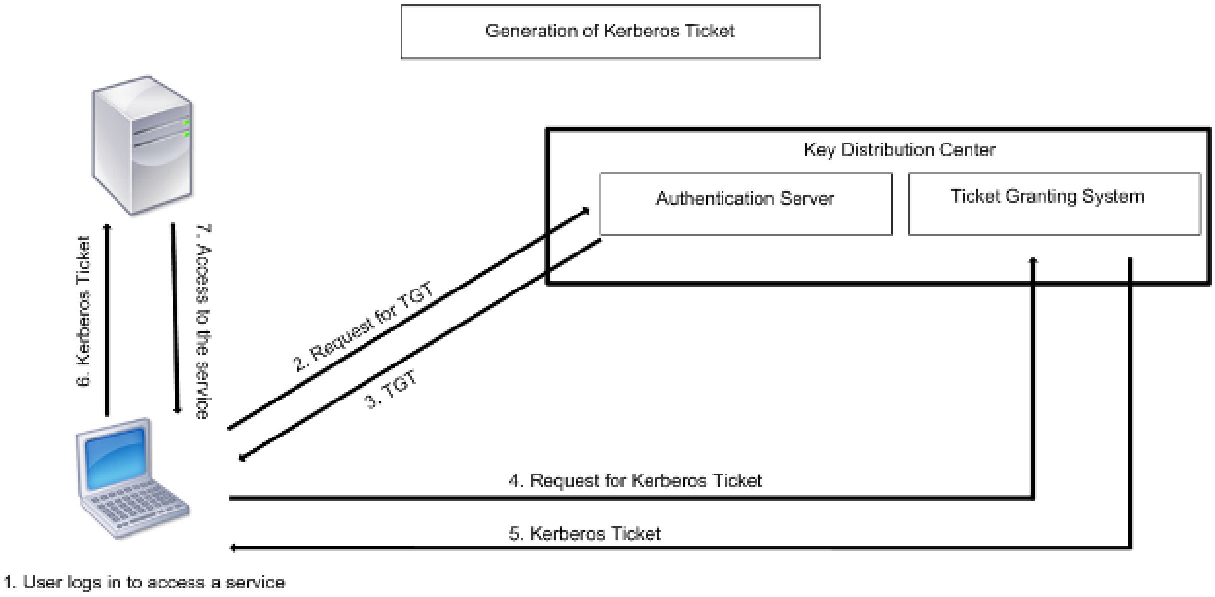
September 21, 2020

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other's authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. **Functioning of Kerberos**



Kerberos authentication has the following advantages:

- Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler appliance is able to decrypt the Kerberos ticket, you can

conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- Single sign-on between Windows and other operating systems that support Kerberos.

Kerberos authentication may have the following disadvantages:

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
- Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
- Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user's password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the NetScaler appliance and on each client.

Optimizing Kerberos authentication on AAA

The NetScaler appliance now optimizes and improves the system performance while Kerberos authentication. The AAA daemon remembers the outstanding Kerberos request for the same user to avoid load on Key Distribution Center (KDC), which will avoid duplicate requests.

How NetScaler appliance implements Kerberos for client authentication

September 21, 2020

> **Important**
>
> Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for AAA traffic management virtual servers.

NetScaler appliance handles the components involved in Kerberos authentication in the following way:

Key Distribution Center (KDC)

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

> **Note**
>
> All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

Authentication service and protocol negotiation

A NetScaler appliance supports Kerberos authentication on the AAA traffic management authentication virtual servers. If the Kerberos authentication fails, the NetScaler appliance uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for AAA. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler appliance attempts to use the Kerberos protocol for AAA and if the client's browser fails to receive a Kerberos ticket, the NetScaler appliance uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler appliance does not use the data that is present locally on the NetScaler appliance.

Authorization

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

Auditing

The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events

- Scriptable log format

Supported Environment

Kerberos authentication does not need any specific environment on the NetScaler appliance. The client (browser) must provide support for Kerberos authentication.

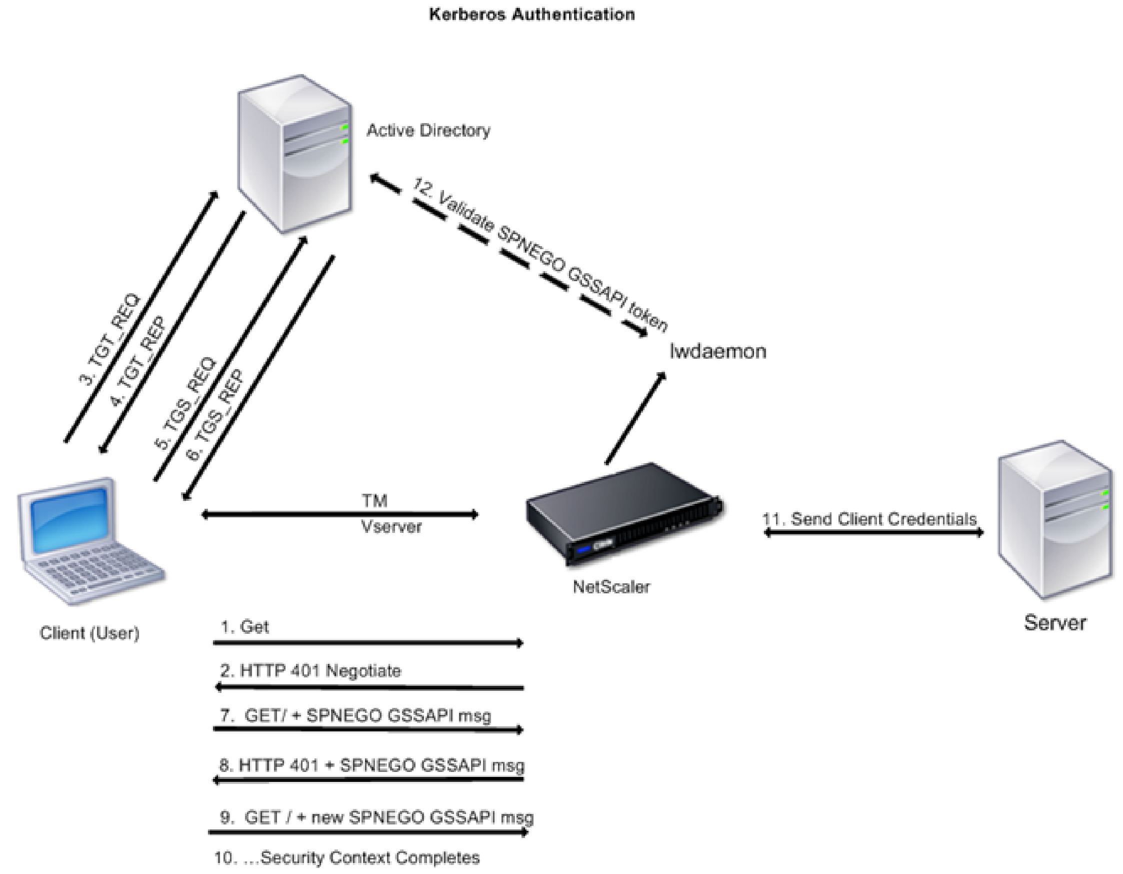
High Availability

In a high availability setup, only the active NetScaler appliance joins the domain. In case of a failover, the NetScaler appliance lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

Kerberos authentication process

The following figure shows a typical process for Kerberos authentication in the NetScaler appliance environment.

Figure 1. Kerberos Authentication Process on NetScaler appliance



Kerberos Authentication

12. Validate SPNEGO GSSAPI token
lwdaemon
3. TGT_REQ
4. TGT_REP
5. TGS_REQ
6. TGS_REP
TM
Vserver
NetScaler
11. Send Client Credentials
Server
Client (User)
1. Get
2. HTTP 401 Negotiate
7. GET/ + SPNEGO GSSAPI msg
8. HTTP 401 + SPNEGO GSSAPI msg
9. GET / + new SPNEGO GSSAPI msg
10. …Security Context Completes

The Kerberos authentication occurs in the following stages:

Client authenticates itself to the KDC

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler appliance sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
    - The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
    - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

> Note
>
> The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client authentication process.

Client requests a service.

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler appliance. The SPNEGO token has the necessary GSSAPI data.
2. The NetScaler appliance establishes a security context between the client and the NetScaler appliance. If the NetScaler appliance cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the NetScaler appliance acts as an HTTP proxy between the client and the physical server.

NetScaler appliance completes the authentication.

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

Configuring kerberos authentication on the NetScaler appliance

September 21, 2020

This topic provides the detailed steps to configure Kerberos authentication on the NetScaler appliance by using the CLI and the GUI.

Configuring Kerberos authentication on the CLI

1. Enable the AAA feature to ensure the authentication of traffic on the appliance.

   ```
   ns-cli-prompt> enable ns feature AAA
   ```

2. Add the keytab file to the NetScaler appliance. A keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. A single keytab file contains authentication details for all the services that are bound to the traffic management virtual server on the NetScaler appliance.

   First generate the keytab file on the Active Directory server and then transfer it to the NetScaler appliance.

   a) Log on to the Active Directory server and add a user for Kerberos authentication. For example, to add a user named “Kerb-SVC-Account”:

   ```
   net user Kerb-SVC-Account freebsd!@#456 /add
   ```

   > **Note**
   >
   > In the **User Properties** section, ensure that the “Change password at next logon option” is not selected and the “Password does not expire” option is selected.

   b) Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:

   ```
   ktpass /out keytabfile /princ HTTP/owa.newacp.com@NEWACP.COM /pass freebsd!@#456
   /mapuser newacp\dummy /ptype KRB5_NT_PRINCIPAL
   ```

   > **Note**
   >
   > You can map more than one service if authentication is required for more than one service. If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

   c) Transfer the keytab file to the NetScaler appliance by using the unix **ftp** command or any other file transfer utility of your choice.

   d) Log on to the NetScaler appliance, and run the **ktutil** utility to verify the keytab file. The keytab file has an entry for the HTTP service after it is imported.

   The **kutil** interactions are as follows:

   ```
   root@ns# ktutil
   ktutil: rkt /var/keytabfile
   ktutil: list
   ```

```
slot KVNO Principal
——————————————————————————

ktutil: wkt /etc/ krb5.keytab
ktutil: list

slot KVNO Principal
—- —- ————————————————————————-

1 2 HTTP/owa.newacp.com@NEWACP.COM

ktutil: quit
```

3. The NetScaler appliance must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler appliance with a DNS server.

   ```
   ns-cli-prompt> add dns nameserver <ip-address>
   ```

   > **Note**
   >
   > Alternatively, you can add static host entries or use any other means so that the NetScaler appliance can resolve the FQDN name of the domain controller to an IP address.

4. Configure the authentication action and then associate it to an authentication policy.

   a) Configure the negotiate action.

   ```
   ns-cli-prompt> add authentication negotiateAction <name> -domain <domainName> -domainUser <domainUsername> -domainUserPasswd <domainUserPassword>
   ```

   b) Configure the negotiate policy and associate the negotiate action to this policy.

   ```
   ns-cli-prompt> add authentication negotiatePolicy <name> <rule> <reqAction>
   ```

5. Create an authentication virtual server and associate the negotiate policy with it.

   a) Create an authentication virtual server.

   ```
   ns-cli-prompt> add authentication vserver <name> SSL <ipAuthVserver> 443 -authenticationDomain <domainName>
   ```

   b) Bind the negotiate policy to the authentication virtual server.

   ```
   ns-cli-prompt> bind authentication vserver <name> -policy <negotiatePolicyName>
   ```

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

   ```
   ns-cli-prompt> set lb vserver <name> -authn401 ON -authnVsName <string>
   ```

> **Note**
>
> Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations by doing the following:
    a) Access the traffic management virtual server, using the FQDN. For example, Sample
    b) View the details of the session on the CLI.

       ns-cli-prompt> **show aaa session**

Configuring Kerberos authentication on the GUI

1. Enable the AAA feature.

   Navigate to **System** > **Settings**, click **Configure Basic Features** and enable the AAA feature.

2. Add the keytab file as detailed in step 2 of the CLI procedure mentioned above.
3. Add a DNS server.

   Navigate to **Traffic Management > DNS > Name Servers**, and specify the IP address for the DNS server.

4. Configure the **Negotiate** action and policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with **Negotiate** as the action type.

5. Bind the negotiate policy to the authentication virtual server.

   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the **Negotiate** policy with the authentication virtual server.

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

   Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and specify the relevant authentication settings.

   > **Note**
   >
   > Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations as detailed in step 7 of the CLI procedure mentioned above.

Configuring kerberos authentication on a client

September 21, 2020

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

To configure Internet Explorer for Kerberos authentication

1. In the **Tools** menu select **Internet Options**.
2. On the **Security** tab, click **Local Intranet**, and then click **Sites**.
3. In the **Local Intranet** dialog box, make sure that the Automatically detect intranet network option is selected, and then click **Advanced**.
4. In the **Local Intranet** dialog box, add the web sites of the domains of the traffic management virtual server on the NetScaler appliance. The specified sites become local intranet sites.
5. Click **Close** or **OK** to close the dialog boxes.

To configure Mozilla Firefox for Kerberos authentication

1. Make sure that you have Kerberos properly configured on your computer.
2. Type about:config in the URL bar.
3. In the filter text box, type network.negotiate.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.

   > Note: If you are running Windows, you also need to enter sspi in the filter text box and change the network.auth.use-sspi option to False.

Offloading Kerberos authentication from physical servers

September 21, 2020

The NetScaler appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the NetScaler appliance authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the NetScaler appliance and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current NetScaler appliance release, Kerberos authentication is available only for AAA traffic management virtual servers. Kerberos authentication is not supported for SSL VPN in the Citrix Gateway Enterprise Edition appliance or for NetScaler appliance management.

Kerberos authentication requires configuration on the NetScaler appliance and on client browsers.

To configure Kerberos authentication on the NetScaler appliance

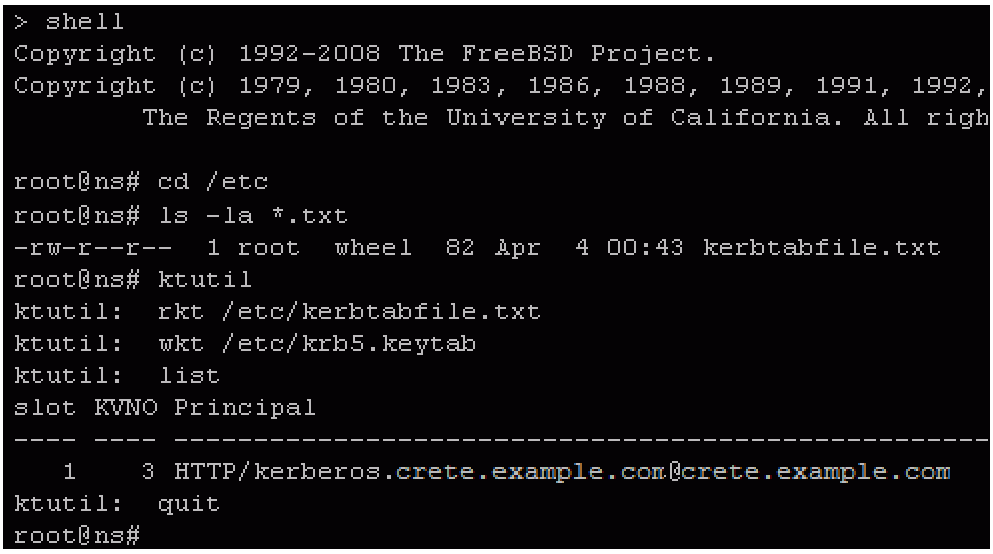
1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
   - Make sure that you do not select the Change password at next logon option.
   - Be sure to select the Password does not expire option.
2. On the AD server, at the CLI command prompt, type:
   - `ktpass -princ HTTP/kerberos.crete.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser kerbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\kerbtabfile.txt`

   > **Note**
   >
   > Be sure to type the above command on a single line. The output of the above command is written into the C:\kerbtabfile.txt file.
3. Upload the kerbtabfile.txt file to the /etc directory of the NetScaler appliance by using a Secure Copy (SCP) client.
4. Run the following command to add a DNS server to the NetScaler appliance.
   - `add dns nameserver 1.2.3.4`

   The NetScaler appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.
5. Switch to the shell prompt and run the following commands from the shell prompt:
   - `ktutil # rkt /etc/kerbtabfile.txt`
   - `# wkt /etc/krb5.keytab`
   - `# list`

     The list command displays the user account details that you created in the Active Directory. A sample screen of the output of the list command is shown below.

     Figure 1. Sample Output of the list Command



```
> shell

        The Regents of the University of California. All righ

root@ns# cd /etc
root@ns# ls -la *.txt
-rw-r--r--  1 root  wheel  82 Apr  4 00:43 kerbtabfile.txt
root@ns# ktutil
ktutil:  rkt /etc/kerbtabfile.txt
ktutil:  wkt /etc/krb5.keytab
ktutil:  list
slot KVNO Principal
---- ---- ----------------------------------------------------
   1    3 HTTP/kerberos.crete.example.com@crete.example.com
ktutil:  quit
root@ns#
```

6. Switch to the command line interface of NetScaler appliance.
7. Run the following command to create a Kerberos authentication server:
    - add authentication negotiateAction KerberosServer -domain “crete.lab.net” -domainUser kerbuser -domainUserPasswd Citrix1
8. Run the following command to create a negotiation policy:
    - `add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200"KerberosServer<!--NeedCopy-->`
9. Run the following command to create an authentication virtual server.
    - `add authentication vserver Kerb-Auth SSL 192.168.17.201 443 -AuthenticationDomain crete.example.com<!--NeedCopy-->`
10. Run the following command to bind the Kerberos policy to the authentication virtual server:
    - `bind authentication vserver Kerb-Auth -policy Kerberos-Policy -priority 100<!--NeedCopy-->`
11. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI NetScaler appliance. Run the following command to use the ServerTestCert sample certificate.
    - `bind ssl vserver Kerb-Auth -certkeyName ServerTestCert<!--NeedCopy-->`
12. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.

    Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.
13. Run the following command to configure an authentication virtual server:

- `set lb vserver <name>-authn401 ON -authnVsName Kerb-Auth<!--NeedCopy -->`

14. Enter the host name Example in the address bar of the Web browser.

    The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

    > **Note**
    >
    > Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP virtual server.

15. Configure Kerberos on the Web browser of the client computer.

    - For configuring on Internet Explorer, see Configuring Internet Explorer for Kerberos authentication.
    - For configuring on Mozilla Firefox, see Configuring Internet Explorer for Kerberos authentication.

16. Verify whether you can access the backend physical server without authentication.

To configure Internet Explorer for Kerberos authentication

1. Select **Internet Options** from the **Tools** menu.
2. Activate the **Security** tab.
3. Select **Local Intranet** from the Select a zone to view change security settings section.
4. Click **Sites**.
5. Click **Advanced**.
6. Specify the URL, Example and click **Add**.
7. Restart **Internet Explorer**.

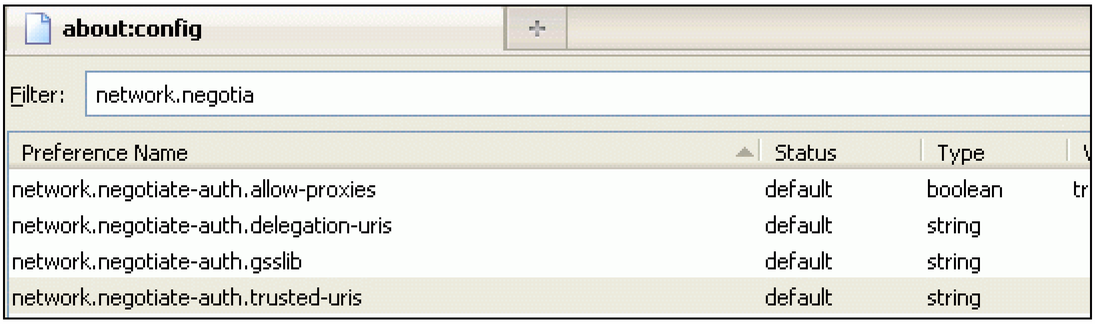
To configure Mozilla Firefox for Kerberos authentication

1. Enter about:config in the address bar of the browser.

2. Click the warning disclaimer.

3. Type **Network.Negotiate-auth.trusted-uris** in the **Filter** box.

4. Double click **Network.Negotiate-auth.trusted-uris.** A sample screen is shown below.



Filter: network.negotia

Preference Name	Status	Type
network.negotiate-auth.allow-proxies	default	boolean
network.negotiate-auth.delegation-uris	default	string
network.negotiate-auth.gsslib	default	string
network.negotiate-auth.trusted-uris	default	string

5. In the Enter String Value dialog box, specify www.crete.example.com.
6. Restart Firefox.

NetScaler appliance kerberos single sign-on

September 21, 2020

NetScaler appliances now support single sign-on (SSO) using the Kerberos 5 protocol. Users log on to a proxy, the Application Delivery Controller (ADC), which then provides access to protected resources.

The NetScaler appliance Kerberos SSO implementation requires the user's password for SSO methods that rely on basic, NTLM, or forms-based authentication. The user's password is not required for Kerberos SSO, although if Kerberos SSO fails and the NetScaler appliance has the user's password, it uses the password to attempt NTLM SSO.

If the user's password is available, the KCD account is configured with a realm, and no delegated user information is present, the NetScaler AD Kerberos SSO engine impersonates the user to obtain access to authorized resources. Impersonation is also called unconstrained delegation.

The NetScaler appliance Kerberos SSO engine can also be configured to use a delegated account to obtain access to protected resources on the user's behalf. This configuration requires delegated user credentials, a keytab, or a delegated user certificate and matching CA certificate. Configuration that uses a delegated account is called constrained delegation.

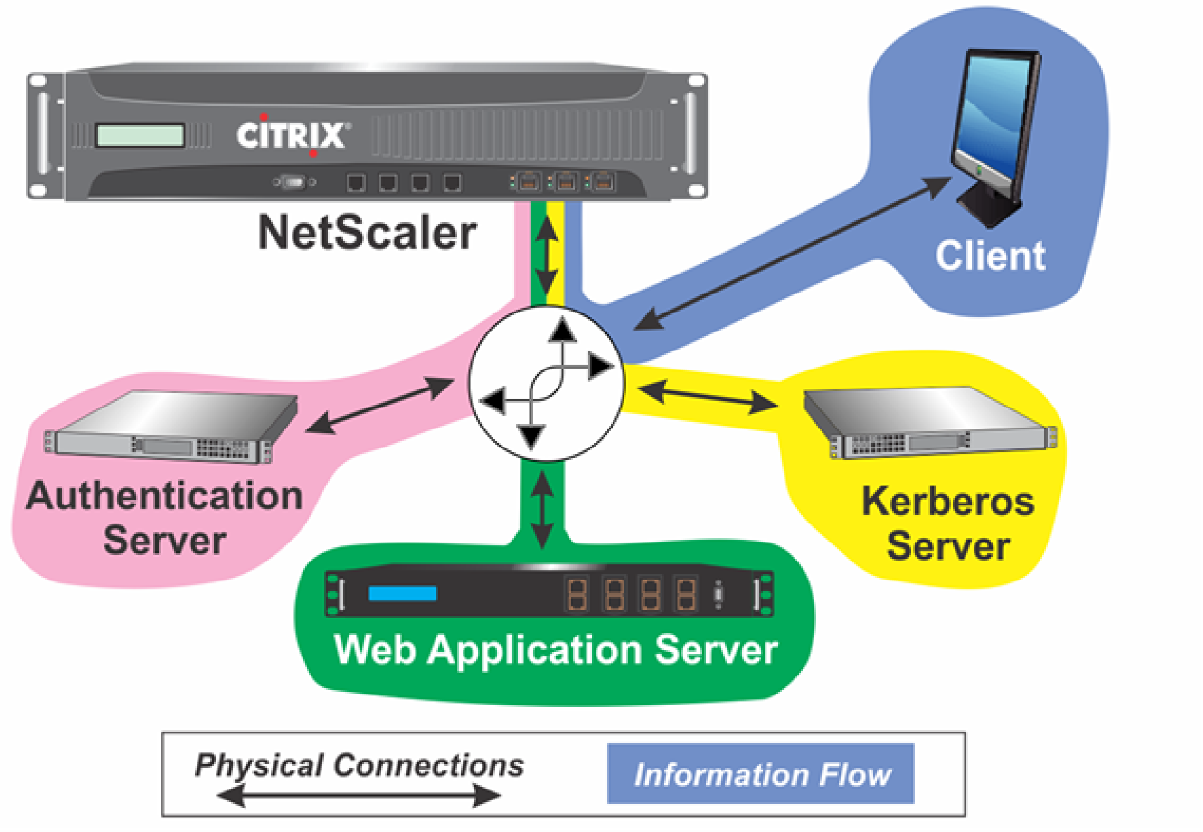
An overview of NetScaler appliance kerberos SSO

September 21, 2020

To use the NetScaler appliance Kerberos SSO feature, users first authenticate with Kerberos or a supported third-party authentication server. Once authenticated, the user requests access to a protected web application. The web server responds with a request for proof that the user is authorized to access that web application. The user's browser contacts the Kerberos server, which verifies that the user is authorized to access that resource, and then provides the user's browser with a service ticket that provides proof. The browser resends the user's request to the web application server with the service ticket attached. The web application server verifies the service ticket, and then allows the user to access the application.

AAA traffic management implements this process as shown in the following diagram. The diagram illustrates the flow of information through the NetScaler appliance and AAA traffic management, on a secure network with LDAP authentication and Kerberos authorization. AAA traffic management environments that use other types of authentication have essentially the same information flow, although they might differ in some details.

Figure 1. A Secure Network with LDAP and Kerberos



The AAA traffic management with authentication and authorization in a Kerberos environment requires that the following actions take place.

1. The client sends a request for a resource to the traffic management virtual server on the NetScaler appliance.
2. The traffic management virtual server passes the request to the authentication virtual server, which authenticates the client and then passes the request back to the traffic management vir-

tual server.

3. The traffic management virtual server sends the client's request to the web application server.
4. The web application server responds to the traffic management virtual server with a 401 Unauthorized message that requests Kerberos authentication, with fallback to NTLM authentication if the client does not support Kerberos.
5. The traffic management virtual server contacts the Kerberos SSO daemon.
6. The Kerberos SSO daemon contacts the Kerberos server and obtains a ticket-granting ticket (TGT) allowing it to request service tickets authorizing access to protected applications.
7. The Kerberos SSO daemon obtains a service ticket for the user and sends that ticket to the traffic management virtual server.
8. The traffic management virtual server attaches the ticket to the user's initial request and sends the modified request back to the web application server.
9. The web application server responds with a 200 OK message.

These steps are transparent to the client, which just sends a request and receives the requested resource.

Integration of NetScaler appliance Kerberos SSO with authentication methods

All AAA traffic management authentication mechanisms support NetScaler appliance Kerberos SSO. AAA traffic management supports the Kerberos SSO mechanism with the Kerberos, CAC (Smart Card) and SAML authentication mechanisms with any form of client authentication to the NetScaler appliance. It also supports the HTTP-Basic, HTTP-Digest, Forms-based, and NTLM (versions 1 and 2) SSO mechanisms if the client uses either HTTP-Basic or Forms-Based authentication to log on to the NetScaler appliance.

The following table shows each supported client-side authentication method, and the supported server-side authentication method for that client-side method.

Table 1. Supported Authentication Methods

	Basic/Digest/NTLM	Kerberos Constrained Delegation	User Impersonation
CAC (Smart Card): at SSL/T LS Layer		X	X
Forms-Based (LDAP/RADIUS/TACACS)	X	X	X
HTTP Basic (LDAP/RADIUS/TACACS)	X	X	X
Kerberos		X	

	Basic/Digest/NTLM	Kerberos Constrained Delegation	User Impersonation
NT LM v1/v2		X	X
SAML		X	
SAML Two-Factor	X	X	X
Certificate Two-Factor	X	X	X

Setting up NetScaler appliance SSO

September 21, 2020

You can configure NetScaler appliance SSO to work in one of two ways: by impersonation or by delegation. SSO by impersonation is a simpler configuration than SSO by delegation, and is therefore usually preferable when your configuration allows it. To configure NetScaler appliance SSO by impersonation, you must have the user's user name and password.

To configure NetScaler appliance SSO by delegation, you must have the delegated user's credentials in one of the following formats: the user's user name and password, the keytab configuration that includes the user name and an encrypted password, or the delegated user certificate and the matching CA certificate.

Prerequisites

September 21, 2020

Before you configure NetScaler appliance SSO, you need to have your NetScaler appliance fully configured to manage traffic to and authentication for your web application servers. Therefore, you must configure either load balancing or content switching, and then AAA, for these web application servers. You should also verify routing between the appliance, your LDAP server, and your Kerberos server.

If your network is not already configured in this manner, perform the following configuration tasks:

- Configure a server and service for each web application server.
- Configure a traffic management virtual server to handle traffic to and from your web application server.

Following are brief instructions and examples for performing each of these tasks from the NetScaler appliance command line. For further assistance, see Setting up an Authentication Virtual Server.

To create a server and service by using the command line

For NetScaler appliance SSO to obtain a TGS (service ticket) for a service, either the FQDN assigned to the server entity on the NetScaler appliance must match the FQDN of the web application server, or the server entity name must match the NetBios name of the web application server. You can take either of the following approaches:

- Configure the NetScaler appliance server entity by specifying the FQDN of the web application server.
- Configure the NetScaler appliance server entity by specifying the IP address of the web application server, and assign the server entity the same name as the NetBios name of the web application server.

At the command prompt, type the following commands:

```
-   add server name <serverFQDN>

-   add service name serverName serviceType port
<!--NeedCopy-->
```

For the variables, substitute the following values:

- **serverName**. A name for the NetScaler appliance to use to refer to this server.
- **serverFQDN**. The FQDN of the server. If the server has no domain assigned to it, use the server's IP address and make sure that the server entity name matches the NetBios name of the web application server.
- **serviceName**. A name for the NetScaler appliance to use to refer to this service.
- **type**. The protocol used by the service, either HTTP or MSSQLSVC.
- **port**. The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

Example

The following examples add server and service entries on the NetScaler appliance for the web application server was1.example.com. The first example uses the FQDN of the web application server; the second uses the IP address.

To add the server and service using the web application server FQDN, was1.example.com, you would type the following commands:

```
add server was1 was1.example.com
add service was1service was1 HTTP 80
<!--NeedCopy-->
```

To add the server and service using the web application server IP and NetBios name, where the web application server IP is 10.237.64.87 and its NetBios name is WAS1, you would type the following commands:

```
add server WAS1 10.237.64.87
add service was1service WAS1 HTTP 8
<!--NeedCopy-->
```

To create a traffic management virtual server by using the command line

The traffic management virtual server manages traffic between the client and the web application server. You can use either a load balancing or a content switching virtual server as the traffic management server. The SSO configuration is the same for either type.

To create a load balancing virtual server, at the command prompt, type the following command:

"'add lb vserver

```
For the variables, substitute the following values:

-  **vserverName** – A name for the NetScaler appliance to use to refer
    to this virtual server.
-  **type** – The protocol used by the service, either HTTP or MSSQLSVC.
-  **IP** – The IP address assigned to the virtual server. This would
    normally be an IANA-reserved, non-public IP address on your LAN.
-  **port** – The port on which the service listens. HTTP services
    normally listen on port 80. Secure HTTPS services normally listen on
     port 443.

## Example

To add a load balancing virtual server called tmvserver1 to a
    configuration that manages HTTP traffic on port 80, assigning it a
    LAN IP address of 10.217.28.20 and then binding the load balancing
    virtual server to the wasservice1 service, you would type the
    following commands:
```

add lb vserver tmvserver1 HTTP 10.217.28.20 80
bind lb vserver tmvserv1 wasservice1

```
## To create an authentication virtual server by using the command line

The authentication virtual server manages authentication traffic
    between the client and the authentication (LDAP) server. To create
```

```
an authentication virtual server, at the command prompt type the following commands:
```

- add authentication vserver SSL 443
- set authentication vserver –authenticationdomain

```
For the variables, substitute the following values:

-  **authvserverName** — A name for the NetScaler appliance to use to refer to this authentication virtual server. Must begin with a letter, number, or the underscore character (\_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (\#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the authentication virtual server is added by using the rename authentication vserver command.
-  **IP** — The IP address assigned to the authentication virtual server. As with the traffic management virtual server, this address would normally be an IANA-reserved, non-public IP on your LAN.
-  **domain** — The domain assigned to the virtual server. This would usually be the domain of your network. It is customary, though not required, to enter the domain in all capitals when configuring the authentication virtual server.

## Example

To add an authentication virtual server called authverver1 to your configuration and assign it the LAN IP 10.217.28.21 and the domain EXAMPLE.COM, you would type the following commands:
```

add authentication vserver authvserver1 SSL 10.217.28.21 443
set authentication vserver authvserver1 –authenticationdomain EXAMPLE.COM

```
## To configure a traffic management virtual server to use an authentication profile

The authentication virtual server can be configured to handle authentication for a single domain or for multiple domains. If it is configured to support authentication for multiple domains, you must also specify the domain for NetScaler appliance SSO by creating an authentication profile, and then configuring the traffic management virtual server to use that authentication profile.

> **Note**
>
> The traffic management virtual server can be either a load balancing
```

```
(lb) or content switching (cs) virtual server. The following instructions assume that you are using a load balancing virtual server. To configure a content switching virtual server, simply substitute
set cs vserver for set lb vserver. The procedure is otherwise the same.

To create the authentication profile, and then configure the authentication profile on a traffic management virtual server, type the following commands:
```

- add authentication authnProfile {-authvserverName } {-authenticationHost } {-authenticationDomain }
- set lb vserver <vserverName> -authnProfile

```
For the variables, substitute the following values:

- **authnprofileName** – A name for the authentication profile. Must begin with a letter, number, or the underscore character (\_), and must consist of from one to thirty-one alphanumeric or hyphen (-), period (.) pound (\#), space ( ), at (@), equals (=), colon (:), and underscore characters.
- **authvserverName** – The name of the authentication virtual server that this profile uses for authentication.
- **authenticationHost** – Host name of the authentication virtual server.
- **authenticationDomain** – Domain for which NetScaler appliance SSO handles authentication. Required if the authentication virtual server performs authentication for more than one domain, so that the correct domain is included when the NetScaler appliance sets the traffic management virtual server cookie.

## Example

To create an authentication profile named authnProfile1 for authentication of the example.com domain, and to configure the load balancing virtual server vserver1 to use the authentication profile authnProfile1, you would type the following commands:
```

add authentication authnProfile authnProfile1 -authnvsName authvsesrver1
-authenticationHost authvsesrver1 -authenticationDomain example.com
set lb vserver vserver1 -authnProfile authnProfile1

‘‘‘

Configuring SSO

September 21, 2020

Configuring NetScaler appliance SSO to authenticate by impersonation is simpler than configuring than SSO to authenticate by delegation, and is therefore usually preferable when your configuration allows it. You just create a KCD account. You can use the user's password.

If you do not have the user's password, you can configure NetScaler appliance SSO to authenticate by delegation. Although somewhat more complex than configuring SSO to authenticate by impersonation, the delegation method provides flexibility in that a user's credentials might not be available to the NetScaler appliance in all circumstances.

For either impersonation or delegation, you must also enable integrated authentication on the web application server.

Enabling integrated authentication on the web application server

September 21, 2020

To set up NetScaler appliance Kerberos SSO on each web application server that Kerberos SSO will manage, use the configuration interface on that server to configure the server to require authentication. Select Kerberos (negotiate) authentication by preference, with fallback to NTLM for clients that do not support Kerberos.

Following are instructions for configuring Microsoft Internet Information Server (IIS) to require authentication. If your web application server uses software other than IIS, consult the documentation for that web server software for instructions.

To configure Microsoft IIS to use integrated authentication

1. Log on to the IIS server and open **Internet Information Services Manager.**
2. Select the web site for which you want to enable integrated authentication. To enable integrated authentication for all IIS web servers managed by IISM, configure authentication settings for the Default Web Site. To enable integrated authentication for individual services (such as Exchange, Exadmin, ExchWeb, and Public), configure these authentication settings for each service individually.
3. Open the **Properties** dialog box for the default web site or for the individual service, and click the **Directory Security** tab.
4. Beside **Authentication** and **Access Control**, select **Edit.**
5. Disable anonymous access.

6. Enable Integrated Windows authentication (only). Enabling integrated Windows authentication should automatically set protocol negotiation for the web server to Negotiate, NTLM, which specifies Kerberos authentication with fallback to NTLM for non-Kerberos capable devices. If this option is not automatically selected, manually set protocol negotiation to Negotiate, NTLM.

Setting up SSO by impersonation

September 21, 2020

You can configure the KCD account for NetScaler appliance SSO by impersonation. In this configuration, the NetScaler appliance obtains the user's username and passwordwhen the user authenticates to the authentication server and uses those credentials to impersonate the user to obtain a ticket-granting ticket (TGT). If the user's name is in UPN format, the appliance obtains the user's realm from UPN. Otherwise, it obtains the user's name and realm by extracting it from the SSO domain used during initial authentication, or from the session profile.

When configuring the KCD account, you must set the realm parameter to the realm of the service that the user is accessing. The same realm is also used as the user's realm if the user's realm cannot be obtained from authentication with the NetScaler appliance or from the session profile.

To create the KCD account for SSO by impersonation with a password

At the command prompt, type the following command:

“‘add aaa kcdaccount -realmStr

```
For the variables, substitute the following values:

-  **accountname**. The KCD account name.
-  **realm**. The domain assigned to NetScaler appliance SSO.

### Example

To add a KCD account named kcdccount1, and use the keytab named kcdvserver.keytab, you would type the following command:
```

add aaa kcdAccount kcdaccount1 -keytab kcdvserver.keytab

‘‘‘

For information on configuring Kerberos impersonation through NetScaler GUI, see Citrix Support.

Configuring SSO by Delegation

September 21, 2020

To configure SSO by Delegation, you need to perform the following tasks:

- If you are configuring delegation by delegated user certificate, install the matching CA certificates on the NetScaler appliance and add them to the NetScaler appliance configuration.
- Create the KCD account on the appliance. The appliance uses this account to obtain service tickets for your protected applications.
- Configure the Active Directory server.

Installing the client CA certificate on the NetScaler appliance

If you are configuring NetScaler appliance SSO with a client certificate, you must copy the matching CA certificate for the client certificate domain (the client CA certificate) to the NetScaler appliance, and then install the CA certificate. To copy the client CA certificate, use the file transfer program of your choice to transfer the certificate and private-key file to the NetScaler appliance, and store the files in /nsconfig/ssl.

To install the client CA certificate on the NetScaler appliance

At the command prompt, type the following command:

“‘add ssl certKey -cert [(-key [-password]) | -fipsKey][-inform (DER | PEM)][-expiryMonitor (ENABLED | DISABLED | UNSET) [-notificationPeriod]] [-bundle (YES | NO)]

```
For the variables, substitute the following values:

-   **certkeyName**. A name for the client CA certificate. Must begin with an ASCII alphanumeric or underscore (\_) character, and must consist of from one to thirty-one characters. Allowed characters include the ASCII alphanumerics, underscore, hash (\#), period(.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created. If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cert" or 'my cert').
-   **cert**. Full path name and file name of the X509 certificate file used to form the certificate-key pair. The certificate file must be stored on the NetScaler appliance, in the /nsconfig/ssl/ directory.
-   **key**. Full path name and file name of the file that contains the private key to the X509 certificate file. The key file must be stored on the NetScaler appliance in the /nsconfig/ssl/ directory.
- **password**. If a private key is specified, the passphrase used to encrypt the private key. Use this option to load encrypted private keys in PEM format.
- **fipsKey**. Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM.
    > **Note**
    >
    > You can specify either a key or a fipsKey, but not both.
- **inform**. Format of the certificate and private-key files, either PEM or DER.
- **passplain**. Pass phrase used to encrypt the private key. Required when adding an encrypted private-key in PEM format.
- **expiryMonitor**. Configure the NetScaler appliance to issue an alert when the certificate is about to expire. Possible values: ENABLED, DISABLED, UNSET.
- **notificationPeriod**. If expiryMonitor is ENABLED, number of days before the certificate expires to issue an alert.
- **bundle**. Parse the certificate chain as a single file after linking the server certificate to its issuer's certificate within the file. Possible values: YES, NO.

#### Example

The following example adds the specified delegated user certificate customer-cert.pem to the NetScaler appliance configuration along with the key customer-key.pem, and sets the password, certificate format, expiration monitor, and notification period.

To add the delegated user certificate, you would type the following commands:
```

"'add ssl certKey customer -cert "/nsconfig/ssl/customer-cert.pem"
-key "/nsconfig/ssl/customer-key.pem" -password "dontUseDefaultPWs!"
-inform PEM -expiryMonitor ENABLED [-notificationPeriod 14]

```
## Creating the KCD account

If you are configuring NetScaler appliance SSO by delegation, you can configure the KCD account to use the user's log-on name and password, to use the user's log-on name and keytab, or to use the user's client certificate. If you configure SSO with user name and password, the NetScaler appliance uses the delegated user account to obtain a Ticket Granting Ticket (TGT), and then uses the TGT to obtain service tickets for the specific services that each user requests.
```

~~~
If you configure SSO with keytab file, the NetScaler appliance uses the delegated user account and keytab information. If you configure SSO with a delegated user certificate, the NetScaler appliance uses the delegated user certificate.

### To create the KCD account for SSO by delegation with a password

At the command prompt, type the following commands:

<!--NeedCopy-->
```add aaa kcdaccount <accountname> -delegatedUser root -kcdPassword <password> -realmStr <realm>```

For the variables, substitute the following values:

-  **accountname**. A name for the KCD account.
-  **password**. A password for the KCD account.
-  **realm**. The realm of the KCD account, usually the domain for which SSO is active.

#### Example (UPN Format)

To add a KCD account named kcdaccount1 to the NetScaler appliance configuration with a password of password1 and a realm of EXAMPLE.COM, specifying the delegated user account in UPN format (as root), you would type the following commands:

<!--NeedCopy-->
~~~

add aaa kcdaccount kcdaccount1 –delegatedUser root
-kcdPassword password1 -realmStr EXAMPLE.COM

```
#### Example (SPN Format)

To add a KCD account named kcdaccount1 to the NetScaler appliance configuration with a password of password1 and a realm of EXAMPLE.COM, specifying the delegated user account in SPN format, you would type the following commands:

<!--NeedCopy-->
```

add aaa kcdAccount kcdaccount1 -realmStr EXAMPLE.COM
-delegatedUser "host/kcdvserver.example.com" -kcdPassword password1

```
### Creating the KCD account for SSO by delegation with a keytab
```

~~~

If you plan to use a keytab file for authentication, first create the keytab. You can create the keytab file manually by logging onto the AD server and using the ktpass utility, or you can use the NetScaler appliance configuration utility to create a batch script, and then run that script on the AD server to generate the keytab file. Next, use FTP or another file transfer program to transfer the keytab file to the NetScaler appliance and place it in the /nsconfig/krb directory. Finally, configure the KCD account for NetScaler appliance SSO by delegation and provide the path and file name of the keytab file to the NetScaler appliance.

To create the keytab file manually

Log on to the AD server command line and, at the command prompt, type the following command:

<!--NeedCopy-->
```ktpass princ <SPN> ptype KRB5_NT_PRINCIPAL mapuser <DOMAIN><username> pass <password> -out <File_Path>```

For the variables, substitute the following values:

-   **SPN**. The service principal name for the KCD service account.
-   **DOMAIN**. The domain of the Active Directory server.
-   **username**. The KSA account username.
-   **password**. The KSA account password.
-   **path**. The full path name of the directory in which to store the keytab file after it is generated.

To use the NetScaler appliance configuration utility to create a script to generate the keytab file

1. Navigate to **Security > AAA - Application Traffic.**
1. In the data pane, under **Kerberos Constrained Delegation**, click **Batch** file to generate Keytab.
1. In the **Generate KCD (Kerberos Constrained Delegation) Keytab Script** dialog box, set the following parameters:
    -   **Domain User Name**. The KSA account username.
    -   **Domain Password**. The KSA account password.
    -   **Service Principal**. The service principal name for the KSA.
    -   **Output File Name**. The full path and file name to which to save the keytab file on the AD server.
1. Clear the **Create Domain User Account** check box.
1. Click **Generate Script**.
~~~

~~~
1.  Log on to the Active Directory server and open a command line window.
1.  Copy the script from the **Generated Script** window and paste it directly into the Active Directory server command-line window. The keytab is generated and stored in the directory under the file name that you specified as **Output File Name**.
1.  Use the file transfer utility of your choice to copy the keytab file from the Active Directory server to the NetScaler appliance and place it in the /nsconfig/krb directory.

#### To create the KCD account

At the command prompt, type the following command:

<!--NeedCopy-->
```add aaa kcdaccount <accountname>  – keytab <keytab>```

##### Example

To add a KCD account named kcdccount1, and use the keytab named kcdvserver.keytab, you would type the following commands:

<!--NeedCopy-->
~~~

add aaa kcdaccount kcdaccount1 –keytab kcdvserver.keytab

~~~
### To create the KCD account for SSO by delegation with a delegated user cert

At the command prompt, type the following command:

<!--NeedCopy-->
```add aaa kcdaccount <accountname> -realmStr <realm> -delegatedUser <user_nameSPN> -usercert <cert> -cacert <cacert>```

For the variables, substitute the following values:

-  **accountname**. A name for the KCD account.
-  **realmStr**. The realm for the KCD account, usually the domain for which SSO is configured.
-  **delegatedUser**. The delegated user name, in SPN format.
-  **usercert**. The full path and name of the delegated user certificate file on the NetScaler appliance. The delegated user certificate must contain both the client certificate and the private key, and must be in PEM format. If you use smart card
~~~

```
    authentication, you might need to create a smart card certificate template to allow certificates to be imported with the private key.
-  **cacert**. The full path to and name of the CA certificate file on the NetScaler appliance.

#### Example

To add a KCD account named kcdccount1, and use the keytab named kcdvserver.keytab, you would type the following command:

<!--NeedCopy-->
```

```
add aaa kcdaccount kcdaccount1 -realmStr EXAMPLE.COM
-delegatedUser “host/kcdvserver.example.com” -usercert /certs/usercert
-cacert /cacerts/cacert
```

```
## Setting up Active Directory for NetScaler appliance SSO

When you configure SSO by delegation, in addition to creating the KCDAccount on the NetScaler appliance, you must also create a matching Kerberos Service Account (KSA) on your LDAP active directory server, and configure the server for SSO. To create the KSA, use the account creation process on the active directory server. To configure SSO on the active directory server, open the properties window for the KSA. In the Delegation tab, enable the following options: Trust this user for delegation to specified services only and Use any Authentication protocol. (The Kerberos only option does not work, because it does not enable protocol transition or constrained delegation.) Finally, add the services that NetScaler appliance SSO will manage.

> **Note**
>
> If the Delegation tab is not visible in the KSA account properties dialog box, before you can configure the KSA as described, you must use the Microsoft
setspn command-line tool to configure the active directory server so that the tab is visible.

### To configure delegation for the Kerberos service account

1.  In the LDAP account configuration dialog box for the Kerberos service account that you created, click the **Delegation** tab.
1.  Choose "Trust this user for delegation to the specified services only".
```

```
1.  Under "Trust this user for delegation to the specified services only," choose "Use any authentication protocol".
1.  Under “Services to which this account can present delegated credentials,” click **Add.**
1.  In the **Add Services** dialog box, click **Users** or **Computers**, choose the server that hosts the resources to be assigned to the service account, and then click **OK.**
    > **Note**
    >
    > Constrained delegation does not support services hosted in domains other than the domain assigned to the account, even though Kerberos might have a trust relationship with other domains
1.  Back in the **Add Services** dialog box, in the **Available Services** list, choose the services assigned to the service account. NetScaler appliance SSO supports the HTTP and MSSQLSVC services.
1.  Click **OK.**
<!--NeedCopy-->
```

Generating the KCD keytab script

September 21, 2020

The KCD Keytab Script dialog box generates the keytab script, which in turn generates the keytab file necessary to configure KCD on the NetScaler appliance.

To generate the KCD keytab script by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic.**
2. In the details pane, under **Kerberos Constrained Delegation**, click Batch file to generate keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) **Keytab Script** dialog box, fill out the fields as described below.
   - **Domain User Name:** The name of the domain user.
   - **Domain Password:** The password for the domain user.
   - **Service Principal:** The service principal.
   - **Output File Name:** A filename for the KCD script file.
   - **Create Domain User Account:** Select this check box to create the specified domain user account.

4. Click **Generate Script** to generate the script. The script is generated, and appears in the **Generated Script** text box below the **Generate Script** button.
5. Copy the script, and save it as a file on your AD domain controller. You must now run this script on the domain controller to generate the keytab file, and then copy the keytab file to the /nsconfig/krb/ directory on the NetScaler appliance.
6. Click **OK.**

SAML authentication

September 21, 2020

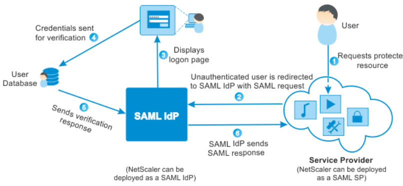
Security Assertion Markup Language (SAML) is an XML-based authentication mechanism that provides single sign-on capability and is defined by the OASIS Security Services Technical Committee.

Why SAML?

Consider a scenario in which a service provider (LargeProvider) hosts a number of applications for a customer (BigCompany). BigCompany has users that must seamlessly access these applications. In a traditional setup, LargeProvider would need to maintain a database of users of BigCompany. This raises some concerns for each of the following stakeholders:

- LargeProvider must ensure security of user data.
- BigCompany must validate the users and keep the user data up-to-date, not just in its own database, but also in the user database maintained by LargeProvider. For example, a user removed from the BigCompany database must also be removed from the LargeProvider database.
- A user has to log on individually to each of the hosted applications.

The SAML authentication mechanism provides an alternative approach. The following deployment diagram shows how SAML works.



Credentials sent
for verification ④
Displays
③ logon page
User
① Requests protected
resource
User
Database
Unauthenticated user is redirected

SAML IdP
⑥
SAML IdP sends
SAML response
Service Provider
(NetScaler can be deployed
as a SAML SP)
(NetScaler can be
deployed as a SAML IdP)

The concerns raised by traditional authentication mechanisms are resolved as follows:

- LargeProvider does not have to maintain a database for BigCompany users. Freed from identity management, LargeProvider can concentrate on providing better services.
- BigCompany does not bear the burden of making sure the LargeProvider user database is kept in sync with its own user database.

- A user can log on once, to one application hosted on LargeProvider, and be automatically logged on to the other applications that are hosted there.

The NetScaler appliance can be deployed as a SAML Service Provider (SP) and a SAML Identity Provider (IdP). Read through the relevant topics to understand the configurations that must be performed on the NetScaler appliance.

A NetScaler appliance configured as a SAML service provider can now enforce an audience restriction check. The audience restriction condition evaluates to "Valid" only if the SAML replying party is a member of at least one of the specified audiences.

You can configure a NetScaler appliance to parse attributes in SAML assertions as group attributes. Parsing them as group attributes enables the appliance to bind policies to the groups.

> **Note**
>
> A NetScaler appliance MPX FIPS appliance used as a SAML service provider now supports encrypted assertions. Also, a NetScaler appliance MPX FIPS appliance functioning as a SAML service provider or a SAML identity provider can now be configured to use the SHA2 algorithms on FIPS hardware.

Configuring FIPS offload support using the command line interface

1. Add SSL FIPS

   add ssl fipsKey fips-key

2. Create a CSR and use it at CA server to generate a certificate. You can then copy the certificate in **/nsconfig/ssl**. Let's assume that the file is *fips3cert.cer*.

   ```
   add ssl certKey fips-cert -cert fips3cert.cer -fipsKey fips-key<!--
   NeedCopy-->
   ```

3. Specify this certificate in the SAML action for SAML SP module

   ```
   set samlAction <name> -samlSigningCertName fips-cert<!--NeedCopy-->
   ```

4. Use the certificate in samlIdpProfile for SAML IDP module

   ```
   set samlidpprofile fipstest -samlIdpCertName fips-cert<!--NeedCopy-->
   ```

The following table lists some articles that are specific to deployments where the NetScaler appliance is used as a SAML SP or a SAML IdP.

SAML SP	SAML IdP	Information Link
NetScaler	Citrix AppController Z3	Citrix Support
NetScaler	CloudGateway	Citrix Support

SAML SP	SAML IdP	Information Link
NetScaler	Microsoft AD FS 2.0	Citrix Support
NetScaler	Shibboleth	Citrix Support
NetScaler	Shibboleth (With SAML single logout configuration)	Citrix Support
Siteminder	NetScaler	Citrix Support
ShareFile	NetScaler	Citrix Support

NetScaler appliance as a SAML SP

June 9, 2021

The SAML Service Provider (SP) is a SAML entity that is deployed by the service provider. When a user tries to access a protected application, the SP evaluates the client request. If the client is unauthenticated (does not have a valid NSC_TMAA or NSC_TMAS cookie), the SP redirects the request to the SAML Identity Provider (IdP).

The SP also validates SAML assertions that are received from the IdP.

When the NetScaler appliance is configured as an SP, all user requests are received by a traffic management virtual server (load balancing or content switching) that is associated with the relevant SAML action.

The NetScaler appliance also supports POST and Redirect bindings during logout.

> **Note**
>
> A NetScaler appliance can be used as a SAML SP in a deployment where the SAML IdP is configured either on the appliance or on any external SAML IdP.

When used as a SAML SP, a NetScaler appliance:

- Can extract the user information (attributes) from the SAML token. This information can then be used in the policies that are configured on the NetScaler appliance. For example, if you want to extract the GroupMember and emailaddress attributes, in the SAMLAction, specify the **Attribute2** parameter as GroupMember and the **Attribute3** parameter as emailaddress.

  > **Note**
  >
  > Default attributes such as username, password, and logout URL must not be extracted in attributes 1 to 16, because they as are implicitly parsed and stored in the session.

- Can extract attribute names of upto 127 bytes from an incoming SAML assertion. The previous limit was 63 bytes. Support introduced in NetScaler 11.0 Build 64.x.
- Supports post, redirect, and artifact bindings. Support for redirect and artifact bindings is introduced in NetScaler 11.0 Build 55.x.

  > **Note**
  >
  > Redirect binding should not be used for large amount of data, when the assertion after inflate or decoding is greater than 10K.

- Can decrypt assertions. Support introduced in NetScaler 11.0 Build 55.x.
- Can extract multi-valued attributes from a SAML assertion. These attributes are sent is nested XML tags such as:

  <AttributeValue> <AttributeValue>Value1</AttributeValue>
  <AttributeValue>Value2</AttributeValue>
  </AttributeValue>

  When presented with above XML, the NetScaler appliance can extract both Value1 and Value2 as values of a given attribute, as opposed to the old firmware that extracts only Value1.

  > **Note**
  >
  > Support introduced in NetScaler 11.0 Build 64.x.

- Can specify the validity of a SAML assertion.

  If the system time on NetScaler appliance SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

  This duration, called the "skew time," specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

  > **Note**
  >
  > Support introduced in NetScaler 11.0 Build 64.x.

- Can send additional attribute called 'ForceAuth' in the authentication request to external IDP (Identity Provider). By default, the ForceAuthn is set to 'False'. It can be set to 'True' to suggest IDP to force authentication despite existing authentication context. Additionally, NetScaler appliance SP does authentication request in query parameter when configured with artifact binding.

To configure the NetScaler appliance as a SAML SP by using the command line interface

1. Configure a SAML SP action.

Example

The following command adds a SAML action that redirects unauthenticated user requests.

```
add authentication samlAction SamlSPAct1 -samlIdPCertName nssp -samlRedirectUrl
 https://auth1.example.com -relaystateRule "AAA.LOGIN.RELAYSTATE.EQ(\"
https://lb.example1.com/\")"
```

Points to note

- Certificate provided for `-samlIdPCertName` in the samlAction command must match the corresponding certificate from IdP for the signature verification to succeed.
- Citrix recommends to have a full domain name with trailing '/' in the expression.
- Administrators must configure an expression for **relaysStateRule** in the samlAction command. The expression must contain the list of published domains that the user connects to before being redirected to the authentication virtual server. For example, the expression must contain the domains of the front-end virtual server (VPN, LB, or CS) that use this SAML action for authentication.

For more details on the command, see https://developer-docs.citrix.com/projects/citrix-adc-command-reference/en/latest/authentication/authentication-samlAction and https://support.citrix.com/article/CTX316577.

2. Configure the SAML policy.

   Example

   The following command defines a SAML policy that applies the above defined SAML action to all traffic.

   ```
   add authentication samlPolicy SamlSPPol1 ns_true SamlSPAct1
   ```

3. Bind the SAML policy to the authentication virtual server.

   Example

   The following command binds the SAML policy to a authentication virtual server named "av_saml".

   ```
   bind authentication vserver av_saml -policy SamlSPPol1
   ```

4. Bind the authentication virtual server to the appropriate traffic management virtual server.

   Example

   The following command adds a load balancing virtual server named "lb1_ssl" and associates the authentication virtual server named "av_saml" to the load balancing virtual server.

   ```
   add lb vserver lb1_ssl SSL 10.217.28.224 443 -persistenceType NONE -
   cltTimeout 180 -AuthenticationHost auth1.example.com -Authentication ON
    -authnVsName av_saml
   ```

To configure a NetScaler appliance as a SAML SP by using the graphical user interface

1. Configure the SAML action and policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, create a policy with SAML as the action type, and associate the required SAML action with the policy.

2. Associate the SAML policy with an authentication virtual server.

   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the SAML policy with the authentication virtual server.

3. Associate the authentication server with the appropriate traffic management virtual server.

   Navigate to **Traffic Management > Load Balancing** (or **Content Switching**) > **Virtual Servers**, select the virtual server, and associate the authentication virtual server with it.

NetScaler appliance as a SAML IdP

June 9, 2021

The SAML IdP (Identity Provider) is a SAML entity that is deployed on the customer network. The IdP receives requests from the SAML SP and redirects users to a logon page, where they must enter their credentials. The IdP authenticates these credentials with the user directory (external authentication server, such as LDAP) and then generates a SAML assertion that is sent to the SP.

The SP validates the token, and the user is then granted access to the requested protected application.

When the NetScaler appliance is configured as an IdP, all requests are received by an authentication virtual server that is associated with the relevant SAML IdP profile.

> **Note**
>
> A NetScaler appliance can be used as a IdP in a deployment where the SAML SP is configured either on the appliance or on any external SAML SP.

When used as a SAML IdP, a NetScaler appliance:

- Supports all authentication methods that it supports for traditional logons.
- Digitally signs assertions. Support for the SHA256 algorithm is introduced in NetScaler 11.0 Build 55.x.
- Supports single-factor and two-factor authentication. SAML must not be configured as the secondary authentication mechanism.

- Can encrypt assertions by using the public key of the SAML SP. This is recommended when the assertion includes sensitive information. Support introduced in NetScaler 11.0 Build 55.x.
- Can be configured to accept only digitally signed requests from the SAML SP. Support introduced in NetScaler 11.0 Build 55.x.
- Can log on to the SAML IdP by using the following 401-based authentication mechanisms: Negotiate, NTLM, and Certificate. Support introduced in NetScaler 11.0 Build 55.x.
- Can be configured to send 16 attributes in addition to the NameId attribute. The attributes must be extracted from the appropriate authentication server. For each of them, you can specify the name, the expression, the format, and a friendly name in the SAML IdP profile. Support introduced in NetScaler 11.0 Build 55.x.
- If the NetScaler appliance is configured as a SAML IdP for multiple SAML SP, a user can gain access to applications on the different SPs without explicitly authenticating every time. The NetScaler appliance creates a session cookie for the first authentication, and every subsequent request uses this cookie for authentication. Support introduced in NetScaler 11.0 Build 55.x.
- Can send multi-valued attributes in a SAML assertion. Support introduced in NetScaler 11.0 Build 64.x.
- Supports post and redirect bindings. Support for redirect bindings is introduced in NetScaler 11.0 Build 64.x.
- Can specify the validity of a SAML assertion.

  If the system time on NetScaler appliance SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

  This duration, called the "skew time," specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

  > **Note**
  >
  > Support introduced in NetScaler 11.0 Build 64.x.

- Can be configured to serve assertions only to SAML SPs that are pre-configured on or trusted by the IdP. For this configuration, the SAML IdP must have the service provider ID (or issuer name) of the relevant SAML SPs. Support introduced in NetScaler 11.0 Build 64.x.

  > **Note**
  >
  > Before proceeding, make sure that you have an authentication virtual server that is linked to an LDAP authentication server.

To configure a NetScaler appliance as a SAML IdP by using the command line interface

1. Configure a SAML IdP profile.

   Example

   Adding Citrix ADC appliance as an IdP with SiteMinder as the SP.

   ```
   add authentication samlIdPProfile samlIDPProf1 -samlSPCertName siteminder
   -cert -encryptAssertion ON -samlIdPCertName ns-cert -assertionConsumerServiceURL
    http://sm-proxy.nsi-test.com:8080/affwebservices/public/saml2assertionconsumer
    -rejectUnsignedRequests ON -signatureAlg RSA-SHA256 -digestMethod
   SHA256 -acsUrlRule AAA.LOGIN.SAML_REQ_ACS_URL.REGEX_MATCH(re##^https://
   example2\.com/cgi/samlauth$##)
   ```

   Points to note

   - In SAML IdP profile, configure **acsURLRule** that takes an expression of the list of applicable service provider URLs for this IdP. This expression depends on the SP being used. If Citrix ADC is configured as SP, ACS URL will be `https://<SP-domain_name>/cgi/samlauth`. Citrix recommends having a full URL in the expression for matching.
   - You must specify the starting of the domain with "^" sign (example: ^https) along with the dollar sign "$" at the end of the string (example: samlauth$).

   For more details on the command, see https://developer-docs.citrix.com/projects/citrix-adc-command-reference/en/latest/authentication/authentication-samlAction and https://support.citrix.com/article/CTX316577.

2. Configure the SAML authentication policy and associate the SAML IdP profile as the action of the policy.

   ```
   add authentication samlIdPPolicy samlIDPPol1 -rule ns\\_true -action
   samlIDPProf1
   ```

3. Bind the policy to the authentication virtual server.

   ```
   bind authentication vserver saml-auth-vserver -policy samlIDPPol1 -
   priority 100
   ```

To configure a NetScaler appliance as a SAML IdP by using the graphical user interface

1. Configure the SAML IdP profile and policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with SAML IdP as the action type, and associate the required SAML IdP profile with the policy.

2. Associate the SAML IdP policy with an authentication virtual server.

   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the SAML IdP policy with the authentication virtual server.

Configuring SAML single sign-on

September 21, 2020

To provide single sign-on capabilities across applications that are hosted on the service provider, you can configure SAML single sign-on on the SAML SP.

Configuring SAML single sign-on by using the command line interface

1. Configure the SAML SSO profile.

   Example

   In the following command, Example is the load balancing virtual server that has a web link from the SharePoint portal. Nssp.example.com is the Traffic Management virtual server that is load balancing the SharePoint server.

   ```
   add tm samlSSOProfile tm-saml-sso -samlSigningCertName nssp -assertionConsumerSer
    "https://nssp2.example.com/cgi/samlauth"-relaystateRule "\\"https://
   nssp2.example.com/samlsso.html\\"" -sendPassword ON -samlIssuerName
   nssp.example.com<!--NeedCopy-->
   ```

2. Associate the SAML SSO profile with the traffic action.

   Example

   The following command enables SSO and binds the SAML SSO profile created above to a traffic action.

   ```
   add tm trafficAction html\\_act -SSO ON -samlSSOProfile tm-saml-sso<!--
   NeedCopy-->
   ```

3. Configure the traffic policy that specifies when the action must be executed.

   Example

   The following command associates the traffic action with a traffic policy.

   ```
   add tm trafficPolicy html_pol "HTTP.REQ.URL.CONTAINS(\\"abc.html\\")"
   html_act<!--NeedCopy-->
   ```

4. Bind the traffic policy created above to a traffic management virtual server (load balancing or content switching). Alternatively, the traffic policy can be associated globally.

> **Note**
>
> This traffic management virtual server must be associated with the relevant authentication virtual sever that is associated with the SAML action.

```
bind lb vserver lb1_ssl -policyName html_pol -priority 100 -gotoPriorityExpressio
 END -type REQUEST<!--NeedCopy-->
```

Configuring SAML single sign-on by using the graphical user interface

1. Define the SAML SSO profile, the traffic profile, and the traffic policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Traffic**, select the appropriate tab, and configure the settings.

2. Bind the traffic policy to a traffic management virtual server or globally to the NetScaler appliance.

OAuth authentication

September 21, 2020

The AAA traffic management feature now supports OAuth and OpenID-Connect mechanisms for authenticating and authorizing users to applications that are hosted on applications such as Google, Facebook, and Twitter.

The authentication mehanism facilitates the inline verification of OpenID tokens. The NetScaler appliance can be configured to obtain certificates and verify signatures on the token.

A major advantage of using the OAuth and OpenID-Connect mechanisms is that the user information is not sent to the hosted applications and therefore the risk of identity theft is considerably reduced.

The NetScaler appliance configured for AAA now accepts incoming tokens that are signed using HMAC HS256 algorithm. In addition, the public keys of the SAML Identity Provider (IdP) are read from a file, instead of learning from an URL endpoint.

In the NetScaler appliance implementation, the application to be accessed is represented by the AAA traffic management virtual server. So, to configure OAuth, you must configure an OAuth policy which must then be associated with a AAA traffic management virtual server.

> **Note**
>
> OAuth on NetScaler appliance is currently qualified for all SAML IdPs that are compliant with "OpenID connect 2.0".

To configure OAuth by using the configuration utilty:

1. Configure the OAuth action and policy.
   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with OAuth as the action type, and associate the required OAuth action with the policy.
2. Associate the OAuth policy with an authentication virtual server.
   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the OAuth policy with the authentication virtual server.

> **Note**
>
> Attributes (1 to 16) can be extracted in the OAuth response. Currently these attributes are not evalauted. They are added for the future reference.

To configure OAuth by using the command line interface:

1. Define an OAuth action.

   ```
   add authentication OAuthAction <name> -authorizationEndpoint <URL>
    -tokenEndpoint <URL> [-idtokenDecryptEndpoint <URL>] -clientID <
   string> -clientSecret <string> [-defaultAuthenticationGroup <string
   >][-tenantID <string>][-GraphEndpoint <string>][-refreshInterval
   <positive_integer>] [-CertEndpoint <string>][-audience <string>][-
   userNameField <string>][-skewTime <mins>][-issuer <string>][-Attribute1
    <string>][-Attribute2 <string>][-Attribute3 <string>]...<!--NeedCopy
   -->
   ```
2. Associate the action with an advanced authentication policy.
   "'add authentication Policy** -rule -action

   ~~~~
   **Example**
   ```preblock
   add authentication oauthAction a -authorizationEndpoint https://
       example.com/ -tokenEndpoint https://example.com/ -clientiD sadf
        -clientsecret df<!--NeedCopy-->
   ~~~~

For more information on authentication OAuthAction parameters, see "authentication OAuthAction".

> **Note**
>
> When a certEndpoint is specified, the NetScaler appliance polls that endpoint at the configured frequency to learn the keys. To configure a NetScaler appliance to read the local file and parse keys from that file, a new configuration option is introduced as follows.

```
set authentication OAuthAction <> -**CertFilePath** <path to local file
with jwks><!--NeedCopy-->
```

Multi-Factor (nFactor) authentication

September 21, 2020

> **Important**
>
> Supported from NetScaler 11.0 Build 62.x onwards.

Multi-factor authentication enhances the security of an application by requiring users to provide multiple proofs of identify to gain access. The NetScaler appliance provides an extensible and flexible approach to configuring multi-factor authentication. This approach is called *nFactor authentication*.

With nFactor authentication you can:

- Configure any number of authentication factors.
- Base the selection of the next factor on the result of executing the previous factor.
- Customize the login interface. For example, you can customize the label names, error messages, and help text.
- Extract user group information without doing authentication.
- Configure pass-through for an authentication factor. This means that no explicit login interaction is required for that factor.
- Configure the order in which different types of authentication are applied. Any of the authentication mechanisms that are supported on the NetScaler appliance can be configured as any factor of the nFactor authentication setup. These factors are executed in the order in which they are configured.
- Configure the NetScaler appliance to proceed to an authentication factor that must be executed when authentication fails. To do so, you configure another authentication policy with the exact same condition, but with the next highest priority and with the action set to "NO_AUTH". You must also configure the next factor, which must specify the alternative authentication mechanism to apply.

For a nFactor benefit, see One Public IP for AAA-TM Deployments on NetScaler.

Sample deployments using nFactor authentication:

- Getting two passwords up-front, pass-through in next factor. Read
- Group extraction followed by certificate or LDAP authentication, based on group membership. Read
- SAML followed by LDAP or certificate authentication, based on attributes extracted during SAML. Read
- SAML in first factor, followed by group extraction, and then LDAP or certificate authentication, based on groups extracted. Read
- Prefilling user name from certificate. Read

- Certificate authentication followed by group extraction for 401 enabled traffic management virtual servers. Read
- Username and 2 passwords with group extraction in third factor. Read
- Certificate fallback to LDAP in same cascade; one virtual server for both certificate and LDAP authentication. Read
- LDAP in first factor and WebAuth in second factor. Read
- Domain drop down in first factor, then different policy evaluations based on group. Read

How to configure nFactor authentication

September 21, 2020

The primary entity used for nFactor authentication is called a *login schema*.

A login schema specifies an authentication schema XML file that defines the manner in which the login form will be rendered. Considering the interaction that the user must have when logging in to the application, you can create a single file for multiple factors or different files for different factors. View sample XML file.

- **Single file for multiple factors.** User will be provided a single form in which to provide credentials for multiple authentication factors.

- **Different files for different factors.** User will be provided a different form for each authentication factor.

Next, you must associate the XML file(s) with login schema(s). You can also specify expressions to extract the user name and the password from the login form.

> **Tip**
>
> You can configure an authentication factor to be pass-through. This means that the user is not required to provide credentials explicitly and there is no login form for that factor. The credentials are either taken from the previous factor or the user name and/or password are dynamically extracted by using the username/password expressions that are configured for that login schema. You must set the login schema to "NOSCHEMA", instead of an XML file.

Now that the login schemas are configured, you must specify the manner in which they must be invoked. A login schema can be invoked by using either a login schema policy or an authentication policy label. The decision depends on the following:

- **Login schema policy.**
  - Specifies the condition on which the login form must be presented to the user.
  - Must be bound to an authentication virtual server.

  - In an authentication virtual server that has multiple login schema policies, the policy with the highest priority that evaluates to true is executed. That is, the login form associated with that policy is presented to the user.
  - The login schema policy is only used to present the first login form.
- **Authentication policy label.**
  - Specifies a collection of authentication policies for a particular factor. Each policy label corresponds to a single factor.
  - Specifies the login form that must be presented to the user.
  - Must be bound as the next factor of an authentication policy or of another authentication policy label.
  - Typically, a policy label includes authentication policies for a specific authentication mechanism. However, you can also have a policy label that has authentication policies for different authentication mechanisms.

To summarize, the configurations you must perform to set up nFactor authentication are as follows:

1. Create the authentication schema XML files.
2. Associate each XML file with a login schema.
3. Associate each login schema with a login schema policy or authentication policy label.
4. Bind login schema policy to an authentication virtual server.
5. Bind authentication policy label, as next factor, to an authentication policy.

How nFactor authentication works

September 21, 2020

Imagine a user requesting access to an application that requires user credentials. As is the case in NetScaler appliance deployments, the request arrives at the NetScaler appliance through a traffic management virtual server (in this case, a load balancing virtual server). Since the user must provide authentication credentials, the load balancing virtual server redirects the request to the authentication virtual server, which does the following:

1. Checks to determine whether any login schema policies are associated with the authentication virtual server.

   - If yes, the user is presented the login form associated with the login schema policy with the highest priority that evaluates to true.

   - If no, the default login form is presented to the user.

   > **Note**
   >
   > The default login schema files are available in the */nsconfig/loginschema/LoginSchema/*

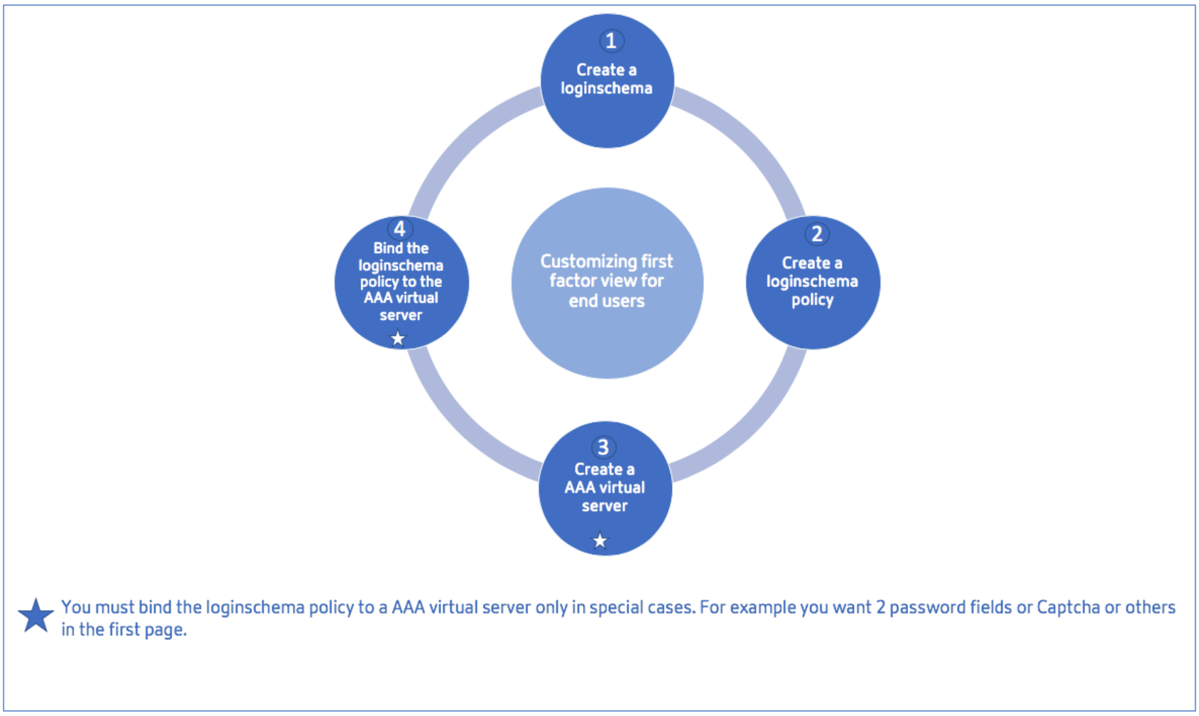
> directory of the NetScaler appliance. Citrix recommends that you copy these files to the */nsconfig/loginschema/* directory before using them, so that changes made to the files are preserved post reboot.

2. The authentication policies that are associated with the authentication virtual server are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.
3. The policy label that is associated as the next factor is invoked.
4. The authentication policies that are associated with the authentication policy label are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.
5. The policy label that is associated as the next factor is invoked.
6. Steps 4 and 5 are performed repetitively till all the configured next factors are executed.

Configuring nFactor authentication

September 21, 2020

The following diagram illustrates the high-level steps involved in nfactor configuration.



1 Create a loginschema
2 Create a loginschema policy
3 Create a AAA virtual server ★
4 Bind the loginschema policy to the AAA virtual server ★
Customizing first factor view for end users
★ You must bind the loginschema policy to a AAA virtual server only in special cases. For example you want 2 password fields or Captcha or others in the first page.

To understand the step-wise configurations for nFactor authentication, let us consider a 2-factor authentication deployment where the 1st factor is LDAP authentication and the 2nd factor is RADIUS authentication.

This sample deployment requires the user to login to both factors using a single login form. Therefore, we define a single login form that accepts two passwords. The first password is used for LDAP authentication and the other for RADIUS authentication. View XML file.

Here are the configurations that are performed.

1. Configure the load balancing virtual server for authentication

   ```
   add lb vserver lbvs55 HTTP 1.217.193.55 80 -AuthenticationHost auth56.aaatm.com -Authentication ON
   ```

2. Configure the authentication virtual server.

   ```
   add authentication vserver auth56 SSL 1.217.193.56 443 -AuthenticationDomain aaatm.com
   ```

3. Configure the login schema for the login form and bind it to a login schema policy.

   ```
   add authentication loginSchema login1 -authenticationSchema login-2passwd.xml -userCredentialIndex 1 -passwordCredentialIndex 2
   ```

   ```
   add authentication loginSchemaPolicy login1 -rule true -action login1
   ```

4. Configure a login schema for the pass-through and bind it to a policy label

   ```
   add authentication loginSchema login2 -authenticationSchema noschema
   ```

   ```
   add authentication policylabel label1 -loginSchema login2
   ```

5. Configure the LDAP and RADIUS policies.

   ```
   add authentication ldapAction ldapAct1 -serverIP 1.217.28.180 -ldapBase “dc=aaatm, dc=com” -ldapBindDn administrator@aaatm.com -ldapBindDnPassword 71ca2b11ad800ce2787fb7deb5484
   -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName samAccountName -groupAttrName memberOf -subAttributeName CN
   ```

   ```
   add authentication Policy ldap -rule true -action ldapAct1
   ```

   ```
   add authentication radiusAction radius -serverIP 1.217.22.20 -radKey a740d6a0aeb3288fa0a6fbe932d329a
   -encrypted -encryptmethod ENCMTHD_3 -radNASip ENABLED -radNASid NS28.50 -radAttributeType 11 -ipAttributeType 8
   ```

   ```
   add authentication Policy radius -rule true -action radius
   ```

6. Bind the login schema policy to the authentication virtual server

   ```
   bind authentication vserver auth56 -policy login1 -priority 1 -gotoPriorityExpression END
   ```

7. Bind the LDAP policy (first factor) to the authentication virtual server.

   ```
   bind authentication vserver auth56 -policy ldap -priority 1 -nextFactor label1 -gotoPriorityExpression next
   ```

8. Bind the RADIUS policy (second factor) to the authentication policy label.

   bind authentication policylabel label1 -policyName radius -priority 2 -gotoPriorityExpression end

Configuration support for SameSite cookie attribute

September 21, 2020

The SameSite attribute indicates the browser whether the cookie can be used for cross-site context or only for same-site context. Also, if an application intends to be accessed in cross-site context then it can do so only via HTTPS connection. For details, see RFC6265.

Until Feb 2020, the SameSite attribute was not explicitly set in Citrix ADC. The browser took the default value (None). The non-setting of SameSite attribute did not impact the Citrix Gateway and Citrix ADC AAA deployments.

With certain browsers upgrade, such as Google Chrome 80, there is a change in the default cross-domain behavior of cookies. The SameSite attribute can be set to one of the following values. Default value for Google Chrome is set to Lax. For certain version of other browsers, the default value for SameSite attribute might still be set to None.

- **None**: Indicates the browser to use cookie in cross-site context only on secure connections.
- **Lax**: Indicates the browser to use cookie for requests on the same-site context. In cross-site context, only safe HTTP methods like GET request can use the cookie.
- **Strict**: Use the cookie only in the same site context.

If there is no SameSite attribute in the cookie, the Google Chrome assumes the functionality of SameSite = Lax.
As a result, for deployments within an iframe with cross-site context that require cookies to be inserted by the browser, Google Chrome does not share cross site cookies. As a result, the iframe within the website might not load.

Configure SameSite cookie attribute

A new cookie attribute named SameSite is added to the VPN and Citrix ADC AAA virtual servers. This attribute can be set at the global level and at the virtual server level.

To configure SameSite attribute, you must perform the following:

1. Set the SameSite attribute for the virtual server
2. Bind cookies to the patset (if the browser drops cross-site cookies)

Setting the SameSite attribute by using the CLI

To set the SameSite attribute at the virtual server level, use the following commands.

```
set vpn vserver VP1 -SameSite  [ STRICT | LAX | None ]
set aaa vserver VP1 -SameSite  [ STRICT | LAX | None ]
<!--NeedCopy-->
```

To set the SameSite attribute at the global level, use the following commands.

```
set vpn param VP1 -SameSite  [ STRICT | LAX | None ]
set aaa param VP1 -SameSite  [ STRICT | LAX | None ]
<!--NeedCopy-->
```

Note: The virtual server level setting takes preference over the global level setting. Citrix recommends setting the SameSite cookie attribute at the virtual server level.

Binding cookies to the patset by using the CLI

If the browser drops cross-site cookies, you can bind that cookie string to the existing ns_cookies_SameSite patset so that the SameSite attribute is added to the cookie.

Example:

```
bind patset ns_cookies_SameSite "NSC_TASS"
bind patset ns_cookies_SameSite "NSC_TMAS"
<!--NeedCopy-->
```

Setting the SameSite attribute by using the GUI

To set the SameSite attribute at the virtual server level:

1. Navigate to **Security > AAA – Application Traffic > Virtual Servers.**
2. Select a virtual server and click **Edit**.
3. Click the edit icon in the **Basic Setting**s section and click **More**.
4. In **SameSite**, select the option as required.

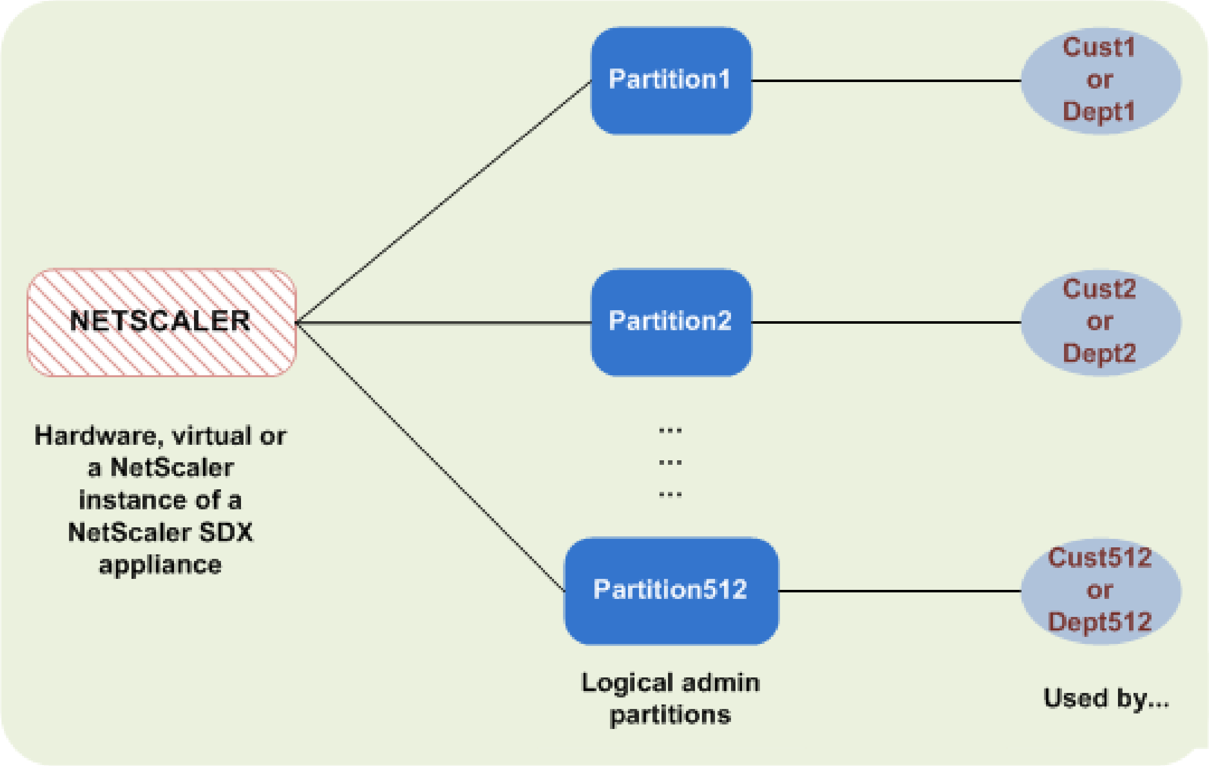
Admin Partitioning

September 21, 2020

A NetScaler appliance can be partitioned into logical entities called admin partitions, where each partition can be configured and used as a separate NetScaler appliance. The following figure shows the partitions of a NetScaler being used by different customers and departments:



NETSCALER
Hardware, virtual or a NetScaler instance of a NetScaler SDX appliance
Partition1
Partition2
...
...
...
Partition512
Logical admin partitions
Cust1 or Dept1
Cust2 or Dept2
Cust512 or Dept512
Used by...

A partitioned NetScaler appliance has a single default partition and one or more admin partitions. The following table provides further details on the two partition types:

> **Note**
>
> In a partitioned appliance, the mode BridgeBPDUs can be enabled only in the default partition and not in the administrative partitions.

Default Partition

Admin Partitions

Availability:

The NetScaler appliance ships with a single partition, which is called a default partition. The default partition is retained even after the NetScaler appliance is partitioned.

Must be explicitly created as described in Configure admin partitions.

Number of Partitions:

One

A NetScaler appliance can have one or more (maximum of 512) admin partitions.

User Access and Roles:

The default partition can be accessed and configured by all NetScaler users who are not associated with a *partition-specific* command policy. As always, the operations that a user can perform are restricted by the associated command policy.

Can be created only by NetScaler superusers who also specify the users for that partition. Only superusers and associated users of the partition can access and configure the admin partition.

Note: Partition users do not have shell access.

File Structure:

All files in a default partition are stored in the default NetScaler file structure.

For example, the NetScaler configuration file is stored in the */nsconfig* directory and NetScaler logs are stored in the */var/log/* directory.

All files in an admin partition are stored in directory paths that have the name of the admin partition.

For example, the NetScaler configuration file (ns.conf) is stored in the */nsconfig/partitions/<partitionName>* directory. Other partition-specific files are stored in the */var/partitions/<partitionName>* directories.

Some other paths in an admin partition:

- Downloaded files: */var/partitions/<partitionName>/download/*
- Log files: */var/partitions/<partitionName>/log/*

Note: Currently, logging is not supported at partition-level. Therefore, this directory is empty and all logs are stored in the */var/log/* directory.

- SSL CRL certificate related files: */var/partitions/<partitionName>/netscaler/ssl*

Resources Available:

All NetScaler resources.

NetScaler resources that are explicitly assigned to the admin partition.

User access and roles

In authenticating and authorizing a partitioned NetScaler appliance, a root administrator can assign a partition administrator to one or more partitions. The partition administrator can authorize users to that partition without affecting other partitions. These are partition users and they are authorized to access only that partition using SNIP address. Both the root administrator and the partition administrator can configure role based access (RBA by authorizing users to access different applications.

Administrators and user roles can be described as follows:

Root Administrator. Accesses the partitioned appliance through its NSIP address and can grant user access to one or more partitions. The administrator can also assign partition administrators to one or more partitions. The administrator can create a partition administrator from the default partition using a NSIP address or switch to a partition and then create a user and assign partition admin access using a SNIP address.

Partition Administrator. Accesses the specified partition through a NSIP address assigned by the root administrator. The administrator can assign role-based access to partition user access to that partition and also configure external server authentication using partition specific configuration.

System User. Accesses partitions through the NSIP address. Has access to the partitions and resources specified by the root administrator.

Partition User. Accesses a partition through a SNIP address. This user account is created by the partition administrator and the user has access to resources, only within the partition.

Points to remember

Following are some points to remember when providing role-based access in a partition.

1. NetScaler users accessing the GUI through NSIP address will use default partition authentication configuration to log on to the appliance.
2. Partition system users accessing the GUI through partition SNIP address will use partition specific authentication configuration to log on to the appliance.
3. Partition user created in a partition cannot login using NSIP address.
4. NetScaler user bound to a partition cannot login using partition SNIP address.
5. External users accessing a partition through external server configuration as LDAP, Radius, or TACACS added in the partition. The user must access using SNIP address to directly log onto the partition.

Use case for managing role Based access in an partitioned setup

Consider a scenario where an enterprise organization, www.example.com has multiple business units and a centralized administrator who manages all instances in their network. However, they want to provide exclusive user privileges and environment for each business unit.

Following are the administrators and users managed by default partition authentication configuration and partition specific configuration in a partitioned appliance.

John: Root Administrator

George: Partition Administrator

Adam: System User

Jane: Partition User

John, is the root administrator of a partitioned NetScaler appliance. John manages all user accounts and administrative user accounts across partitions (for example, P1, P2, P3, P4, and P5) within the appliance. He provides granular role-based access to entities from the default partition of the appliance. John creates user accounts and assigns partition access to each account. George being a network engineer within the organization prefers to have a role based access to few applications running on partition P2. Based on user management, John creates a partition administrator role for George and associates his user account with partition-admin command policy in P2 partition. Adam being another network engineer prefers to access an application running on P2. John creates a system user account for Adam and associates his user account to P2 partition. Once his account is created, Adam can log into the appliance to access the NetScaler Management interface through NSIP address and can switch to partition P2 based on user/group binding.

Suppose, Jane who is another network engineer wants to directly access an application running only on partition P2, George (partition administrator) can create a partition user account for her and associate her account with command policies for authorization privileges. Jane's user account created within the partition is now directly associated with P2. Now Jane can access the NetScaler Management interface through SNIP address and cannot switch to any other partition.

> **Note**
>
> If Jane's user account is created by a partition administrator in partition P2, she can access the NetScaler Management interface only through SNIP address (created within the partition) and not permitted to access the interface through NSIP address. Similarly, if Adam's user account is created by a root administrator in the default partition and is bound to P2 partition, he can access the NetScaler Management interface only through NSIP address or SNIP address created in the default partition (with management access enabled) and not permitted to access the partition interface through SNIP address created in the administrative partition.

Configure roles and responsibilities for partition administrators

Following are the configurations performed by a root administrator in a default partition.

Creating administrative partitions and system users – A root administrator creates administrative partitions and system users in the default partition of the appliance. The administrator then associates the users to different partitions. If you are bound to one or more partitions, you can switch from one partition to another based on user bindings. Also, your access to one or more bound partitions is authorized only by the root administrator.

Authorizing system user as partition administrator for a specific partition – Once a user account is created, the root administrator switches to a specific partition and authorizes the user as the partition administrator. This is done by assigning partition-admin command policy to the user account. Now, the user can access the partition as partition administrator and manage entities within the partition.

Following are the configurations perform by a partition administrator in an administrative partition.

Configuring SNIP address in an administrative partition- The partition administrator logs on to the partition and creates a SNIP address and provides management access to the address.

Creating and Binding a Partition System User with Partition Command Policy -The partition administrator creates partition users and defines the scope of user access. This is done by binding the user account to partition command policies.

Creating and Binding a Partition System User Groups with Partition Command Policy -The partition administrator creates partition user groups and defines the scope of user group access. This is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

Following are the tasks performed in configuring role-based access for partition users in an Administrative Partition.

1. Creating an Administrative Partition – Before you create partition users in an administrative partition, you must first create the partition. As a root administrator, you can create a partition from the default partition using the configuration utility or a command line interface.
2. Switching user access from default partition to partition P2 – If you are partition administrator accessing the appliance from the default partition, you can switch from default partition to a specific partition (for example, partition P2) based on user binding.
3. Adding SNIP address to the Partition user account with Management access enabled-Once you have switched your access to an administration partition, you must create a SNIP address and provide management access to the address.
4. Creating and Binding a Partition System User with Partition Command Policy-If you are a partition administrator, you can create partition users and define the scope of user access. This is done by binding the user account to partition command policies.
5. Creating and Binding Partition user group with Partition Command Policy-If you are a partition administrator, you can create partition user groups and define the scope of user access control. This is done by bind the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

Benefits of using admin partitions

You can avail the following benefits by using admin partitions for your deployment:

- Allows delegation of administrative ownership of an application to the customer.
- Reduces the cost of ADC ownership without compromising on performance and ease-of-use.
- Safeguards from unwarranted configuration changes. In a non-partitioned NetScaler appliance, authorized users of other application could intentionally or unintentionally change

configurations that are required for your application. This could lead to undesirable behavior. This possibility is reduced in a partitioned NetScaler appliance.

- Isolates traffic between different applications by the use of dedicated VLANs for each partition.
- Accelerates and allows to scale application deployments.
- Allows application-level or localized management and reporting.

Let us analyze a couple of cases to understand the scenarios in which you can use admin partitions.

User case 1: How Admin partition is used in an enterprise network

Let us consider a scenario faced by a company named **Foo.com**.

- **Foo.com** has a single NetScaler.
- There are five departments and each department has one application that requires to be deployed with the NetScaler.
- Each application must be managed independently by a different set of users or administrators.
- Other users must be restricted from accessing the configurations.
- The application or back-end must be able to share resources like IP addresses.
- The global IT department must be able to control NetScaler-level settings which must be common to all partitions.
- Applications must be independent of one another. An error in configuration of one application must not affect the other.

A non-partitioned NetScaler would not be able to satisfy these requirements. However, you can achieve all these requirements by partitioning a NetScaler.

Simply create a partition for each of the applications, assign the required users to the partitions, specify a VLAN for each partition, and define global settings on the default partition.

Use case 2: How an admin partition is used by a service provider

Let us consider a scenario faced by a service provider named **BigProvider**:

- BigProvider has 5 customers: 3 small enterprises and 2 large enterprises.
- **SmallBiz**, **SmallerBiz**, and **StartupBiz** need only the most basic NetScaler functionality.
- **BigBiz** and **LargeBiz** are larger enterprises and have applications that attract a lot of traffic. They would like to use some of the more complex NetScaler functionality.

In a non-partitioned approach, the NetScaler administrator would typically use a NetScaler SDX appliance and provision a NetScaler instance for each customer.

This solution suits **BigBiz** and **LargeBiz** because their applications need the undiminished power of the entire non-partitioned NetScaler appliance. However, this solution might not be as cost effective for servicing **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

Therefore, **BigProvider** decides on the following solution:

- Using a NetScaler SDX appliance to bring up dedicated NetScaler instances for **BigBiz** and **LargeBiz**.
- Using a single NetScaler which is partitioned into three partitions, one each for **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

The NetScaler administrator (superuser) creates an admin partition for each of these customers, specifies the users for the partitions, specifies the NetScaler resources for the partitions, and specifies the VLAN to be used by the traffic that is destined for each of the partitions.

Supported NetScaler configurations

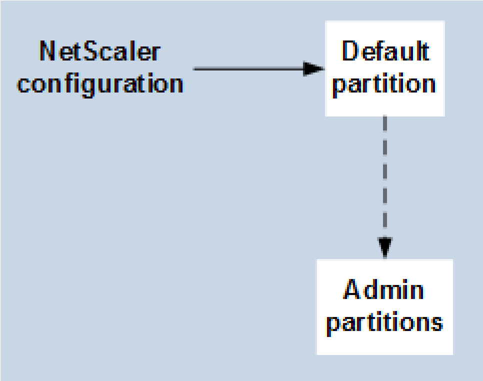
November 10, 2020

Depending on the NetScaler configuration and the partition in which the configuration is performed, NetScaler configurations can be categorized into the following three types of configurations.

> **Note**
>
> - Admin partitions cannot be set up on a NetScaler cluster. This means that a NetScaler cluster cannot be partitioned.
> - Admin partitions cannot be set up on a NetScaler MPX-FIPS appliance.
> - Case 3 lists the NetScaler features that are not supported in admin partitions.
> - Load balancing templates are not supported in admin partitions.

Case 1 (global configurations)

Configurations that can be performed ONLY in the default partition and which are available or impact all the admin partitions.

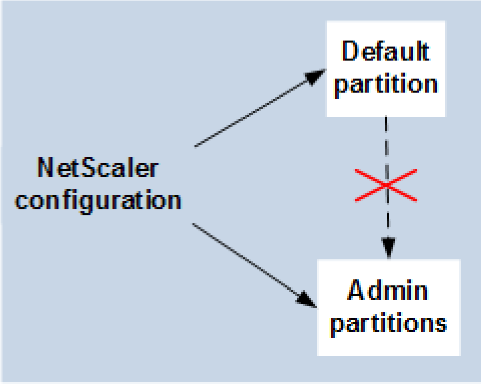


- Updates to built-in entities for monitors, TCP profiles, HTTP profiles, and so on.

- Updates to global parameters for syslog, nslog, weblog, content switching, IPSEC, SIP, DHCP, Surge protection, TCP buffering, and system collection.
- High availability (HA) configurations
- Interface and VLAN changes
- User configurations

Case 2 (partition-specific configurations)

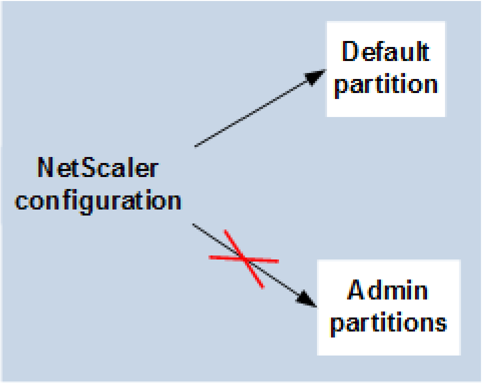
Configurations that can be performed independently in default and admin partitions. These configurations are applicable only to the partition in which they are performed.



- Getting traffic level statistics for a partition.
- Partition admin can update IP bindings for VLAN which is bound to that partition. But cannot update the interface bindings.
- Clearing NetScaler configurations.
- Feature-specific parameters for the following features: AppFlow, AppQoE, HTTP compression, DNS, TCP, HTTP, encryption, responder, rewrite, and SSL.
- Feature-specific configurations such as virtual servers, services, and monitors.

Case 3

Configu rations that cannot be performed on admin partitions. These features can be configured in the default partition, but there is no impact on admin partitions.



> **Note**
>
> Configurations that are supported on admin partitions for a particular release are marked as **Yes**.

Feature Component	Citrix ADC Feature	NetScaler 11.1	NetScaler 12.0	Citrix ADC 12.1	Citrix ADC 13.0

Configure admin partitions

September 21, 2020

> **Important**
>
> - Only superusers are authorized to create and configure admin partitions.
> - Unless specified otherwise, configurations to set up an admin partition must be done from the default partition.

By partitioning a NetScaler appliance, you are in-effect creating multiple instances of a single NetScaler appliance. Each instance has its own configurations and the traffic of each of these partitions is isolated from the other by assigning each partition a dedicated VLAN or a shared VLAN.

A partitioned NetScaler has one default partition and the admin partitions that are created. To set up an admin partition, you must first create a partition with the relevant resources (memory, maximum bandwidth, and connections). Then, specify the users that can access the partition and the level of authorization for each of the users on the partition.

Accessing a partitioned NetScaler is the same as accessing a non-partitioned NetScaler: through the NSIP address or any other management IP address. As a user, after you provide your valid logon credentials, you are taken to the partition to which you are bound. Any configurations that you create are saved to that partition. If you are associated with more than one partition, you are taken to the first partition with which you were associated. If you want to configure entities on one of your other partitions, you must explicitly switch to that partition.

After accessing the appropriate partition, configurations that you perform are saved to that partition and are specific to that partition.

> **Note**
>
> - NetScaler superusers and other non-partition users are taken to the default partition.
> - Users of all the 512 partitions can log in simultaneously.

Tip

To access a partitioned NetScaler appliance over HTTPS by using the SNIP (with management access enabled), make sure that each partition has the certificate of its partition administrator. Within the partition, the partition admin must do the following:

1. Add the certificate to the NetScaler.

   add ssl certKey ns-server-certificate -**cert** ns-server.cert -**key** ns-server.key

2. Bind it to a service named "nskrpcs-<SNIP>-3009", where <SNIP> must be replaced with the SNIP address, in this case 100.10.10.1.

   bind ssl service nskrpcs-100.10.10.1-3009 -**certkeyName** ns-server-certificate

Partition resource limiting

In a partitioned NetScaler appliance, a network administrator can create a partition with partition resources such as memory, bandwidth, and connection limit configured as unlimited. This is done by specifying Zero as the partition resource value, where Zero indicates the resource is unlimited on the partition and it can be consumed up to system limits. Partition resource configuration is useful when you migrate a traffic domain deployment to an administrative partition or if you do not know about resource allocation limit for a partition in a given deployment.

Resource limit for an administrative partition is as follows:

1. **Partition memory**. This is the maximum allocated memory for a partition. You must make sure to specify the values when creating a partition.

> **Note**
>
> From NetScaler 12.0 onwards, when you create a partition, you can set the memory limit to Zero. If a partition is already created with a specific memory limit, you can reduce the limit to any value or set the limit as Zero.

Parameter: maxMemLimit

Maximum memory is allocated in megabytes in a partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits.

Default value: 10

2. **Partition bandwidth**. Maximum allocated bandwidth for a partition. If you specify a limit, make sure it is within the appliance's licensed throughput. Otherwise, you are not limiting the bandwidth that can be used by the partition. The specified limit is accountable for the bandwidth that the application requires. If the application bandwidth exceeds the specified limit, packets are dropped.

   > **Note**
   >
   > From NetScaler 12.0 onwards, when you can create a partition, you can set the partition bandwidth limit to Zero. If a partition is already created with a specific bandwidth, you can reduce the bandwidth or set the limit as Zero.

   Parameter: maxBandwidth

   Maximum bandwidth is allocated in Kbps in a partition. A zero value indicates the bandwidth is unrestricted. That is, the partition can consume up to the system limits.

   Default value: 10240

   Maximum Value: 4294967295

3. **Partition connection**. Maximum number of concurrent connections that can be open in a partition. The value must accommodate the maximum simultaneous flow expected within the partition. The partition connections are accounted from the partition quota memory. Previously, the connections were accounted from the default partition quota memory. It is configured only on the client-side, not on the back-end server-side TCP connections. New connections cannot be established beyond this configured value.

   > **Note**
   >
   > From NetScaler 12.0 onwards, you can create a partition with number of open connections set to Zero. If you have already created a partition with a specific number of open connections, you can reduce the connection limit or set the limit as Zero.

   Parameter: maxConnections

Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on number of open connections.

Default value: 1024

Minimum value: 0

Maximum Value: 4294967295

Configure an admin partition

To configure an admin partition, complete the following tasks.

Access an admin partition

To access in an admin partition by using the command line interface

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The command prompt displays the name of the currently selected partition.
3. If yes, skip to the next step.
4. If no, get a list of the partitions with which you are associated and switch over to the appropriate partition.
    - **show system user** <username>
    - **switch ns partition** <partitionName>
5. Now, you can perform the required configurations just as a non-partitioned NetScaler.

To access an admin partition by using the configuration utility

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The top bar of the graphical user interface displays the name of the currently selected partition.
    - If yes, skip to the next step.
    - If no, navigate to **Configuration > System > Administrative Partitions > Partitions**, right-click the partition to which you want to switch, and select **Switch**.
3. Now, you can perform the required configurations just as a non-partitioned NetScaler.

Add an admin partition

The root administrator adds an administrative partition from the default partition and binds the partition with VLAN 2.

To create an administrative partition by using the command line interface

At the command prompt, type:

```
add partition <partitionname>
```

Switch user access from default partition to an admin partition

Now switch user access from default partition to partition Par1.

To switch a user account from default partition to an admin partition by using the command line interface:

At the command prompt, type:

```
Switch ns partition <pname>
```

Adding SNIP address to a partition user account with management access enabled

In the partition, create SNIP address with management access enabled.

To add SNIP address to the partition user account with management access enabled by using the command line interface:

At the command prompt, type:

```
> add ns ip <ip address> <subnet mask> -mgmtAccess enabled
```

Create and Bind a partition user with partition command policy

In partition, create a partition system user and bind the user with partition-admin command policies.

To create and bind a partition system user with partition command policy by using the command line interface:

At the command prompt, type:

```
> add system user <username> <password>
Done
```

Creating and binding partition user group with partition command policy

In Partition Par1, create a partition system user group and bind the group with partition command policy such as partition admin, partition read-only, partition-operator, or partition-network.

To create and bind a partition user group with partition command policy by using the command line interface:

```
> add system group <groupName>
> bind system group <groupname> (-userName | -policyName <cmdpolicy> <
    priority> | -partitionName)
```

Configuring external server authentication for external users

In partition Par1 you can configure an external server authentication to authenticate external TACACS users accessing the partition through SNIP address.

To configure external server authentication for external users by using the command line interface:

At the command prompt, type:

```
add authentication tacacsaction <name> -serverip <IP> -tacacsSecret <
    secret key> -authorization ON -accounting ON
add authentication policy <policname> -rule true -action <name>
bind system global <policyname> -priority <value>1
```

Configure a Partition System User Accounts in a Partition by using the GUI

To configure a partition user account in an administrative partition, you must create a partition user or a partition user group and bind it partition command policies. Also, you can configure the external server authentication for an external user.

To create a partition user account in a partition by using the GUI

Navigate to **System > User Administration**, click **Users** to add a partition system user and bind the user to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

To create a partition user group account in a partition by using the GUI

Navigate to **System > User Administration**, click **Groups** to add a partition system user group and bind the user group to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

To configure External server authentication for external users by using the GUI

Navigate to **System > Authentication > Basic Actions** and click **TACACS** to configure TACACS server for authenticating external users accessing the partition.

Sample Configuration

The following configuration shows how to create a partition user or a partition user group and bind it partition command policies. Also, how to configure the external server authentication for authenticating an external user.

```
add partition Par1
switch ns partition Par1
> add ns ip 10.102.29.203 255.255.255.0 -mgmtAccessenabled
> add system user John Password
> bind system user Jane partition-read-only -priority 1
> add system group Retail
> bind system group Retail -policyname partition-network 1 (where 1 is
   the priority number)
> bind system group Retail  - username Jane
> add authentication tacacssaction tacuser  - serverip 10.102.29.200  -
   tacacsSecret Password  - authorization ON  - accounting ON
> add authentication policy polname  - rule true  - action tacacsAction
> bind system global polname  - priority 1
```

Command Policies for a Partition Users and Partition User Groups in Administrative Partition

Commands to authorize an user account inside administrative partition	Command policies available inside an administrative partition (built-in policies)	User account access type
add system user	Partition-admin	SNIP (with management access enabled)
add system group	Partition-network	SNIP (with management access enabled)
add authentication <action, policy>, bind system global <policy name>	Partition-read-only	SNIP (with management access enabled)
remove system user	Partition-admin	SNIP(with management access enabled)

Commands to authorize an user account inside administrative partition	Command policies available inside an administrative partition (built-in policies)	User account access type
remove system group	Partition-admin	SNIP (with management access enabled)
bind system cmdpolicy to system user; bind system cmdpolicy to system group	Partition-admin	SNIP (with management access enabled)

Configure an LACP ethernet channel on the default admin partition

With Link Aggregation Control Protocol (LACP), you can combine multiple ports into a single, high-speed link (also called a channel). An LACP-enabled appliance exchanges LACP Data Units (LACPDU) over the channel.

There are three LACP configuration modes that you can enable in the default partition of a NetScaler appliance:

1. Active. A port in active mode sends LACPDUs. Link aggregation is formed if the other end of the Ethernet link is in the LACP active or passive mode.
2. Passive. A port in passive mode sends LACPDUs only when it receives LACPDUs. The link aggregation is formed if the other end of the Ethernet link is in the LACP active mode.
3. Disable. Link aggregation is not formed.

> **Note**
>
> By default, the link aggregation is disabled in the default partition of the appliance.

LACP exchanges LACPDU between devices connected by an Ethernet link. These devices are typically referred as an actor or partner.

A LACPDU data unit contains the following parameters:

- LACP Mode. Active, passive or disable.
- LACP timeout. The waiting period before timing out the partner or actor. Possible values: Long and Short. Default: Long.
- Port Key. To distinguish between the different channel. When key is 1, LA/1 is created. When key is 2, LA/2 is created. Possible values: Integer from 1 through 8. 4 through 8 is for cluster CLAG.
- Port Priority. Minimum value: 1. Maximum value: 65535. Default: 32768.
- System Priority. Uses this priority along with system MAC to form the system ID to uniquely identify the system during LACP negotiation with the partner. Sets system priority from 1 and 65535. The default value is set to 32768.

- Interface. Supports 8 interfaces per channel on NetScaler 10.1 appliance and supports 16 interfaces per channel on NetScaler 10.5 and 11.0 appliances.

After exchanging LACPDUs, the actor and partner negotiate the settings and decide whether to add the ports to the aggregation.

Configure and verify LACP

To configure and verify LACP on a NetScaler appliance by using the command line

1. Enable LACP on each interface.

   At the command prompt, type:

   ```
   set interface <Interface_ID> -lacpMode PASSIVE -lacpKey 1<!--NeedCopy
   -->
   ```

   When you enable LACP on an interface, the channels are dynamically created. Additionally, when you enable LACP on an interface and set lacpKey to 1, the interface is automatically bound to channel LA/1.

   > **Note**
   >
   > When you bind an interface to a channel, the channel parameters take precedence over the interface parameters, so the interface parameters are ignored. If a channel was created dynamically by LACP, you cannot perform add, bind, unbind, or remove operations on the channel. A channel dynamically created by LACP is automatically deleted when you disable LACP on all interfaces of the channel.

2. Set the system priority.

   At the command prompt, type:

   ```
   set lacp -sysPriority <Positive_Integer><!--NeedCopy-->
   ```

3. Verify that LACP is working as expected.

   "'show interface

   ~~~
   ```show channel<!--NeedCopy-->
   ~~~

   ```
   show LACP<!--NeedCopy-->
   ```

   > **Note**
   >
   > In some versions of Cisco IOS, running the switchport trunk native vlan <VLAN_ID> command causes the Cisco switch to tag LACP PDUs. This causes the LACP channel between

> the Cisco switch and the NetScaler appliance to fail. However, this issue does not affect the static link aggregation channels configured in the above procedure.

VLAN configuration for admin partitions

March 17, 2021

VLANs can be bound to a partition as a "Dedicated" VLAN or a "Shared" VLAN. Based on your deployment, you can bind a VLAN to a partition to isolate its network traffic from other partitions.

Dedicated VLAN – A VLAN bound only to one partition with the "Sharing" option disabled and must be a tagged VLAN. For example, in a client-server deployment, for security reasons a system administrator creates a dedicated VLAN for each partition on the server side.

Shared VLAN – A VLAN bound (shared across) to multiple partitions with the "Sharing" option enabled. For example, in a client-server deployment, if the system administrator do not have control over the client side network, a VLAN is created and shared across multiple partitions.

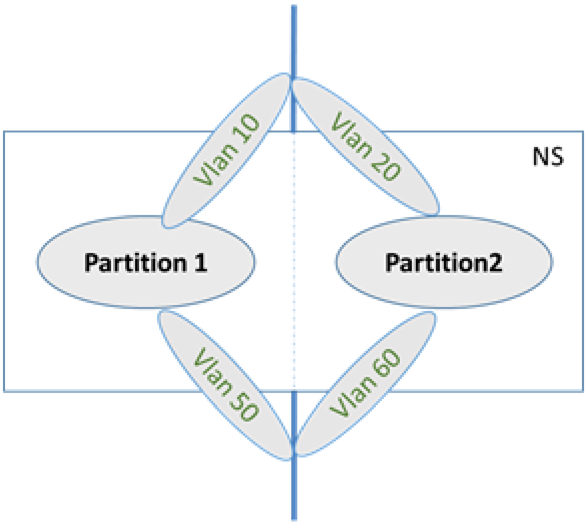
Shared VLAN can be used across multiple partitions. It is created in the default partition and you can bind a shared VLAN to multiple partitions. By default, a shared VLAN is bound to the default partition implicitly and hence it cannot be bound explicitly.

> **Important**
>
> - A NetScaler appliance deployed on any hypervisor (ESX, KVM, Xen, and Hyper-V) platform must comply with both the following conditions in a partition setup and traffic domain:
>   - Enable the promiscuous mode, MAC changes, MAC spoofing, or forged transmit for shared VLANs with partition.
>   - Enable the VLAN with `portgroup` properties of the virtual switch, if the traffic is through a dedicated VLAN.
> - Citrix recommends you to bind a Dedicated or Shared VLAN to multiple partitions. You can bind only a tagged VLAN to a partition. If there are untagged VLANs, you must enable them as "Shared" VLANs and then bind them to other partitions. It ensures that you control traffic packets (for example, LACP, LLDP, and xST P packets) handled in the default partition. If you have already bound an untagged VLAN for a partition in 11.0, see "Deployment procedure for upgrading a sharable VLAN to NetScaler 11.1 software" procedure.

In a partitioned (multitenant) NetScaler appliance, a system administrator can isolate the traffic flowing to a particular partition or partitions. It is done by binding one or more VLANs to each partition. A VLAN can be dedicated to one partition or shared across multiple partitions.

Dedicated VLANs

To isolate the traffic flowing into a partition, create a VLAN and associate it with the partition. The VLAN is then visible only to the associated partition, and the traffic flowing through the VLAN is classified and processed only in the associated partition.



To implement a dedicated VLAN for a particular partition, do the following.

1. Add a VLAN (V1).
2. Bind a network interface to VLAN as a tagged network interface.
3. Create a partition (P1).
4. Bind partition (P1) to the dedicated VLAN (V1).

Configure the following by using the CLI

- Create a VLAN

  `add vlan <id>`

Example

```
add vlan 100
```

- Bind a VLAN

  `bind vlan <id> -ifnum <interface> -tagged`

Example

```
bind vlan 100 - ifnum 1/8 -tagged
```

- Create a partition

`Add ns partition <partition name> [-maxBandwidth <positive_integer>][-maxConn <positive_integer>] [-maxMemLimit <positive_integer>]`

Example

```
Add ns partition P1 - maxBandwidth 200 - maxconn 50 - maxmemlimit
   90

Done
```

- Bind a partition to a VLAN

  `bind partition <partition-id> -vlan <id>`

Example

```
bind partition P1 - vlan 100
```

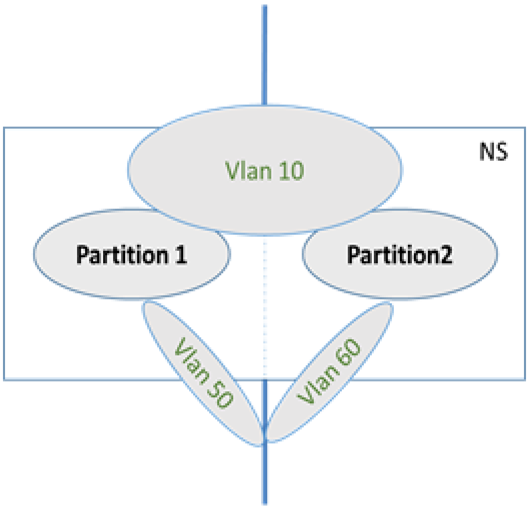
Configure a dedicated VLAN by using the NetScaler GUI

1. Navigate to **Configuration > System > Network > VLANs*** and click **Add** to create a VLAN.
2. On the **Create VLAN** page, set the following parameters:
   - VLAN ID
   - Alias Name
   - Maximum Transmission Unit
   - Dynamic Routing
   - IPv6 Dynamic Routing
   - Partitions Sharing
3. In the **Interface Bindings** section, select one or more interfaces and bind it to the VLAN.
4. In the **IP Bindings** section, select one or more IP addresses and bind to the VLAN.
5. Click **OK** and **Done**.

Shared VLAN

In a shared VLAN configuration, each partition has a MAC address, and traffic received on the shared VLAN is classified by MAC address. Only a Layer3 VLAN is recommended because it can restrict the subnet traffic. A partition MAC address is applicable and important only for a shared VLAN deployment.

The following diagram shows how a VLAN (VLAN 10) is shared across two partitions.



To deploy a shared VLAN configuration, do the following:

1. Create a VLAN with the sharing option 'enabled', or enable the sharing option on an existing VLAN. By default, the option is 'disabled'.
2. Bind partition interface to shared VLAN.
3. Create the partitions, each with its own PartitionMAC address.
4. Bind the partitions to the shared VLAN.

Configure a shared VLAN by using the CLI

At the command prompt, type one of the following commands to add VLAN or set the sharing parameter of an existing VLAN:

```
add vlan <id> [-sharing (ENABLED | DISABLED)]

set vlan <id> [-sharing (ENABLED | DISABLED)]

add vlan 100  - sharing ENABLED

set vlan 100  - sharing ENABLED
```

Bind a partition to a Shared VLAN by using the CLI

At the command prompt, type:

```
bind partition <partition-id> -vlan <id>

bind partition P1  - vlan 100

```

```
add ns partition P1  - maxBandwidth 200  - maxconn 50    - maxmemlimit 90
    -partitionMAC<mac_addr

Done
```

Configure a Partition MAC Address by using the CLI

```
set ns partition <partition name> [-partitionMAC<mac_addr>]

set ns partition P1  - partitionMAC 22:33:44:55:66:77
```

Bind partitions to a shared VLAN by using the CLI

```
bind partition <partition-id> -vlan <id>

bind partition <partition-id> -vlan <id>

bind partition P1  - vlan 100

bind partition P2  - vlan 100

bind partition P3  - vlan 100

bind partition P4  - vlan 100
```

Configure Shared VLAN by using the NetScaler GUI

1. Navigate to **Configuration > System > Network > VLANs** and then select a **VLAN** profile and click **Edit** to set the partition sharing parameter.
2. On the **Create VLAN** page, select the **Partitions Sharing** check box.
3. Click **OK** and then **Done**.

Shared VLAN in a partitioned deployment on a NetScaler SDX appliance

Log on to a Storage Virtualization Manager (SVM) appliance and assign each partition's MAC (VMAC) to a NetScaler VPX appliance.

- **Maximum memory limit.** Must be configured as the memory that is required for each admin partition. Make sure that you set the appropriate
  value when creating the partition.

Once an admin partition is created, the memory limit cannot be decreased. The memory limit can however be increased when required or more specifically, when there is execution failure due to insufficient memory in a partition. It is done provided sufficient memory is available in the default partition.

> **Note**
>
> From NetScaler 11.0 build 64.x onwards, you can set the memory limit to a minimal value of 5 MB, when creating the admin partition. It can be useful for lighter deployments of the NetScaler appliance.

- **Maximum bandwidth**. The maximum bandwidth that is used by an admin partition. This value must be limited to the appliance's licensed throughput.
  Otherwise, in effect, you are NOT limiting the bandwidth that is used by the admin partition.

  It must be configured such that it accounts for the bandwidth that the application requires. If the application bandwidth exceeds the configured value, packets are dropped. It accounts for incoming and outgoing packets. The maximum bandwidth can be increased or decreased when required.

> **Note**
>
> - The default value is 10240 kbps, minimum value is 0, and maximum value is 4294967295 kbps.
> - Setting this parameter to its minimum value (0) means that you are not assigning any bandwidth to the partition. Traffic received for this partition is dropped.
> - It is not the guaranteed bandwidth available for the admin partition. After a partition is configured with a maximum bandwidth value, the actual bandwidth assigned depends on the appliance's licensed throughput.

- **Maximum number of connections**. Must be configured such that it accounts for the maximum simultaneous flows expected within a partition. It is configured only on the client-side and not on the back-end server-side TCP connections. New connections cannot be established beyond this configured value.

  The maximum number of connections can be increased or decreased when required.

> **Note**
>
> - When the bandwidth and number of connections crosses the threshold value, if SNMP is configured, traps are sent with the relevant information.
> - After creating a partition, inform the users that the NetScaler configurations they perform will be isolated from users who are not members of the partition.

> - Make sure the relevant users, command policies, VLANs, and bridge groups are available on the NetScaler appliance.
> - For deployments that have a large size of NetScaler configuration and large quantum of traffic, Citrix recommends you to increase the default values for the maximum memory limit, maximum bandwidth, and maximum number of connections.
> - Shared VLAN in a partitioned appliance does not support the dynamic routing protocol.

Configure shared VLAN by using the NetScaler CLI

- Create a partition and configure the NetScaler resources for that partition.

  `add ns partition <partitionName> [-maxBandwidth <positive_integer>] [-maxConn <positive_integer>] [-maxMemLimit <positive_integer>]`

> **Note**
>
> Check the rate limiting content provided for tips to update the maximum memory limit, maximum
> bandwidth, and maximum number of connections.

- Associate the appropriate users with the partition.

  `bind system user <name> -partitionName <string>`

- Specify the level of authorization for each user by associating one of the following command policies: *partition operator, partition-read-only, partition-network, and partition-admin.*

  `bind system user <name> <policyName> <priority>`

- Configure the VLAN through which traffic for this partition must be routed. You can use bridge groups instead of VLANs to route the traffic.
  - Add the VLAN and bind the required interfaces to it.

    ```
    - add vlan <id>
    - bind vlan <id> if num <interface>
    ```

    > **Note**
    >
    > When a VLAN is bound to an admin partition, its IP address bindings are lost. To make sure that the VLAN continues to have the IP address, create the IP address on the admin partition and then bind it to that VLAN.

  OR

  - Add the bridge group and bind the required VLANs to it.

```
-  add bridgegroup <id>
-  bind bridgegroup <id> -vlan <id>
```

- Bind the VLAN or bridge group to the partition.

  ```
  bind ns partition <partitionName> -vlan <positive_integer>
  ```

  OR

  ```
  bind ns partition <partitionName> -bridgegroup <positive_integer>
  ```

  > **Note**
  >
  > Use the show VLAN or the show bridge group command to view the partitions associated with that VLAN or bridge group.

- Verify the configurations of the partition.

  ```
  show ns partition <partitionName>
  ```

  > **Note**
  >
  > You can also use the `stat ns partition` command to view partition configurations.

- Save the configuration.

  ```
  save ns config
  ```

Configure Shared VLAN by using the NetScaler GUI

- Navigate to **System > Partition Administration**, click **Add**, and do the following:
  - Create and configure the resources for the admin partition.
  - Specify the VLANs or bridge groups to associate with partition.
  - Associate users with the partition.

    > **Note**
    >
    > Make sure you bind users who are not yet associated with partition type command policies.

- Navigate to **System > User Administration**, and to the partition user, bind the appropriate command policy. The command policy must be one of the partition-entries. The choice depends on the level of authorization you intend the user to have.
- Save the configuration.

SNMP support for admin partitions

September 21, 2020

A partitioned NetScaler appliance uses SNMP infrastructure for partition rate limiting and for monitoring partition resource utilization details.

SNMP traps for admin partition rate limiting

On a partitioned NetScaler appliance, a PARTITION-RATE-LIMIT alarm can generate nine SNMP traps for notifying a partition resource (such as bandwidth, connection, or memory) has reached its limit or returned to normal.

The following nine SNMP traps are generated when:

- **partitionCONNThresholdReached**. The number of active connections for a partition exceeds its high threshold percentage.
- **partitionCONNThresholdNormal**. The number of active connections is less than or equal to the normal threshold percentage.
- **partitionBWThresholdReached**. The partition's bandwidth usage reaches its high threshold percentage.
- **partitionMEMThresholdReached**. The current memory usage of the partition exceeds its high threshold percentage.
- **partitionMEMThresholdNormal**. The current memory usage of the partition becomes less than or equal to the normal threshold percentage.
- **partitionMEMLimitExceeded.** The current memory usage of the partition exceeds its memory limit percentage.
- **partitionCONNLimitExceeded**. The number of active connections for a partition exceeds its configured limit and new connections are being dropped.
- **partitionCONNLimitNormal**. The number of active connections for a partition goes below its configured limit and the partition can now accept a new connection.
- **partitionBWLimitExceeded**. The current bandwidth usage for a partition has exceeded its configured limit.

The threshold values for the SNMP traps are non-configurable and are as follows are:

- High threshold = 80% (applicable for all partition rate limit traps)
- Low threshold = 60 % (applicable for all partition rate limit traps)
- Memory limit = 95% (applicable only for partition memory traps)

Configuring PARTITION-RATE-LIMIT alarm

To configure PARTITION-RATE-LIMIT alarm in a specific partition and enable generation of the SNMP trap messages.

1. Enable PARTITION-RATE-LIMIT Alarm
2. Configure PARTITION-RATE-LIMIT Alarm
3. Configure SNMP Trap Destination

To enable PARTITION-RATE-LIMIT alarm by using the NetScaler CLI

At the command prompt, type the following commands:

```
enable snmp alarm PARTITION-RATE-LIMIT

show snmp alarm PARTITION-RATE-LIMIT
```

To configure PARTITION-RATE-LIMIT Alarm by using the NetScaler CLI

At the command prompt, type the following command

```
set snmp alarm PARTITION-RATE-LIMIT [-state ( ENABLED | DISABLED )] [-
    severity <severity>] [-logging ( ENABLED | DISABLED )]
```

To configure SNMP trap destination by using the NetScaler CLI

At the command prompt, type the following command:

```
add snmp trap <trapClass> <trapDestination> [-version <version>] [-td <
    positive_integer>] [-destPort <port>] [-communityName <string>] [-
    srcIP <ip_addr|ipv6_addr>] [-severity <severity>] [-allPartitions (
     ENABLED | DISABLED )]
```

To configure PARTITION-Rate-Limit alarm by using the NetScaler GUI

Navigate to **System > SNMP > Alarms**, select **PARTITION-RATE-LIMIT** alarm and configure the alarm parameters.

To configure SNMP trap destination by using the NetScaler GUI

Navigate to **System > SNMP > Trap**, specify the IP address of the destination device.

SNMP monitoring for partition resource utilization

Using SNMP, you can monitor a partition's resource (such as bandwidth, connection, and memory) utilization details at real time on a NetScaler appliance. This is done by sending a SNMP request (such as SNMP GET, SNMP GET BULK, SNMP GETNEXT, or SNMP WALK) from the SNMP Manager.

> **Note**
>
> In order to monitor partition resources, you must configure the SNMP community in the default partition. Wherein, the *partitionTable* is maintained in the default partition, and the SNMP communication is done through the NSIP address of the appliance.

Consider a scenario where a NetScaler administrator wants to know the bandwidth usage of partition P1 on the appliance. The SNMP Manager retrieves this information by sending an SNMP GET request on the corresponding OID (partitionCurrentBandwidth) to the NSIP address of the appliance. The SNMP agent on the default partition retrieves and sends the current bandwidth usage of P1 to the SNMP Manager through the NSIP address.

The following table lists the SNMP counters which are part of *partitionTable* and its description:

SNMP Parameter	SNMP OID	Description
partitionName	1.3.6.1.4.1.5951.4.1.1.88.1.1	Partition name
partitionCurrentBandwidth	1.3.6.1.4.1.5951.4.1.1.88.1.2	Current bandwidth usage of the partition.
partitionCurrentConnections	1.3.6.1.4.1.5951.4.1.1.88.1.3	Current number of active connections of the partition.
partitionMemoryUsagePcnt	1.3.6.1.4.1.5951.4.1.1.88.1.4	Current Memory usage (in percentage) of the partition.

AppExpert

September 21, 2020

The following topics provide a conceptual reference and configuration instructions for the AppExpert and other features of the NetScaler appliance.

> **Note**
>
> For information about policy extensions, see Policy Extensions.

- Action Analytics: Collects run-time statistics on the basis of pre-defined criteria. When used with policies, the feature also provides you with the infrastructure for automatic, real-time traffic optimization.

- AppExpert Applications and Templates: Simplify configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, Citrix Gateway applications, and entity templates.
- AppQoE: Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing.
- Entity Template: Describes how to use entity templates to set up and configure individual NetScaler entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.
- HTTP Callouts: An HTTP request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation.
- Pattern Sets: Allow string matching during the evaluation of a default syntax policy.
- Policies and Expressions: Rules that determine the operations that the NetScaler appliance must perform.
- Rate Limiting: Defines the maximum load for a given network entity or virtual entity on the NetScaler appliance.
- Responder: Bases responses on who sends the request, where it is sent from, and other criteria with security and system management implications.
- Rewrite: Rewrites information in the requests or responses handled by the NetScaler appliance.
- String Maps: Perform pattern matching in all NetScaler features that use the default policy syntax.

Action analytics

September 21, 2020

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the action analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data, for example, URLs and HTTP methods by configuring default syntax expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions tool in the GUI.

Configure a selector

September 21, 2020

A selector is a filter for identifying requests. It consists of up to five individual default syntax expressions that identify request attributes such as the client IP address and the URL in the request. Each expression is a non-compound default syntax expression and is considered to be in an AND relationship with the other expressions. Following are some examples of selector expressions:

- `HTTP.REQ.URL`
- `CLIENT.IP.SRC`
- `HTTP.RES.BODY(1000).AFTER_STR("<string>").BEFORE_STR("<string>")"`
- `CLIENT.IP.SRC.SUBNET(24)`

Selectors are used in rate limiting and action analytics configurations. A selector is optional in a rate limiting configuration but is required in an action analytics configuration.

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

If you modify an expression in a selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a selector named myLimitSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1. If you change the expression in myLimitSelector1, you might receive an error when binding dnsRateLimit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

The NetScaler appliance provides built-in selectors for some of the most common use cases. Refer to the pdf.

You can also configure a selector with expressions that identify the request attributes of your choice. For example, you might want to create a record for a request that arrives with a specific header. To evaluate the header, you can add HTTP.REQ.HEADER("") to the selector that you intend to use.

To configure a selector by using the command line interface:

At the command prompt, type the following commands to configure a selector and verify the configuration:

- `add stream selector <name> <rule> ...`
- `show stream selector`

Example

```
> add stream selector myselector HTTP.REQ.URL CLIENT.IP.SRC
Done
> show stream selector myselector
    Name: myselector
    Expressions:
        1) HTTP.REQ.URL
        2) CLIENT.IP.SRC
Done
```

```
>
<!--NeedCopy-->
```

To modify or remove a selector by using the command line interface:

- To modify a selector, type the set stream selector command, the name of the selector, and the rule parameter with the expressions. Enter the existing expressions that you want to retain, along with the new expressions that you want to add.
- To remove a selector, type the rm stream selector command and the name of the selector.

To configure a selector by using the GUI:

1. Navigate to **AppExpert** > **Action Analytics** > **Selectors**.
2. In the details pane, do one of the following:
   - To create a selector, click **Add**.
   - To modify a selector, select the selector, and then click **Edit**.
3. In the **Create Selector** or **Configure Selector** page, set the following parameters:
   - Name
   - Expressions
     To add the expression to the selector configuration, click
     Add. To remove an expression from the selector configuration, in the
     Expression box, select the expression, and then click
     Delete.
     Note: In the
     Expressions box, enter a valid parameter. For example, enter HTTP. Then, enter a period after this parameter. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. To select the next keyword in this expression prefix, double-click the selection in the drop-down menu. The Expressions text box displays both the first and second keywords for the expression prefix, for example,
     HTTP.REQ. Continue adding expression components until the complete expression is formed.
4. Click **Add**.
5. Continue adding up to five non-compound expressions.
6. Click **OK** and then **Close**.

Configure a stream identifier

September 21, 2020

You configure a stream identifier to specify parameters for collecting statistical data from requests identified by a given selector. An identifier specifies the selector to be used, the statistics collection interval, the sample count, and the field on which the records are to be sorted.

The NetScaler appliance includes the following built-in stream identifiers for common use cases. All the built-in identifiers specify a sample count of 1 and an interval of 1 minute. Additionally, they sort the data on the
REQUESTS attribute. They differ only in being associated with different built-in selectors. Each built-in identifier is associated with a built-in selector of the same name (for example, the built in identifier Top_URL is associated with the built-in selector
Top_URL). Following are the built-in identifiers:

- Top_URL
- Top_CLIENTS
- Top_URL_CLIENTS_LBVSERVER
- Top_URL_CLIENTS_CSVSERVER
- Top_MSSQL_QUERY_DB_LBVSERVER
- Top_MYSQL_QUERY_DB_LBVSERVER

For more information about the built-in selectors, see Configuring a Selector.

> **Note**:
>
> The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

You cannot modify a built-in identifier's configuration. However, you can create an identifier with a configuration of your choice.

To configure a stream identifier by using the command line interface

At the command prompt, type the following commands to configure a stream identifier and verify the configuration:

- `add stream identifier <name> <selectorName> [-interval <positive_integer>] [-SampleCount <positive_integer>] [-sort <sort>]`
- `show stream identifier <name>`

Example

```
> add stream identifier myidentifier Top_URL -interval 10 -sampleCount
   100
 Done
<!--NeedCopy-->
```

To configure a stream identifier by using the GUI

1. Navigate to **AppExpert** > **Action Analytics** > **Stream Identifiers**.
2. In the details pane, do one of the following:
    - To create a stream identifier, click **Add**.
    - To modify a stream identifier, select the identifier, and then click **Edit**.
3. In the Configure Stream Identifier page, set the following parameters:
    - Name
    - Selector
    - Interval
    - Sample Count
    - Sort
4. Click **OK**, and then click **Close**.

View statistics

September 21, 2020

You can view the collected statistics in tabular format in the command-line interface and in graphical format in the GUI.

The following table describes the collected statistics:

Statistics	**stat stream identifier** `<identifier name>` **command**	**Description**
Number of requests	Req	The number of requests for which records were created in the last `<interval>` number of minutes.

Statistics	**stat stream identifier** `<identifier name>` **command**	**Description**
Bandwidth consumed	BandW	The total bandwidth consumed by the requests that were received in the last `<interval>` number of minutes. The total bandwidth of a request is the bandwidth consumed by the request and its response. The value is rounded off to the next higher or next lower integer value. Consequently, it might differ slightly from the expected value. For example, if a request's total bandwidth consumption is 2.2 KB, one instance of the request might be shown as having consumed 2 KB and two instances might be shown as having consumed 4 KB, but three instances might be shown as having consumed 7 KB.
Response time	RspTime	The average response time for all the requests received in the last `<interval>` number of minutes.
Concurrent connections	Conn	The total number of concurrent connections that are currently open.

To view the statistical data collected for a stream identifier by using the command line

At the command prompt, type:

```
stat stream identifier <name> [<pattern> ...] [-detail] [-fullValues] [-
```

```
ntimes <positive_integer>] [-logFile <input_filename>] [-sortBy <sortBy> [<
sortOrder>]
```

Examples

Example 1 show how to sort the output on the BandW column, in the descending order. Example 2 sorts the output in Example 1, on the Req column, and in the ascending order

Example 1:

```
> stat stream identifier myidentifier -sortBy BandW Descending -fullValues
Stream Session statistics
                   Req                BandW
User1              508               125924
User2             5020                12692
User3             2025                 4316

               RspTime                 Conn
User1             5694                    0
User2              109                    0
User3                3                    0
 Done
<!--NeedCopy-->
```

Example 2:

```
> stat stream identifier myidentifier -sortBy Req Ascending  -fullValues
Stream Session statistics
                   Req                BandW
User1              508               125924
User3             2025                 4316
User2             5020                12692

               RspTime                 Conn
User1             5694                    0
User3                3                    0
User2              109                    0
 Done
<!--NeedCopy-->
```

To view the statistical data collected for a stream identifier by using the GUI

1. Navigate to **AppExpert** > **Action Analytics** > **Stream Identifiers**.

2. Select the stream identifier whose sessions you want to view, and then click Statistics For information about how you can group the output on the basis of the values collected for various selector expressions.

Grouping records on attribute values

September 21, 2020

Statistical information such as the number of times a particular URL has been accessed overall and per client, and the total number of GET and POST requests per client can provide valuable insights into whether any of your resources need to be expanded to meet the demand or be optimized for delivery. To obtain such statistics, you must use an appropriate set of selector expressions, and then use the pattern parameter in the stat stream identifier command. The grouping is based on the pattern that is specified in the command. Grouping can be performed concurrently on the values of multiple expressions.

In the command-line interface, you can group the output by using patterns of your choice. In the GUI, the pattern depends on the choices you make when drilling down through the values of various selector expressions. For example, consider a selector that has the expressions HTTP.REQ.URL, CLIENT.IP.SRC, and HTTP.REQ.LB_VSERVER.NAME, in that order. The statistics home page displays icons for each of these expressions. If you click the icon for CLIENT.IP.SRC, the output is based on the patterns ?. The output displays statistics for each client IP address. If you click an IP address, the output is based on the patterns * `<IP address>` ? and ? `<IP address>` * where `<IP address>` is the IP address you selected. In the resulting output, if you click a URL, the pattern used is `<URL> <IP address> ?`.

To group the records on the values of selector expressions by using the command line interface

At the command prompt, enter the following command to group the records on the basis of a selector expression:

```
stat stream identifier <name> [<pattern> ...]
```

Examples

Each example uses a different pattern to demonstrate the effect of the pattern on the output of the stat stream identifier command. The selector expressions are HTTP.REQ.URL and HTTP.REQ.HEADER("UserHeader"), in that order. The requests contain a custom header whose name is UserHeader. Note that in the examples, a given statistical value changes as determined by the grouping, but the sum total of the values for a given field remains the same.

Example 1

In the following command, the pattern used is ? ?. The appliance groups the output on the values collected for both selector expressions. The row headers consist of the expression values separated by a question mark (?). The row with the header /mysite/mypage1.html?Ed displays statistics for requests made by user Ed for the URL /mysite/mypage1.html.

```
> stat stream identifier myidentifier ? ? -fullValues
Stream Session statistics
                                        Req                 BandW
/mysite/mypage2.html?Grace                1                  2553
/mysite/mypage1.html?Grace                2                     4
/mysite/mypage1.html?Ed                   8                    16
/mysite/mypage2.html?Joe                  1                  2554
/mysite/mypage1.html?Joe                  5                    10
/mysite/?Joe                              1                     4

                                    RspTime                  Conn
/mysite/mypage2.html?Grace                0                     0
/mysite/mypage1.html?Grace                0                     0
/mysite/mypage1.html?Ed                   0                     0
/mysite/mypage2.html?Joe                  0                     0
/mysite/mypage1.html?Joe                  0                     0
/mysite/?Joe                              6                     0
 Done
<!--NeedCopy-->
```

Example 2

In the following command, the pattern used is * ?. The appliance groups the output on the values accumulated for the second expression HTTP.REQ.HEADER(“UserHeader”). The rows display statistics for all requests made by users Grace, Ed, and Joe.

```
> stat stream identifier myidentifier * ?
Stream Session statistics
                 Req    BandW  RspTime      Conn
Grace              3     2557        0         0
Ed                 8       16        0         0
Joe                7     2568        6         0
 Done
<!--NeedCopy-->
```

Example 3

In the following command, the pattern used is ? *, which is the default pattern. The output is grouped on the values collected for the first selector expression. Each row displays statistics for one URL.

```
> stat stream identifier myidentifier ? * -fullValues
Stream Session statistics
                                        Req                BandW
/mysite/mypage2.html                      2                 5107
/mysite/mypage1.html                     15                   30
/mysite/                                  1                    4

                                     RspTime                Conn
/mysite/mypage2.html                       0                    0
/mysite/mypage1.html                       0                    0
/mysite/                                   6                    0
 Done
<!--NeedCopy-->
```

Example 4

In the following command, the pattern used is `* *`. The appliance displays one set of collective statistics for all the requests received, with no row title.

```
> stat stream identifier myidentifier * *
Stream Session statistics
                 Req    BandW  RspTime     Conn
                  18     5141        6        0
 Done
<!--NeedCopy-->
```

Example 5

In the following command, the pattern is `/mysite/mypage1.html *`. The appliance displays one set of collective statistics for all the requests received for the URL `/mysite/mypage1.html`, with no row title.

```
> stat stream identifier myidentifier /mysite/mypage1.html *
Stream Session statistics
                 Req    BandW  RspTime     Conn
                  15       30        0        0
 Done
<!--NeedCopy-->
```

To group the records on the values of selector expressions by using the GUI

1. Navigate to **AppExpert** > **Action Analytics** > **Stream Identifiers**.
2. In the details pane, click the stream identifier for which you want to view statistics, and then click **Stream Sessions**.

3. On the Home page, click the icon for the stream selector by which you want to group the output.
4. To return to the Home page from the statistics page for a selector expression, click **Home**.
5. To view statistics for the value of a given selector expression, click the value. You can repeat this step for a selector expression value in each subsequent output until you obtain the statistics you want.

Clearing a stream session

September 21, 2020

You can flush all the records that have been accumulated for a stream identifier.

To clear a stream session by using the command line interface

At the command prompt, enter the following commands to clear a stream session and verify the results:
git commit -m "test"

- clear stream session
- stat stream identifier
- one more

Example

This example uses the stat stream identifier command first, so that a comparison can be made with the stat stream identifier command that is used for verifying the result of the clear stream session command.

```
>stat stream identifier myidentifier
Stream Session statistics
                 Req     BandW  RspTime     Conn
/aed....html       2         0        0        0
/                636       303       12        0
 Done
>clear stream session myidentifier
 Done
>stat stream identifier myidentifier
 Done
<!--NeedCopy-->
```

To clear a stream session by using the GUI

1. Navigate to **AppExpert** > **Action Analytics** > **Stream Identifiers**.
2. Select the stream identifier whose sessions you want to clear, and then click **Clear Sessions**.

Configure policy for optimizing traffic

September 21, 2020

To put the selector-identifier pair in your action analytics configuration into effect, you must associate the pair with the point in the traffic flow at which you want to collect statistics. You can do so by configuring a default syntax policy and referencing the stream identifier from the policy rule. You can use compression policies, caching policies, rewrite policies, application firewall policies, responder policies, and any other policies whose action is based on a Boolean expression.

The action analytics feature introduces a set of default syntax expressions and functions for collecting and evaluating data. The expression `ANALYTICS.STREAM(<identifier_name>)` is used for referencing the identifier that you want to use. The expression COLLECT_STATS is used to collect statistical data. Functions such as `IS_TOP(<uint>)` and `IS_TOP_FREQUENTS(<uint>)` are used for making automatic, real-time traffic optimization decisions.

- `IS_TOP(<number>)`. Finds if a given object is in the top `<number>` of elements. For example, is the element among the top 10 elements. When multiple elements have the count, they are considered to be similar in nature. The sort function must be turned on to avoid an undef condition.

- `IS_TOP_FREQUENTS(<frequency>)`. Finds if a given object is in the top `<frequency>` of the elements that are in the top elements. For example, is the element among the top 50% of all the top elements maintained. Elements having the same values are considered similar in nature. The sort function must be turned on to avoid an undef condition.

It is your policy configuration that determines whether the NetScaler appliance must only collect data from traffic or also perform an action. If the appliance must only collect statistical data, you can configure a policy with the rule `ANALYTICS.STREAM(<identifier_name>).COLLECT_STATS` and the action NOOP. The NOOP policy must be the policy with the highest priority at the bind point. This policy is sufficient if you are only collecting statistics. Traffic optimization decisions, such as what to compress or cache, must be based on manual, periodic evaluation of the statistical data.

If, in addition to collecting statistics, the appliance must also perform an action on the traffic, you must configure the gotoPriorityExpression parameter of the NOOP policy such that another policy that has the desired rule and action is evaluated subsequently. This second policy must have a rule that begins with the `ANALYTICS.STREAM(<identifier_name>)` prefix and a function that evaluates the data.

Following is an example of two responder policies that are configured and bound globally. The policy `responder_stat_collection` enables the appliance to collect statistics based on the identifier, myidentifier. The policy `responder_notify` evaluates the data that is collected.

Example

```
> add responder action send_notification respondwith '"You are in the Top 10 list for bandwidth consumption"'
 Done
> add responder policy responder_stat_collection' ANALYTICS.STREAM("myidentifier").COLLECT_STATS' NOOP
Done
> add responder policy responder_notify 'ANALYTICS.STREAM("myidentifier").BANDWIDTH.IS_TOP(10)' send_notification
 Done
> bind responder global responder_stat_collection 10 NEXT
 Done
> bind responder global responder_notify 20 END
 Done
<!--NeedCopy-->
```

How to limit bandwidth consumption for user or client device

April 27, 2021

Your web site, application, or file hosting service has finite network and server resources available to it to serve all its users. One of the most important resources is bandwidth. Substantial bandwidth consumption by only a subset of the user base can result in network congestion and reduced resource availability to other users. To prevent network congestion, you might have to limit a client's bandwidth consumption by using temporary service denial techniques such as responding to a client request with an HTML page if it has exceeded a preconfigured bandwidth value over a fixed time period leading up to the request.

In general, you can regulate bandwidth consumption either per client device or per user. This use case demonstrates how you can limit bandwidth consumption per client to 100 MB over a time period of one hour. The use case also demonstrates how you can regulate bandwidth consumption per user to 100 MB over a time period of one hour, by using a custom header that provides the user name. In both cases, the tracking of bandwidth consumption over a moving time period of one hour is achieved by setting the interval parameter in the stream identifier to 60 minutes. The use cases also demonstrate how you can import an HTML page to send to a client that has exceeded the limit. Importing an HTML page not only simplifies the configuration of the responder action in these use cases, but also simplifies the configuration of all responder actions that need the same response.

To limit bandwidth consumption per user or client device by using the command line interface

In the command-line interface, perform the following tasks to configure action analytics for limiting a client's or user's bandwidth consumption. Each step includes sample commands and their output.

1. **Set up your load balancing configuration.** Configure load balancing virtual server mysitevip, and then configure all the services that you need. Bind the services to the virtual server. The following example creates ten services and binds the services to mysitevip.

   ```
   > add lb vserver mysitevip HTTP 192.0.2.17 80
    Done
   > add service service[1-10] 192.0.2.[240-249] HTTP 80
   service "service1" added
   service "service2" added
   service "service3" added
   .
   .
   .
   service "service10" added
    Done
   > bind lb vserver vserver1 service[1-10]
   service "service1" bound
   service "service2" bound
   service "service3" bound
   .
   .
   .
   service "service10" bound
    Done
   <!--NeedCopy-->
   ```

2. **Configure the stream selector.** Configure one of the following stream selectors:

   - To limit bandwidth consumption per client, configure a stream selector that identifies the client IP address.

     ```
     > add stream selector myselector CLIENT.IP.SRC
      Done
     <!--NeedCopy-->
     ```

   - To limit bandwidth consumption per user on the basis of the value of a request header that provides the user name, configure a stream selector that identifies the header. In the following example, the name of the header is UserHeader.

```
> add stream selector myselector HTTP.REQ.HEADER( “UserHeader” )
 Done
<!--NeedCopy-->
```

3. **Configure a stream identifier.** Configure a stream identifier that uses the stream selector. Set the interval parameter to 60 minutes.

```
> add stream identifier myidentifier myselector -interval 60 -sampleCount 1 -sort BANDWIDTH
 Done
<!--NeedCopy-->
```

4. **Configure the responder action.** Import the HTML page that you want to send to users or clients that have exceeded the bandwidth consumption limit, and then use the page in responder action crossed_limits.

```
> import responder htmlpage http://192.0.2.20:80/stdpages/wait.html crossed-limits.html
This operation may take some time, Please wait...

 Done
> add responder action crossed_limits respondwithhtmlpage crossed-limits.html
 Done
<!--NeedCopy-->
```

5. **Configure the responder policies.** Configure responder policy myrespol1 with the rule ANALYTICS.STREAM(“myidentifier”).COLLECT_STATS and the action NOOP. Then, configure policy myrespol2 for determining whether a client or user has crossed the 100 MB limit. The policy myrespol2 is configured with the responder action crossed_limits.

```
> add responder policy myrespol1 'ANALYTICS.STREAM("myidentifier").COLLECT_STATS' NOOP
 Done
> add responder policy myrespol2 'ANALYTICS.STREAM("myidentifier").BANDWIDTH.GT(104857600)' crossed_limits
 Done
<!--NeedCopy-->
```

6. **Bind the responder policies to the load balancing virtual server.** The policy myrespol1, which only collects statistical data, must have the higher priority and a GOTO expression of NEXT.

```
> bind lb vserver mysitevip -policyName myrespol1 -priority 1 -gotoPriorityExpression NEXT
 Done
> bind lb vserver mysitevip -policyName myrespol2 -priority 2 -gotoPriorityExpression END
 Done
<!--NeedCopy-->
```

7. **Test the configuration.** Test the configuration by sending test HTTP requests, from multiple clients or users, to the load balancing virtual server and using the stat stream identifier command to view the statistics that are collected for the specified identifier. The following output displays statistics for clients.

```
> stat stream identifier myidentifier -sortBy BandW  - fullValues
Stream Session statistics
                          Req           BandW
192.0.2.30                5000          3761
192.0.2.31                29            2602
192.0.2.32                25            51

                          RspTime       Conn
192.0.2.30                2             0
192.0.2.31                0             0
192.0.2.32                0             0
 Done
>
<!--NeedCopy-->
```

AppExpert applications and templates

March 10, 2021

An AppExpert application is a collection of configuration information that you set up on the NetScaler appliance for securing and optimizing traffic for a Web application, such as Microsoft SharePoint. Managing AppExpert applications is simplified by a graphical user interface (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Additionally, it consolidates all deployment tasks in one view, so you can quickly configure target IP addresses for clients and specify host servers.

To get started with an AppExpert application, you must first obtain the appropriate application template and import the template to the NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

AppExpert application terminology

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

Public endpoint. The IP address and port combination at which the NetScaler appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent to a public endpoint. An AppExpert application can be assigned multiple endpoints. You configure public endpoints after you import a template.

Application unit. An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The NetScaler services associated with these policies are Compression, Caching, Rewrite, Responder, and application firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units, thereby ensuring that all client requests are processed.

Application units and their associated rules, policies, and actions are included in AppExpert application templates.

Service. The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format <IP address>:<Port>. A web application that serves a large number of requests is usually hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the NetScaler appliance. Services are deployment-specific and are therefore not included in templates. You must configure services after you import a template.

Application unit rule. Either a classic expression or a default syntax expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a default syntax expression that identifies a traffic subset that consists of four image types:

HTTP.REQ.UR	HTTP.REQ.UR	HTTP.REQ.UR	HTTP.REQ.URL.SUFFIX.E

For more information about default syntax expressions and classic policy expressions, see Policies and Expressions.

Traffic Subset. A set of client requests that require a common set of traffic optimization and security policies. A traffic subset is managed by an application unit and is defined by a rule.

How AppExpert Application Works

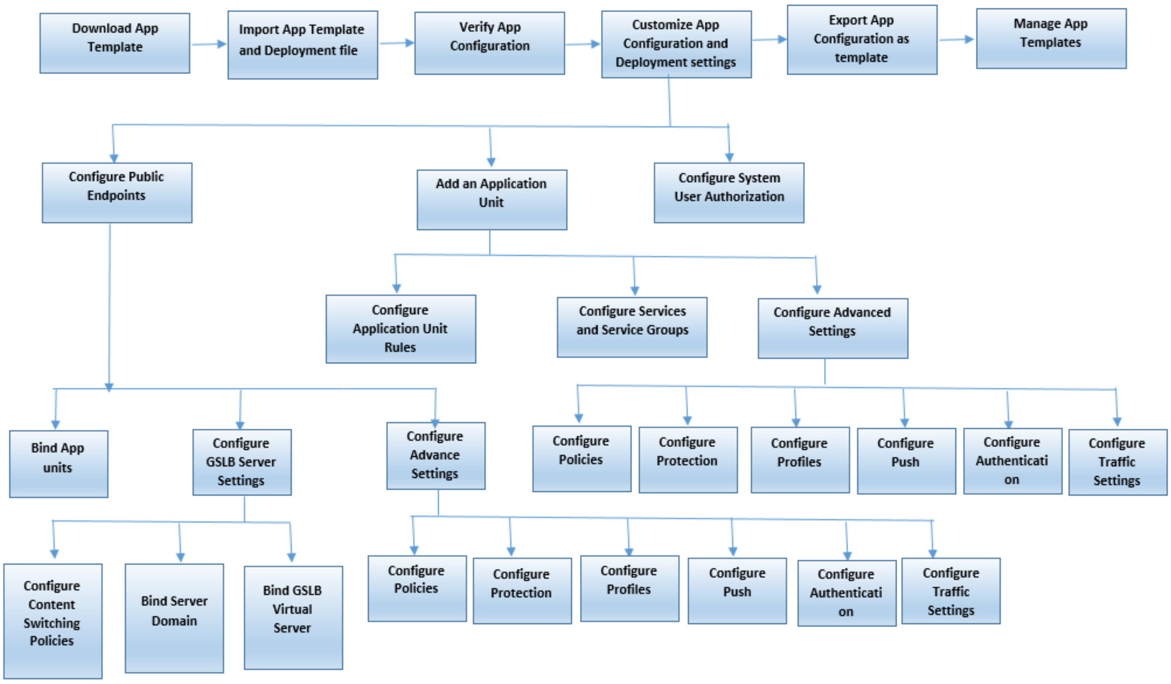
September 21, 2020

When the endpoint receives a client request, the NetScaler appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.

If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

The following flow diagram illustrates the AppExpert Application flow sequence for using a built-in application template.



Download App Template
Import App Template and Deployment file
Verify App Configuration
Customize App Configuration and Deployment settings
Export App Configuration as template
Manage App Templates
Configure Public Endpoints
Add an Application Unit
Configure System User Authorization
Configure Application Unit Rules
Configure Services and Service Groups
Configure Advanced Settings
Bind App units
Configure GSLB Server Settings
Configure Advance Settings
Configure Policies
Configure Protection
Configure Profiles
Configure Push
Configure Authentication
Configure Traffic Settings
Configure Content Switching Policies
Bind Server Domain
Bind GSLB Virtual Server
Configure Policies
Configure Protection
Configure Profiles
Configure Push
Configure Authentication
Configure Traffic Settings

If you prefer to create a customized application without using a template, do the following:

1. Create a custom application.
2. Configure application and deployment settings.
3. Export the configuration to new template files (optional).
4. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration

Get started with AppExpert

September 21, 2020

To get started with an AppExpert application, you must first obtain an application template and import the template to a NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

The process of setting up an application can be done in two ways:

- Using a prebuilt application template

- Creating a custom application without using a template.

If you prefer to set up the application by using a prebuilt application template, do the following:

1. Download an application template.
2. Import template files to NetScaler appliance.
3. Verify application setup.
4. Configure application and deployment settings.
5. Export the configuration to new template files (optional).
6. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration.

NetScaler's video tutorials enable you to understand NetScaler features in easy and simple way. Watch https://www.youtube.com/watch?v=aqayflvCR_0 video to learn how to set up an application using AppExpert Application template.

Downloading an application template

April 29, 2021

AppExpert application setup begins with downloading an application template from the Citrix community website at http://community.citrix.com to your local computer or NetScaler appliance. The application templates are imported and exported, so that you can easily share application-specific configurations within an organization or across organizations. An application template includes the following set of entities:

1. Application components (for example, webpages, files, archives, and web services)
2. Traffic management entities (for example, virtual server IP addresses and associated load-balancing algorithms, and SSL offload settings) for the application components.
3. NetScaler policies used for optimizing the application traffic.

> **Note**:
>
> Application templates are available in different versions for configuring different types of NetScaler appliances.

Importing an Application Template

September 21, 2020

For NetScaler software version 9.3 or later, each AppExpert template has two XML files: a Template file and a Deployment file. You must import both files from your local computer to a NetScaler appliance.

You can either import the template files from your computer to the AppExpert application templates directory in NetScaler appliance or upload files to a NetScaler appliance and then import them from the appliance.

Note: When you import a template from an appliance, you have to provide the variable value available in the template. By default, the pre-configured value is display `https://docs.citrix.com/en-us/netscaler//11/appexpert/appexpert-application-templates/creating-managing-templates/netscaler-application-template-deployment-files.html`

After you import the template files, the application-configuration and deployment information populates the target application automatically. The appliance imports all the configuration from the template files through the NITRO API. If you do not import the deployment file, the system generates an application populated with content switching virtual server configuration. For more information about the format of application templates and deployment files, see Understanding NetScaler Application Templates and Deployment Files.

When you import a template, if you do not include a deployment file, you have to configure the public endpoints in the application that the system automatically generates from the template. One endpoint for HTTP and another endpoint for HTTPS. When configuring a public endpoint of type HTTPS, make sure you enable the SSL feature, bind the server certificate, and include the server-certificate and certificate-key files.

For more information about configuring endpoints after you import a template, see Configuring Public Endpoints.

To import AppExpert application template files to a NetScaler appliance by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click **Import Template**.
3. On the **Import** page, set the following parameters:
   a) Application Name (mandatory)
   b) Template File (mandatory)
   c) Use deployment file
4. Click **Continue** to auto populate application-configuration and deployment information into an application.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simply way. Watch https://www.youtube.com/watch?v=AR9TwSD9uJM video to learn how to import an application template.

Verifying and Testing Application Configuration

September 21, 2020

The GUI includes icons that indicate the states of the entities in the AppExpert application. These icons are displayed for applications and application units and are based on the health checks that the NetScaler appliance performs periodically on services and entities. The following table lists the icons and describes their meanings.

Icon	Entity	Indicates that
🟢	Application	At least one public endpoint is up. The application will accept client requests from the public endpoints that are up.
🟢	Application unit	The application unit is up. The application unit is up when at least one service or service group is up.
🟡	Application	The public endpoint is out of service (disabled). This indicator is displayed when only one public endpoint is configured for the AppExpert application.
🔴	Application	All the endpoints that are configured for the application are out of service. This indicator is displayed only when multiple endpoints are configured for the application.
🔴	Application unit	All the services configured for the application unit are down.

You must ensure that the icons for each application and its application units are green at all times. If the icon that is displayed for an application is not green, verify that you have configured the public endpoints correctly. If the icon that is displayed for an application unit is not green, verify that the services are configured correctly. However, note that a green indicator does not mean that the state of all associated entities is UP. It only means that the application has sufficient resources (endpoints and services) to serve client requests. To verify that the state of all associated entities is UP, check the health of all the entities on the statistics page for the application.

Customizing the configuration

September 21, 2020

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for a traffic subset or modify the existing application unit. After you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:

1. Configuring Public Endpoints
2. Configuring Application Units
3. Specifying the Order of Evaluation
4. Viewing Application Configuration using Visualizer

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.

Configure public endpoints

September 21, 2020

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Edit.
3. In the **Applications** page, go to **Public Endpoint** section and click the pencil icon.
4. In the **Public Endpoint** slider, set the following parameters.
    a) Public endpoint type. Select the radio button to define the endpoint type.
    b) Name. Name of the public endpoint.
    c) IP address. IP address of the public endpoint.
    d) Port. Port number of the public endpoint.
    e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click **Continue.**
6. In the **Application Units** section, select an application unit from the list.
7. Click **Continue** to set the policy and server details.
8. Click **OK** and then Done.
9. Click Close.

For more information about the parameters in the **Configure Public Endpoint** dialog box, see Content Switching.

Configure services and service groups for an application unit

September 21, 2020

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application and then click **Edit.**
3. In the **Applications** page, select an application unit and then click **Continue**.
4. In the **Services and Service Groups** section, do the following:
    a) In the Service Binding slider, set the following parameters.
        i. Service. Select a load balancing service from the list or create a new service.
        ii. Weight. Provide a weight value for the service.
    b) Click **Bind** and then **Done.**
    c) In the ServiceGroup Binding slider, set the following parameters:

        i. Service Group Name. Select a load balancing service group or create a new service group.
        ii. Click **Bind** and then **Done**.
    d) Click **Done**.
5. Click **Continue** to set other configurations.

Create application units

September 21, 2020

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications **page, go to** Application Units** section and click the **+ **icon. to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
    a) To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
    b) To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
    c) In the Rule box, configure the expression.
5. Click **OK**.

Configuring application unit rules

September 21, 2020

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.
3. In the **Configure Application Unit** dialog box, do the following:
    a) To specify the format of the new expression, do one of the following:
        - To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
        - To specify that you want to configure an advanced expression in the Rule box, click **Default Syntax**.
    b) In the Rule box, configure the expression.
4. Click **OK**.

Configuring policies for application units

September 21, 2020

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

> **Note**:
>
> When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or
> default syntax. Additionally, when you configure

> default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks.
> For information about configuring policies and expressions in both formats, see Policies and Expressions.

Configuring compression policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
    - Click Switch to Default Syntax if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click Switch to Classic Syntax to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.
      Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the
      default syntax view, when you click
      Insert Policy, the list that appears in the
      Policy Name column will include only
      default syntax policies. You cannot bind policies of both types to an application unit.
    - If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
      You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
    - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.
      For information about modifying a compression policy, see Compression.
    - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
    - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
    - To regenerate assigned priorities, click **Regenerate Priorities**.

- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Compression Policy** dialog box, configure the policy, and then click **Create**.

  For information about modifying a compression policy, see Compression.
- If you are configuring a default syntax expression, do the following:
  - In the **Goto Expression** column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

Configuring Caching Policies

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the **Configure Cache Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

     You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy.** Then, in the **Configure Cache Policy** dialog box, modify the policy, and then click **OK**.

     For information about modifying a Caching policy, see Integrated Caching.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.
   - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.

     For information about modifying a Caching policy, see Integrated Caching.
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

Configuring Rewrite policies

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
     You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click OK.
     For information about modifying a Rewrite policy, see Rewrite.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.
   - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.
     For information about modifying a Rewrite policy, see Rewrite.
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Responder policies

You can use only default syntax policies and expressions to configure Responder policies.

To configure Responder policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.

2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the **Configure Responder Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
    - To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Responder Policy** dialog box, modify the policy, and then click **OK**.
      For information about modifying a Responder policy, see Responder.
    - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
    - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
    - To regenerate assigned priorities, click **Regenerate Priorities.**
    - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name column**, click **New Policy**. Then, in the **Create Responder Policy** dialog box, configure the policy, and then click **Create**.
      For information about modifying a Responder policy, see Responder.
    - In the Goto Expression column, select a Goto expression.
    - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Application Firewall policies

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Application Firewall column.
3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
    - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.
      Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select
      Advanced Expression, when you click

  Insert Policy, the list that appears in the
  Policy Name column will include only
  default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.
- To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK.
  For information about modifying a application firewall policy, see Policies.
- To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click **Regenerate Priorities**.
- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Application Firewall Policy** dialog box, configure the policy, and then click **Create**.
  For information about modifying a application firewall policy, see Policies.

4. Click **Apply Changes**, and then click **Close**.

Configuring Application Units

September 21, 2020

To configure an application unit by using the GUI:

1. Navigate to **AppExpert** > **Applications** > **Application Unit** section and then click the plus icon to add a new application unit for a traffic subset.
2. In the **Application Unit** slider, set the following parameters:
   - Name
   - Expression

   You can insert an expression either by adding the expression components manually or by using the Expression Editor link. To manually add an expression, enter a selector component and then type a period (.) to display a list from which you can select the next component. For example, type HTTP and then type a period. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. Select a component from the drop-down menu. The Expression* text box now displays the components that you have added to the expression (for example, HTTP.REQ). Continue adding components until the complete expression is formed.

If you prefer assistance to form the expression, you can use the Expression Editor link. On the Expression Editor page, you can form an expression by selecting components from the drop-down boxes. Select the components and click Done to insert the expression on the Application Unit page.

3. Click **Continue** to bind services and service groups.
4. Click the **Service** section to select or add a virtual service and bind it to the application unit.
5. Click **Continue** and click the **Service Group** section to select or add a virtual service group and bind it to the application unit.
6. Click **Bind** and **Continue** to configure Advanced Settings (such as Policies, Method, Persistence, Protection, Profiles, Push, Authentication, and Traffic Settings) for the application unit.
7. Click the **plus** icon in each section to set the configuration parameters.
8. Click **OK** and then **Done**.

To edit an application unit for an application by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Application Unit** section, select an entity, click the edit icon and modify the application unit settings.

Note: You cannot modify the name and rule expression for an existing application unit.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simple way. Watch <`https://www.youtube.com/watch?v=bJ5_i8fV2hc`> video to learn how configure an application unit.

Configuring public endpoints for an application

September 21, 2020

To configure public endpoints for an application by using the GUI:

1. Navigate to **AppExpert** > **Applications**, select an application entity, and then click **Edit**.
2. In the **Public Endpoint** section, click **+** to configure a new public endpoint.
3. In the **Public Endpoint** slider, do one of the following:
    a) Click **New** to create a new endpoint.
    b) Click **Existing Public Endpoint** to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
    a) Name
    b) IP address
    c) Protocol
    d) Port

5. Click **Continue** to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click **OK** and then **Done**.
7. Click **Continue** and then **Done**.

To edit a public endpoint for an application by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application, and click **Edit**. In the **Public Endpoint** section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:

Navigate to **AppExpert** > **Applications** > **Public Endpoint,** click the pen icon to view the delete icon next to the entity.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simply way. Watch `<https://www.youtube.com/watch?v=z4v-edQiVpw>` video to learn how to configure a public endpoint.

Specifying the Order of Evaluation of Application Units

September 21, 2020

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Application Unit** section, click the **Pencil** icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

Configuring Persistency Groups for Application Units

September 21, 2020

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the **Applications View** dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click **Configure Persistency Groups**.
3. In the **Configure Persistency Groups** dialog box, do one of the following:
   - To add a persistency group, click **Add**.
   - To modify a persistency group, click **Open**.
4. In the **Create Persistency Group** or **Configure Persistency Group** dialog box, set the following parameters:
   - Group Name—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application's configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.
   - Persistence—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
   - Timeout—Time period for which a persistence session is in effect.
   - Backup Persistence—Type of backup persistence for the group.
   - Backup Timeout—Time period, in minutes, for which backup persistence is in effect.
   - Application Units—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click **Add**. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click **Remove**.
5. Click **OK**.

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer

September 21, 2020

The Visualizer feature shows you a graphical representation of an application's configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application's configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to **AppExpert** > **Applications**, select an application entity, and click **Visualizer**.

Configuring User Authentication, Authorization, and Auditing

September 21, 2020

You can configure authorization for users and groups to enable then to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure AAA users and AAA user groups for an application by using the configuring utility

1. Navigate to **AppExpert** > **Applications**, select an application entity, and then click **Edit**.
2. In the **Advanced Settings** section, click **Authorization**, and configure authorized users and user groups.
3. Click the **AAA** user section to bind authorized users to the application.
4. In the **AAA User** slider, set the parameters .
5. Click **Continue**, and then click **Authorization Policies** in the **Advanced Settings** section.
6. In the **Authorization Policy** slider, bind an authorization policy to the application.
7. Click **Continue**, and then click the **Authorization Group** section in the **Advanced Settings** section.
8. In the **AAA Group Binding** slider, bind an authorization user group to the application.
9. Click **Continue**, and then click **Policies** in the **Advanced Settings** section.
10. In the **Policies** slider, bind an **Audit Syslog** or **Audit NSlog** policy to the application.
11. Click **Continue** and then **Done**.

To edit AAA users and AAA user groups for an application by using the GUI:

Navigate to **AppExpert** > **Applications** > **Advanced Settings** and click **Authorization**. Then click the edit icon and specify values for user or user-group authorization settings.

To delete AAA users and AAA user groups by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Applications** page, click **Advanced Settings** and click **Authorization**. Click the delete icon next to the entity.

Monitoring a NetScaler Application

September 21, 2020

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. You can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

Viewing Application Statistics

In the **Applications** node, you can select an application and view the Statistics page for the application. On the Statistics page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the Statistics page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click the application for which you want to view statistics, and then click **Statistics**.

Monitoring an Application by Using the Application Visualizer

You can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, select the application for which you want to view statistical information, and then click **Visualizer**.
3. In the **Application Visualizer** window, do the following:
    - To view the statistics, click **Show Stats**.
      The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.
    - To refresh the statistical information, click **Refresh Stats**.

Viewing Hits

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count. For instructions on viewing hit counters, see Verifying and Testing the Configuration.

Deleting an Application

September 21, 2020

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.

When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application unit for an application by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Application Unit** section, click the delete icon next to the entity

Configure application authentication, authorization, and auditing

September 21, 2020

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, do one of the following:
    a) Click Add to add an authentication for a new application.
    b) Click Edit to modify an existing application.
3. In the **Applications** page, select an Application Unit.
4. In the **Application Unit** slider page, click Authentication from the **Advanced Settings** section.
5. In the **Authentication** section, select the authentication type as follows:
    a) Form based authentication
    b) 401 based authentication
    c) None
6. Click **OK** and then click **Done**.

Configure application authorization

You can configure authorization for users and groups to enable then to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click the AppExpert application for which you want to configure a user or group access.
3. In the **Applications** page, and then click Authorization. from the **Advanced Settings** section.
4. Do one of the following:

  - If the AAA user or group for which you want to configure permissions are already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the application tree. Then, right-click the user or group and click Allow.
  - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.
    The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
5. Click **Done** and then click **Close**.

Configure application auditing

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application's public endpoints.

To configure auditing policies for an application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click the application for which you want to configure auditing policies.
3. In the Application Unit slider page, click + icon in the **Policies** section to configure the auditing policies.
4. In the **Policies** slider page, select policy type as Syslog auditing or Nslog auditing and click **Continue**.
5. In the Policy binding section, set the following parameters.
   a) Select a policy for binding. If you do not have a policy for binding. click + to create a new policy.
   b) To create a new auditing policy, under Policy Name, click **New Policy,** and then, in the** Polic**y page do the following:
      i. In the Name box, type a name for the policy.
      ii. The Name box already contains the string that is required at the beginning of the server name. You cannot modify the string.
      iii. From the Auditing Type list, select the auditing type (either SYSLOG or NSLOG).
      iv. If the audit server you want to specify is already listed in the Server list, select the server from the list, and then, if you want to modify the server settings, click Modify. In the Configure Auditing Server dialog box, modify the settings as appropriate, and then click OK. For more information about the settings in the Configure Auditing Server dialog box, see Auditing Authenticated Sessions.
      v. If you want to configure a new audit server, click New, and then, in the Create Audit-

        ing Server dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click **OK**.
        vi. Click **Create**.
    c) To change the priorities for the new auditing policies you created, under Priority, for each policy for which you want to change the priority, double-click the priority value and type new priority value.
    d) To regenerate priorities, click **Regenerate Priorities**.
    e) To unbind a policy, click the policy, and then click **Unbind Policy**.
    f) To modify a policy, click the policy, and then click **Modify Policy.**
6. Click **Apply Changes,** and then click **Close**.

Disabling AAA for an Application

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:
3. To disable AAA for the application, click **Turn Off AAA.**
4. To enable AAA for the application, click **Turn On AAA**.

Setting Up a Custom NetScaler Application

September 21, 2020

If an AppExpert application template is not available for the Web application that you want to manage through the NetScaler appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.

After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.

Creating an Application

When you create an AppExpert application, the appliance creates a container to which you can add application units. The default application unit is not created until you create the first application unit.

To create an AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click Applications, and then click Add.
3. In the Create Application dialog box, in Name, enter a name for the application, and then click OK.

Creating Application Units

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. Click Create.

Configuring Public Endpoints for an AppExpert Application

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the NetScaler appliance.

To configure public endpoints for an AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click Activate All.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
   - If you want to create a new public endpoint, click Add. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click OK.
     In the Create public endpoint dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click Open.

  Then, in the Configure Public Endpoint dialog box, provide additional settings, and then click OK.
  For more information about the parameters in the Create public endpoint and Configure Public Endpoint dialog boxes, see Content Switching.
  - If you want to modify a public endpoint, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, modify settings for the endpoint, and then click OK.
    For more information about the parameters in the Configure Public Endpoint dialog box, see Content Switching.
4. Click Close.

Configuring Public Endpoints for an Application Unit

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see Configuring Endpoints for an Application Unit.

To configure endpoints for an application unit by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click **Configure Public Endpoints**.
3. In the **Choose Public Endpoints** dialog box for the application unit, do one of the following:
   - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click **OK**.

Configuring Services and Service Groups for an AppExpert Application

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.

To configure a service or service group for the AppExpert application by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
    - To configure services, click the **Services** tab.
    - To configure service groups, click the **Service Groups** tab.
4. On the Service or **Service Groups** tab, do one of the following:
    - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
    - If you want to specify all the services or service groups, click **Activate All**.
    - If you want to create a new service or service group, click **Add**. Then, in the **Create Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **Create**.
    - If you want to modify a service, click the service, and then click **Open**. Then, in the Configure Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click **OK**.

For information about the settings in the Create Service, Configure Service, and Create Service Group dialog boxes, see Load Balancing.

Configuring services and service groups for an application Unit

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
    - To configure services, click the **Services** tab.
    - To configure service groups, click the **Service Groups** tab.
4. In the **Services** or **Service Groups** tab, do one of the following:
    - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.
    - To specify all services or service groups, click **Activate All**.

5. On the Method and **Persistence** and **Advanced** tabs, specify the desired parameters.
6. Click **OK**.

Configuring Policies

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see Configuring Policies for Application Units.

Creating and managing template files

September 21, 2020

After you set up an AppExpert application and customize it to suit your requirements, you can create a template from the configuration and then share the template with other administrators. Or, you can create a template and then import the template to other NetScaler appliances that require a similar AppExpert application configuration. This simplifies and expedites the process of setting up similar applications on other appliances.

AppExpert application template files can be exported either to the template directory on the NetScaler appliance or to a folder on your local computer. You can then upload and download the templates to and from the NetScaler appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

AppExpert application template files can be exported either to the template directory on the NetScaler appliance or to a folder on your local computer. You can then upload and download the templates to and from the NetScaler appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

Exporting an appExpert application to a template file

September 21, 2020

When you export an appExpert application, all application-configuration information is exported to a template file, and all deployment-specific information is exported to a deployment file. The string _deployment is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory. If you have configured a NetScaler Gateway application, you can choose to include the NetScaler Gateway policies in the template.

To export an AppExpert application to a template file by using the GUI:

1. Navigate to **AppExpert** > **Application**, select an application entity, and then click **Edit**.
2. On the **Applications** page, click the **Export** as a Template link to export the application configuration and deployment settings as a template.
3. In the **Export Application** slider, set the following parameters:
   a) Template Filename
   b) Deployment Filename
4. Click **Continue** and **Done**.
5. Navigate to **AppExpert** > **Application** and click **Manage Templates** to show the exported configuration as files on the **Template File** and **Deployment File** tabs.

Exporting a Content Switching Virtual Server Configuration to a Template File

September 21, 2020

You can also export a content switching configuration as an application template. You can export a content switching virtual server configuration to an application template either from the Content Switching Virtual Servers pane or from the Content Switching Visualizer. Configuration information, which includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies, is exported to a template file and all deployment-specific information is exported to a deployment file. The string "_deployment" is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory.

For more information about the format of application templates and deployment files, see Understanding NetScaler Application Templates and Deployment Files. The configuration information that is exported includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies.

However, if the content switching virtual server is already configured as the public endpoint for an AppExpert application, you cannot export the configuration to a template file . In this scenario, you must export the associated AppExpert application to a template.

For more information about exporting an AppExpert application to a template file, see Exporting an AppExpert Application to a Template File.

To export a content switching configuration to an application template file from the Content Switching Visualizer by using the GUI:

1. Navigate to **Traffic Management** > **Content Switching** > **Virtual Servers**.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click **Visualizer**.
3. In the **Content Switching Visualizer**, click the icon for the content switching vserver, click **Related Tasks**, and then click **Create Template**.
4. In the **Export…as Template** dialog box, enter a name for the template file, and then do one of the following:
    - To export the template file to the appliance, make sure that Browse (Appliance) is displayed.
    - To export the template file to your computer, click the Browse (Appliance) drop-down menu, click **Local**, browse to the location to which you want to save the file, and then click **Save**.
5. Provide the following information:
    - **Introduction Description**—Any text that introduces the AppExpert application template during import. This text is displayed on the Specify Application Name page of the AppExpert Template Wizard when the template is imported.
    - **Summary Description**—Any summary that you might want to display on the Summary page of the AppExpert Template Wizard when the template is imported.
    - **Author**—The name of the author of the template.
    - **Major**—The major version number of the template.
    - **Minor**—The minor version number of the template. This number is appended to the major version number and displayed on the Summary page of the AppExpert Template Wizard, during import, in the format Major.Minor.
6. Click OK.

To export a content switching configuration to an application template file from the Content Switching Virtual Servers pane by using the GUI:

1. Navigate to **Traffic Management** > **Content Switching** > **Virtual Servers.**
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click **Create AppExpert** Template.
3. Perform steps 4 through 6 described in **To export a content switching configuration to an application template file from the Content Switching Visualizer** procedure.

Creating Variables in Application Templates

September 21, 2020

Application templates support the declaration of variables in the policy expressions and actions that are configured for an application. The ability to declare variables in policy expressions and actions enables you to replace preconfigured values in expressions (for example, configurable parameters such as the host name of a server or the target for a Rewrite action) with values that suit the environment into which you are importing the template. If variables have been configured for an AppExpert application template, the AppExpert Template Wizard, which appears when you import an AppExpert application template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the template.

As an example, consider the following policy expression that is configured to evaluate the value of the Host header in an HTTP request:

```
HTTP.REQ.HEADER("Host").CONTAINS("server1")
<!--NeedCopy-->
```

If you want the server name to be configurable at import time, you can specify the string "server1" as a variable. When importing the template, you can specify a new value for the variable on the Variables tab.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

In the export application template wizard, you can define variables in certain fields (fields with an adjacent button) for the following entities:

- Cache policies
- Rewrite policies
- Rewrite actions
- Responder policies
- Responder actions

To configure a variable in a policy expression or action by using the GUI:

1. Navigate to **AppExpert > Variables**.

2. In the **Variables** page, click **Add**.
3. In the **Create Variables** page, set the following parameters.
   Name. Name of the variable.

   Scope. Select the scope as Global or transaction.

   Type. Select the variable type as text, ulong, map.

   Expires in. Enter the expiry date.

   If Full*. Action to perform if an assignment to a map exceeds its configured max-entries:
   lru - (default) reuse the least recently used entry in the map.
   undef - force the assignment to return an undefined (Undef) result to the policy executing the assignment.
   Possible values: undef, lru
   Default value: lru.

   if no value. Value expiration in seconds. If the value is not referenced within the expiration period it will be deleted. 0 (the default) means no expiration. Minimum value: 0, Maximum value: 31622400

   Init Value. Initialization value for this variable, to which a singleton variable or map entry will be set if it is referenced before an assignment action has assigned it a value. If the singleton variable or map entry already has been assigned a value, setting this parameter will have no effect on that variable value. Default: 0 for ulong, NULL for text Maximum Length: 127

   Comments. A brief description about the variable.
4. Click **Close**.

Uploading and downloading template files

September 21, 2020

Template files can be uploaded from your local computer to the NetScaler appliance or downloaded from the appliance to your local computer. On the appliance, AppExpert application templates are always stored in the AppExpert application templates directory, which is `/nsconfig/nstemplates/applications/`.

To upload an AppExpert application template from your local computer to the NetScaler appliance:

1. Navigate to **AppExpert** > **Templates**.
2. In the details pane, click **Manage Templates**.

3. In the **Manage Application Templates** dialog box, click **Application Templates**, and then click **Upload**.
4. In the **Upload Application Template** dialog box, browse to the directory in which the template file is stored, click the template file, and then click **Select**.

   The template file is uploaded to the AppExpert application template directory on the appliance.

To download an AppExpert application template from the NetScaler appliance to your local computer:

1. Navigate to **AppExpert** > **Templates**.
2. In the details pane, click **Manage Templates**.
3. In the **Manage Application Templates** dialog box, click the AppExpert application template that you want to download, and click **Download**.
4. In the **Download Application Template** dialog box, browse to the location to which you want to save the file, and then click **Save**.

Understanding NetScaler application templates and deployment files

September 21, 2020

When you export a NetScaler application, the following two files are automatically created:

- **NetScaler application template file**. Contains application-configuration information such as application units, rules, and configured policies.
- **Deployment file**. Contains deployment-specific information such as public endpoints, services, associated IP addresses, and configured variables.

In a template file or deployment file, each unit of application-configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, each public endpoint and associated endpoint details are encapsulated within the <`appendpoint`> and <`appendpoint`> tags, and all the endpoint elements are encapsulated within the <`appendpoint_list`> and <`appendpoint_list`> tags.

Note: After you export a NetScaler application, you can add elements, remove elements, and modify existing elements before importing the application to a NetScaler appliance.

Example of a NetScaler Application Template

Following is an example of a template file that was created from a NetScaler application called **SharePoint_Team_Site**:

```
<?xml version="1.0" encoding="UTF-8" ?>
<template>
```

```
<template_info>
   <application_name>SharePoint_Team_Site</application_name>
   <templateversion_major>1</templateversion_major>
   <templateversion_minor>1</templateversion_minor>
   <author>Ed</author>
   <introduction>An application for managing a SharePoint team site
      with images, reports, and, XML content.</introduction>
   <summary>This template includes variables</summary>
   <version_major>9</version_major>
   <version_minor>3</version_minor>
   <build_number>38</build_number>
</template_info>
<apptemplate>
   <rewrite>
      <rewriteaction_list>
         <rewriteaction>
            <name>Rw_name</name>
            <type>replace</type>
            <target>HTTP.REQ.BODY(10000).AFTER_REGEX(re/number/).
               BEFORE_REGEX(re/address/)</target>
            <stringbuilderexpr>"NA"</stringbuilderexpr>
            <allow_unsafe_pi1>NO</allow_unsafe_pi1>
         </rewriteaction>
         <rewriteaction>
            .
            .
            .
         </rewriteaction>
         .
         .
         .
      </rewriteaction_list>
      <rewritepolicy_list>
         <rewritepolicy>
            <name>Rw_number_NA</name>
            <rule>HTTP.REQ.BODY(100000).CONTAINS("admin")</rule>
            <action>Rw_name</action>
         </rewritepolicy>
         <rewritepolicy>
            .
            .
            .
         </rewritepolicy>
         .
         .
```

```
            .
        </rewritepolicy_list>
    </rewrite>
    <appunit_list>
        <appunit>
            <name>SharePoint_Team_Sitedefault</name>
            <rule />
            <expressiontype>PE</expressiontype>
            <servicetype>HTTP</servicetype>
            <ipv46>0.0.0.0</ipv46>
            <ipmask>*</ipmask>
            <port>0</port>
            <range>1</range>
            <persistencetype>NONE</persistencetype>
            <timeout>2</timeout>
            <persistencebackup>NONE</persistencebackup>
            <backuppersistencetimeout>2</backuppersistencetimeout>
            <lbmethod>LEASTCONNECTION</lbmethod>
            <persistmask>255.255.255.255</persistmask>
            <v6persistmasklen>128</v6persistmasklen>
            <pq>OFF</pq>
            <sc>OFF</sc>
            <m>IP</m>
            <datalength>0</datalength>
            <dataoffset>0</dataoffset>
            <sessionless>DISABLED</sessionless>
            <state>ENABLED</state>
            <connfailover>DISABLED</connfailover>
            <clttimeout>180</clttimeout>
            <somethod>NONE</somethod>
            <sopersistence>DISABLED</sopersistence>
            <redirectportrewrite>DISABLED</redirectportrewrite>
            <downstateflush>DISABLED</downstateflush>
            <gt2gb>DISABLED</gt2gb>
            <ipmapping>0.0.0.0</ipmapping>
            <disableprimaryondown>DISABLED</disableprimaryondown>
            <insertvserveripport>OFF</insertvserveripport>
            <authentication>OFF</authentication>
            <authn401>OFF</authn401>
            <push>DISABLED</push>
            <pushlabel>none</pushlabel>
            <l2conn>OFF</l2conn>
        </appunit>
        <appunit>
            .
            .
            .
        </appunit>
        .
        .
        .
    </appunit_list>
    </apptemplate>
    <parameters>
        <property_list>
            <property>
                <variable_definition_list>
                    <variable_definition>
                        <name>body_size</name>
                        <defaultvalue>10000</defaultvalue>
                        <description>Evaluation Scope</description>
                        <startindex>14</startindex>
                        <length>5</length>
                    </variable_definition>
                    .
                    .
                    .
                </variable_definition_list>
                <object_type>rewriteaction</object_type>
                <object_name>Rw_name</object_name>
                <name>target</name>
            </property>
            .
            .
            .
        </property_list>
    </parameters>
</template>
<!--NeedCopy-->
```

Example of a deployment file

Following is the deployment file associated with the **SharePoint_Team_Site** application in the preceding example:

```
<?xml version="1.0" encoding="UTF8" ?>
<template_deployment>
    <template_info>
        <application_name>SharePoint_Team_Site</application_name>
```

```
      <templateversion_major>1</templateversion_major>
      <templateversion_minor>1</templateversion_minor>
      <author>Ed</author>
      <introduction>An application for managing a SharePoint team site with images, reports, and, XML content.</introduction>
      <summary>This template includes variables</summary>
      <version_major>9</version_major>
      <version_minor>3</version_minor>
      <build_number>38</build_number>
   </template_info>
   <appendpoint_list>
      <appendpoint>
         <ipv46>10.111.111.1</ipv46>
         <port>80</port>
         <servicetype>HTTP</servicetype>
      </appendpoint>
   </appendpoint_list>
   <service_list>
      <service>
         <ip>10.102.29.5</ip>
         <port>80</port>
         <servicetype>HTTP</servicetype>
      </service>
      <service>
         .
         .
         .
      </service>
      .
      .
      .
   </service_list>
   <variable_list>
      <variable>
         <name>body_size</name>
         <description>Evaluation Scope</description>
         <value>10000</value>
      </variable>
      <variable>
         .
         .
         .
      </variable>
      .
      .
```

```
        .
    </variable_list>
</template_deployment>
<!--NeedCopy-->
```

Deleting a Template File

September 21, 2020

If you no longer need an application template and its configuration, you can delete it. When you delete a template, the template XML file that is stored in the application template directory gets deleted. When you delete a template file, you are prompted to confirm the deletion. Click **Yes** to confirm and delete the selected file from the directory.

To delete a template file from the application template directory by using the GUI:

1. Navigate to **AppExpert > Applications** and then click **Manage Template**. Select a file from **Template Files** tab page or **Deployment Files** tab page and click **Delete**.

NetScaler Gateway Applications

September 21, 2020

When you configure an AppExpert application to manage a web application through the Citrix® NetScaler® appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure NetScaler Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.

You can also configure NetScaler Gateway policies for intranet subnets, file shares, and other network resources. Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the NetScaler Gateway home page.

You can configure the entities in the NetScaler Gateway Applications feature only by using the GUI.

How an NetScaler Gateway Application Works

When you create an AppExpert application in the Applications node in the GUI, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application's configured public endpoint is automatically created for the Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The NetScaler appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application's public endpoint. Traffic received at the AppExpert application's public endpoint is first evaluated against the NetScaler Gateway policies and then evaluated against the policies configured for AppExpert application's application units.

The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert application. Therefore, before you configure NetScaler Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the NetScaler Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

How a NetScaler Configuration for a File Share Works

On the NetScaler appliance, you can configure Authorization policies for a file share that is hosted on your organization's network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The NetScaler configuration for a file share cannot be saved in AppExpert application templates.

How a NetScaler Configuration for an Intranet Subnet Works

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the NetScaler appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet's IP address and netmask, respectively.

The NetScaler configuration for an intranet subnet cannot be saved in AppExpert application templates.

How the Other Resources Category Works

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the NetScaler appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The NetScaler appliance applies the configured NetScaler Gateway policies to any requests that match the configured rule.

The NetScaler configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

Entity Naming Conventions

The NetScaler Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (_). The name that you provide for the entity is appended to this string. If the name of a subnet is "subnet1," the name of the profile begins with "subnet1_." When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

Adding Intranet Subnets

September 21, 2020

You can specify authorization and Traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
    - To add an intranet subnet, click Intranet Subnets, and then click Add.
    - To modify an intranet subnet, click an intranet subnet, and then click Open.

3. In the Create Intranet Subnet or Configure Intranet Subnet dialog box, do the following:
    a) In the Name box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
    b) In the IP Address box, type the IP address of the intranet subnet.
    c) In the Netmask box, type the netmask that will be used for the intranet subnet.
    d) Click Create or OK, and then click Close.

Adding Other Resources

September 21, 2020

For a network resource that you add to Other Resources, you must configure a classic expression that identifies the subset of traffic associated with the resource. For more information about configuring a classic expression, see the .

To configure a resource in Other Resources by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
    - To add a resource, click Other Resources, and then click Add.
    - To modify a resource, click a resource, and then click Open.
3. In the Create Resource or Configure Resource dialog box, do the following:
    a) In the Name box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
    b) In the Rule box, type the rule that will identify the subset of traffic that is associated with the resource you are adding.
    Alternatively, click Configure, and then create the rule in the Create Expression dialog box.
    c) Click Create or OK, and then click Close.

Configuring Authorization Policies

September 21, 2020

You can configure NetScaler Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.

2. In the details pane, in the Authorization column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.
3. Do one of the following:
    - If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the `<application name>` tree. Then, right-click the user or group and click **Allow**.
    - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the `<application name>` tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.
      The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
4. Click **Close**.

Configuring Traffic Policies

September 21, 2020

The traffic policies that you configure for the resources in the NetScaler Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application time-out, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the Traffic column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.
3. In the **Configure Traffic Policies** dialog box, do the following:
    - To specify an existing traffic policy, click **Insert Policy**, and then, in the Policy Name column, click the name of the policy.
    - To configure a new policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Traffic Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Request Profile, either select an existing request profile or click New to configure a new request profile. You can also select an existing profile and then click Modify to modify the profile.

  For more information about configuring a traffic policy or profile, see NetScaler Gateway.
  - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click **Modify Profile**.
  - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
  - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
  - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

Configuring Clientless Access Policies

September 21, 2020

Clientless access, when configured for a resource on the NetScaler appliance, allows end-users to access the resource without using the NetScaler Gateway client software. Users can use web browsers to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the NetScaler Gateway Applications node:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the **Clientless Access **column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.
3. In the **Configure Clientless Access Policies** dialog box, do the following:
   - To specify an existing clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
   - To configure a new clientless access policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Clientless Access Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Profile, either select an existing profile or click New to configure a new profile. You can also select an existing profile and then click Modify to modify the profile.
     For more information about configuring a clientless access policy or profile, see NetScaler Gateway.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
   - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.

    - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

Configuring TCP Compression Policies

September 21, 2020

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see NetScaler Gateway.

To configure a TCP compression policy for a resource in the NetScaler Gateway Applications node

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the TCP Compression column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.
3. In the Configure TCP Compression Policies dialog box, do the following:
    - To specify an existing TCP compression policy, click **Insert Policy**, and then, in the **Policy Name **column, click the name of the policy.
    - To create a new TCP compression policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create TCP Compression Policy dialog box, in the Policy Name box, after the underscore ("_"), type a name for the policy. Then, in Action, either select an existing action or click New and configure a new action. You can also click View to view the configured compression type.
      For more information about configuring a TCP compression policy or action, see NetScaler Gateway , Enterprise Edition at NetScaler Gateway.
    - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**.
    - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
    - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
    - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes,** and then click **Close**.

Configure bookmarks

October 23, 2020

You can configure bookmarks for internal applications or resources that are available for an entitled user. You can then bind the bookmark to a user, user group or virtual server globally and enable it for the user in the Access Interface. The bookmark links that you create appear on the websites panes under enterprise websites.

For more information, see Creating and Applying Web Links topic.

Customizing the configuration

September 21, 2020

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for a traffic subset or modify the existing application unit. After you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:

1. Configuring Public Endpoints
2. Configuring Application Units
3. Specifying the Order of Evaluation
4. Viewing Application Configuration using Visualizer

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.

Configure public endpoints

September 21, 2020

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Edit.
3. In the **Applications** page, go to **Public Endpoint** section and click the pencil icon.
4. In the **Public Endpoint** slider, set the following parameters.
    a) Public endpoint type. Select the radio button to define the endpoint type.
    b) Name. Name of the public endpoint.
    c) IP address. IP address of the public endpoint.
    d) Port. Port number of the public endpoint.
    e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click **Continue.**
6. In the **Application Units** section, select an application unit from the list.
7. Click **Continue** to set the policy and server details.
8. Click **OK** and then Done.
9. Click Close.

For more information about the parameters in the **Configure Public Endpoint** dialog box, see Content Switching.

Configuring Endpoints for an Application Unit

September 21, 2020

When you configure multiple public endpoints for an AppExpert application, by default, all endpoints are bound to each application unit, and each application unit processes the requests received by all the endpoints. However, you can specify that a given application unit manages the traffic that is received by only a subset of the endpoints that are configured for the AppExpert application.

To configure endpoints for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application unit, do one of the following:
   - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click **OK**.

Configure services and service groups for an application unit

September 21, 2020

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application and then click **Edit.**
3. In the **Applications** page, select an application unit and then click **Continue**.
4. In the **Services and Service Groups** section, do the following:
   a) In the Service Binding slider, set the following parameters.
      i. Service. Select a load balancing service from the list or create a new service.
      ii. Weight. Provide a weight value for the service.
   b) Click **Bind** and then **Done.**
   c) In the ServiceGroup Binding slider, set the following parameters:
      i. Service Group Name. Select a load balancing service group or create a new service group.
      ii. Click **Bind** and then **Done**.

    d) Click **Done**.
5. Click **Continue** to set other configurations.

Configuring services, service groups, and load balancing Parameters for an application unit

September 21, 2020

When you configure services and service groups for an AppExpert application, by default, all the services and service groups are bound to each application unit. However, depending on how you have configured your web application, the application resources that are managed by an application unit might be hosted on only some of the servers that are configured as services for the AppExpert application. Or, a set of servers might host content that is meant for the requests received at one or more specific public endpoints. In such scenarios, if all the services and service groups that are configured for the AppExpert application are associated with the application unit, a request that is forwarded to a server that does not host the requested content might not be served or might be served incorrect content. Therefore, you must ensure that each application unit is configured to manage only those services that can serve the requested content.

When configuring services and service groups for an application unit, you might choose to specify load balancing settings such as the weights that services must be assigned and the desired load balancing, persistence, and spillover methods. For more information about these settings, see Load Balancing.

To configure services or service groups for an application unit

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. In the **Services** or **Service Groups **tab, do one of the following:
   - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.
   - To specify all services or service groups, click **Activate All**.
5. On the **Method** and **Persistence** and **Advanced** tabs, specify the desired parameters.
6. Click **OK**.

Create application units

September 21, 2020

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications **page, go to** Application Units** section and click the **+ **icon. to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
    a) To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
    b) To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
    c) In the Rule box, configure the expression.
5. Click **OK**.

Configuring application unit rules

September 21, 2020

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.

3. In the **Configure Application Unit** dialog box, do the following:
    a) To specify the format of the new expression, do one of the following:
        - To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
        - To specify that you want to configure an advanced expression in the Rule box, click **Default Syntax**.
    b) In the Rule box, configure the expression.
4. Click **OK**.

Configuring policies for application units

September 21, 2020

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

> **Note**:
>
> When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or
> default syntax. Additionally, when you configure
> default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks.
> For information about configuring policies and expressions in both formats, see Policies and Expressions.

Configuring compression policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
    - Click Switch to Default Syntax if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click Switch to Classic Syntax to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.
      Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the
      default syntax view, when you click
      Insert Policy, the list that appears in the
      Policy Name column will include only
      default syntax policies. You cannot bind policies of both types to an application unit.
    - If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
      You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
    - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.
      For information about modifying a compression policy, see Compression.
    - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
    - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
    - To regenerate assigned priorities, click **Regenerate Priorities**.
    - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Compression Policy** dialog box, configure the policy, and then click **Create**.
      For information about modifying a compression policy, see Compression.
    - If you are configuring a default syntax expression, do the following:

    - In the **Goto Expression** column, select a Goto expression.
    - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Caching Policies

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the **Configure Cache Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
    - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
      You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
    - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy.** Then, in the **Configure Cache Policy** dialog box, modify the policy, and then click **OK**.
      For information about modifying a Caching policy, see Integrated Caching.
    - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
    - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
    - To regenerate assigned priorities, click **Regenerate Priorities**.
    - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.
      For information about modifying a Caching policy, see Integrated Caching.
    - In the Goto Expression column, select a Goto expression.
    - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Rewrite policies

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
    - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
      You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
    - To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click OK.
      For information about modifying a Rewrite policy, see Rewrite.
    - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
    - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
    - To regenerate assigned priorities, click **Regenerate Priorities**.
    - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.
      For information about modifying a Rewrite policy, see Rewrite.
    - In the Goto Expression column, select a Goto expression.
    - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Responder policies

You can use only default syntax policies and expressions to configure Responder policies.

To configure Responder policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the **Configure Responder Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
    - To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Responder Policy** dialog

  box, modify the policy, and then click **OK**.
  For information about modifying a Responder policy, see Responder.
  - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
  - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
  - To regenerate assigned priorities, click **Regenerate Priorities.**
  - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name column**, click **New Policy**. Then, in the **Create Responder Policy** dialog box, configure the policy, and then click **Create**.
    For information about modifying a Responder policy, see Responder.
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Application Firewall policies

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Application Firewall column.
3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.
     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select
     Advanced Expression, when you click
     Insert Policy, the list that appears in the
     Policy Name column will include only
     default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.
   - To modify an application firewall policy that is already bound to the application unit, click

    the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK.
    For information about modifying a application firewall policy, see Policies.
  - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
  - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
  - To regenerate assigned priorities, click **Regenerate Priorities**.
  - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Application Firewall Policy** dialog box, configure the policy, and then click **Create**.
    For information about modifying a application firewall policy, see Policies.
4. Click **Apply Changes**, and then click **Close**.

Create application units

September 21, 2020

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert** > **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications **page, go to** Application Units** section and click the **+ **icon. to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
   a) To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
   b) To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
   c) In the Rule box, configure the expression.

5. Click **OK**.

Configuring public endpoints for an application

September 21, 2020

To configure public endpoints for an application by using the GUI:

1. Navigate to **AppExpert** > **Applications**, select an application entity, and then click **Edit**.
2. In the **Public Endpoint** section, click **+** to configure a new public endpoint.
3. In the **Public Endpoint** slider, do one of the following:
    a) Click **New** to create a new endpoint.
    b) Click **Existing Public Endpoint** to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
    a) Name
    b) IP address
    c) Protocol
    d) Port
5. Click **Continue** to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click **OK** and then **Done**.
7. Click **Continue** and then **Done**.

To edit a public endpoint for an application by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application, and click **Edit**. In the **Public Endpoint** section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:

Navigate to **AppExpert** > **Applications** > **Public Endpoint,** click the pen icon to view the delete icon next to the entity.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simply way. Watch <`https://www.youtube.com/watch?v=z4v-edQiVpw`> video to learn how to configure a public endpoint.

Specifying the Order of Evaluation of Application Units

September 21, 2020

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the **Application Unit** section, click the **Pencil** icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

Configuring Persistency Groups for Application Units

September 21, 2020

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to **AppExpert** > **Applications**.
2. In the **Applications View** dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click **Configure Persistency Groups**.
3. In the **Configure Persistency Groups** dialog box, do one of the following:
   - To add a persistency group, click **Add**.
   - To modify a persistency group, click **Open**.
4. In the **Create Persistency Group** or **Configure Persistency Group** dialog box, set the following parameters:
   - Group Name—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application's configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot

remove that prefix. Enter a name of your choice after the prefix.
   - Persistence—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
   - Timeout—Time period for which a persistence session is in effect.
   - Backup Persistence—Type of backup persistence for the group.
   - Backup Timeout—Time period, in minutes, for which backup persistence is in effect.
   - Application Units—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click **Add**. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click **Remove**.
5. Click **OK**.

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer

September 21, 2020

The Visualizer feature shows you a graphical representation of an application's configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application's configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to **AppExpert** > **Applications**, select an application entity, and click **Visualizer**.

AppQoE

September 21, 2020

Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle queuing of all requests to a web site or application as one group before load balancing, instead of as separate streams after load balancing.

The features that are integrated into AppQoE are HTTP Denial-of-Service Protection (HDOSP), Priority Queuing (PQ), and SureConnect. Collectively these services provide protection against a number of problems:

- **Simple overload.** Any server, no matter how robust, can accept only a limited number of connections at one time. When a protected web site or application receives too many requests at once, the Surge Protection feature detects the overload and queues the excess connections til the server can accept them. The Priority Queuing feature ensures that whoever most needs access to a resource is provided access without having to wait behind other lower-priority requests. The SureConnect feature displays an alternate web page that notifies users that the resource that they requested is not available.
- **Denial-of-Service (DOS) attacks.** Any public-facing resource is vulnerable to attacks whose purpose is to bring that service down and deny legitimate users access to it. The Surge Protection, Priority Queuing, and SureConnect features help manage DOS attacks as well as other types of high load. In addition, the HTTP Denial-of-Service Protection feature targets DOS attacks against your web sites, sending challenges to suspected attackers and dropping connections if the clients do not send an appropriate response.

Until the current version of the NetScaler operating system, these features were implemented at the service level, which means that each service was assigned its own queues. While service-level queues work, they also have some disadvantages, most of which are due to the NetScaler appliance having to load balance requests before implementing any of the protection features that rely on queuing. Implementing protection features before queuing has a number of advantages, some of which are listed below:

- Absolute priority of connections as configured in the priority queuing feature can be maintained.
- Connections are not flushed if a service transitions state, as they are in a service-level queue.
- During periods of high load, such as a denial-of-service attack, HTTP DoS and SureConnect come into play before load balancing, allowing these features to detect and divert unwanted or lower-priority traffic from the load balancer before the load balancer must cope with it.

In addition to implementing fair queuing, AppQoE integrates a set of features that each provide a different set of tools to achieve a common goal: protecting your networked resources from excessive or inappropriate demand. Putting these features into a common framework enables you to configure and implement them more easily.

Enabling AppQoE

September 21, 2020

To configure AppQoE, you must first enable the feature.

To enable AppQoE by using the command line

At the command prompt, type the following commands:

- enable ns feature appqoe
- show ns feature

Example:

```
> enable ns feature appqoe
 Done
> show ns feature

        Feature                        Acronym              Status
        -------                        -------              ------
 1)     Web Logging                    WL                   ON
 2)     Surge Protection               SP                   ON
 3)     Load Balancing                 LB                   ON
 ...
 1)     AppQoE                         AppQoE               ON
 Done
<!--NeedCopy-->
```

To enable AppQoE by using the GUI

1. Navigate to **System** > **Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

AppQOE actions

September 21, 2020

After enabling the AppQoE feature, you must configure one or more actions for handling requests.

> **Important**: No specific individual parameters are required to create an action, but you must include at least one parameter or you cannot create the action.

To configure an AppQoE action by using the command line

At the command prompt, type the following commands:

- `add appqoe action <name> [-priority <priority>] [-respondWith (ACS|NS)[<customfile>] [-altContentSvcName <string>] [-altContentPath <string>] [-maxConn <positive_integer>] [-delay <usecs>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-dosAction (**SimpleResponse** | **HICResponse**)]`
- `show appqoe action`

Example

To configure priority queuing with policy queue depths of 10 and 1000 for medium and lowest priority queues, respectively:

```
> add appqoe action appqoe-act-basic-prhigh -priority HIGH
 Done

> add appqoe action appqoe-act-basic-prmedium -priority MEDIUM -
   polqDepth 10
 Done

> add appqoe action appqoe-act-basic-prlow -priority LOW -polqDepth
   1000
 Done

> show appqoe action
1)       Name: appqoe-act-basic-prhigh
         ActionType: PRIORITY_QUEUING
         Priority: HIGH
         PolicyQdepth: 0
         Qdepth: 0

2)       Name: appqoe-act-basic-prmedium
         ActionType: PRIORITY_QUEUING
         Priority: MEDIUM
         PolicyQdepth: 10
         Qdepth: 0

3)       Name: appqoe-act-basic-prlow
         ActionType: PRIORITY_QUEUING
```

```
        Priority: LOW
        PolicyQdepth: 1000
        Qdepth: 0
Done
<!--NeedCopy-->
```

To modify an existing AppQoE action by using the command line

At the command prompt, type the following commands:

- `set appqoe action <name> [-priority <priority>] [-altContentSvcName <string>] [-altContentPath <string>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-maxConn <positive_integer>] [-delay <usecs>] [-dosTrigExpression <expression>] [-dosAction ( SimpleResponse | HICResponse )]`
- `show appqoe action`

To remove an AppQoE action by using the command line

At the command prompt, type the following commands:

- `rm appqoe action <name>`
- `show appqoe action`

Parameters for configuring an AppQoE action

- name

  A name for the new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.

- priority

  The priority queue to which the request is assigned. When a protected web server or application is heavily loaded and cannot accept additional requests, specifies the order in which waiting requests are to be fulfilled when resources are available. The choices are:

  1. **HIGH.** Fulfills the request as soon as resources are available.
  2. **MEDIUM.** Fulfills the request after it has fulfilled all requests in the HIGH priority queue.
  3. **LOW.** Fulfills the request after it has fulfilled all requests in the HIGH and MEDIUM priority queues.
  4. **LOWEST.** Fulfills the request only after it has fulfilled all requests in higher-priority queues.

If priority is not configured, then the NetScaler appliance assigns the request to the LOWEST priority queue by default.

- respondWith

  Configures the NetScaler to take the specified Responder action when the specified threshold is reached. Must be used with one of the following settings:

  - **ACS:** Serves content from an alternate content service. Threshold: maxConn (maximum connections) or delay.
  - **NS:** Serves a built-in response from the NetScaler. Threshold: maxConn (maximum connections) or delay.
  - **NO ACTION:** Serves no alternative content. Assigns connections to the LOWEST priority queue if the maxConn (maximum connections) or delay threshold is reached.

- altContentSvcName

  If
  -responseWith ACS is specified, the name of the alternative content service, usually an absolute URL to the web server that hosts the alternate content.

- altContentPath

  If
  -responseWith (ACS | NS) is specified, the path to the alternative content.

- polqDepth

  Policy queue depth threshold value for the policy queue associated with this action. When the number of connections in the policy queue associated with this action increases to the specified number, subsequent requests are assigned to the LOWEST policy queue. Minimum value: 1 Maximum value: 4,294,967,294

- priqDepth

  Policy queue depth threshold value for the specified priority queue. If the number of requests in the specified queue on the virtual server to which the policy associated with the current action is bound increases to the specified number, subsequent requests are assigned to the LOWEST priority queue. Minimum value: 1 Maximum value: 4,294,967,294

- maxConn

  The maximum number of connections that can be open for requests that match the policy rule. Minimum value: 1 Maximum value: 4,294,967,294

- delay

  The delay threshold, in microseconds, for requests that match the policy rule. If a matching request has been delayed for longer than the threshold, the

NetScaler appliance performs the specified action. If NO ACTION is specified, then the appliance assigns requests to the LOWEST priority queue. Minimum value: 1 Maximum value: 599999,999

- dosTrigExpression

  Adds an optional second-level check to trigger DoS actions.

- dosAction

  Action to take when the ADC determines that it or a protected server is under DoS attack. Possible values: SimpleResponse, HICResponse.

These values specify HTTP challenge-response methods for validating the authenticity of incoming requests to mitigate an HTTP-DDoS attack.

In the HTTP challenge-response generation and validation process, AppQoE uses cookies to validate the client's response and verify that the client seems to be genuine. When sending a challenge, a NetScaler appliance generates two cookies:

Header cookie (_DOSQ). Contains client-specific information, so that the NetScaler appliance can verify the response.

Body cookie (_DOSH). Information used to validate the client machine. The client's browser (or the user, in the case of HIC) computes a value for this cookie. The NetScaler appliance compares that value with the expected value to verify the client.

The information that the appliance sends to the client for computing the _DOSH value is based on the DoS Action configuration.

1. SimpleResponse: In this case, a NetScaler appliance splits the value and generates a JavaScript code to combine the final value. A client machine capable of computing the original value is considered genuine.
2. HICResponse: in this case, a NetScaler appliance generates two single-digit numbers and generates images for those numbers. Then, using a backpatch framework, the appliance inserts those images as base64 strings.

Limitations:

1. This is not a trivial CAPTCHA implementation, which is why that term not used.
2. The validation number is based on a NetScaler-generated number that does not change for 120s. This number should be dynamic or client specific.

To configure an AppQoE action by using the GUI

1. Navigate to **App-Expert** > **AppQoE** > **Actions**.
2. In the details pane, do one of the following:
    - To create a new action, click **Add**.

  - To modify an existing action, select the action, and then click **Edit**.
3. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the AppQoE Action" as follows (asterisk indicates a required parameter):
   - Name—name
     > - Action type—respondWith
   - Priority—priority
   - Policy Queue Depth—polqDepth
   - Queue Depth—priqDepth
   - DOS Action—dosAction
4. Click **Create** or **OK**.

AppQoE parameters

September 21, 2020

In the AppQoE parameters, you configure the session life of an AppQoE session, the file name of the file containing the customized response, and the number of client connections that can be placed in a queue.

To configure the AppQoE parameter settings by using the command line

At the command prompt, type the following commands:

- `set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>] [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]`
- `show appqoe parameter`

Parameters for configuring the AppQoE parameters

- sessionLife

  Number of seconds to wait after displaying alternate content before the ADC displays the same content again. Default value: 300 Maximum Minimum value: 1 Maximum value: 4,294,967,294

- avgwaitingclient

  The average number of client requests that can be in the service waiting queue. Default value: 1000000 Maximum value: 4,294,967,294

- MaxAltRespBandWidth

  The maximum bandwidth to consume when sending alternate responses. If the maximum is reached, the ADC quits sending the alternate content til bandwidth consumption drops. Default value: 100 Minimum value: 1 Maximum value: 4,294,967,294

- dosAtckThrsh

  The denial-of-service attack threshold. The number of connections that must be waiting in queues before the ADC responds with DoS protection measures. Default value: 2000 Minimum value: 0 Maximum value: 4,294,967,294

To configure the AppQoE parameter settings by using the GUI

1. Navigate to **AppExpert** > **AppQoE**.
2. In the details pane, click **Configure AppQoE Parameters**.
3. In the **Configure AppQoE params** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the AppQoE Parameters" as follows (asterisk indicates a required parameter):
   - Session Life (secs)
   - sessionLife
   - Average waiting client—avgwaitingclient
   - Alternate Response Bandwidth Limit(Mbps) —MaxAltRespBandWidth
   - DOS Attack Threshold —dosAttackThresh
4. Click **OK**.

AppQoE Policies

September 21, 2020

To implement AppQoE, you must configure at least one policy to tell your NetScaler how to distinguish the connections to be queued in a specific queue.

To configure an AppQoE policy by using the command line

At the command prompt, type the following command:

```
add appqoe policy <name> -rule <expression> -action <string>
```

Example:

The following example selects requests with a User-Agent header that contains "Android", and assigns them to the medium priority queue. These requests come from smartphones and tablets that run the Google Android operating system.

```
> add appqoe action appqoe-act-primd -priority MEDIUM
Done
> add appqoe policy appqoe-pol-primd -rule "HTTP.REQ.HEADER("User-Agent
   ").CONTAINS("Android")" -action appqoe-act-primd
Done
> sh appqoe policy appqoe-pol-primd
        Name: appqoe-pol-primd
        Rule: HTTP.REQ.HEADER("User-Agent").CONTAINS("Android")
        Action: appqoe-act-primd
        Hits: 0

Done
<!--NeedCopy-->
```

Parameters for configuring an AppQoE policy

- name. A name for the AppQoE policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the type of action.
- rule. A NetScaler expression that tells the appliance which connections it should handle.
- action. The AppQoE action to perform when a connection matches the policy.

To configure an AppQoE policy by using the GUI

1. Navigate to **App-Expert** > **AppQoE** > **Policies**.
2. In the details pane, do one of the following:
   - To create a new policy, click **Add**.
   - To modify an existing policy, select the policy, and then click **Edit**.
3. If you are creating a new policy, in the **Create AppQoE Policy** dialog, in the Name text box, type a name for your new policy.

   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the purpose and effect of this policy.

If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the **Action** drop-down list, choose the AppQoE action to perform when the policy matches a connection. Click the plus (+) to open the **Add AppQoE Action** dialog and add a new action.
5. In the **Rule** text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:
    a) In the **Create Expression** dialog box, click **Add**.
    b) In the Add Expression dialog box, select a common expression from the Frequently Used Expressions drop-down list, or use the Construct Expression drop-down lists to create the expression that defines which traffic to filter.

       If you choose to create your own expression, you start by selecting the first term from the first drop-down list on the left side of the Construct Expression area. The choices in that list are:

       - HTTP: All traffic to port 80 and port 443.
       - SYS:
       - CLIENT:
       - SERVER:
       - ANALYTICS:
       - TEXT:

       The default choice is HTTP. After you make a choice in the first drop-down list (or accept the default), you can choose the next term in your expression from the drop-down list to the right of it. The terms in that list and other lists that follow change depending on your previous choices; the lists offer only terms that are valid choices. Continue to select terms until you have finished the expression.
    c) When you have created the expression that you want, click **OK**. The expression is added in the **Expression** text box.
6. Click **Create**. The expression appears in the **Rule** text box.

Entity templates

September 21, 2020

An entity template is a collection of configuration information for an individual entity on a NetScaler® appliance. It provides a specification and a set of defaults for a configurable NetScaler entity, such as a policy, virtual server, service, or action. By using a template that defines a set of defaults, you can quickly configure multiple entities that require a similar configuration while eliminating several configuration steps.

Entity templates are available only in the GUI. You use the NetScaler GUI to create, manage, and use any type of entity template. You can share entity templates with other administrators and manage local folders that contain the templates. You can also import entity templates from and export entity templates to your local computer.

Before creating a template, you should be familiar with the configuration of the entity.

Note: You use entity templates to configure individual entities. To configure multiple entities related to a particular Web application, you must use an application template. For more information, see “ AppExpert Applications and Templates.”

How Entity Templates Work:

When you create a template for a NetScaler entity, you specify default values for the entity. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard. All the information and settings you provide are stored in the template file.

When a user imports the entity template to a NetScaler appliance, a wizard guides the user through the various pages that you configured for the template. The wizard displays the read-only parameter values and prompts the user to specify values for the configurable parameters. After the user follows the instructions in the wizard, the appliance creates the entity with the configured values.

For example, you can create an entity template for HTTP services that provides a text box for a service name and assigns preset values for the service protocol, timeouts, thresholds, and monitors. Later, when you use the template to create new HTTP services, a wizard prompts you for a service name and supplies the preset values that you would otherwise have configured manually.

The procedure for creating entity templates for load balancing virtual servers is different than the AppExpert procedure for creating other entity templates. For more information, see “Creating an Entity Template.”

In addition, the procedure for using the template to create the load balancing virtual server entity is different. For more information, see “Creating an Entity from a Template.”

Configuring an entity template

September 21, 2020

You can create or modify an entity template either from the AppExpert feature node or from the associated NetScaler feature node for the entity. For example, you can create a content switching virtual server entity template in either the AppExpert feature node or the content switching feature node in the GUI.

If you create a template that is not based on an existing entity, you can specify the following options and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available parameters.
- The entities that must be bound to the entity for which the template is being created.

  For example, when you are creating a cache redirection virtual server template, you can specify the policies that you want to bind to the cache redirection virtual servers that you create from the template. However, only binding information is included in the template. The bound entities are not included. If the entity template is imported to another NetScaler appliance, the bound entities must exist on the appliance at import time for the binding to succeed. If none of the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exist on the target appliance, they are bound to the entity that is created from the template.

When you create a template based on an existing entity, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

Configuring variables in load balancing virtual server templates

September 21, 2020

Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing the template. The Entity Template Wizard, which appears when you import a template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the entity template. This wizard page appears only when you import a template that is configured with existing variables.

As an example, consider the following expression configured for a policy that is bound to a load balancing virtual server for which you are creating a template. The expression evaluates the value of the Accept-Language header in an HTTP request.

```
HTTP.REQ.HEADER("Accept-Language").CONTAINS("en-us")
```

If you want the value of the header to be configurable at import time, you can specify the string en-us as a variable. When importing the template, you can specify a new value for the variable on the Specify Variable Values page.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

To configure variables in a load balancing virtual server template

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**
2. In the details pane, right-click the virtual server that you want to export to a template file, and then click **Create Template**.
3. In the **Create Template** dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click **Configure Variables**.
4. In the **Configure Variables** dialog box, click the tab that lists the entity for which you want to configure a variable, select the entity, and then click **Configure Variables**.
5. In the Variables for Entity Type: Entity Name dialog box, click the √x button next to the parameter value or expression in which you want to create a variable.
6. In the variables for Field Name dialog box, do the following:
    - To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click **Add**. In the **Create Variable** dialog box, specify a name and a description for the variable, and then click **Create**.

      The name of the variable, its value, and the description you provided appear in the Available Variables listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.

- To modify a variable, in the Available Variables list, click the variable, and then click **Open**. In the **Create Variable** dialog box, modify the value and the description, and then click **OK**.

  The new value that you specify will not replace the text selected in the text box that displays the configured expression or value. However, when you import the template, the new value will be displayed as the default value for the variable in the template import wizard.

- To view all the strings that are assigned to a given variable, in the Available Variables listing, click the name of the variable. The strings that are assigned to the variable are highlighted.
- To view a list of all the parameters, expressions, and actions in which the variable is used, in the Available Variables listing, click the variable whose references you want to view, and then click **Show References**.
- To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click **Use existing Variable**, and then click the name of the variable to which you want to assign the string.

  If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.

7. Click **Close**.

Modifying an entity template

September 21, 2020

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. The NetScaler appliance does not provide you with the option of modifying a load balancing virtual server template.

To modify an entity template by using the AppExpert feature node

1. Navigate to **AppExpert** > **Templates**.
2. In the details pane, on the **Entity Templates** tab, select the template you want to change, and then click **Open**.
3. In the **Modify…Template** dialog box, follow the instructions to modify a template.
4. Click **Finish**, and then click **Exit**.

To modify an entity template by using its corresponding feature node

1. Navigate to **Traffic Management**, select the feature (for example, Content Switching), and then select the entity (for example, Virtual Servers) for which you want to modify the entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the** Manage <`feature entity name`> Entity Templates** dialog box, select the template that you want to modify, and then click **Modify**.
4. In the **Modify <`template name`> Template** dialog box, follow the instructions to modify a template.
5. Click **Finish**, and then click **Exit**.
6. Click **Close**.

Deleting an entity template

September 21, 2020

Deleting an entity template does not affect any objects that have been created by using the template. You can delete a load balancing virtual server template only from the AppExpert feature node.

To delete an entity template by using the AppExpert feature node

1. Navigate to **AppExpert** > **Templates**.
2. In the details pane, on the **Entity Templates** tab, click the template you want to delete, and then click **Remove**.

To delete an entity template by using its corresponding feature node

1. Navigate to **Traffic Management**, and select the feature (for example, Content Switching) and then select the entity (for example, Virtual Servers), for which you want to delete the entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage…Entity Templates** dialog box, select the template that you want to delete, and then click **Delete**.

Creating an entity from a template

September 21, 2020

You can create an entity from an entity template either from the AppExpert feature node in the NetScaler GUI or from the NetScaler feature node that corresponds to the type of entity that you want to create. For example, you can create a content switching virtual server from a template with either the AppExpert feature node or the content switching feature node in the GUI.

The procedure for creating a load balancing virtual server from a template is different than the AppExpert procedure for creating other entities from templates.

After you create an instance of an entity using an entity template, you can configure it in the same way that you would any other object of that type, such as by using the GUI or the command line.

To create an entity from a template by using the AppExpert feature node

1. Navigate to **AppExpert** > **Templates**.
2. In the details pane, do one of the following:
   a) To create any entity other than a load balancing virtual server from a template, on the **Entity Templates** tab, click the template that you want to use, and then click Use Template.
   b) To create a load balancing virtual server from a template, on the LB Templates tab, click the template that you want to use, and then click **Use Template**.
3. In the <`Entity Template Name`> wizard, follow the instructions to create the entity on the NetScaler.
4. Click **Finish**, and then click **Exit**.

To create an entity from a template by using its corresponding feature node

1. Navigate to **Traffic Management**, and expand a feature node (for example, Content Switching), and then click an entity subnode (for example, Virtual Servers).

2. At the top of the details pane, click **Entity Templates**, and then click Use **Template**.

3. Click the name of the template that you want to use.

4. In the Use <`template name`> Template wizard, follow the instructions to create the entity.

   Only templates that match the current context are displayed. For example, in the details pane for content switching virtual servers, only entity templates for content switching virtual servers appear, if configured.

5. Click **Finish**, and then click **Exit**.

To create a load balancing virtual server by using a load balancing virtual server template

1. Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**.

2. In the details pane, click Use **Template**.
3. In the **Entity Template Wizard**, follow the instructions to create a load balancing virtual server on the NetScaler.

   Only templates that match the current context are displayed. For example, when you click Browse (Appliance), only entity templates for load balancing virtual servers appear, if configured.
4. Click **Finish**, and then click **Exit**.

   > **Note**: The **Entity Template Wizard** includes a **Specify Variable Values** page on which you can specify new values for variables. For more information about configuring variables in load balancing virtual server templates, see Configuring Variables in Load Balancing Virtual Server Templates."

Managing entity template folders

September 21, 2020

You can organize only load balancing virtual server template folders.

To organize load balancing virtual server template folders

1. Navigate to **AppExpert** > **Templates** > **LB Templates**.
2. In the **Manage LB Templates** dialog box do one of the following:
   - To change the name of a folder, select the folder and click **Rename**.

     You can also click the folder that you want to rename, and then press F2. You cannot rename the top-level default folder.
   - To remove the folder, select the folder and click **Delete**.

     You can also click the folder that you want to remove, and then press the Delete key. You cannot remove the top-level default folder.
3. Click **Close**.

Uploading and downloading entity templates

September 21, 2020

You can import the entity templates that are stored on your local computer. You can also download entity templates from the NetScaler appliance to your local computer and then import them to other NetScaler appliances.

To upload an entity template to the NetScaler appliance

1. Navigate to **Traffic Management**, and expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage…Entity Templates** dialog box, click the top-level folder, and then click **Upload**.
4. In the **Upload Entity Template** dialog box, navigate to the template file that you want to upload, and then click **Select**.
5. Click **Close**.

To download an entity template from the NetScaler appliance

1. Navigate to **Traffic Management**, and expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage…Entity Templates** dialog box, click the template that you want to download, and then click **Download**.
4. In the **Download Entity Template** dialog box, navigate to the location at which you want to save the template on your local computer, enter a file name, and then click **Save**.
5. Click **Close**.

Understanding load balancing entity templates and deployment files

September 21, 2020

Load balancing entity templates are created in the same way that NetScaler application templates are created. When you export a load balancing virtual server to a template file, the following two files are automatically created:

- **Load balancing virtual server template file.** Contains XML elements that store the values of the parameters that are configured for the load balancing virtual server. The file also contains XML elements for storing information about bound policies.
- **Deployment file.** Contains XML elements that store deployment-specific information such as services, service groups, and configured variables.

In the template and deployment files, each unit of configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, the load balancing method parameter, lbMethod, is encapsulated within the
`<lbmethod>` and
`<lbmethod>` tags.

Note: After you export a load balancing virtual server, you can add elements, remove elements, and modify existing elements before importing the configuration information to a NetScaler appliance.

Example of a load balancing virtual server template

Following is an example of a template file that was created from a load balancing virtual server called “Lbvip”:

```
<?xml version="1.0" encoding="UTF-8" ?>
  <template>
    <template_info>
      <entity_name>Lbvip</entity_name>
      <version_major>10</version_major>
      <version_minor>0</version_minor>
      <build_number>40.406</build_number>
    </template_info>
    <entitytemplate>
      <lbvserver_list>
        <lbvserver>
          <name>Lbvip</name>
          <servicetype>HTTP</servicetype>
          <ipv46>0.0.0.0</ipv46>
          <ipmask>*</ipmask>
          <port>0</port>
          <range>1</range>
          <persistencetype>NONE</persistencetype>
          <timeout>2</timeout>
          <persistencebackup>NONE</persistencebackup>
          <backuppersistencetimeout>2</backuppersistencetimeout>
          <lbmethod>LEASTCONNECTION</lbmethod>
          <persistmask>255.255.255.255</persistmask>
          <v6persistmasklen>128</v6persistmasklen>
          <pq>OFF</pq>
          <sc>OFF</sc>
          <m>IP</m>
          <datalength>0</datalength>
          <dataoffset>0</dataoffset>
          <sessionless>DISABLED</sessionless>
          <state>ENABLED</state>
          <connfailover>DISABLED</connfailover>
          <clttimeout>180</clttimeout>
          <somethod>NONE</somethod>
          <sopersistence>DISABLED</sopersistence>
          <sopersistencetimeout>2</sopersistencetimeout>
          <redirectportrewrite>DISABLED</redirectportrewrite>
          <downstateflush>DISABLED</downstateflush>
          <gt2gb>DISABLED</gt2gb>
          <ipmapping>0.0.0.0</ipmapping>
          <disableprimaryondown>DISABLED</disableprimaryondown>
          <insertvserveripport>OFF</insertvserveripport>
          <authentication>OFF</authentication>
          <authn401>OFF</authn401>
          <push>DISABLED</push>
          <pushlabel>none</pushlabel>
          <l2conn>OFF</l2conn>
          <appflowlog>DISABLED</appflowlog>
          <icmpvsrresponse>PASSIVE</icmpvsrresponse>
          <lbvserver_cmppolicy_binding_list>
            <lbvserver_cmppolicy_binding>
              <name>Lbvip</name>
              <policyname>NOPOLICY-COMPRESSION</policyname>
              <priority>100</priority>
              <gotopriorityexpression>END</gotopriorityexpression>
              <bindpoint>REQUEST</bindpoint>
            </lbvserver_cmppolicy_binding>
          </lbvserver_cmppolicy_binding_list>
        </lbvserver>
      </lbvserver_list>
    </entitytemplate>
  </template>
<!--NeedCopy-->
```

Example of a deployment file

Following is the deployment file associated with the virtual server in the preceding example:

```
<?xml version="1.0" encoding="UTF-8" ?>
  <template_deployment>
    <template_info>
      <entity_name>Lbvip</entity_name>
      <version_major>10</version_major>
      <version_minor>0</version_minor>
      <build_number>40.406</build_number>
    </template_info>
    <service_list>
      <service>
      <ip>1.2.3.4</ip>
      <port>80</port>
      <servicetype>HTTP</servicetype>
      </service>
    </service_list>
    <servicegroup_list>
      <servicegroup>
        <name>svcgrp</name>
        <servicetype>HTTP</servicetype>
        <servicegroup_servicegroupmember_binding_list>
          <servicegroup_servicegroupmember_binding>
            <ip>1.2.3.90</ip>
            <port>80</port>
          </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.8.0</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.8.1</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.9.0</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
      </servicegroup_servicegroupmember_binding_list>
    </servicegroup>
  </servicegroup_list>
</template_deployment>
<!--NeedCopy-->
```

HTTP callouts

September 21, 2020

For certain types of requests, or when certain criteria are met during policy evaluation, you might want to stall policy evaluation briefly, retrieve information from a server, and then perform a specific action that depends on the information that is retrieved. At other times, when you receive certain types of requests, you might want to update a database or the content hosted on a Web server. HTTP callouts enable you to perform all these tasks.

An HTTP callout is an HTTP or HTTPS request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation. The information that is retrieved from the server can be analyzed by default syntax policy expressions, and an appropriate action can be performed. You can configure HTTP callouts for HTTP content switching, TCP content switching, rewrite, responder, and for the token-based method of load balancing.

Before you configure an HTTP callout, you must set up an application on the server to which the callout will be sent. The application, which is called the *HTTP callout agent* , must be configured to respond to the HTTP callout request with the required information. The HTTP callout agent can also be a Web server that serves the data for which the NetScaler appliance sends the callout. You must make sure that the format of the response to an HTTP callout does not change from one invocation to another.

After you set up the HTTP callout agent, you configure the HTTP callout on the NetScaler appliance. Finally, to invoke the callout, you include the callout in a default syntax policy in the appropriate NetScaler feature and then bind the policy to the bind point at which you want the policy to be evaluated.

After you have configured the HTTP callout, you must verify the configuration to make sure that the callout is working correctly.

How an HTTP callout works

September 21, 2020

When the NetScaler appliance receives a client request, the appliance evaluates the request against the policies bound to various bind points. During this evaluation, if the appliance encounters the HTTP callout expression, SYS.HTTP_CALLOUT(<name>), it stalls policy evaluation briefly and sends a request to the HTTP callout agent by using the parameters configured for the specified HTTP callout. Upon receiving the response, the appliance inspects the specified portion of the response, and then either performs an action or evaluates the next policy, depending on whether the evaluation of the response from the HTTP callout agent evaluates to TRUE or FALSE, respectively. For example, if the HTTP callout is included in a responder policy, if the evaluation of the response evaluates to TRUE, the appliance performs the action associated with the responder policy.

If the HTTP callout configuration is incorrect or incomplete, or if the callout invokes itself recursively, the appliance raises an UNDEF condition, and updates the undefined hits counter.

The following figure illustrates the working of an HTTP callout that is invoked from a globally bound responder policy. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client's IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client's IP address is listed, and sends a response that the NetScaler appliance evaluates. If the response indicates that the client's IP address is not blacklisted, the appliance forwards the response to the configured service. If the client's IP address is blacklisted, the appliance resets the client connection

Figure 1. HTTP Callout Entity Model

5: Connection RESET if 3 indicates a bad IP address

Notes on the format of HTTP requests and responses

September 21, 2020

The NetScaler appliance does not check for the validity of the HTTP callout request. Therefore, before you configure HTTP callouts, you must know the format of an HTTP request. You must also know the format of an HTTP response, because configuring an HTTP callout involves configuring expressions that evaluate the response from the HTTP callout agent.

This section includes the following sections:

- Format of an HTTP Request

- Format of an HTTP Response

Format of an HTTP request

An HTTP request contains a series of lines that each end with a carriage return and a line feed, represented as either `<CR><LF>` or `\r\n`.

The first line of a request (the *message line*) contains the HTTP method and target. For example, a message line for a GET request contains the keyword GET and a string that represents the object that is to be fetched, as shown in the following example:

```
GET /mysite/mydirectory/index.html HTTP/1.1\r\n
<!--NeedCopy-->
```

The rest of the request contains HTTP headers, including a required Host header and, if applicable, a message body.

The request ends with a bank line (an extra <CR><LF> or \r\n).

Following is an example of a request:

```
Get /mysite/index.html HTTP/1.1\r\n
Host: 10.101.101.10\r\n
Accept: */*\r\n
\r\n
<!--NeedCopy-->
```

Format of an HTTP Response

An HTTP response contains a status message, response HTTP headers, and the requested object or, if the requested object cannot be served, an error message.

Following is an example of a response:

```
HTTP/1.1 200 OK\r\n
Content-Length: 55\r\n
Content-Type: text/html\r\n
Last-Modified: Wed, 12 Aug 1998 15:03:50 GMT\r\n
Accept-Ranges: bytes\r\n
ETag: “04f97692cbd1:377” \r\n
Date: Thu, 19 Jun 2008 19:29:07 GMT\r\n
\r\n
<55-character response>
<!--NeedCopy-->
```

Configuring an HTTP callout

September 21, 2020

When configuring an HTTP callout, you specify the type of request (HTTP or HTTPS), destination and format of the request, the expected format of the response, and, finally, the portion of the response that you want to analyze.

For the destination, you either specify the IP address and port of the HTTP callout agent or engage a load balancing, content switching, or cache redirection virtual server to manage the HTTP callout requests. In the first case, the HTTP callout requests will be sent directly to the HTTP callout agent. In the second case, the HTTP callout requests will be sent to the virtual IP address (VIP) of the specified virtual server. The virtual server will then process the request in the same way as it processes a client request. For example, if you expect a large number of callouts to be generated, you can configure instances of the HTTP callout agent on multiple servers, bind these instances (as services) to a load balancing virtual server, and then specify the load balancing virtual server in the HTTP callout configuration. The load balancing virtual server then balances the load on those configured instances as determined by the load balancing algorithm.

For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as a default syntax expression (an expression-based HTTP callout).

> **Note**:
>
> The appliance does not check for the validity of the request. You must make sure that the request is a valid request. An incorrect or incomplete HTTP callout configuration results in a runtime UNDEF condition that is not associated with an action. The UNDEF condition merely updates the Undefined Hits counter, which enables you to troubleshoot an incorrectly configured HTTP callout. However, the appliance parses the HTTP callout request to enable you to configure certain NetScaler features for the callout. This can lead to an HTTP callout invoking itself. For information about callout recursion and how you can avoid it, see “
> Avoiding HTTP Callout Recursion.”

Finally, regardless of whether you use HTTP request attributes or an expression to define the format of the HTTP callout request, you must specify the format of the response from the HTTP callout agent and the portion of the response that you want to evaluate. The response can be a Boolean value, a number, or text. The portion of the response that you want to evaluate is specified by an expression. For example, if you specify that the response contains text, you can use HTTP.RES.BODY(<unit>) to specify that the appliance must evaluate only the first <unit> bytes of the response from the callout agent.

At the command line, you first create an HTTP callout by using the

add command. When you add a callout, all parameters are set to a default value of NONE, except the HTTP method, which is set to a default value of GET. You then configure the callout's parameters by using the set command. The
set command is used to configure both types of callouts (attribute-based and expression-based). The difference lies in the parameters that are used for configuring the two types of callouts. Accordingly, the command-line instructions that follow include a
set command for configuring an attribute-based callout and a
set command for configuring an expression-based callout. In the GUI, all of these configuration tasks are performed in a single dialog box.

Note: Before you put an HTTP callout into a policy, you can modify all configured parameters except the return type. Once an HTTP callout is in a policy, you cannot completely modify an expression that is configured in the callout. For example, you cannot change

```
HTTP.REQ.HEADER("myval") to
CLIENT.IP.SRC. However, you can modify the operators and arguments that
    are passed to the expression. For example, you can change
HTTP.REQ.HEADER("myVal1") to
HTTP.REQ.HEADER("myVal2"), or
HTTP.REQ.HEADER("myVal") to
HTTP.REQ.HEADER("myVal").AFTER_STR(<string>). If the set command fails,
    create a new HTTP callout.
<!--NeedCopy-->
```

HTTP callout configuration involves configuring default syntax expressions.

To configure an HTTP callout by using the command line interface

At the command prompt, do the following:

1. Create a HTTP callout.

`add policy httpCallout <name>`

```
**Example**
```

```
    add policy httpCallout mycallout
<!--NeedCopy-->
```

1. Configure the details of the HTTP callout.

   - To configure an attribute-based HTTP callout, type:

```
set policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-port
    <port|*>] [-vServer <string>] [-returnType <returnType>] [-
    httpMethod ( GET | POST )] [-hostExpr <string>] [-urlStemExpr <
    string>] [-headers <name(value)> ...] [-parameters <name(value)>
    ...] [-resultExpr <string>]
<!--NeedCopy-->
```

Example:

```
> set policy httpCallout mycallout -vserver lbv1 -returnType num -
    httpMethod GET -hostExpr 'http.req.header("Host")'
-urlStemExpr "http.req.url" -parameters Name("My Name") -headers Name("
    MyHeader")
-resultExpr "http.res.body(10000).length"

<!--NeedCopy-->
```

To configure an expression-based HTTP callout, type:

```
set policy httpCallout <name> [-vServer <string>] [-returnType <
    returnType>] [-httpMethod ( GET | POST )] [-fullReqExpr <string>] [-
    resultExpr <string>]
<!--NeedCopy-->
```

Example:

```
> set policy httpCallout mycallout1 -vserver lbv1 -returnType num -
    httpMethod GET
-fullReqExpr q{
 "GET " + http.req.url + "HTTP/" + http.req.version.major + "." + http.
     req.version.minor.sub(1)+
"r\nHost:10.101.10.10\r\nAccept: */*\r\n\r\n" }

<!--NeedCopy-->
```

3. Verify the configurations of the HTTP callout.

```
show policy httpCallout <name>
<!--NeedCopy-->
```

To configure an HTTP callout by using the GUI

1. Navigate to **AppExpert** > **HTTP Callouts**.
2. In the details pane, click **Add**.
3. In the **Create HTTP Callout** dialog box, configure the parameters of the HTTP callout. For a description of the parameter, hover the mouse cursor over the check box.

4. Click **Create** and then click **Close**.

Verifying the Configuration

September 21, 2020

For an HTTP callout to work correctly, all the HTTP callout parameters and the entities associated with the callout must be configured correctly. While the NetScaler appliance does not check the validity of the HTTP callout parameters, it indicates the state of the bound entities, namely the server or virtual server to which the HTTP callout is sent. The following table lists the icons and describes the conditions under which the icons are displayed.

Icon	Indicates that
🟢	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is UP.
🟡	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is OUT OF SERVICE.
🔴	The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is DOWN.

For an HTTP callout to function correctly, the icon must be green at all times. If the icon is not green, check the state of the callout server or virtual server to which the HTTP callout is sent. If the HTTP callout is not working as expected even though the icon is green, check the parameters configured for the callout.

You can also verify the configuration by sending test requests that match the policy from which the HTTP callout is invoked, checking the hits counter for the policy and the HTTP callout, and verifying the responses that the NetScaler appliance sends to the client.

> **Note**:
>
> An HTTP callout can sometimes invoke itself recursively a second time. If this happens, the hits counter is incremented by two counts for each callout that is generated by the appliance. For the hits counter to display the correct value, you must configure the HTTP callout in such a way that it does not invoke itself a second time. For more information about how you can avoid HTTP callout recursion, see
> Avoiding HTTP Callout Recursion.

To view the hits counter for an HTTP callout

1. Navigate to AppExpert > HTTP Callouts.
2. In the details pane, click the HTTP callout for which you want to view the hits counter, and then view the hits in the Details area.

Invoking an HTTP Callout

September 21, 2020

After you configure an HTTP callout, you invoke the callout by including the `SYS.HTTP_CALLOUT(<name>)` expression in a default syntax policy rule. In this expression, `<name>` is the name of the HTTP callout that you want to invoke.

You can use default syntax expression operators with the callout expression to process the response and then perform an appropriate action. The return type of the response from the HTTP callout agent determines the set of operators that you can use on the response. If the part of the response that you want to analyze is text, you can use a text operator to analyze the response. For example, you can use the CONTAINS(<string>) operator to check whether the specified portion of the response contains a particular string, as in the following example:

```
SYS.HTTP_CALLOUT(mycallout).contains("Good IP address")
<!--NeedCopy-->
```

If you use the preceding expression in a responder policy, you can configure an appropriate responder action.

Similarly, if the part of the response that you want to evaluate is a number, you can use a numeric operator such as GT(int). If the response contains a Boolean value, you can use a Boolean operator.

Note: An HTTP callout can invoke itself recursively. HTTP callout recursion can be avoided by combining the HTTP callout expression with a default syntax expression that prevents recursion. For in-

formation about how you can avoid HTTP callout recursion, see
Avoiding HTTP Callout Recursion.

You can also cascade HTTP callouts by configuring policies that each invoke a callout after evaluating previously generated callouts. In this scenario, after one policy invokes a callout, when the NetScaler appliance is parsing the callout before sending the callout to the callout server, a second set of policies can evaluate the callout and invoke additional callouts, which can in turn be evaluated by a third set of policies, and so on. Such an implementation is described in the following example.

First, you could configure an HTTP callout called myCallout1, and then configure a responder policy, Pol1, to invoke myCallout1. Then, you could configure a second HTTP callout, myCallout2, and a responder policy, Pol2. You configure Pol2 to evaluate myCallout1 and invoke myCallout2. You bind both responder policies globally.

To avoid HTTP callout recursion, myCallout1 is configured with a unique custom HTTP header called "Request1." Pol1 is configured to avoid HTTP callout recursion by using the default syntax expression,

```
HTTP.REQ.HEADER("Request1").EQ("Callout Request").NOT.
<!--NeedCopy-->
```

Pol2 uses the same default syntax expression, but excludes the .NOT operator so that the policy evaluates myCallout1 when the NetScaler appliance is parsing it. Note that myCallout2 identifies its own unique header called "Request2," and Pol2 includes a default syntax expression to prevent myCallout2 from invoking itself recursively.

Example:

```
> add policy httpCallout myCallout1

Done

> set policy httpCallout myCallout1 -IPAddress 10.102.3.95 -port 80 -returnType TEXT -hostExpr
 ""10.102.3.95"" -urlStemExpr "\"/cgi-bin/check_clnt_from_database.pl\"" -headers Request1
("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"

Done

> add responder policy Pol1 "HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout Request\").NOT &&
SYS.HTTP_CALLOUT(myCallout1).CONTAINS(\"IP Matched\")" RESET

Done

```

```
> bind responder global Pol1 100 END -type OVERRIDE

Done

> add policy httpCallout myCallout2

Done

> set policy httpCallout myCallout2 -IPAddress 10.102.3.96 -port 80 -returnType TEXT -hostExpr
"\"10.102.3.96\"" -urlStemExpr "\"/cgi-bin/check_clnt_location_from_database.pl\"" -headers Request2
("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(200)"

 Done

> add responder policy Pol2 "HTTP.REQ.HEADER(\"Request2\").EQ(\"Callout Request\").NOT &&
 HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout Request\") && SYS.HTTP_CALLOUT(myCallout2).CONTAINS
(\"APAC\")" RESET

 Done

> bind responder global Pol2 110 END -type OVERRIDE

Done
<!--NeedCopy-->
```

Avoiding HTTP callout recursion

September 21, 2020

Even though the NetScaler appliance does not check for the validity of the HTTP callout request, it parses the request once before it sends the request to the HTTP callout agent. This parsing allows the appliance to treat the callout request as any other incoming request, which in turn allows you to configure several useful NetScaler features (such as integrated caching, SureConnect, and Priority Queuing) to work on the callout request.

However, during this parsing, the HTTP callout request can select the same policy and therefore invoke itself recursively. The appliance detects the recursive invocation and raises an undefined (UN-

DEF) condition. However, the recursive invocation results in the policy and HTTP callout select counters being incremented by two counts each instead of one count each.

To prevent a callout from invoking itself, you must identify at least one unique characteristic of the HTTP callout request, and then exclude all requests with this characteristic from being processed by the policy rule that invokes the callout. You can do so by including another default syntax expression in the policy rule. The expression must precede the `SYS.HTTP\\_CALLOUT(\<name\>)` expression so that it is evaluated before the callout expression is evaluated. For example:

```
<Expression that prevents callout recursion> OR SYS.HTTP_CALLOUT(<name>)
<!--NeedCopy-->
```

When you configure a policy rule in this way, when the appliance generates the request and parses it, the compound rule evaluates to FALSE, the callout is not generated a second time, and the select counters are incremented correctly.

One way by which you can assign a unique characteristic to an HTTP callout request is to include a unique custom HTTP header when you configure the callout. Following is an example of an HTTP callout called "myCallout." The callout generates an HTTP request that checks whether a client's IP address is present in a database of blacklisted IP addresses. The callout includes a custom header called "Request," which is set to the value "Callout Request." A globally bound responder policy, "Pol1," invokes the HTTP callout but excludes all requests whose Request header is set to this value, thus preventing a second invocation of myCallout. The expression that prevents a second invocation is HTTP.REQ.HEADER(\“Request\”).EQ(\“Callout Request\”).NOT.

Example:

```
> add policy httpCallout myCallout
 Done

> set policy httpCallout myCallout -IPAddress 10.102.3.95 -port 80 -returnType TEXT -hostExpr "\"10.102.3.95\"" -urlStemExpr "\"/cgi-bin/check_clnt_from_database.pl\"" -headers Request("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"
Done

> add responder policy Pol1 "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT && SYS.HTTP_CALLOUT(myCallout).CONTAINS(\"IP Matched\")" RESET
Done

> bind responder global Pol1 100 END -type OVERRIDE
Done
```

```
<!--NeedCopy-->
```

> **Note**:
> You can also configure an expression to check whether the request URL includes the stem expression configured for the HTTP callout. To implement the solution, ensure the HTTP callout agent can respond only to HTTP callouts and not to other requests directed through the appliance. If the HTTP callout agent is an application or Web server that serves other client requests, such an expression prevents the appliance from processing those client requests. Instead, use a unique custom header as described earlier.

Caching HTTP Callout Responses

September 21, 2020

For improved performance while using callouts, you can use the integrated caching feature to cache callout responses. The responses are stored in an integrated caching content group named callout-ContentGroup for a specified time duration.

Note: To cache callout responses, make sure that the integrated caching feature is enabled.

To set the cache duration by using the command line interface

At the command prompt, type:

`set policy httpCallout <name> -cacheForSecs <secs>`

Example:

```
> set httpcallout httpcallout1 -cacheForSecs 120
<!--NeedCopy-->
```

To set the cache duration by using the GUI

1. Navigate to **AppExpert > **HTTP Callouts**.
2. In the details pane, select the HTTP callout for which you want to set the cache duration and click **Open**.
3. In the **Configure HTTP Callout** dialog box, specify the **Cache Expiration Time**.
4. Verify that you have entered the correct time duration, and then click **OK**.

Use Case: Filtering Clients by Using an IP Blacklist

September 21, 2020

HTTP callouts can be used to block requests from clients that are blacklisted by the administrator. The list of clients can be a publicly known blacklist, a blacklist that you maintain for you organization, or a combination of both.

The NetScaler appliance checks the IP address of the client against the pre-configured blacklist and blocks the transaction if the IP address has been blacklisted. If the IP address is not in the list, the appliance processes the transaction.

To implement this configuration, you must perform the following tasks:

1. Enable responder on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response to the HTTP callout, and then bind the policy globally.
4. Create an HTTP callout agent on the remote server.

Enabling Responder

You must enable responder before you can use it.

To enable responder by using the GUI

1. Make sure that you have installed the responder license.
2. In the GUI, expand AppExpert, and right-click Responder, and then click Enable Responder feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP_Callout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see
Configuring an HTTP Callout pdf.

Configuring a Responder Policy and Binding it Globally

After you configure the HTTP callout, verify the callout configuration, and then configure a responder policy to invoke the callout. While you can create a responder policy in the
Policies sub-node and then bind it globally by using the

Responder Policy Manager, this demonstration uses the
Responder Policy Manager to create the responder policy and bind the policy globally.

To create a responder policy and bind it globally by using the GUI

1. Navigate to **AppExpert** > **Responder**.
2. In the details pane, under **Policy Manager**, click **Policy Manager**.
3. In the **Responder Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, under **Policy Name**, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
    a) In Name, type **Policy-Responder-1**.
    b) In **Action**, select **RESET**.
    c) In **Undefined-Result Action**, select **Global undefined-result** action.
    d) In **Expression**, type the following default syntax expression:

    ```
    "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT &&
        SYS.HTTP_CALLOUT(HTTP_Callout).CONTAINS(\"IP Matched\")"
    <!--NeedCopy-->
    ```

    e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

Creating an HTTP Callout Agent on the Remote Server

You must now create an HTTP callout agent on the remote callout server that will receive callout requests from the NetScaler appliance and respond appropriately. The HTTP callout agent is a script that is different for each deployment and must be written with the server specifications in mind, such as the type of database and the scripting language supported.

Following is a sample callout agent that verifies whether the given IP address is part of an IP blacklist. The agent has been written in the Perl scripting language and uses a MYSQL database.

The following CGI script checks for a given IP address on the callout server.

```
#!/usr/bin/perl -w
print "Content-type: text/html\n\n";
        use DBI();
        use CGI qw(:standard);
#Take the Client IP address from the request query
        my $ip_to_check = param('cip');
# Where a MYSQL database is running
        my $dsn = 'DBI:mysql:BAD_CLIENT:localhost';
# Database username to connect with
        my $db_user_name =  ‘dbuser’ ;
```

```
# Database password to connect with
        my $db_password = 'dbpassword';
        my ($id, $password);
# Connecting to the database
        my $dbh = DBI->connect($dsn, $db_user_name, $db_password);
        my $sth = $dbh->prepare(qq{
  select * from bad_clnt  }
 );
        $sth->execute();
        while (my ($ip_in_database) = $sth->fetchrow_array()) {

        chomp($ip_in_database);
# Check for IP match
        if ($ip_in_database eq $ip_to_check) {

              print "\n IP Matched\n";
                                                     $sth->finish();
                                               exit;
                 }

        }

       print "\n IP Failed\n";
       $sth->finish();
       exit;
<!--NeedCopy-->
```

Use Case: ESI Support for Fetching and Updating Content Dynamically

September 21, 2020

Edge Side Includes (ESI) is a markup language for edge-level dynamic Web content assembly. It helps in accelerating dynamic Web-based applications by defining a simple markup language to describe cacheable and non-cacheable Web page components that can be aggregated, assembled, and delivered at the network edge. By using HTTP callouts on the NetScaler appliance, you can read through the ESI constructs and aggregate or assemble content dynamically.

To implement this configuration, you must perform the following tasks:

1. Enable rewrite on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.

3. Configure a rewrite action to replace the ESI content with the callout response body.
4. Configure a rewrite policy to specify the conditions under which the action is performed, and then bind the rewrite policy globally.

Enabling Rewrite

Rewrite must be enabled before it is used on the NetScaler appliance. The following procedure describes the steps to enable the rewrite feature.

To enable rewrite by using the GUI

1. Make sure that you have installed the rewrite license.
2. In the GUI, expand AppExpert, and right-click Rewrite, and then click Enable Rewrite feature.

Creating an HTTP Callout on the NetScaler Appliance

For more information about creating an HTTP callout, see
Configuring an HTTP Callout.
For more information about the parameter values, see Parameters and Values for HTTP-Callout-2 pdf.

Configuring the rewrite action

Create a rewrite action, Action-Rewrite-1, to replace the ESI content with the callout response body. Use the parameter settings shown in the following table.

Table 2. Parameters and Values for Action-Rewrite-1

Parameter	Value
Name	Action-Rewrite-1
Type	Replace
Expression to choose target text reference	"HTTP.RES.BODY(500).AFTER_STR (\"<example>\").BEFORE_STR (\"</example>\")"
String expression for replacement text	"SYS.HTTP_CALLOUT(HTTP-Callout-2)"

To configure the rewrite action by using the GUI

1. Navigate to **AppExpert** > **Rewrite** > **Actions**.

2. In the details pane, click **Add**.

3. In the **Create Rewrite Action** dialog box, in Name, type **Action-Rewrite-1**.
4. In Type, select **REPLACE**.
5. In **Expression** to choose target text reference, type the following default syntax expression:

```
"HTTP.RES.BODY(500).AFTER_STR(\"<example>\").BEFORE_STR(\"</
    example>\")"
<!--NeedCopy-->
```

6. In the String expression for replacement text, type the following string expression:

```
"SYS.HTTP_CALLOUT(HTTP-Callout-2)"
<!--NeedCopy-->
```

7. Click **Create**, and then click **Close**.

Creating the rewrite policy and binding it globally

Create a rewrite policy, Policy-Rewrite-1, with the parameter settings shown in the following table. You can create a rewrite policy in the
Policies subnode and then bind it globally by using the
Rewrite Policy Manager. Alternatively, you can use the
Rewrite Policy Manager to perform both these tasks simultaneously. This demonstration uses the Rewrite Policy Manager to perform both tasks.

Parameter	Value
Name	Policy-Rewrite-1
Action	Action_Rewrite-1
Undefined Result Action	-Global undefined-result action-
Expression	“HTTP.REQ.HEADER(”Name”).CONTAINS (”Callout”).NOT”

Table 3. Parameters and Values for Policy-Rewrite-1

To configure a rewrite policy and bind it globally by using the GUI

1. Navigate to **AppExpert** > **Rewrite**.
2. In the details pane, under **Policy Manager**, click **Rewrite Policy Manager**.
3. In the **Rewrite Policy Manager** dialog box, click **Override Global**.

4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Rewrite Policy** dialog box, do the following:

   1.In Name, type Policy-Rewrite-1.

   a) In Action, select Action-Rewrite-1.
   b) In Undefined-Result Action, select Global undefined-result action.
   c) In Expression, type the following default syntax expression:

```
"HTTP.REQ.HEADER(\"Name\").CONTAINS(\"Callout\").NOT"
<!--NeedCopy-->
```

5. Click **Create**, and then click **Close**.

6. Click **Apply Changes**, and then click **Close**.

Use Case: Access control and authentication

September 21, 2020

In high security zones, it is mandatory to externally authenticate the user before a resource is accessed by clients. On the NetScaler appliance, you can use HTTP callouts to externally authenticate the user by evaluating the credentials supplied. In this example, the assumption is that the client is sending the user name and password through HTTP headers in the request. However, the same information could be fetched from the URL or the HTTP body.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling responder

The responder feature must be enabled before it is used on the NetScaler appliance.

To enable responder by using the GUI

1. Make sure that the responder license is installed.
2. In the GUI, expand **AppExpert**, and right-click **Responder**, and then click **Enable Responder** feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTPCallout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout.

Refer to HTTP callout table, for more information about its parameters and values.

Creating a Responder policy to analyze the response

Create a responder policy, Policy-Responder-3, that will check the response from the callout server and RESET the connection if the source IP address has been blacklisted. Create the policy with the parameters settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the
Responder Policy Manager, this demonstration uses the
Responder Policy Manager to create the responder policy and bind the policy globally.

Parameter	Value
Name	Policy-Responder-3
Action	RESET
Undefined-Result-Action	-Global undefined-result action-
Expression	“HTTP.REQ.HEADER(\“Request\”).EQ(\“Callout Request\”).NOT && SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\“Authentication Failed\”)”

Table 2. Parameters and Values for Policy-Responder-3

To create a responder policy and bind it globally by using the GUI

1. Navigate to **AppExpert** > **Responder**.
2. In the details pane, under **Policy Manager**, click **Responder Policy Manager.**
3. In the **Responder Policy Manger** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the Policy Name column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
    a) In Name, type Policy-Responder-3.
    b) In **Action**, select **RESET**.
    c) In Undefined-Result Action , select Global undefined-result action.
    d) In the **Expression** text box, type:

```
"HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT && SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\"Authentication Failed\")"
<!--NeedCopy-->
```

    e) Click **Create**, and then click **Close**.

6. Click **Apply Changes**, and then click **Close**.

Creating an HTTP Callout agent on the remote server

You now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds appropriately. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

Following is sample callout agent pseudo-code that verifies whether the supplied user name and password are valid. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

To verify the supplied user name and password by using pseudo-code

1. Accept the user name and password supplied in the request and format them appropriately.
2. Connect to the database that contains all the valid user names and passwords.
3. Check the supplied credentials against your database.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

Use Case: OWA-Based Spam Filtering

September 21, 2020

Spam filtering is the ability to dynamically block emails that are not from a known or trusted source or that have inappropriate content. Spam filtering requires an associated business logic that indicates that a particular kind of message is spam. When the NetScaler appliance processes Outlook Web Access (OWA) messages based on the HTTP protocol, HTTP callouts can be used to filter spam.

You can use HTTP callouts to extract any portion of the incoming message and check with an external callout server that has been configured with rules that are meant for determining whether a message is legitimate or spam. In case of spam email, for security reasons, the NetScaler appliance does not notify the sender that the email is marked as spam.

The following example conducts a very basic check for various listed keywords in the email subject. These checks can be more complex in a production environment.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Create a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling Responder

The responder feature must be enabled before it can be used on the NetScaler appliance.

To enable responder by using the GUI

1. Make sure that the responder license is installed.
2. In the GUI, expand AppExpert, and right-click Responder, and then click **Enable Responder** feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTPCallout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see
Configuring an HTTP Callout.

For more information, see Parameters and Values for HTTCallout pdf.

Creating a Responder Action

Create a responder action, Action-Responder-4. Create the action with the parameter settings shown in the following table.

Parameter	Value
Name	Action-Responder-4
Type	Respond with

Parameter	Value
Target	””HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-Control: no-cache\r\n\r\n””

Table 2. Parameters and Values for Action-Responder-4

To create a responder action by using the GUI

1. Navigate to **AppExpert** > **Responder** > **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, in Name, type **Action-Responder-4**.
4. In Type, click **Respond with**.
5. In Target, type:

```
    "\"HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-Control: no-cache\r\n\r\n\""
<!--NeedCopy-->
```

1. Click **Create**, and then click **Close**.

Creating a Responder Policy to Invoke the HTTP Callout

Create a responder policy, Policy-Responder-4, that will check the request body and, if the body contains the word “ *subject*,” invoke the HTTP callout to verify the email. Create the policy with the parameter settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind it globally.

Parameter	Value
Name	Policy-Responder-4
Action	Action-Responder-4

Parameter	Value
Undefined-Result-Action	-Global undefined-result action-
Expression	“HTTP.REQ.BODY(1000).CONTAINS(”urn:schemas:httpmail:su && SYS.HTTP_CALLOUT(HTTP-Callout-4)”

To create a responder policy by using the GUI

1. Navigate to **AppExpert** > **Responder**.
2. In the details pane, under **Policy Manager**, click **Responder policy** manager.
3. In the **Responder Policy Manger** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
    a) In Name, type **Policy-Responder-4**.
    b) In Action, click **Action-Responder-4**.
    c) In Undefined-Result Action, click **Global undefined-result** action.
    d) In the **Expression** text box, type:

    ```
    "HTTP.REQ.BODY(1000).CONTAINS(\"urn:schemas:httpmail:subject\") && SYS.HTTP_CALLOUT(HTTP-Callout-4)"
    <!--NeedCopy-->
    ```

    e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

Creating an HTTP Callout Agent on the Remote Server

You will now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds accordingly. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

The following pseudo-code provides instructions for creating a callout agent that checks a list of words that are generally understood to indicate spam mails. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

To identify spam email by using pseudo-code

1. Accept the email subject provided by the NetScaler appliance.
2. Connect to the database that contains all the terms against which the email subject is checked.

3. Check the words in the email subject against the spam word list.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

Use Case: Dynamic Content Switching

September 21, 2020

This use case provides dynamic content switching by using an HTTP callout to get the name of the load balancing virtual server to which the request is forwarded.

1. Add a content switching virtual server.

   ```
   > add cs vserver cs_vserver1 HTTP 10.102.29.196 80
   <!--NeedCopy-->
   ```

2. Create an HTTP callout.

   ```
   > add policy httpCallout http_callout1
   <!--NeedCopy-->
   ```

3. Configure the HTTP callout to respond with the name of the load balancing virtual server from a request that contains the client IP address in the HTTP header “X-CLIENT-IP”.

   ```
   > set policy httpCallout http_callout1 -IPAddress 10.217.14.23 -port 80 -returnType TEXT -hostExpr "\"www.get-lbvip.com\"" -urlStemExpr "\"/index.html\"" -headers X-CLIENT-IP(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(1000).AFTER_STR(\"<lbvip>\").BEFORE_STR(\"</lbvip\")"
   <!--NeedCopy-->
   ```

4. Configure the content switching action to retrieve the callout response.

   ```
   > add cs action cs_action1 -targetVserverExpr 'SYS.HTTP_CALLOUT(http_callout1)'
   <!--NeedCopy-->
   ```

   Note: You must bind a load balancing virtual server to the content switching virtual server to account for:

   - The non-availability of the load balancing virtual server that the callout resolves to.
   - A UNDEF condition that results from the execution of the callout.

```
> bind cs vserver cs_vserver1 -lbvserver default_lbvip
<!--NeedCopy-->
```

5. Configure the content switching policy.

```
> add cs policy cs_policy1 -rule true -action cs_action1
<!--NeedCopy-->
```

6. Binding the content switching policy to the content switching virtual server.

```
> bind cs vserver cs_vserver1 -policyName cs_policy1 -priority 10
<!--NeedCopy-->
```

Pattern sets and data sets

September 21, 2020

Policy expressions for string matching operations on a large set of string patterns tend to become long and complex. Resources consumed by the evaluation of such complex expressions are significant in terms of processing cycles, memory, and configuration size. You can create simpler, less resource-intensive expressions by using pattern matching.

Depending on the type of patterns that you want to match, you can use one of the following features to implement pattern matching:

- A pattern set is an array of indexed patterns used for string matching during default syntax policy evaluation. Example of a pattern set: imagetypes {svg, bmp, png, gif, tiff, jpg}.
- A data set is a specialized form of pattern set. It is an array of patterns of types number (integer), IPv4 address, or IPv6 address.

In many cases, you can use either pattern sets or data sets. However, in cases where you want specific matches for numerical data or IPv4 and IPv6 addresses, you must use data sets.

> **Note**:
> Pattern sets
> and data sets can be used only in default syntax policies.

To use pattern sets or data sets, first create the pattern set or data set and bind patterns to it. Then, when you configure a policy for comparing a string in a packet, use an appropriate operator and pass the name of the pattern set or data set as an argument.

How string matching works with pattern sets and data sets

September 21, 2020

A pattern set or data set contains a set of patterns, and each pattern is assigned a unique index. When a policy is applied to a packet, an expression identifies a string to be evaluated, and the operator compares the string to the patterns defined in the pattern set or data set until a match is found or all patterns have been compared. Then, depending on its function, the operator returns either a boolean value that indicates whether or not a matching pattern was found or the index of the pattern that matches the string.

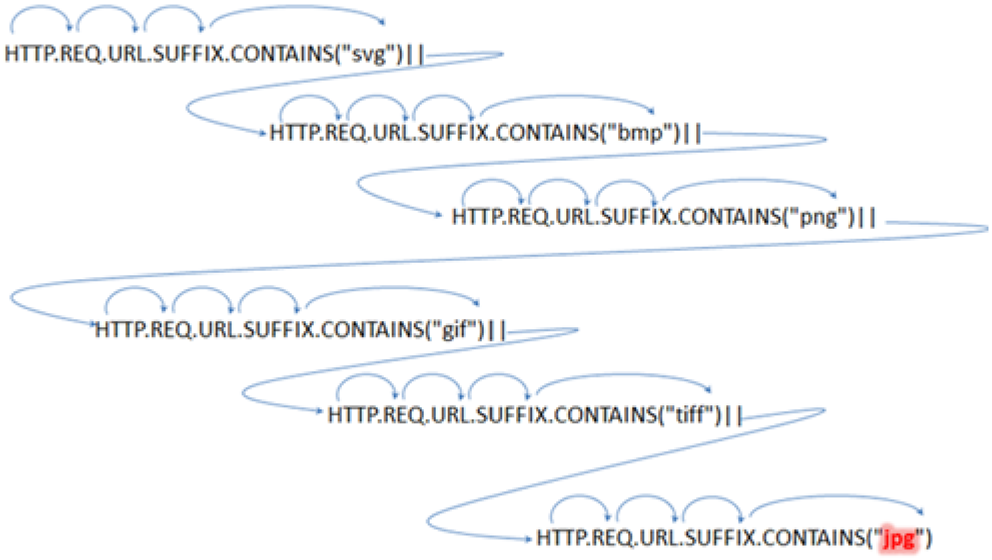
Note: This topic explains the working of a pattern set. Data sets work the same way. The only difference between pattern sets and data sets is the type of patterns defined in the set.

Consider the following use case to understand how patterns can be used for string matching.

You want to determine whether the URL suffix (target text) contains any of the image file extensions. Without using pattern sets, you would have to define a complex expression, as follows:

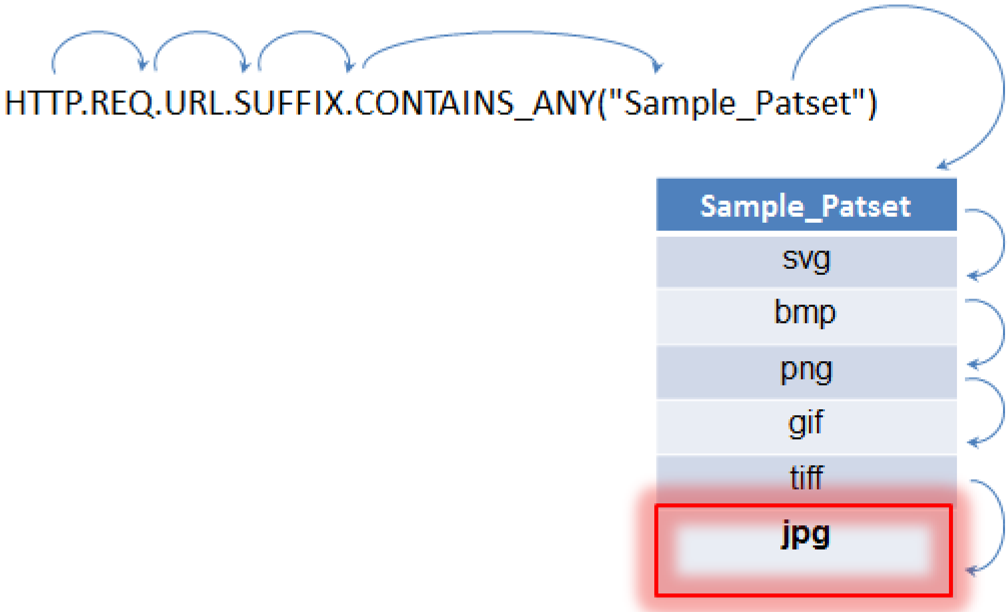
```
HTTP.REQ.URL.SUFFIX.CONTAINS("svg") || HTTP.REQ.URL.SUFFIX.CONTAINS("
    bmp") || HTTP.REQ.URL.SUFFIX.CONTAINS("png") ||
HTTP.REQ.URL.SUFFIX.CONTAINS("gif") || HTTP.REQ.URL.SUFFIX.CONTAINS("
    tiff") || HTTP.REQ.URL.SUFFIX.CONTAINS("jpg")
<!--NeedCopy-->
```

If the URL has a suffix of "jpg," with the above compound expression, the Citrix ADC appliance has to iterate through the entire compound expression sequentially, from one sub expression to the next, to determine that the request refers to a jpg image. The following figure shows the steps in the process.



HTTP.REQ.URL.SUFFIX.CONTAINS("svg")||
HTTP.REQ.URL.SUFFIX.CONTAINS("bmp")||
HTTP.REQ.URL.SUFFIX.CONTAINS("png")||
HTTP.REQ.URL.SUFFIX.CONTAINS("gif")||
HTTP.REQ.URL.SUFFIX.CONTAINS("tiff")||
HTTP.REQ.URL.SUFFIX.CONTAINS("jpg")

When a compound expression includes hundreds of sub expressions, the above process is resource intensive. A better alternative is an expression that invokes a pattern set, as shown in the following figure.



During policy evaluation as shown above, the operator (CONTAINS_ANY) compares the string identified in the request with the patterns defined in the pattern set until a match is found. With the Sample_Patset expression, the multiple iterations through six sub expressions are reduced to just one.

By eliminating the need to configure compound expressions that perform string matching with multiple OR operations, pattern sets or data sets simplify configuration and accelerate processing of requests and responses.

Configuring a Pattern Set

September 21, 2020

To configure a pattern set, you must specify the strings that are to serve as patterns. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

Note: Pattern sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern "product1," for example, is not the same as the string pattern "Product1."

Points to remember about index values:

- You cannot bind the same index value to more than one pattern.

- An automatically assigned index value is one number larger than the highest index value of the existing patterns within the pattern set. For example, if the highest index value of existing patterns in a pattern set is 104, the next automatically assigned index value will be 105.
- If you do not specify an index for the first pattern, index value 1 is automatically assigned to that pattern.
- Index values are not regenerated automatically if one or more patterns are deleted or modified. For example, if the set contains five patterns, with indexes from 1 through 5, and if the pattern with an index of 3 is deleted, the other index values in the pattern set are not automatically regenerated to produce values from 1 through 4.
- The maximum index value that can be assigned to a pattern is 4294967290. If that value is already assigned to a pattern in the set, you must manually assign index values to any newly added patterns. An unused index value that is lower than a currently used value cannot be assigned automatically.

To configure a pattern set by using the command line interface

At the command prompt, do the following:

1. Create a pattern set.

   ```
   add policy patset <name>
   ```

   Example:

   ```
   > add policy patset samplepatset
   <!--NeedCopy-->
   ```

2. Bind patterns to the pattern set.

   ```
   bind policy patset <name> <string> [-index <positive_integer>]
   ```

   Example:

   ```
   > bind policy patset samplepatset product1 -index 1
   <!--NeedCopy-->
   ```

   Note: Repeat this step for all the patterns you want to bind to the pattern set.

3. Verify the configuration.

   ```
   show policy patset <name>
   ```

To configure a pattern set by using the configuration utility

1. Navigate to **AppExpert** > **Pattern Sets**.
2. In the details pane, click **Add** to open the **Create Pattern Set** dialog box.

3. Specify a name for the pattern set in the Name text box.
4. Under Specify Pattern, type the first pattern and, optionally, specify values for the following parameters:
    - Treat back slash as escape character—Select this check box to specify that any backslash characters that you might include in the pattern are to be treated as escape characters.
    - Index—A user assigned index value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Add**.
6. Repeat steps 4 and 5 to add additional patterns, and then click **Create**.

Configuring a data set

September 21, 2020

To configure a data set, you must specify the strings that are to serve as patterns, and assign a type (number, IPv4 address, or IPv6 address) to each pattern. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically. Dataset is not related to HTTP or any 7 layer protocol. It works only on text/string. There are different types of dataset such as num, ulong, ipv4, and ipv6. To use a dataset on IP, we have to convert the input into text/string.

Note: Data sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern "product1," for example, is not the same as the string pattern "Product1."

The rules applied for index values of data sets are the same as those applied for pattern sets. For information about index values, see Configuring a Pattern Set.

To configure a data set by using the command line interface

At the command prompt, do the following:

1. Create a data set.

```
add policy dataset <name> <type>
```

Example:

```
```
> add policy dataset sampledataset ipv4
<!--NeedCopy--> ```
```

1. Bind patterns to the data set.

    ```
    bind policy dataset <name> <value> [-index <positive_integer>]
    ```
    ```

Example:

```
```
> bind policy dataset sampledataset 10.102.29.1 -index 1
<!--NeedCopy--> ```
```

> **Note**:
>
> Repeat this step for all the patterns you want to bind to the data set.

1. add policy expression sampleexpression client.ip.src.typecast_text_t.equals_any("sampledataset")
2. Verify the configuration.

   `show policy dataset <name>`

### To configure a data set by using the configuration utility

Navigate to **AppExpert** > **Data Sets**, click **Add** and specify the relevant details.

## Using pattern sets and data sets

September 21, 2020

Default syntax policy expressions that take pattern sets or data sets as an argument can be used to perform string matching operations.

The usage is as follows:

```
<text>.<operator>("<name>")
<!--NeedCopy-->
```

where,

- `<text>` is the expression that identifies a string in a packet. Example: HTTP.REQ.HEADER("Host").
- `<operator>` is one of the operators described in the Pattern Set Types table pdf.

For sample usage, see Sample Usage.

Sample usage

September 21, 2020
```

To understand the usage of pattern sets in expressions, consider the example of a pattern set named “imagetypes.”

Patterns	Index value
svg	1
bmp	2
png	3
gif	4
tiff	5
jpg	6

Table 1. Pattern set "imagetypes"

Example 1: Determine whether the suffix of an HTTP request is one of the file extensions defined in the "imagetypes" pattern set.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_ANY("imagetypes")
- **Sample URL.** `http://www.example.com/homepageicon.jpg`
- **Result.** TRUE

Example 2: Determine whether the suffix of an HTTP request is one of the file extensions defined in the "imagetypes" pattern set, and return the index of that pattern.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes")
- **Sample URL.** `http://www.example.com/mylogo.png`
- **Result.** 4 (The index value of the pattern "gif".)

Example 3: Use the index value of a pattern to determine whether the URL suffix is within a specified index-value range.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").GE(3) && HTTP.REQ.URL.SUFFIX.EQUALS
- **Sample URL.** `http://www.example.com/mylogo.png`
- **Result.** TRUE (The index value of gif file types is 4.)

Example 4: Implement one set of policies for file extensions bmp, jpg, and png, and a different set of policies for gif, tiff, and svg files.

An expression that returns the index of a matched pattern can be used to define traffic subsets for a web application. The following two expressions could be used in content switching policies for a content switching virtual server:

- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").LE(3)
- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").GE(4)

Variables

September 21, 2020

Variables are named objects that store information in the form of tokens. These tokens are used within and across different transactions on the NetScaler Appliance for internal computation and policy processing.

The NetScaler appliance supports creation of variables of the following types:

- **Singleton variables.** Can have a single value of one of the following types: ulong and text (max-size). The ulong type is an unsigned 64-bit integer, the text type is a sequence of bytes, and max-size is the maximum number of bytes in the sequence.
- **Map variables.** Maps hold values associated with keys: each key-value pair is called a map entry. The key for each entry is unique within the map. Maps are specified as follows:

  map (key_type, value_type, max-values).

  where,

  - *key_type* is the data type of the key. It is of type text (max-size).
  -
    ```
    *value_type* is the data type of the values of the map. It can
        be of type ulong or text (max-size).
    ```

    ```
    *max-values* is the maximum number of entries that the map can
        contain. It is of type ulong.
    ```

Values for these variables are set using assignments which must be invoked on policy actions.

> - **Note**: Variables are not yet supported in a high-availability setup or in a cluster.

Variables Scope

A map variable or a singleton variable can have a global scope. Alternatively, the scope of a singleton variable can be limited to a single transaction.

- **Global Scope Variable** - A variable with global scope (the default) has only one instance, and that instance has the same value(s) across all cores of a NetScaler appliance and across all nodes of a cluster or HA configuration. Global variable values exist until they are explicitly deleted, until they expire, or until a standalone appliance is restarted or all nodes of a cluster or HA configuration are restarted.

- **Transaction Scope Variable** - A variable with transaction scope has a separate instance, with its own value, for each transaction processed by the NetScaler appliance. When the transaction processing is complete, the transaction variable value is deleted.

> **Note**: Transaction scope variables are available in NetScaler release 10.5.e or later.

Configuring and using Variables

September 21, 2020

You must first create a variable and then assign a value or specify the operation that must be performed on the variable. After performing these operations, you can use the assignment as a policy action.

Note: Once configured, a variable's settings cannot be modified or reset. If the variable needs to be changed, the variable and all references to the variable (expressions and assignments) must be deleted. The variable can then be re-added with new settings, and the references (expressions and assignments) can be re-added.

To configure variables by using the command line interface

1. Create a variable.

```
add ns variable <name> -type <string> [-scope global] [-ifFull ( undef
    | lru )] [-ifValueTooBig ( undef | truncate )] [-ifNoValue ( undef |
     init )] [-init <string>] [-expires <positive_integer>] [-comment <
    string>]
<!--NeedCopy-->
```

Note: Refer to the man page "man add ns variable" for description of the command parameters.

Example 1: Create a ulong variable named "my_counter" and initialize it to 1.

```
add ns variable my_counter  - type ulong -init 1
<!--NeedCopy-->
```

Example 2: Create a map named "user_privilege_map". The map will contain keys of maximum length 15 characters and text values of maximum length 10 characters, with a maximum of 10000 entries.

```
add ns variable user_privilege_map -type map(text(15),text(10),10000)
<!--NeedCopy-->
```

Note: If the map contains 10000 unexpired entries, assignments for new keys reuse one of the least recently used entries. By default, an expression trying to get a value for a non-existent key will initialize an empty text value.

Assign the value or specify the operation to be performed on the variable. This is done by creating an assignment.

```
add ns assignment <name> -variable <expression> [-set <expression> | -
    add <expression> | -sub <expression> | -append <expression> | -clear
    ] [-comment <string>]
<!--NeedCopy-->
```

Note: A variable is referenced by using the variable selector ($). Therefore,
$variable1 is used to refer to text or ulong variables. Similarly,
$variable2[key-expression] is used to refer to map variables.

Example 1: Define an assignment named "inc_my_counter" that automatically adds 1 to the "my_counter" variable.

```
add ns assignment inc_my_counter -variable $my_counter -add 1
<!--NeedCopy-->
```

Example 2: Define an assignment named "set_user_privilege" that adds to the "user_privilege_map" variable an entry for the client's IP address with the value returned by the "get_user_privilege" HTTP callout.

```
add ns assignment set_user_privilege -variable $user_privilege_map[
    client.ip.src.typecast_text_t] -set sys.http.callout(
    get_user_privilege)
<!--NeedCopy-->
```

Note: If an entry for that key already exists, the value will be replaced. Otherwise a new entry for the key and value will be added. Based on the previous declaration for user_privilege_map, if the map already has 10000 entries, one of the least recently used entries will be reused for the new key and value.

1. Invoke the variable assignment in a policy.

   There are two functions that can operate on map variables.

   - **$name.valueExists(key-expression).** Returns true if there is a value in the map selected by the key-expression. Otherwise returns false. This function will update the expiration and LRU information if the map entry exists, but will not create a new map entry if the value does not exist.

- **$name.valueCount.** Returns the number of values currently held by the variable. This is the number of entries in a map. For a singleton variable, this is 0 if the variable is uninitialized or 1 otherwise.

Example: Invoke the assignment named "set_user_privilege" with a compression policy.

```
add cmp policy set_user_privilege_pol -rule $user_privilege_map.
    valueExists(client.ip.src.typecast_text_t).not -resAction
    set_user_privilege
<!--NeedCopy-->
```

Use Case to insert HTTP header in the response side

The following example shows an example of a singleton variable.

Add a singleton variable of type text. This variable can hold maximum 100 Bytes data.

```
add ns variable http_req_data -type text(100) -scope transaction
<!--NeedCopy-->
```

Add an assignment action, which will be used to store the HTTP request data into the variable.

```
add ns assignment set_http_req_data -variable $http_req_data -set http.
    req.body(100)
<!--NeedCopy-->
```

Add a rewrite action to insert HTTP header, whose value will be fetched from the variable.

```
add rewrite action act_ins_header insert_http_header user_name
    $http_req_data.after_str("user_name").before_str("password")
<!--NeedCopy-->
```

Add a rewrite policy which will evaluate in the request time, and take assignment action to store data. When we hit this policy, we'll take assignment action and store the data into the ns variable (http_req_data)

```
add rewrite policy pol_set_variable true set_http_req_data

bind rewrite global pol_set_variable 10 -type req_dEFAULT
<!--NeedCopy-->
```

Add a rewrite policy which will evaluate in the response time, and add an HTTP header in the response.

```
add rewrite policy pol_ins_header true act_ins_header

```

```
bind rewrite global pol_ins_header 10 -type res_dEFAULT
<!--NeedCopy-->
```

To configure variables by using the GUI

1. Navigate to **AppExpert** > **NS Variables**, to create a variable.
2. Navigate to **AppExpert** > **NS Assignments,** to assign value(s) to the variable.
3. Navigate to the appropriate feature area where you want to configure the assignment as an action.

Use Case: Caching User Privileges

September 21, 2020

In this use case, user privileges ("GOLD", "SILVER", and so on) must be retrieved from an external web service.

To achieve this use case, perform the following operations

Create an HTTP callout to fetch the user privileges from the external web service.

```
add policy httpcallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port <
    port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (
    GET | POST )] [-hostExpr <string>] [-urlStemExpr <string>] [-headers
     <name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr <
    string>][-fullReqExpr <string>] [-scheme ( http | https )] [-
    resultExpr <string>] [-cacheForSecs <secs>] [-comment <string>]

add policy httpcallout get_user_privilege -ipaddress 10.217.193.84 -
    port 80 -returnType text -httpMethod GET -hostExpr '"/
    get_user_privilege"' -resultExpr 'http.res.body(5)'
<!--NeedCopy-->
```

Store the privileges in a variable.

```
add ns variable <name> -type <string> [-scope ( global | transaction )
    ][-ifFull ( undef | lru )] [-ifValueTooBig ( undef | truncate )][-
    ifNoValue ( undef | init )] [-init <string>] [-expires <
    positive_integer>] [-comment <string>]

```

```
add ns variable user_privilege_map -type map(text(15),text(10),10000) -expires 1200

add ns assignment set_user_privilege -variable $user_privilege_map[client.ip.src] -set sys.http_callout(get_user_privilege)
<!--NeedCopy-->
```

Create a policy to check if there is already a cached entry for the client’s IP address; if not, it calls the HTTP callout to set a map entry for the client.

```
add cmp policy <name> -rule <expression> -resAction <string>

add cmp policy set_user_privilege_pol -rule $user_privilege_map.valueExists(client.ip.src).not -resAction set_user_privilege>
<!--NeedCopy-->
```

Create a policy that compresses if the cached privilege entry for the client is “GOLD”.

```
add cmp policy <name> -rule <expression> -resAction <string>

add cmp policy compress_if_gold_privilege_pol -rule '$user_privilege_map[client.ip.src].eq("GOLD")' -resAction compress
<!--NeedCopy-->
```

Bind the compression policies globally.

```
bind cmp global <policyName> [-priority <positive_integer>] [-state ( ENABLED | DISABLED )] [-gotoPriorityExpression <expression>] [-type <type>] [-invoke (<labelType> <labelName>) ]

bind cmp global set_user_privilege_pol -priority 10 NEXT

bind cmp global compress_if_gold_privilege_pol -priority 20 END
<!--NeedCopy-->
```

Use Case: Limiting the Number of Sessions

September 21, 2020

In this use case, the requirement is to limit the number of active backend sessions. In the deployment, each session login has login in the URL and each session logout has logout in the URL. On successful login, the backend sets a sessionid cookie with a unique 10 character value.

To achieve this use case, perform the following operations:

1. Create a map variable that can store each active session. The key of the map is the sessionid. The expiry time for the variable is set to 600 seconds (10 minutes).

   ```
   > add ns variable session_map -type map(text(10),ulong,100) -
     expires 600
   <!--NeedCopy-->
   ```

2. Create the following assignments for the map variable:

   - Create an entry for the sessionid and set that value to 1 (this value is not actually used).

     ```
     > add ns assignment add_session -variable '$session_map[http.
       req.cookie.value("sessionid")]' -set 1
     <!--NeedCopy-->
     ```

   - Deallocate the entry for a session ID, which implicitly decrements the value count for session_map.

     ```
     > add ns assignment delete_session -variable '$session_map[
       http.req.cookie.value("sessionid")]' -clear
     <!--NeedCopy-->
     ```

3. Create responder policies for the following:

   - To check if a map entry exists for that sessionid in the HTTP request. The add_session assignment is executed if the map entry does not exist.

     ```
     > add responder policy add_session_pol 'http.req.url.contains
       ("twbkwbis.P_SabanciLogin") || $session_map.valueExists(
       http.req.cookie.value("netsuis"))' add_session
     <!--NeedCopy-->
     ```

     Note: The
     valueExists() function in the
     add_session_pol policy counts as a reference to the session’s map entry, so each request resets the expiration timeout for its session. If no requests for a session are received after 10 minutes, the session’s entry will be deallocated.

   - To check when the session is logged out. The delete_session assignment is executed.

     ```
     add responder policy delete_session_pol "http.req.url.
       contains(\"Logout\")" delete_session
     ```

```
<!--NeedCopy-->
```

- To check for login requests and if the number of active sessions exceed 100. If these conditions are satisfied, in order to limit the number of sessions, the user is redirected to a page that indicates that the server is busy.

  ```
  add responder action redirect_too_busy redirect "/too_busy.
     html"
  add responder policy check_login_pol "http.req.url.contains
     (\"twbkwbis.P_SabanciLogin\") && $session_map.valueCount >
      100" redirect_too_busy
  <!--NeedCopy-->
  ```

4. Bind the responder policies globally.

   ```
   bind responder global add_session_pol 30 next
   bind responder global delete_session_pol 10
   bind responder global check_login_pol 20
   <!--NeedCopy-->
   ```

Policies and expressions

September 21, 2020

The following topics provide the conceptual and reference information that you require for configuring advanced policies on the Citrix® NetScaler® appliance.

To know about all the advanced policy expressions supported on the Citrix ADC appliance, see Policy Expressions

Introduction to Policies and Expressions	Describes the purpose of expressions, policies, and actions, and how different Citrix ADC applications make use of them.

Configuring Advanced Policies	Describes the structure of advanced policies and how to configure them individually and as policy banks.
Configuring Advanced Expressions: Getting Started	Describes expression syntax and semantics, and briefly introduces how to configure expressions and policies.
Advanced Expressions: Evaluating Text	Describes expressions that you configure when you want to operate on text (for example, the body of an HTTP POST request or the contents of a user certificate).

Advanced Expressions: Working with Dates, Times, and Numbers	Describes expressions that you configure when you want to operate on any type of numeric data (for example, the length of a URL, a client's IP address, or the date and time that an HTTP request was sent).
Advanced Expressions: Parsing HTTP, TCP, and UDP Data	Describes expressions for parsing IP and IPv6 addresses, MAC addresses, and data that is specific to HTTP and TCP traffic.

Advanced Expressions: Parsing SSL Certificates	Describes how to configure expressions for SSL traffic and client certificates, for example, how to retrieve the expiration date of a certificate or the certificate issuer.				
Advanced Expressions: IP and MAC Addresses, Throughput, VLAN IDs	Describes expressions that you can use to work with any other client- or server-related data not discussed in other chapters.	Typecasting Data	Describes expressions for transforming data of one type to another.	Regular Expressions	Describes how to pass regular expressions as arguments to operators in advanced expressions.
Configuring Classic Policies and Expressions	Provides details on how to configure the simpler policies and expressions known as classic policies and classic expressions.	Expressions Reference	A reference for classic and advanced expression arguments.	Summary Examples of Advanced Expressions and Policies	Examples of classic and advanced expressions and policies, in both quick reference and tutorial format, that you can customize for your own use.

Tutorial Examples of Advanced Policies for Rewrite	Examples of advanced policies for use in the Rewrite feature.
Tutorial Examples of Classic Policies	Examples of classic policies for Citrix ADC features such as application firewall and SSL.
Migration of Apache mod_rewrite Rules to Advanced Policies	Examples of functions that were written using the Apache HTTP Server mod_rewrite engine, with examples of these functions after translation into Rewrite and Responder policies on the Citrix ADC.

Introduction to policies and expressions

September 21, 2020

For many NetScaler features, policies control how a feature evaluates data, which ultimately determines what the feature does with the data. A policy uses a logical expression, also called a rule, to evaluate requests, responses, or other data, and applies one or more actions determined by the outcome of the evaluation. Alternatively, a policy can apply a profile, which defines a complex action.

Some NetScaler features use default syntax policies, which provide greater capabilities than do the older, classic, policies. If you migrated to a newer release of the NetScaler software and have configured classic policies for features that now use default syntax policies, you might have to manually migrate policies to the default syntax.

Classic and advanced policies

September 21, 2020

> **Warning**
>
> Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies

Classic policies evaluate basic characteristics of traffic and other data. For example, classic policies can identify whether an HTTP request or response contains a particular type of header or URL.

Advanced policies can perform the same type of evaluations as classic policies. In addition, default syntax policies enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, transforming data in the body of a request into an HTTP header).

In addition to assigning a policy an action or profile, you bind the policy to a particular point in the processing associated with the NetScaler features. The bind point is one factor that determines when the policy will be evaluated.

Benefits of using advanced policies

Default syntax policies use a powerful expression language that is built on a class-object model, and they offer several options that enhance your ability to configure the behavior of various NetScaler features. With default syntax policies, you can do the following:

- Perform fine-grained analyses of network traffic from layers 2 through 7.

- Evaluate any part of the header or body of an HTTP or HTTPS request or response.
- Bind policies to the multiple bind points that the default syntax policy infrastructure supports at the default, override, and virtual server levels.
- Use goto expressions to transfer control to other policies and bind points, as determined by the result of expression evaluation.
- Use special tools such as pattern sets, policy labels, rate limit identifiers, and HTTP callouts, which enable you to configure policies effectively for complex use cases.

Additionally, the GUI extends robust graphical user interface support for default syntax policies and expressions and enables users who have limited knowledge of networking protocols to configure policies quickly and easily. The GUI also includes a policy evaluation feature for default syntax policies. You can use this feature to evaluate a default syntax policy and test its behavior before you commit it, thus reducing the risk of configuration errors.

Basic components of an advanced policy

Following are a few characteristics of an Advanced policy:

- Name.

  Each policy has a unique name.

- Rule.

  The rule is a logical expression that enables the NetScaler feature to evaluate a piece of traffic or another object.

  For example, a rule can enable the NetScaler to determine whether an HTTP request originated from a particular IP address, or whether a Cache-Control header in an HTTP request has the value "No-Cache."

  Advanced policies can use all of the expressions that are available in a classic policy, with the exception of classic expressions for the SSL VPN client. In addition, Advanced policies enable you to configure more complex expressions.

- Bindings.

  To ensure that the NetScaler can invoke a policy when it is needed, you associate the policy, or bind it, to one or more bind points.

  You can bind a policy globally or to a virtual server. For more information, see "About policy bindings."

- An associated action.

  An action is a separate entity from a policy. Policy evaluation ultimately results in the NetScaler performing an action.

For example, a policy in the integrated cache can identify HTTP requests for .png or .jpeg files. An action that you associate with this policy determines that the responses to these types of requests are served from the cache.

For some features, you configure actions as part of a more complex set of instructions known as a profile.

How different NetScaler features use policies

The NetScaler supports a variety of features that rely on policies for operation. The following table summarizes how the NetScaler features use policies.

Feature Name	Policy Type	How You Use Policies in the Feature
System	Classic	For the Authentication function, policies contain authentication schemes for different authentication methods. For example, you can configure LDAP and certificate-based authentication schemes. You also configure policies in the Auditing function.
DNS	Advanced	To determine how to perform DNS resolution for requests.
SSL	Classic and Advanced	To determine when to apply an encryption function and add certificate information to clear text. To provide end-to-end security, after a message is decrypted, the SSL feature re-encrypts clear text and uses SSL to communicate with Web servers.
Compression	Classic and Advanced	To determine what type of traffic is compressed.
Integrated Caching	Advanced	To determine whether HTTP responses are cacheable.

Feature Name	Policy Type	How You Use Policies in the Feature
Responder	Advanced	To configure the behavior of the Responder function.
Protection Features	Classic	To configure the behavior of the Filter, SureConnect, and Priority Queuing functions.
Content Switching	Classic and Advanced	To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.
AAA - Traffic Management	Classic. Exceptions: Traffic policies support only default syntax policies aand authorization policies support both classic and default syntax policies.	To check for client-side security before users log in and establish a session. Traffic policies, which determine whether single sign-on (SSO) is required, use only the default syntax. Authorization policies authorize users and groups that access intranet resources through the appliance.
Cache Redirection	Classic	To determine whether responses are served from a cache or from an origin server.

Feature Name	Policy Type	How You Use Policies in the Feature
Rewrite	Advanced	To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a new home page, or a new server, or a selected server based on the address of the incoming request, or you can modify the data to mask server information in a response for security purposes. The URL Transformer function identifies URLs in HTTP transactions and text files for the purpose of evaluating whether a URL should be transformed.
Application Firewall	Classic and Advanced	To identify characteristics of traffic and data that should or should not be admitted through the firewall.
NetScaler Gateway, Clientless Access function	Advanced	To define rewrite rules for general Web access using the NetScaler Gateway.
NetScaler Gateway	Classic	To determine how the NetScaler Gateway performs authentication, authorization, auditing, and other functions.

About actions and profiles

Policies do not themselves take action on data. Policies provide read-only logic for evaluating traffic. To enable a feature to perform an operation based on a policy evaluation, you configure actions or profiles and associate them with policies.

Note: Actions and profiles are specific to particular features. For information about assigning actions and profiles to features, see the documentation for the individual features.

About actions

Actions are steps that the NetScaler takes, depending on the evaluation of the expression in the policy. For example, if an expression in a policy matches a particular source IP address in a request, the action that is associated with this policy determines whether the connection is permitted.

The types of actions that the NetScaler can take are feature specific. For example, in Rewrite, actions can replace text in a request, change the destination URL for a request, and so on. In Integrated Caching, actions determine whether HTTP responses are served from the cache or an origin server.

In some NetScaler features actions are predefined, and in others they are configurable. In some cases, (for example, Rewrite), you configure the actions using the same types of expressions that you use to configure the associated policy rule.

About profiles

Some NetScaler features enable you to associate profiles, or both actions and profiles, with a policy. A profile is a collection of settings that enable the feature to perform a complex function. For example, in the application firewall, a profile for XML data can perform multiple screening operations, such as examining the data for illegal XML syntax or evidence of SQL injection.

Use of actions and profiles in particular features

The following table summarizes the use of actions and profiles in different NetScaler features. The table is not exhaustive. For more information about specific uses of actions and profiles for a feature, see the documentation for the feature.

Feature	Use of an Action	Use of a Profile
Application firewall	Synonymous with a profile	All application firewall features use profiles to define complex behaviors, including pattern-based learning. You add these profiles to policies.
NetScaler Gateway	The following features of the NetScaler Gateway use actions: Pre-Authentication. Uses Allow and Deny actions. You add these actions to a profile., Authorization. Uses Allow and Deny actions. You add these actions to a policy. TCP Compression. Uses various actions. You add these actions to a policy.	The following features use a profile: Pre-Authentication, Session, Traffic, and Clientless Access. After configuring the profiles, you add them to policies.
Rewrite	You configure URL rewrite actions and add them to a policy.	Not used.
Integrated Caching	You configure caching and invalidation actions within a policy	Not used.
AAA - Traffic Management	You select an authentication type, set an authorization action of ALLOW or DENY, or set auditing to SYSLOG or NSLOG.	You can configure session profiles with a default timeout and authorization action.
Protection Features	You configure actions within policies for the following functions: Filter, Compression, Responder, and SureConnect.	Not used.
SSL	You configure actions within SSL policies	Not used.

Feature	Use of an Action	Use of a Profile
System	The action is implied. For the Authentication function, it is either Allow or Deny. For Auditing, it is Auditing On or Auditing Off.	Not used.
DNS	The action is implied. It is either Drop Packets or the location of a DNS server.	Not used.
SSL Offload	The action is implied. It is based on a policy that you associate with an SSL virtual server or a service.	Not used.
Compression	Determine the type of compression to apply to the data	Not used.
Content Switching	The action is implied. If a request matches the policy, the request is directed to the virtual server associated with the policy.	Not used.
Cache Redirection	The action is implied. If a request matches the policy, the request is directed to the origin server.	Not used.

About policy bindings

A policy is associated with, or bound to, an entity that enables the policy to be invoked. For example, you can bind a policy to request-time evaluation that applies to all virtual servers. A collection of policies that are bound to a particular bind point constitutes a policy bank.

Following is an overview of different types of bind points for a policy:

- Request time global.

  A policy can be available to all components in a feature at request time.

- Response time global.

A policy can be available to all components in a feature at response time.

- Request time, virtual server-specific.

  A policy can be bound to request-time processing for a particular virtual server. For example, you can bind a request-time policy to a cache redirection virtual server to ensure that particular requests are forwarded to a load balancing virtual server for the cache, and other requests are sent to a load balancing virtual server for the origin.

- Response time, virtual server-specific.

  A policy can also be bound to response-time processing for a particular virtual server.

- User-defined policy label.

  For default syntax policies, you can configure custom groupings of policies (policy banks) by defining a policy label and collecting a set of related policies under the policy label.

- Other bind points.

  The availability of additional bind points depends on type of policy (classic or default syntax), and specifics of the relevant NetScaler feature. For example, classic policies that you configure for the
  NetScaler Gateway have user and group bind points.

For additional information about default syntax policy bindings, see "Bind policies that use the default syntax" and Configure a policy bank for a virtual server. For additional information about classic policy bindings, see "Configure a classic policy."

About evaluation order of policies

For classic policies, policy groups and policies within a group are evaluated in a particular order, depending on the following:

- The bind point for the policy, for example, whether the policy is bound to request-time processing for a virtual server or global response-time processing. For example, at request time, the NetScaler evaluates all request-time classic policies before evaluating any virtual server-specific policies.
- The priority level for the policy. For each point in the evaluation process, a priority level that is assigned to a policy determines the order of evaluation relative to other policies that share the same bind point. For example, when the NetScaler evaluates a bank of request-time, virtual server-specific policies, it starts with the policy that is assigned to the lowest priority value. In classic policies, priority levels must be unique across all bind points.

For Advanced policies, as with classic policies, the NetScaler selects a grouping, or bank, of policies at a particular point in overall processing. Following is the order of evaluation of the basic groupings, or banks, of Advanced policies:

1. Request-time global override
2. Request-time, virtual server-specific (one bind point per virtual server)
3. Request-time global default
4. Response-time global override
5. Response-time virtual server-specific
6. Response-time global default

However, within any of the preceding banks of policies, the order of evaluation is more flexible than in classic policies. Within a policy bank, you can point to the next policy to be evaluated regardless of the priority level, and you can invoke policy banks that belong to other bind points and user-defined policy banks.

Order of evaluation based on traffic flow

As traffic flows through the NetScaler and is processed by various features, each feature performs policy evaluation. Whenever a policy matches the traffic, the NetScaler stores the action and continues processing until the data is about to leave the NetScaler. At that point, the NetScaler typically applies all matching actions. Integrated Caching, which only applies a final Cache or NoCache action, is an exception.

Some policies affect the outcome of other policies. Following are examples:

- If a response is served from the integrated cache, some other NetScaler features do not process the response or the request that initiated it.
- If the Content Filtering feature prevents a response from being served, no subsequent features evaluate the response.

If the application firewall rejects an incoming request, no other features can process it.

Classic and advanced policy expressions

September 21, 2020

One of the most fundamental components of a policy is its rule. A policy rule is a logical expression that enables the policy to analyze traffic. Most of the policy's functionality is derived from its expression.

An expression matches characteristics of traffic or other data with one or more parameters and values. For example, an expression can enable the NetScaler to accomplish the following:

- Determine whether a request contains a certificate.
- Determine the IP address of a client that sent a TCP request.

- Identify the data that an HTTP request contains (for example, a popular spreadsheet or word processing application).
- Calculate the length of an HTTP request.

About classic expressions

Classic expressions enable you to evaluate basic characteristics of data. They have a structured syntax that performs string matching and other operations.

Following are a few simple examples of classic expressions:

- An HTTP response contains a particular type of Cache Control header.

res.http.header Cache-Control contains public

- An HTTP response contains image data.

res.http.header Content-Type contains image/

- An SSL request contains a certificate.

req.ssl.client.cert exists

About advanced policy expressions

Any feature that uses default syntax policies also uses Advanced expressions. For information about which features use Advanced policies, see the table NetScaler Feature, Policy Type, and Policy Usage.

Advanced policy expressions have a few other uses. In addition to configuring Advanced expressions in policy rules, you configure Advanced
expressions in the following situations:

- Integrated Caching:

  You use Advanced policy expressions to configure a selector for a content group in the integrated cache.

- Load Balancing:

  You use Advanced policy expressions to configure token extraction for a load balancing virtual server that uses the TOKEN method for load balancing.

- Rewrite:

  You use Advanced policy expressions to configure rewrite actions.

- Rate-based policies:

  You use Advanced policy expressions to configure limit selectors when configuring a policy to control the rate of traffic to various servers.

Following are a few simple examples of Advanced policy expressions:

- An HTTP request URL contains no more than 500 characters.

```
http.req.url.length \<= 500
```

- An HTTP request contains a cookie that has fewer than 500 characters.

```
http.req.cookie.length \< 500
```

- An HTTP request URL contains a particular text string.

```
http.req.url.contains(".html")
```

Converting policy expressions using NSPEPI tool

September 21, 2020

You can convert a classic expression to the Advanced policy expression by using the nspepi conversion tool. You can also use the tool to convert all the classic expressions in the NetScaler configuration to the Advanced policy (with the exception of NetScaler entities that currently support only classic expressions).

The conversion tool does not convert policies configured for the following features because the features currently support only classic policies:

- Authentication, Pre-authentication
- SSL
- Cache redirection
- VPN (session, traffic, and tunnel traffic)
- Content filtering (The responder feature not only provides you with functionality that is equivalent to that provided by the content filtering feature but also surpasses the content filtering feature in the use cases that it supports. Additionally, responder supports the more powerful default syntax for policy expressions.)

The following NetScaler features support both classic and Advanced policy expression and, therefore, support the conversion of classic expressions to Advanced policy expressions:

- Application firewall policies
- Authorization policies
- Named expressions
- Compression policies
- Content switching policies
- User-defined, rule-based tokens/persistency (the –rule parameter value that is specified for a load balancing virtual server)

About the conversion process

When parsing a NetScaler configuration file, the conversion tool performs the following actions:

1. In commands that create classic named expressions, the conversion tool replaces the names of the classic expressions with Advanced policy expression.
2. In commands that support only the classic policy, if classic named expressions are used, the conversion tool replaces the names of the classic expressions with the actual classic expressions they represent. This action ensures that the names of expressions in classic-only features do not reference the Advanced policy expression created from Step 1.
3. In commands associated with entities that support both the classic syntax and the Advanced policies, the conversion tool replaces all classic expressions in commands with Advanced policy expressions.

Example:

Consider the following sample configuration commands:

```
add policy expression ne_c1 "METHOD == GET"
add policy expression ne_c2 "ne_c1 || URL == /*.htm "
add filter policy pol1 -rule "ne_c2" -reqAction YES
add cmp policy pol2 -rule "REQ.HTTP.HEADER Accept CONTAINS \'text/html\'" -resAction COMPRESS
add cmp policy pol3 -rule "ne_c1 || ne_c2" -resAction GZIP
<!--NeedCopy-->
```

In the commands that create the classic named expressions ne_c1 and ne_c2, the tool replaces the names of the expressions with actual Advanced policy expression. This action, which corresponds to Step 1 described earlier, results in the following commands:

```
add policy expression ne_c2 "HTTP.REQ.METHOD.EQ(\"GET\")"

add policy expression ne_c1 "HTTP.REQ.URL.SUFFIX.EQ(\"htm\")"
<!--NeedCopy-->
```

The filter policy command supports only the classic syntax. Therefore, the conversion tool replaces the classic named expression ne_c1 with the actual classic expression it represents. Note that the tool replaces ne_c1 in the expression for ne_c2, and then replaces ne_c2 in the filter policy with the classic expression. This action, which corresponds to Step 2 described earlier, results in the following command:

`add filter policy pol1 -rule "METHOD == GET || URL == /\*.htm"-reqAction YES`

The compression feature supports both classic and Advanced policy expression. Therefore, in the command that creates the compression policy pol2, the conversion tool replaces the expression with

Advanced policy expression. This action, which corresponds to Step 3 described earlier, results in the following command:

```
add cmp policy pol2 -rule "HTTP.REQ.HEADER(\"Accept\").AFTER_STR(\"text/
html\").LENGTH.GT(0)"-resAction COMPRESS
```

The command that creates the compression policy pol3 is unaffected by the conversion process because, after the conversion process is complete, ne_c1 and ne_c2 reference the Advanced policy expression that results from Step 1.

Client security messages are not supported in the newer default policy format and, therefore, are lost. The
SYS.EVAL_CLASSIC_EXPR function is replaced with a Advanced policy expression. The following entities support the
SYS.EVAL_CLASSIC_EXPR function:

- DNS policies
- Rate limit selectors
- Cache selectors
- Cache policies
- Content switching policies
- Rewrite policies
- URL transformation policies
- Responder policies
- Application firewall policies
- Authorization policies
- Compression policies
- CVPN access policies

After performing the conversion, the tool saves the changes in a new configuration file. The new configuration file is created in the directory in which the input file exists. The name of the new configuration file is the same as the name of the input configuration file except for the string new_ used as a prefix. Conversion warnings are reported in a warning line at the end of the screen output. Additionally, a warning file is created in the directory in which the input configuration file resides. For more information about the warning file and the types of warnings that are reported, see “Conversion warnings.”

Convert expressions

You can use the nspepi tool to convert a single classic expression to the Advanced policy expression. The nspepi tool must be run from the shell prompt on the NetScaler appliance.

Convert a classic expression to the Advanced policy by using the CLI

At the shell prompt, type:

‘nspepi -e “<classic expression>”

Example:

```
root@NS# nspepi -e "REQ.HTTP.URL == /*.htm"
 "HTTP.REQ.URL.REGEX_MATCH(re#/(.*)\.htm#)"
<!--NeedCopy-->
```

Convert a NetScaler configuration file

You can use the nspepi tool to convert all the classic expressions in a NetScaler configuration file to the Advanced policy (except for those commands that do not support the Advanced policy). The nspepi tool must be run from the shell prompt on the NetScaler appliance.

Convert all the classic expressions in a NetScaler configuration file to the default syntax by using the CLI

At the shell prompt, type:

nspepi -f “<ns config file>” -v

Example:

```
root@NS# nspepi -f ns.conf
OUTPUT: New configuration file created: new_ns.conf
OUTPUT: New warning file created: warn_ns.conf
WARNINGS: Total number of warnings due to bind commands: 18
WARNINGS: Line numbers which has bind command issues: 305, 306, 706,
    707, 708, 709, 710, 711, 712, 713,
714, 715, 767, 768, 774, 775, 776, 777
root@NS#
<!--NeedCopy-->
```

Conversion warnings

When classic expressions that are included in CLI commands are upgraded to the Advanced policy, the number of characters in the expression might exceed the 1499-character limit. The commands that include expressions longer than 1499 characters fail when the configuration is being applied. You must manually update these commands.

In addition, multiple classic policies can be bound to a given bind point with priority 0 or with equal priority, but the Advanced policy infrastructure does not support a priority value of 0 or policies with the same priority at a given bind point. These commands fail when the configuration is being applied. The commands must be updated manually with the correct priority values.

The line numbers of lines that threw a warning during conversion are listed at the end of the output in a warning line. In addition, a warning file is created in the same directory as the one in which the old and new configuration files reside. The name of the warning file is the same as the name of the input configuration file except that the string warn_ is added as a prefix.

Before you proceed

September 21, 2020

Before configuring expressions and policies, be sure you understand the relevant NetScaler feature and the structure of your data, as follows:

- Read the documentation on the relevant feature.
- Look at the data stream for the type of data that you want to configure.

You may want to run a trace on the type of traffic or content that you want to configure. This will give you an idea of the parameters and values, and operations on these parameters and values, that you need to specify in an expression.

Note: The NetScaler supports either classic or Advanced policy within a feature. You cannot have both types in the same feature. Over the past few releases, some NetScaler features have migrated from using classic policies and expressions to Advanced policy and expressions. If a feature of interest to you has changed to the Advanced policy format, you may have to manually migrate the older information. Following are guidelines for deciding if you need to migrate your policies:

- If you configured classic policies in a version of the Integrated Caching feature prior to release 9.0 and then upgrade to version 9.0 or later, there is no impact. All legacy policies are migrated to the Advanced policy format.
- For other features, you need to manually migrate classic policies and expressions to the Advanced syntax if the feature has migrated to the Advanced policy.

Configure advanced policy infrastructure

September 21, 2020

You can create advanced policies for various NetScaler features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the NetScaler Gateway. Policies control the behavior of these features.

When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a *policy bank*. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure *policy labels*. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.

For some features, you can use the policy manager to configure and bind policies.

Rules for names in identifiers used in policies

September 21, 2020

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (*). The remaining characters can be ASCII alphanumeric characters or underscores (*).

The names of these identifiers must not begin with the following reserved words:

- The words ALT, TRUE, or FALSE or the Q or S one-character identifier.
- The special-syntax indicator RE (for regular expressions) or XP (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP
  - SERVER
  - SYS
  - TARGET

  - TEXT
  - URL
  - MYSQL
  - MSSQL

Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be IGNORECASE, YEAR, or LATIN2_CZECH_CS (a MySQL character set).

Note: The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with
TRUE,
True, or
true.

Create or modify a policy

September 21, 2020

All policies have some common elements. Creating a policy consists, at minimum, of naming the policy and configuring a rule. The policy configuration tools for the various features have areas of overlap, but also differences. For the details of configuring a policy for a particular feature, including associating an action with the policy, see the documentation for the feature.

To create a policy, begin by determining the purpose of the policy. For example, you may want to define a policy that identifies HTTP requests for image files, or client requests that contain an SSL certificate. In addition to knowing the type of information that you want the policy to work with, you need to know the format of the data that the policy is analyzing.

Next, determine whether the policy is globally applicable, or if it pertains to a particular virtual server. Also consider the effect that the order in which your policies are evaluated (which will be determined by how you bind the policies) will have on the policy that you are about to configure.

Create a policy by using the CLI

At the command prompt, type the following commands to create a policy and verify the configuration:

```
-  add responder|dns|cs|rewrite|cache policy <policyName> -rule <
   expression> [<feature-specific information>]

-  show rewrite policy <name>
<!--NeedCopy-->
```

Example 1:

```
add rewrite policy "pol_remove-ae" true "act_remove-ae"
Done
> show rewrite policy pol_remove-ae
            Name: pol_remove-ae
            Rule: true
            RewriteAction: act_remove-ae
            UndefAction: Use Global
            Hits: 0
            Undef Hits: 0
            Bound to: GLOBAL RES_OVERRIDE
            Priority: 90
            GotoPriorityExpression: END
Done
<!--NeedCopy-->
```

Example 2:

```
add cache policy BranchReportsCachePolicy -rule q{
 http.req.url.query.value("actionoverride").contains("branchReport s")}
  -action cache
Done
show cache policy BranchReportsCachePolicy
            Name: BranchReportsCachePolicy
            Rule: http.req.url.query.value("actionoverride").contains("branchReports")
            CacheAction: CACHE
            Stored in group: DEFAULT
            UndefAction: Use Global
            Hits: 0
            Undef Hits: 0
Done
<!--NeedCopy-->
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, seeConfigure advanced policy expressions: Get started.

Create or modify a policy by using the GUI

1. In the navigation pane, expand the name of the feature for which you want to configure a policy, and then click Policies. For example, you can select Content Switching, Integrated Caching,

DNS, Rewrite, or Responder.

2. In the details pane, click Add, or select an existing policy and click Open. A policy configuration dialog box appears.
3. Specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in "Parameters for creating or modifying a policy.")
4. Click Create, and then click Close.
5. Click Save. A policy is added.

   Note: After you create a policy, you can view the policy's details by clicking the policy entry in the configuration pane. Details that are highlighted and underlined are links to the corresponding entity (for example, a named expression).

Policy configuration examples

September 21, 2020

These examples show how policies and their associated actions are entered at the command line interface. In the GUI, the expressions would appear in the Expression window of the feature-configuration dialog box for the integrated caching or rewrite feature.

Following is an example of creating a caching policy. Note that actions for caching policies are built in, so you do not need to configure them separately from the policy.

```
 add cache policy BranchReportsCachePolicy -rule q{
http.req.url.query.value("actionoverride").contains("branchReports") }
 -action cache
<!--NeedCopy-->
```

Following is an example of a rewrite policy and action:

```
add rewrite action myAction1 INSERT_HTTP_HEADER "myHeader" "
   valueForMyHeader"
add rewrite policy myPolicy1 "http.req.url.contains(\"myURLstring\")"
   myAction1
<!--NeedCopy-->
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see Configure advanced policy expressions: Get started.

Bind policies using advanced policy

July 15, 2021

After defining a policy, the policy can be invoked by binding the policy to a bind point and specifying a priority level. You can bind the policy to only one bind point. A bind point can be global (applying to all configured virtual servers) or bind point can be a specific virtual server (either a load balancing or a content switching virtual server).

The order in which policies are evaluated determines the order in which they are applied. ADC features typically evaluate various policy banks in a particular order. Sometimes, however, other features can affect the order of evaluation. Within a policy bank, the order of evaluation depends on parameter values configured in the policies. Most features apply all the actions associated with a policy if the evaluated result matches with the data being processed.

> **Note:**
>
> Integrated caching feature is an exception.

Feature-specific differences in policy bindings

You can bind policies to a built-in, global bind points (or banks), specific virtual servers, or policy labels.

However, the Citrix ADC features differ in the type of bindings that are available. The following table summarizes policy bindings in Citrix ADC features that use policies.

Feature Name	Virtual Servers Configured in the Feature	Policies Configured in the Feature	Bind Points Configured for the Policies	Use of Policies in the Feature
DNS	none	DNS policies	Global	To determine how to perform DNS resolution for requests.

Feature Name	Virtual Servers Configured in the Feature	Policies Configured in the Feature	Bind Points Configured for the Policies	Use of Policies in the Feature
Content Switching (Note: This feature can support either or classic or Advanced policies, but not both.)	Content Switching (CS)	Content Switching policies	Content switching or cache redirection virtual server; Policy label	To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.
Integrated Caching	none	Caching policies	Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server	To determine whether HTTP responses can be stored in, and served from, the Citrix ADC appliance's integrated cache.

Feature Name	Virtual Servers Configured in the Feature	Policies Configured in the Feature	Bind Points Configured for the Policies	Use of Policies in the Feature
Responder	none	Responder policies	Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server	To configure the behavior of the Responder function.
Rewrite	none	Rewrite policies	Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server	To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a selected server based on the address of the incoming request, or to mask server information in a response for security purposes.

Feature Name	Virtual Servers Configured in the Feature	Policies Configured in the Feature	Bind Points Configured for the Policies	Use of Policies in the Feature
URL Transform function in the Rewrite feature	none	Transformation policies	Global override, Global default, Policy label	To identify URLs in HTTP transactions and text files for evaluating whether a URL should be altered.
Citrix Gateway (clientless VPN functions only)	VPN server	Clientless Access policies	VPN Global, VPN server	To determine how the Citrix Gateway performs authentication, authorization, auditing, and other functions, and to define rewrite rules for general Web access using the Citrix Gateway.

Bind points and order of evaluation

For a policy to take effect, you must ensure that the policy is invoked at some point during processing. To do so, you associate the policy with a bind point. The collection of policies that is bound to a bind point is known as a policy bank.

Following are the bind points that the Citrix ADC evaluates, listed in the typical order of evaluation within a policy bank

1. **Request-time override.** When a request flows through a feature, the Citrix ADC first evaluates request-time override policies for the feature.
2. **Request-time Load Balancing virtual server.** If policy evaluation cannot be completed after all the request-time override policies have been evaluated, the Citrix ADC processes request-time policies for load balancing virtual servers.

3. **Request-time Content Switching virtual server.** If policy evaluation cannot be completed after all the request-time policies for load balancing virtual servers have been evaluated, the Citrix ADC processes request-time policies for content switching virtual servers.
4. **Request-time default.** If policy evaluation cannot be completed after all request-time, virtual server-specific policies have been evaluated, the Citrix ADC processes request-time Advanced policies.
5. **Response-time override.** At response time, the Citrix ADC starts with policies that are bound to the response-time override bind point.
6. **Response-time Load Balancing virtual server.** If policy evaluation cannot be completed after all response-time override policies have been evaluated, the Citrix ADC process the response-time policies for load balancing virtual servers.
7. **Response-time Content Switching virtual server.** If policy evaluation cannot be completed after all policies have been evaluated for load balancing virtual servers, the Citrix ADC process the response-time policies for content switching virtual servers.
8. **Response-time default.** If policy evaluation cannot be completed after all response-time, virtual-server-specific policies have been evaluated, the Citrix ADC processes response-time Advanced policies.

Policy evaluation across features

In addition to evaluate policies within a feature, if you bind policies to a content switching virtual server, it is important that these policies are evaluated before other policies. Binding a policy to a content switching virtual server produces a different result in Citrix ADC versions 9.0.x and later than in 8.x versions. In Citrix ADC 9.0 and later versions, evaluation occurs as follows:

- Content switching policies are evaluated before other policies. If a content switching policy evaluates to TRUE, the target load balancing virtual server is selected.
- If all content switching policies evaluate to FALSE, the default load balancing virtual server under the content switching VIP is selected.

After a target load balancing virtual server is selected by the content switching process, policies are evaluated in the following order:

1. Policies that are bound to the global override bind point.
2. Policies that are bound to the default load balancing virtual server.
3. Policies that are bound to the target content switching virtual server.
4. Policies that are bound to the global default bind point.

To be sure that the policies are evaluated in the intended order, follow these guidelines:

- Make sure that the default load balancing virtual server is not directly reachable from the outside; for example, the virtual server IP address can be 0.0.0.0.

- To prevent exposing internal data on the load balancing default virtual server, configure a policy to respond with a "503 Service Unavailable" status and bind it to the default load balancing virtual server.

Entries in a policy bank

Each entry in a policy bank has, at minimum, a policy and a priority level. You can also configure entries that change the priority-based evaluation order, and you can configure entries that invoke external policy banks.

The following table summarizes each entry in a policy bank.

Policy Name	Priority	Goto Expression	Invocation Type	Policy Bank to Be Invoked
The policy name, or a "dummy" policy named NOPOLICY. The **NOPOLICY** entry controls evaluation flow without processing a rule.	An integer.	Optional. Identifies the next policy in the bank to evaluate, or ends any further evaluation	Optional. Indicates that an external policy bank will be invoked. This field restricts the choices to a global policy label or a virtual server.	Optional. Used with Invocation Type. This is the label for a policy bank or a virtual server name. The Citrix ADC returns to the current bank after processing the external bank.

If the policy evaluates to TRUE, the Citrix ADC stores the action that is associated with the policy. If the policy evaluates to FALSE, the Citrix ADC evaluates the next policy. If the policy is neither TRUE nor FALSE, the Citrix ADC uses the associated Under (undefined) action.

Evaluation order within a policy bank

Within a policy bank, the evaluation order depends on the following parameters:

- **A priority.**

  The most minimal amount of information about evaluation order is a numeric priority level. The lower the number, the higher the priority.

- **A Goto expression.**

If supplied, the Goto expression indicates the next policy to be evaluated, typically within the same policy bank. Goto expressions can only proceed forward in a bank. To prevent looping, a policy bank configuration is not valid if a Goto statement point backwards in the bank.

- **Invocation of other policy banks.**

  Any entry can invoke an external policy bank. The Citrix ADC provides a built-in entity named NOPOLICY that does not have a rule. You can add a NOPOLICY entry in a policy bank when you want to invoke another policy bank, but do not want to process any other rules prior to the invocation. You can have multiple NOPOLICY entries in multiple policy banks.

Values for a Goto expression are as follows:

- **NEXT.**

  This keyword selects the policy with the next higher priority level in the current policy bank. The Policies are evaluated in priority order from lower numbered priority to higher numbered priority.

- **An integer.**

  If you supply an integer, it must match the priority level of another policy in the current policy bank.

- **END.**

  This keyword stops evaluation after processing the current policy, and no additional policies in this bank are processed.

- **Blank.**

  If the Goto expression is empty, it is the same as specifying END.

- **A numeric expression.**

  This is an advanced policy expression that resolves to a priority number for another policy in the current bank.

- **USE_INVOCATION_RESULT.**

  This phrase can be used only if you are invoking an external policy bank. Entering this phrase causes the Citrix ADC to perform one of the following actions:

  - If the final Goto in the invoked policy bank has a value of END or is empty, the invocation result is END, and evaluation stops.
  - If the final Goto expression in the invoked policy bank is anything other than END, the Citrix ADC performs a NEXT.

The following table illustrates a policy bank that uses Goto statements and policy bank invocations.

Polic Name	Priori	Goto	Invoc	Polic Bank to Be Invoke	—	——–	—-	—-	—-					
ClientCertificatePolicy (rule: does the request contain a client certificate?)	100	300	None	None										
Subn (rule: is the clien from a private subnet?)	200	NEXT	None	None	NOPO	300	USE INVOCATION RESULT	Requ virtual serve	My_R	NOPO	350	USE INVOCATION RESULT	Polic Label	My_Policy_Label
WorkingHoursPolicy (rule: is it working hours?)	400	END	None	None										

Table 3. Example of a Policy Bank That Uses Gotos and External Bank Invocations

How policy evaluation ends

Evaluation of a policy bank ends when the Citrix ADC appliance executes one of the following steps:

- If a policy evaluation is "TRUE," it invokes an external policy bank and its Goto statement value is "USE_INVOCATION_RESULT," and if another policy in the external policy bank also evaluates "TRUE" and Goto statement value is "END," then after returning from the external policy bank, no further policy will be evaluated.
- An external policy bank is invoked, its evaluation returns an END, and the Goto statement uses a value of USE_INVOCATION_RESULT or END. Evaluation continues with the next policy bank for this feature. For example, if the current bank is the request-time override bank, the Citrix ADC next evaluates request-time policy banks for the virtual servers.
- The Citrix ADC has walked through all the policy banks in this feature, but has not encountered an END.

If this is the last entry to be evaluated in this policy bank, the Citrix ADC proceeds to the next feature.

How features use actions after policy evaluation

After evaluating all relevant policies for a particular data point (for example, an HTTP request), the Citrix ADC stores all the actions that are associated with any policy that matched the data.

For most features, all the actions from matching policies are applied to a traffic packet as it leaves the Citrix ADC. The Integrated Caching feature only applies one action: CACHE or NOCACHE. This action is associated with the policy with the lowest priority value in the "highest priority" policy bank (for example, request-time override policies are applied before virtual server-specific policies).

Bind a policy globally

September 21, 2020

The following binding procedures are typical. However, refer to the documentation for the feature of interest to you for complete instructions.

Bind an integrated caching policy globally by using the CLI

At the command prompt, type the following commands to bind an Integrated Caching policy and verify the configuration:

```
-  bind cache global <policy> -priority <positiveInteger> [-type
   REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
```

```

-  show cache global
<!--NeedCopy-->
```

Example:

```
> bind cache global _nonPostReq -priority 100 -type req_default
     Done
> show cache global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 2

    2)      Global bindpoint: RES_DEFAULT
            Number of bound policies: 1
Done
<!--NeedCopy-->
```

The type argument is optional to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

Bind a rewrite policy globally by using the CLI

At the command prompt, type the following commands to bind a Rewrite policy and verify the configuration:

```
-  bind rewrite global <policyName> <priority> [-type REQ_OVERRIDE |
   REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]

-  show rewrite global
<!--NeedCopy-->
```

Example:

```
bind rewrite global pol_remove-pdf 100
Done
> show rewrite global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 1

    2)      Global bindpoint: REQ_OVERRIDE
            Number of bound policies: 1

Done
```

```
<!--NeedCopy-->
```

The type argument is optional for globally bound policies, to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

Bind a compression policy globally by using the CLI

At the command prompt, type the following commands to bind a compression policy and verify the configuration:

```
-  bind cmp global <policyName> -priority <positiveInteger> [-type
    REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]

-  show cmp global
<!--NeedCopy-->
```

Example:

```
> bind cmp global cmp_pol_1 -priority 100
Done
> show cmp policy cmp_pol_1
            Name: cmp_pol_1
            Rule: HTTP.REQ.URL.SUFFIX.EQ("BMP")
            Response Action: COMPRESS
            Hits: 0

            Policy is bound to following entities
            1) GLOBAL REQ_DEFAULT
            Priority: 100
            GotoPriorityExpression: END
Done
<!--NeedCopy-->
```

Bind a responder policy globally by using the CLI

At the command prompt, type the following commands to bind a Responder policy and verify the configuration:

```
-  bind responder global <policyName> <priority> [-type OVERRIDE |
    DEFAULT ]

-  show responder global
```

```
<!--NeedCopy-->
```

Example:

```
bind responder global pol404Error1 200
Done
> show responder global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 1

Done
<!--NeedCopy-->
```

Bind a DNS policy globally by using the CLI

At the command prompt, type the following commands to bind a DNS policy and verify the configuration:

```
-  bind dns global <policyName> <priority>

-  show dns global
<!--NeedCopy-->
```

Example:

```
> bind dns global pol_ddos_drop1 150
Done
> show dns global
    Policy name : pol_ddos_drop
            Priority : 100
            Goto expression : END
    Policy name : pol_ddos_drop1
            Priority : 150
Done
<!--NeedCopy-->
```

Bind an integrated caching, responder, rewrite, or compression policy globally by using the GUI

1. In the navigation pane, click the name of the feature for which you want to bind the policy.
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point to which you want to bind the policy (for example, for Integrated Caching, Rewrite, or Compression, you could select Request and

Default Global). The Responder does not differentiate between request-time and response-time policies.

4. Click Insert Policy and, from the Policy Name pop-up menu, select the policy name. A priority is assigned automatically to the policy, but you can click the cell in the Priority column and drag it anywhere within the dialog box if you want the policy to be evaluated after other policies in this bank. The priority is automatically reset. Note that priority values within a policy bank must be unique.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is bound successfully.

Bind a DNS policy globally by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the global bindings dialog box, click Insert Policy, and select the policy that you want to bind globally.
4. Click in the Priority field and enter the priority level.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Bind a policy to a virtual server

September 21, 2020

A globally bound policy applies to all load balancing and content switching virtual servers.

Note that when binding a policy to a virtual server, you must identify it as a request-time or a response-time policy.

Bind a policy to a load balancing or content switching virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to a load balancing or content switching virtual server and verify the configuration:

```
-  bind lb|cs vserver <virtualServerName> -policyName <policyName> -
    priority <positiveInteger> -type REQUEST|RESPONSE

-  show lb vserver <name>
<!--NeedCopy-->
```

Example:

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50
Done
> show lb vserver lbvip
            lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
            State: DOWN
            Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)
            Time since last state change: 28 days, 01:57:26.350
            Effective State: DOWN
            Client Idle Timeout: 180 sec
            Down state flush: ENABLED
            Disable Primary Vserver On Down : DISABLED
            Port Rewrite : DISABLED
            No. of Bound Services :  0 (Total)       0 (Active)
            Configured Method: LEASTCONNECTION
            Mode: IP
            Persistence: NONE
            Vserver IP and Port insertion: OFF
            Push: DISABLED  Push VServer:
            Push Multi Clients: NO
            Push Label Rule: none

    1)      Policy : ns_cmp_msapp Priority:50
    2)      Policy : cf-pol Priority:1      Inherited
Done
<!--NeedCopy-->
```

Bind a policy to an SSL offload virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to an SSL offload virtual server and verify the configuration:

```
bind ssl vserver <vServerName>@ -policyName <policyName> -priority <positiveInteger
>
```

Bind a policy to a virtual server by using the GUI

1. In the navigation pane, expand Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA- Application Traffic, or NetScaler Gateway, and then click Virtual Servers.
2. In the details pane, double-click the virtual server to which you want to bind the policy, and then click Open.

3. On the Policies tab, click the icon for the type of policy that you want to bind (the choices are feature-specific), and then click the name of the policy. Note that for some features, you can bind both classic policies and policies that use the default syntax to the virtual server.
4. If you are binding a policy to a Content Switching virtual server, in the Target field select a load balancing virtual server to which traffic that matches the policy is sent.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Display policy bindings

September 21, 2020

You can display policy bindings to verify that they are correct.

Display policy bindings by using the CLI

At the command prompt, type the following commands to display policy bindings and verify the configuration:

`show rewrite policy <name>`

Example:

```
> show rewrite policy pol_remove-pdf
        Name: pol_remove-pdf
        Rule: http.req.url.contains(".pdf")
        RewriteAction: act_remove-ae
        UndefAction: Use Global
        Hits: 0
        Undef Hits: 0
        Bound to: GLOBAL REQ_DEFAULT
        Priority: 100
        GotoPriorityExpression: END
 Done
>
<!--NeedCopy-->
```

Display global policy bindings for integrated caching, rewrite, or responder by using the GUI

1. In the navigation pane, expand the feature that contains the policy that you want to view, and then click Policies.

2. In the details pane, click the policy. Bound policies have a check mark next to them.
3. At the bottom of the page, under Details, next to Bound to, view the entity to which the policy is bound.

Display global policy bindings for DNS or clientless access in the NetScaler Gateway by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.

Display global policy bindings for content switching by using the GUI

1. Navigate to Traffic Management > Content Switching > Policies.
2. In detailed pane, select policy.
3. In the details pane, click Show Bindings.

Unbind a policy

September 21, 2020

If you want to re-assign a policy or delete it, you must first remove its binding.

Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI

At the command prompt, type the following commands to unbind an integrated caching, rewrite, or compression Advanced policy globally and verify the configuration:

```
-  unbind cache|rewrite|cmp global <policyName> [-type req_override|
    req_default|res_override|res_default] [-priority <positiveInteger>]

-  show cache|rewrite|cmp global
<!--NeedCopy-->
```

Example:

```
> unbind cache global_nonPostReq
Done
> show cache global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 1

    2)      Global bindpoint: RES_DEFAULT
            Number of bound policies: 1

Done
<!--NeedCopy-->
```

The priority is required only for the "dummy" policy named NOPOLICY.

Unbind a responder policy globally by using the CLI

At the command prompt, type the following commands to unbind a responder policy globally and verify the configuration:

```
-  unbind responder global <policyName> [-type override|default] [-
   priority <positiveInteger>]

-  show responder global
<!--NeedCopy-->
```

Example:

```
> unbind responder global pol404Error
Done
> show responder global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 1
Done
<!--NeedCopy-->
```

The priority is required only for the "dummy" policy named NOPOLICY.

Unbind a DNS policy globally by using the CLI

At the command prompt, type the following commands to unbind a DNS policy globally and verify the configuration:

```
-  unbind responder global <policyName>

-  unbind responder global
<!--NeedCopy-->
```

Example:

```
unbind dns global dfgdfg
Done
show dns global
    Policy name : dfgdfggfhg
            Priority : 100
            Goto expression : END
Done
<!--NeedCopy-->
```

Unbind an advanced policy from a virtual server by using the CLI

At the command prompt, type the following commands to unbind an Advanced policy from a virtual server and verify the configuration:

```
-  unbind cs vserver <name> -policyName <policyName> [-priority <
    positiveInteger>] [-type REQUEST|RESPONSE]

-  show lb vserver <name>
<!--NeedCopy-->
```

Example:

```
unbind cs vserver vs-cont-switch  -policyName pol1
Done
> show cs vserver vs-cont-switch
            vs-cont-switch (10.102.29.10:80) - HTTP Type: CONTENT
            State: UP
            Last state change was at Wed Aug 19 08:56:55 2009 (+18 ms)
            Time since last state change: 0 days, 02:47:55.750
            Client Idle Timeout: 180 sec
            Down state flush: ENABLED
            Disable Primary Vserver On Down : DISABLED
            Port Rewrite : DISABLED
            State Update: DISABLED
            Default:        Content Precedence: RULE
            Vserver IP and Port insertion: OFF
            Case Sensitivity: ON
            Push: DISABLED  Push VServer:
            Push Label Rule: none
Done
<!--NeedCopy-->
```

The priority is required only for the “dummy” policy named NOPOLICY.

Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI

1. In the navigation pane, click the feature with the policy that you want to unbind (for example, Integrated Caching).
2. In the details pane, click <Feature Name> policy manager.
3. In the **Policy Manager** dialog box, select the bind point with the policy that you want to unbind, for example, Advanced Global.
4. Click the policy name that you want to unbind, and then click Unbind Policy.
5. Click **Apply Changes**.
6. Click **Close**. A message in the status bar indicates that the policy is unbound successfully.

Unbind a DNS policy globally by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the Global Bindings dialog box, select policy and click unbind policy.
4. Click OK. A message in the status bar indicates that the policy is unbinded successfully.

Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI

1. Navigate to **Traffic Management,** and expand Load Balancing or Content Switching, and then click **Virtual Servers**.
2. In the details pane, double-click the virtual server from which you want to unbind the policy.
3. On the **Policies** tab, in the **Active** column, clear the check box next to the policy that you want to unbind.
4. Click **OK**. A message in the status bar indicates that the policy is unbinded successfully.

Create policy labels

September 21, 2020

In addition to the built-in bind points where you set up policy banks, you can also configure user-defined policy labels and associate policies with them.

Within a policy label, you bind policies and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. The NetScaler also permits you to define an arbitrary evaluation order as follows:

- You can use "goto" expressions to point to the next entry in the bank to be evaluated after the current one.
- You can use an entry in a policy bank to invoke another bank.

Each feature determines the type of policy that you can bind to a policy label, the type of load balancing virtual server that you can bind the label to, and the type of content switching virtual server from which the label can be invoked. For example, a TCP policy label can only be bound to a TCP load balancing virtual server. You cannot bind HTTP policies to a policy label of this type. And you can invoke a TCP policy label only from a TCP content switching virtual server.

After configuring a new policy label, you can invoke it from one or more banks for the built-in bind points.

Create a caching policy label by using the CLI

At the command prompt, type the following commands to create a Caching policy label and verify the configuration:

```
-  add cache policylabel <labelName> -evaluates req|res

-  show cache policylabel<labelName>
<!--NeedCopy-->
```

Example:

```
> add cache policylabel lbl-cache-pol -evaluates req
Done

> show cache policylabel lbl-cache-pol
            Label Name: lbl-cache-pol
            Evaluates: REQ
            Number of bound policies: 0
            Number of times invoked: 0
Done
<!--NeedCopy-->
```

Create a content switching policy label by using the CLI

At the command prompt, type the following commands to create a Content Switching policy label and verify the configuration:

```
-  add cs policylabel <labelName> http|tcp|rtsp|ssl

-  show cs policylabel <labelName>
```

```
<!--NeedCopy-->
```

Example:

```
> add cs policylabel lbl-cs-pol http
Done
> show cs policylabel lbl-cs-pol
            Label Name: lbl-cs-pol
            Label Type: HTTP
            Number of bound policies: 0
            Number of times invoked: 0
Done
<!--NeedCopy-->
```

Create a rewrite policy label by using the CLI

At the command prompt, type the following commands to create a Rewrite policy label and verify the configuration:

```
-  add rewrite policylabel <labelName> http_req|http_res|url|text|clientless_vpn_req|clientless_vpn_res

-  show rewrite policylabel <labelName>
<!--NeedCopy-->
```

Example:

```
> add rewrite policylabel lbl-rewrt-pol http_req
Done

> show rewrite policylabel lbl-rewrt-pol
            Label Name: lbl-rewrt-pol
            Transform Name: http_req
            Number of bound policies: 0
            Number of times invoked: 0
Done
<!--NeedCopy-->
```

Create a responder policy label by using the CLI

At the command prompt, type the following commands to create a Responder policy label and verify the configuration:

```
-  add responder policylabel <labelName>

-  show responder policylabel <labelName>
<!--NeedCopy-->
```

Example:

```
> add responder policylabel lbl-respndr-pol
Done

> show responder policylabel lbl-respndr-pol
            Label Name: lbl-respndr-pol
            Number of bound policies: 0
            Number of times invoked: 0
Done
<!--NeedCopy-->
```

Note: Invoke this policy label from a policy bank. For more information, see the "Binding a Policy to a Policy Label" section.

Create a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to create a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, Content Switching, or Responder.
2. In the details pane, click Add.
3. In the Name box, enter a unique name for this policy label.
4. Enter feature-specific information for the policy label. For example, for Integrated Caching, in the Evaluates drop-down menu, you would select REQ if you want this policy label to contain request-time policies, or select RES if you want this policy label to contain response-time policies. For Rewrite, you would select a Transform name.
5. Click Create.
6. Configure one of the built-in policy banks to invoke this policy label. For more information, see the "Binding a Policy to a Policy Label" section. A message in the status bar indicates that the policy label is created successfully.

Bind a policy to a policy label

As with policy banks that are bound to the built-in bind points, each entry in a policy label is a policy that is bound to the policy label. As with policies that are bound globally or to a vserver, each policy that is bound to the policy label can also invoke a policy bank or a policy label that is evaluated after the current entry has been processed. The following table summarizes the entries in a policy label.

- **Name**. The name of a policy, or, to invoke another policy bank without evaluating a policy, the "dummy" policy name NOPOLICY.

  You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.

- **Priority**. An integer. This setting can work with the Goto expression.
- **Goto Expression**. Determines the next policy to evaluate in this bank. You can provide one of the following values:

  - **NEXT**. Go to the policy with the next higher priority.
  - **END**. Stop evaluation.
  - **USE_INVOCATION_RESULT**. Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT.
  - **Positive number:** The priority number of the next policy to be evaluated.
  - **Numeric expression**. An expression that produces the priority number of the next policy to be evaluated.

  The Goto can only proceed forward in a policy bank.

  If you omit the Goto expression, it is the same as specifying END.

- **Invocation Type**. Designates a policy bank type. The value can be one of the following:

  - **Request Vserver**. Invokes request-time policies that are associated with a virtual server.
  - **Response Vserver**. Invokes response-time policies that are associated with a virtual server.
  - **Policy label**. Invokes another policy bank, as identified by the policy label for the bank.

- **Invocation Name**. The name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

Configure a policy label or virtual server policy bank

July 7, 2021

After you have created policies, and created policy banks by binding the policies, you can perform additional configuration of policies within a label or policy bank. For example, before you configure invocation of an external policy bank, you might want to wait until you have configured that policy bank.

This topic includes the following sections:

- Configure a policy label
- Configure a policy bank for a virtual server

Configure a policy label

A policy label consists of a set of policies and invocations of other policy labels and virtual server-specific policy banks. An Invoke parameter enables you to invoke a policy label or a virtual server-specific policy bank from any other policy bank. A special-purpose NoPolicy entry enables you to invoke an external bank without processing an expression (a rule). The NoPolicy entry is a "dummy" policy that does not contain a rule.

For configuring policy labels from the NetScaler command line, note the following elaborations of the command syntax:

- gotoPriorityExpression is configured as described in Table 2. Format of Each Entry in a Policy Bank of the section "Entries in a Policy Bank" in Bind policies using advanced policy.
- The type argument is required. This is unlike binding a conventional policy, where this argument is optional.
- You can invoke the bank of policies that are bound to a virtual server by using the same method as you use for invoking a policy label.

Configure a policy label by using the CLI

At the command prompt, type the following commands to configure a policy label and verify the configuration:

```
-  bind cache|rewrite|responder policylabel <policylabelName> -policyName <policyName> -priority <priority> [-gotoPriorityExpression <gotopriorityExpression>] [-invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>]

-  show cache|rewrite|responder policylabel <policylabelName>
<!--NeedCopy-->
```

Example:

```
bind cache policylabel _reqBuiltinDefaults -policyName  _nonGetReq -priority 100
Done
show cache policylabel _reqBuiltinDefaults
            Label Name: _reqBuiltinDefaults
            Evaluates: REQ
            Number of bound policies: 3
            Number of times invoked: 0
    1)      Policy Name: _nonGetReq
            Priority: 100
            GotoPriorityExpression: END
    2)      Policy Name: _advancedConditionalReq
            Priority: 200
            GotoPriorityExpression: END

    3)      Policy Name: _personalizedReq
            Priority: 300
            GotoPriorityExpression: END
Done
<!--NeedCopy-->
```

Invoke a policy label from a rewrite policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Rewrite policy bank with a NOPOLICY entry and verify the configuration:

```
-  bind rewrite global <policyName> <priority> <gotoPriorityExpression> -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>

-  show rewrite global
<!--NeedCopy-->
```

Example:

```
> bind rewrite global NOPOLICY 100 -type REQ_DEFAULT -invoke policylabel lbl-rewrt-pol
Done
> show rewrite global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 1

    2)      Global bindpoint: REQ_OVERRIDE
            Number of bound policies: 1
Done
<!--NeedCopy-->
```

Invoke a policy label from an Integrated Caching policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from an Integrated Caching policy bank and verify the configuration:

```
-  bind cache global NOPOLICY -priority <priority> -gotoPriorityExpression <gotopriorityExpression> -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>

-  show cache global
<!--NeedCopy-->
```

Example:

```
bind cache global NOPOLICY -priority 100 -gotoPriorityExpression END -type REQ_DEFAULT -invoke policylabel lbl-cache-pol
Done
> show cache global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 2

    2)      Global bindpoint: RES_DEFAULT
            Number of bound policies: 1

Done
<!--NeedCopy-->
```

Invoke a policy label from a Responder policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Responder policy bank and verify the configuration:

```
-  bind responder global NOPOLICY <priority> <gotopriorityExpression> -type OVERRIDE|DEFAULT -invoke vserver|policylabel <policyLabelName>|<vserverName>

-  show responder global
<!--NeedCopy-->
```

Example:

```
> bind responder global NOPOLICY 100 NEXT -type DEFAULT -invoke policylabel lbl-respndr-pol
Done
```

```
> show responder global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 2

Done
<!--NeedCopy-->
```

Configure a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to configure a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, or Responder.
2. In the details pane, double-click the label that you want to configure.
3. If you are adding a new policy to this policy label, click Insert Policy, and in the Policy Name field, select New Policy. For more information about adding a policy, see Create or modify a policy. Note that if you are invoking a policy bank, and do not want a rule to be evaluated prior to the invocation, click Insert Policy, and in the Policy Name field select NOPOLICY.
4. For each entry in this policy label, configure the following:
   - **Policy Name:**

     This is already determined by the Policy Name, new policy, or NOPOLICY entry that you inserted in this bank.
   - **Priority:**

     A numeric value that determines either an absolute order of evaluation within the bank, or is used in conjunction with a Goto expression.
   - **Expression:**

     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see
     Configure advanced policy expressions: Get started.
   - **Action:**

     The action to be taken if this policy evaluates to TRUE.
   - **Goto Expression:**

     Optional. Used to augment the Priority level to determine the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see Table 2. Format of Each Entry in a Policy Bank of the section "Entries in a Policy Bank" in
     Bind policies using advanced policy.

- **Invoke:**

  Optional. Invokes another policy bank.

5. Click **OK**. A message in the status bar indicates that the policy label is configured successfully.

Configure a policy bank for a virtual server

You can configure a bank of policies for a virtual server. The policy bank can contain individual policies, and each entry in the policy bank can optionally invoke a policy label or a bank of policies that you configured for another virtual server. If you invoke a policy label or policy bank, you can do so without triggering an expression (a rule) by selecting a NOPOLICY "dummy" entry instead of a policy name.

Add policies to a virtual server policy bank by using the CLI

At the command prompt, type the following commands to add policies to a virtual server policy bank and verify the configuration:

```
-  bind lb|cs vserver <virtualServerName> <serviceType> [-policyName <
   policyName>] [-priority <positiveInteger>] [-gotoPriorityExpression
   <expression>] [-type REQUEST|RESPONSE]

-  show lb|cs vserver <virtualServerName>
<!--NeedCopy-->
```

Example:

```
add lb vserver vs-cont-sw TCP
Done
show lb vserver vs-cont-sw
            vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS
            State: DOWN
            Last state change was at Wed Aug 19 10:04:02 2009 (+279 ms)
            Time since last state change: 0 days, 00:02:14.420
            Effective State: DOWN
            Client Idle Timeout: 9000 sec
            Down state flush: ENABLED
            Disable Primary Vserver On Down : DISABLED
            No. of Bound Services :  0 (Total)       0 (Active)
            Configured Method: LEASTCONNECTION
            Mode: IP
            Persistence: NONE
            Connection Failover: DISABLED
Done
```

```
<!--NeedCopy-->
```

Invoke a policy label from a virtual server policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a virtual server policy bank with a NOPOLICY entry and verify the configuration:

```
-  bind lb|cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|
   NOPOLICY-CACHE|NOPOLICY-RESPONDER -priority <integer> -type REQUEST|
   RESPONSE -gotoPriorityExpression <gotopriorityExpression> -invoke
   reqVserver|resVserver|policyLabel <vserverName>|<labelName>

-  show lb vserver
<!--NeedCopy-->
```

Example:

```
> bind lb vserver vs-cont-sw -policyname NOPOLICY-REWRITE -priority 200
    -type REQUEST -gotoPriorityExpression NEXT -invoke policyLabel lbl-
   rewrt-pol
Done
<!--NeedCopy-->
```

Configure a virtual server policy bank by using the GUI

1. In the left navigation pane, expand ** **Traffic Management** > **Load Balancing, Traffic Management** > **Content Switching, Traffic Management** > **SSL Offload, Security** > **AAA - Application Traffic**, or **NetScaler Gateway**, as appropriate, and then click **Virtual Servers.**
2. In the details pane, select the virtual server that you want to configure, and then click **Open**.
3. In the **Configure Virtual Server** dialog box click the **Policies** tab.
4. To create a new policy in this bank, click the icon for the type of policy or policy label that you want to add to the virtual server's bank of policies, click **Insert Policy**. Note that if you want to invoke a policy label without evaluating a policy rule, select the NOPOLICY "dummy" policy.
5. To configure an existing entry in this policy bank, enter the following:
   - **Priority:**
     A numeric value that determines either an absolute order of evaluation within the bank or is used in conjunction with a Goto expression.
   - **Expression:**
     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see
     Configuring Advanced Policy Expressions: Getting Started.

- **Action:**
  The action to be taken if this policy evaluates to TRUE.
- **Goto Expression:**
  Optional. Determines the next policy or policy bank evaluate. For more information on possible values for a Goto expression, see the section "Entries in a Policy Bank" in Bind policies using advanced policy.
- **Invoke:**
  Optional. To invoke another policy bank, select the name of the policy label or virtual server policy bank that you want to invoke.

6. Click **OK**. A message in the status bar indicates that the policy is configured successfully.

Invoke or remove a policy label or virtual server policy bank

September 21, 2020

Unlike a policy, which can only be bound once, you can use a policy label or a virtual server's policy bank any number of times by invoking it. Invocation can be performed from two places:

- From the binding for a named policy in a policy bank.
- From the binding for a NOPOLICY "dummy" entry in a policy bank.

Typically, the policy label must be of the same type as the policy from which it is invoked. For example, you would invoke a responder policy label from a responder policy.

Note: When binding or unbinding a global NOPOLICY entry in a policy bank at the command line, you specify a priority to distinguish one NOPOLICY entry from another.

Invoke a rewrite or integrated caching policy label by using the CLI

At the command prompt, type the one of the following commands to invoke a rewrite or integrated caching policy label and verify the configuration:

```
-  bind cache global <policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel <label_name>

-  bind rewrite global<policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel <label_name>

-  show cache global|show rewrite global
<!--NeedCopy-->
```

Example:

```
> bind cache global _nonPostReq2 -priority 100 -type req_override -invoke
    policylabel lbl-cache-pol
Done
> show cache global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 2

    2)      Global bindpoint: RES_DEFAULT
            Number of bound policies: 1

    3)      Global bindpoint: REQ_OVERRIDE
            Number of bound policies: 1

Done
<!--NeedCopy-->
```

Invoke a responder policy label by using the CLI

At the command prompt, type the following commands to invoke a responder policy label and verify the configuration:

```
-  bind responder global <policy_Name> <priority_as_positive_integer> [<gotoPriorityExpression>] -type REQ_OVERRIDE|REQ_DEFAULT|OVERRIDE|DEFAULT -invoke vserver|policylabel <label_name>

-  show responder global
<!--NeedCopy-->
```

Example:

```
> bind responder global pol404Error1 300 -invoke policylabel lbl-respndr-pol
Done
> show responder global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 2

Done
```

```
<!--NeedCopy-->
```

Invoke a virtual server policy bank by using the CLI

At the command prompt, type the following commands to invoke a Virtual Server Policy Bank and verify the configuration:

```
-  bind lb vserver <vserver_name> -policyName <policy_Name> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQUEST|RESPONSE -invoke reqvserver|resvserver|policylabel <policy_Label_Name>

-  bind lb vserver <vserver_name>
<!--NeedCopy-->
```

Example:

```
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 100
Done

> show lb vserver lbvip
            lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
            State: DOWN
            Last state change was at Wed Jul 15 05:54:24 2009 (+166 ms)
            Time since last state change: 28 days, 06:37:49.250
            Effective State: DOWN
            Client Idle Timeout: 180 sec
            Down state flush: ENABLED
            Disable Primary Vserver On Down : DISABLED
            Port Rewrite : DISABLED
            No. of Bound Services :  0 (Total)       0 (Active)
            Configured Method: LEASTCONNECTION
            Mode: IP
            Persistence: NONE
            Vserver IP and Port insertion: OFF
            Push: DISABLED  Push VServer:
            Push Multi Clients: NO
            Push Label Rule: none

    1)      CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority: 100   Hits: 0

    2)      Policy : pol-ssl Priority:0
    3)      Policy : ns_cmp_msapp Priority:100
    4)      Policy : cf-pol Priority:1      Inherited
Done
<!--NeedCopy-->
```

Remove a rewrite or integrated caching policy label by using the CLI

At the command prompt, type one of the following commands to remove a rewrite or integrated caching policy label and verify the configuration:

```
-  unbind rewrite global <policyName> -priority <positiveInteger> -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT

-  unbind cache global <policyName> -priority <positiveInteger> -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT

-  show rewrite global|show cache global
<!--NeedCopy-->
```

Example:

```
> unbind rewrite global NOPOLICY -priority 100 -type REQ_OVERRIDE
> show rewrite global
Done
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 1

Done
<!--NeedCopy-->
```

Remove a responder policy label by using the CLI

At the command prompt, type the following commands to remove a responder policy label and verify the configuration:

```
-  unbind responder global <policyName> -priority <positiveInteger> -type OVERRIDE|DEFAULT

-  show responder global
<!--NeedCopy-->
```

Example:

```
> unbind responder global NOPOLICY -priority 100 -type REQ_DEFAULT
```

```
Done
> show responder global
    1)      Global bindpoint: REQ_DEFAULT
            Number of bound policies: 1

Done
<!--NeedCopy-->
```

Remove a virtual server policy label by using the CLI

At the command prompt, type one of the following commands to remove a Virtual Server policy label and verify the configuration:

```
-  unbind lb vserver <virtualServerName> -policyName NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <positiveInteger>

-  unbind cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <positiveInteger>

-  show lb vserver|show cs vserver
<!--NeedCopy-->
```

Example:

```
> unbind lb vserver lbvip -policyName ns_cmp_msapp -priority 200
Done
> show lb vserver lbvip
            lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
            State: DOWN
            Last state change was at Wed Jul 15 05:54:24 2009 (+161 ms)
            Time since last state change: 28 days, 06:47:54.600
            Effective State: DOWN
            Client Idle Timeout: 180 sec
            Down state flush: ENABLED
            Disable Primary Vserver On Down : DISABLED
            Port Rewrite : DISABLED
            No. of Bound Services :  0 (Total)        0 (Active)
            Configured Method: LEASTCONNECTION
            Mode: IP
            Persistence: NONE
            Vserver IP and Port insertion: OFF
            Push: DISABLED  Push VServer:
```

```
            Push Multi Clients: NO
            Push Label Rule: none

    1)      CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority: 100   Hits: 0

    1)      Policy : pol-ssl Priority:0
    2)      Policy : cf-pol Priority:1      Inherited
Done
<!--NeedCopy-->
```

Invoke a policy label or virtual server policy bank by using the GUI

1. Bind a policy, as described in Bind a policy globally, Bind a policy to a virtual server, or Bind a policy to a policy label. Alternatively, you can enter a NOPOLICY "dummy" entry instead of a policy name. You do this if you do not want to evaluate a policy before evaluating the policy bank.
2. In the Invoke field, select the name of the policy label or virtual server policy bank that you want to evaluate if traffic matches the bound policy. A message in the status bar indicates that the policy label or virtual server policy bank is invoked successfully.

Remove a policy label invocation by using the GUI

1. Open the policy and clear the Invoke field. Unbinding the policy also removes the invocation of the label. A message in the status bar indicates that the policy label is removed successfully.

Configure and bind policies with the policy manager

September 21, 2020

> **Warning:**
>
> Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies.

Some applications provide a specialized Policy Manager in the NetScaler GUI to simplify configuring policy banks. It also lets you find and delete policies and actions that are not being used.

The Policy Manager is currently available for the Rewrite, Integrated Caching, Responder, and Compression features.

The following are keyboard equivalents for the procedures in this section:

- For editing a cell in the Policy Manager, you can tab to the cell and click F2 or press the SPACE bar on the keyboard.
- To select an entry in a drop-down menu, you can tab to the entry, press the space bar to view the drop-down menu, use the UP and DOWN ARROW keys to navigate to the entry that you want, and press the space bar again to select the entry.
- To cancel a selection in a drop-down menu, press the Escape key.
- To insert a policy, tab to the row above the insertion point and press Control + Insert, or click Insert Policy.
- To remove a policy, tab to the row that contains the policy and press Delete.

Note: Note that when you delete the policy, the NetScaler searches the Goto Expression values of other policies in the bank. If any of these Goto Expression values match the priority level of the deleted policy, they are removed.

Configure policy bindings by using the policy manager

1. In the navigation pane, click the feature for which you want to configure policies. The choices are Responder, Integrated Caching, Rewrite or Compression.

2. In the details pane, click Policy Manager.

3. If you are configuring classic policy bindings for compression, in the Compression Policy Manager dialog box, click **Switch to Classic Syntax**. The dialog box switches to the classic syntax view and displays the Switch to Advanced Policy button. At any time before you complete configuring policy bindings, if you want to configure bindings for policies that use the Advanced Policy click the Switch to Advanced Policy button.

4. For features other than Responder, to specify the bind point, click Request or Response, and then click one of the request-time or response-time bind points. The options are Override Global, LB Virtual Server, CS Virtual Server, Default Global, or Policy Label. If you are configuring the Responder, the Request and Response flow types are not available.

5. To bind a policy to this bind point, click Insert Policy, and select a previously configured policy, a NOPOLICY label, or the New policy option. Depending on the option that you select, you have the following choices:

   - **New policy:** Create the policy as described in "Create or modify a policy," and then configure the priority level, GoTo expression, and policy invocation as described in the table, "Format of each entry in a policy bank."
   - **Existing policy**, **NOPOLICY**, or **NOPOLICY<feature name>**: Configure the priority level, GoTo expression, and policy invocation as described in the table, "Format of each entry in

a policy bank.” The **NOPOLICY** or **NOPOLICY<feature name>** options are available only for policies that use Advanced Policies.

6. Repeat the preceding steps to add entries to this policy bank.
7. To modify the priority level for an entry, you can do any of the following:
   - Double-click the Priority field for an entry and edit the value.
   - Click and drag a policy to another row in the table.
   - Click Regenerate Priorities.

   In all three cases, priority levels of all other policies are modified as needed to accommodate the new value. Goto Expressions with integer values are also updated automatically. For example, if you change a priority value of 10 to 100, all policies with a Goto Expression value of 10 are updated to the value 100.
8. To change the policy, action, or policy bank invocation for an row in the table, click the down arrow to the right of the entry and do one of the following:
   - To change the policy, select another policy name or select New Policy and follow the steps in Create or modify a policy.
   - To change the Goto Expression, select Next, End, USE_INVOCATION_RESULT, or select more and enter an expression whose result returns the priority level of another entry in this policy bank.
   - To modify an invocation, select an existing policy bank, or click New Policy Label and follow the steps in Bind a policy to a policy label.
9. To unbind a policy or a policy label invocation from this bank, click any field in the row that contains the policy or policy label, and then click Unbind Policy.
10. When you are done, click Apply Changes. A message in the status bar indicates that the policy is bound successfully.

Remove unused policies by using the policy manager

1. In the navigation pane, click the feature for which you want to configure the policy bank. The choices are Responder, Integrated Caching, or Rewrite.
2. In the details pane, click <Feature Name> policy manager.
3. In the <**Feature Name**> **Policy Manage**r dialog box, click **Cleanup Configuration**.
4. In the **Cleanup Configuration** dialog box, select the items that you want to delete, and then click **Remove**.
5. In the Remove dialog box, click **Yes**.
6. Click **Close**. A message in the status bar indicates that the policy is removed successfully.

Configuring advanced policy expression: getting started

September 21, 2020

Advanced policies evaluate data on the basis of information that you supply in Advanced policy expressions. An Advanced policy expression analyzes data elements (for example, HTTP headers, source IP addresses, the NetScaler system time, and POST body data). In addition to configuring an Advanced policy expression in a policy, in some NetScaler features, you configure Advanced policy expression outside of the context of a policy.

To create an Advanced policy expression, you select a prefix that identifies a piece of data that you want to analyze, and then you specify an operation to perform on the data. For example, an operation can match a piece of data with a text string that you specify, or it can transform a text string into an HTTP header. Other operations match a returned string with a set of strings or a string pattern. You configure compound expressions by specifying Boolean and arithmetic operators, and by using parentheses to control the order of evaluation.

Advanced policy expression can also contain classic expressions. You can assign a name to a frequently used expression to avoid having to build the expression repeatedly.

Policies and a few other entities include rules that the NetScaler uses to evaluate a packet in the traffic flowing through it, to extract data from the NetScaler system itself, to send a request (a “callout”) to an external application, or to analyze another piece of data. A rule takes the form of a logical expression that is compared against traffic and ultimately returns values of TRUE or FALSE.

The elements of the rule can themselves return TRUE or FALSE, string, or numeric values.

Before configuring an Advanced policy expression, you need to understand the characteristics of the data that the policy or other entity is to evaluate. For example, when working with the Integrated Caching feature, a policy determines what data can be stored in the cache. With Integrated Caching, you need to know the URLs, headers, and other data in the HTTP requests and responses that the NetScaler receives. With this knowledge, you can configure policies that match the actual data and enable the NetScaler to manage caching for HTTP traffic. This information helps you determine the type of expression that you need to configure in the policy.

Basic elements of an advanced policy expression

September 21, 2020

An Advanced policy expression consists of, at a minimum, a prefix (or a single element used in place of a prefix). Most expressions also specify an operation to be performed on the data that the prefix identifies. You format an expression of up to 1,499 characters as follows:

`<prefix>.<operation> [<compound-operator> <prefix>.<operation>. . .]`

where

- <prefix>

  is an anchor point for starting an expression.

  The prefix is a period-delimited key that identifies a unit of data. For example, the following prefix examines HTTP requests for the presence of a header named Content-Type:

  http.req.header("Content-Type")

  Prefixes can also be used on their own to return the value of the object that the prefix identifies.

- <operation>

  identifies an evaluation that is to be performed on the data identified by the prefix.

  For example, consider the following expression:

  http.req.header("Content-Type").eq("text/html")

  In this expression, the following is the operator component:

  eq("text/html")

  This operator causes the NetScaler to evaluate any HTTP requests that contain a Content-Type header, and in particular, to determine if the value of this header is equal to the string "text/html." For more information, see Operations.

- <compound-operator>

  is a Boolean or arithmetic operator that forms a compound expression from multiple prefix or prefix.operation elements.

  For example, consider the following expression:

  http.req.header("Content-Type").eq("text/html") && http.req.url.contains(".html")

Prefixes

An expression prefix represents a discrete piece of data. For example, an expression prefix can represent an HTTP URL, an HTTP Cookie header, or a string in the body of an HTTP POST request. An expression prefix can identify and return a wide variety of data types, including the following:

- A client IP address in a TCP/IP packet
- NetScaler system time
- An external callout over HTTP
- A TCP or UDP record type

In most cases, an expression prefix begins with one of the following keywords:

- CLIENT:
    - Identifies a characteristic of the client that is either sending a request or receiving a response, as in the following examples:
    - The prefix client.ip.dst designates the destination IP address in the request or response.
    - The prefix client.ip.src designates the source IP address.
- HTTP:
    - Identifies an element in an HTTP request or a response, as in the following examples:
    - The prefix http.req.body(integer) designates the body of the HTTP request as a multiline text object, up to the character position designated in integer.
    - The prefix http.req.header("header_name") designates an HTTP header, as specified in header_name.
    - The prefix http.req.url designates an HTTP URL in URL-encoded format.
- SERVER:

  Identifies an element in the server that is either processing a request or sending a response.
- SYS:

  Identifies a characteristic of the NetScaler that is processing the traffic.

  Note: Note that DNS policies support only SYS, CLIENT, and SERVER objects.

  In addition, in the NetScaler Gateway, the Clientless VPN function can use the following types of prefixes:
- TEXT:

  Identifies any text element in a request or a response.
- TARGET:

  Identifies the target of a connection.
- URL:

  Identifies an element in the URL portion of an HTTP request or response.

As a general rule of thumb, any expression prefix can be a self-contained expression. For example, the following prefix is a complete expression that returns the contents of the HTTP header specified in the string argument (enclosed in quotation marks):

```
http.res.header.("myheader")
```

Or you can combine prefixes with simple operations to determine TRUE and FALSE values. For example, the following returns a value of TRUE or FALSE:

```
http.res.header.("myheader").exists
```

You can also use complex operations on individual prefixes and multiple prefixes within an expression, as in the following example:

```
http.req.url.length + http.req.cookie.length <= 500
```

Which expression prefixes you can specify depends on the NetScaler feature. The following table describes the expression prefixes that are of interest on a per-feature basis

Feature	Types of Expression Prefix Used in the Feature
DNS	SYS, CLIENT, SERVER
Responder in Protection Features	HTTP, SYS, CLIENT
Content Switching	HTTP, SYS, CLIENT
Rewrite	HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN
Integrated Caching	HTTP, SYS, CLIENT, SERVER
NetScaler Gateway, Clientless Access	HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN

Table 1. Permitted Types of Expression Prefixes in Various NetScaler Features

Note: For details on the permitted expression prefixes in a feature, see the documentation for that feature.

Single-element expressions

The simplest type of Advanced policy expression contains a single element. This element can be one of the following:

- true. An Advanced policy expression can consist simply of the value true. This type of expression always returns a value of TRUE. It is useful for chaining policy actions and triggering Goto expressions.
- false. An Advanced policy expression can consist simply of the value false. This type of expression always returns a value of FALSE.
- A prefix for a compound expression. For example, the prefix HTTP.REQ.HOSTNAME is a complete expression that returns a host name and HTTP.REQ.URL is a complete expression that returns a URL. The prefix could also be used in conjunction with operations and additional prefixes to form a compound expression.

Operations

In most expressions, you also specify an operation on the data that the prefix identifies. For example, suppose that you specify the following prefix:

```
http.req.url
```

This prefix extracts URLs in HTTP requests. This expression prefix does not require any operators to be used in an expression. However, when you configure an expression that processes HTTP request URLs, you can specify operations that analyze particular characteristics of the URL. Following are a few possibilities:

- Search for a particular host name in the URL.
- Search for a particular path in the URL.
- Evaluate the length of the URL.
- Search for a string in the URL that indicates a time stamp and convert it to GMT.

The following is an example of a prefix that identifies an HTTP header named Server and an operation that searches for the string IIS in the header value:

```
http.res.header("Server").contains("IIS")
```

Following is an example of a prefix that identifies host names and an operation that searches for the string "www.mycompany.com" as the value of the name:

```
http.req.hostname.eq("www.mycompany.com")
```

Basic operations on expression prefixes

The following table describes a few of the basic operations that can be performed on expression prefixes.

Operation	Determines Whether or Not
CONTAINS(<string>)	The object matches <string>. Following is an example: http.req.header("Cache-Control").contains("no-cache")
EXISTS	A particular item is present in an object. Following is an example: http.res.header("MyHdr").exists
EQ(<text>)	A particular non-numeric value is present in an object. Following is an example: http.req.method.eq(post)

Operation	Determines Whether or Not
EQ(<integer>)	A particular numeric value is present in an object. Following is an example: client.ip.dst.eq(10.100.10.100)
LT(<integer>)	An object's value is less than a particular value. Following is an example: http.req.content_length.lt(5000)
GT(<integer>)	An object's value is greater than a particular value. Following is an example: http.req.content_length.gt(5)

The following table summarizes a few of the available types of operations.

Operation Type	Description
Text operations	Match individual strings and sets of strings with any portion of a target. The target can be an entire string, the start of a string, or any portion of text in between the start and the end of the string. For example, you can extract the string "XYZ" from "XYZSomeText". Or, you can compare an HTTP header value with an array of different strings. You can also transform text into another type of data. Following are examples: Transform a string into an integer value, create a list from the query strings in a URL, and transform a string into a time value.
Numeric operations	Numeric operations include applying arithmetic operators, evaluating content length, the number of items in a list, dates, times, and IP addresses.

Compound advanced policy expressions

July 22, 2021

You can configure an Advanced policy expression that contains Boolean or arithmetic operators and multiple atomic operations. The following compound expression contains a boolean AND:

```
http.req.hostname.eq("mycompany.com")&& http.req.method.eq(post)
```

The following expression adds the value of two targets, and compares the result to a third value:

```
http.req.url.length + http.req.cookie.length \<= 500
```

A compound expression can contain any number of logical and arithmetic operators. The following expression evaluates the length of an HTTP request on the basis of its URL and cookie, evaluates text in the header, and performs a Boolean AND on these two results:

```
http.req.url.length + http.req.cookie.length \<= 500 && http.req.header.
contains("some text")
```

You can use parentheses to control the order of evaluation in a compound expression.

Booleans in compound expressions

You configure compound expressions with the following operators:

- &&.

  This operator is a logical AND. For the expression to evaluate to TRUE, all components that are joined by the And must evaluate to TRUE. Following is an example:

  http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists

.

- This operator is a logical OR. If any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE.
- !.

  Performs a logical NOT on the expression.

In some cases, the NetScaler GUI offers AND, NOT, and OR operators in the Add Expression dialog box. However, these are of limited use. Citrix recommends that you use the operators &&, , and ! to configure compound expressions that use Boolean logic.

Parentheses in compound expressions

You can use parentheses to control the order of evaluation of an expression. The following is an example:

```
http.req.url.contains("myCompany.com")|| (http.req.url.hostname.eq("myHost"
)&& http.req.header("myHeader").exists)
```

The following is another example:

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").
eq("text/html"))|| (http.req.header("Transfer-Encoding").exists || http.req
.header("Content-Length").exists)
```

Compound operations for strings

The following table describes operators that you can use to configure compound operations on string data.

Operations that produce a string value	Description
str + str	Concatenates the value of the expression on the left of the operator with the value on the right. Following is an example:http.req.hostname + http.req.url.protocol
str + num	Concatenates the value of the expression on the left of the operator with a numeric value on the right. Following is an example:http.req.hostname + http.req.url.content_length
num + str	Concatenates the numeric value of the expression on the left side of the operator with a string value on the right. Following is an example:http.req.url.content_length + http.req.url.hostname
str + ip	Concatenates the string value of the expression on the left side of the operator with an IP address value on the right. Following is an example:http.req.hostname + 10.00.000.00

Operations that produce a string value	Description
ip + str	Concatenates the IP address value of the expression on the left of the operator with a string value on the right.Following is an example:client.ip.dst + http.req.url.hostname
str1 ALT str2	.Uses string2 if the evaluation of string1 results in an undef exception or the result is a null string; otherwise uses string1 and never evaluates string2 Following is an example:http.req.hostname alt client.ip.src

Operations on strings that produce a result of TRUE or FALSE	Description
str == str	Evaluates whether the strings on either side of the operator are the same. Following is an example: http.req.header("myheader") == http.res.header("myheader")
str <= str	Evaluates whether the string on the left side of the operator is the same as the string on the right, or precedes it alphabetically.
str >= str	Evaluates whether the string on the left side of the operator is the same as the string on the right, or follows it alphabetically.
str < str	Evaluates whether the string on the left side of the operator precedes the string on the right alphabetically.
str > str	Evaluates whether the string on the left side of the operator follows the string on the right alphabetically.
str !!= str	Evaluates whether the strings on either side of the operator are different.

Logical operations on strings	Description	
bool && bool	This operator is a logical AND. When evaluating the components of the compound expression, all components that are joined by the AND must evaluate to TRUE. Following is an example:http.req.method.eq && http.req.url.query.conta && my_pagelabel”)	
bool || bool	This operator is a logical OR. When evaluating the components of the compound expression, if any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE. Following is an example:http.req.url.contains(“.js”)	http.res.header.(“Content-Type”).contains(“javascript”)
bool	Performs a logical NOT on the expression.	

Compound operations for numbers

You can configure compound numeric expressions. For example, the following expression returns a numeric value that is the sum of an HTTP header length and a URL length:

`http.req.header.length + http.req.url.length`

The following tables describes operators that you can use to configure compound expressions for numeric data.

Arithmetic operations on numbers	Description
num + num	Add the value of the expression on the left of the operator to the value of the expression on the right. Following is an example:http.req.content_le + http.req.url.length
num – num	Subtract the value of the expression on the right of the operator from the value of the expression on the left.
num x num	Multiply the value of the expression on the left of the operator with the value of the expression on the right. Following is an example:client.interface.rxth * 9
num / num	Divide the value of the expression on the left of the operator by the value of the expression on the right.

Arithmetic operations on numbers	Description
num % num	Calculate the modulo, or the numeric remainder on a division of the value of the expression on the left of the operator by the value of the expression on the right. For example, the values “15 mod 4” equals 3, and “12 mod 4” equals 0.
~number	Returns a number after applying a bitwise logical negation of the number. The following example assumes that numeric.expression returns 12 (binary 1100):~numeric.expression. The result of applying the ~ operator is -11 (a binary 1110011, 32 bits total with all ones to the left). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

Arithmetic operations on numbers	Description
number ^ number	Compares two bit patterns of equal length and performs an XOR operation on each pair of corresponding bits in each number argument, returning 1 if the bits are different, and 0 if they are the same. Returns a number after applying a bitwise XOR to the integer argument and the current number value. If the values in the bitwise comparison are the same, the returned value is a 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010):numeric.expression1 ^ numeric.expression2The result of applying the ^ operator to the entire expression is 6 (binary 0110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

Arithmetic operations on numbers	Description		
number | number	Returns a number after applying a bitwise OR to the number values. If either value in the bitwise comparison is a 1, the returned value is a 1. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010):numeric.expression1	numeric.expression2The result of applying the	operator to the entire expression is 14 (binary 1110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

Arithmetic operations on numbers	Description
number & number	Compares two bit patterns of equal length and performs a bitwise AND operation on each pair of corresponding bits, returning 1 if both of the bits contains a value of 1, and 0 if either bits are 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010):numeric.expression1 & numeric.expression2. The whole expression evaluates to 8 (binary 1000). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

Arithmetic operations on numbers	Description
num « num	Returns a number after a bitwise left shift of the number value by the right-side number argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3: numeric.expression1 « numeric.expression2 The result of applying the LSHIFT operator is 96 (a binary 1100000).Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

Arithmetic operations on numbers	Description
num » num	Returns a number after a bitwise right shift of the number value by the integer argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3:numeric.expression1 » numeric.expression2 The result of applying the RSHIFT operator is 1 (a binary 0001). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

Numeric operators that produce a result of TRUE or FALSE	Description
num == num	Determine if the value of the expression on the left of the operator is equal to the value of the expression on the right.

Numeric operators that produce a result of TRUE or FALSE	Description
num != num	Determine if the value of the expression on the left of the operator is not equal to the value of the expression on the right.
num > num	Determine if the value of the expression on the left of the operator is greater than the value of the expression on the right.
num < num	Determine if the value of the expression on the left of the operator is less than the value of the expression on the right.
num >= num	Determine if the value of the expression on the left of the operator is greater than or equal to the value of the expression on the right.
num <= num	Determine if the value of the expression on the left of the operator is less than or equal to the value of the expression on the right

Functions for data types in the policy infrastructure

The NetScaler policy infrastructure supports the following numeric data types:

- Integer (32 bits)
- Unsigned long (64 bits)
- Double (64 bits)

Simple expressions can return all of these data types. Therefore, you can create compound expressions that use arithmetic operators and logical operators to evaluate or return values of these data types. Additionally, you can use all of these values in policy expressions. Literal constants of type unsigned long can be specified by appending the string ul to the number. Literal constants of type double contain a period (.), an exponent, or both.

Arithmetic Operators, Logical Operators, and Type Promotion

In compound expressions, the following standard arithmetic and logical operators can be used for the double and unsigned long data types:

- +, -, *, and /

%, ~, ^, &,	, <<, and >> (do not apply to double)

-
- ==, !=, >, <, >=, and <=

All of these operators have the same meaning as in the C programming language.

In all cases of mixed operations between operands of type integer, unsigned long, and double, type promotion is performed so that the operation can be performed on operands of the same type. A type of lower precedence is automatically promoted to the type of the operand with the highest precedence involved in the operation. The order of precedence (higher to lower) is as follows:

- Double
- Unsigned long
- Integer

Therefore, an operation that returns a numeric result returns a result of the highest type involved in the operation.

For example, if the operands are of type integer and unsigned long, the integer operand is automatically converted to type unsigned long. This type conversion is performed even in simple expressions in which the type of data identified by the expression prefix does not match the type of data that is passed as the argument to the function. To illustrate such an example, in the operation HTTP.REQ.CONTENT_LENGTH.DIV(3ul), the integer returned by the prefix HTTP.REQ.CONTENT_LENGTH is automatically converted to unsigned long (the type of the data passed as the argument to the DIV() function), and an unsigned long division is performed. Similarly, the argument can be promoted in an expression. For example, HTTP.REQ.HEADER("myHeader").TYPECAST_DOUBLE_AT.DIV(5) promotes the integer 5 to type double and performs double-precision division.

For information about expressions for casting data of one type to data of another type, see Typecasting data.

Specify the character set in expressions

September 21, 2020

The policy infrastructure on the Citrix® NetScaler® appliance supports the ASCII and UTF-8 character sets. The default character set is ASCII. If the traffic for which you are configuring an expression consists of only ASCII characters, you need not specify the character set in the expression. However, you must specify the character set in every simple expression that is meant for UTF-8 traffic. To specify the

UTF-8 character set in a simple expression, you must include the SET_CHAR_SET(<charset>) function, with <charset> specified as UTF_8, as shown in the following examples:

```
HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8).CONTAINS("ß")

HTTP.RES.BODY(100).SET_CHAR_SET(UTF_8).BEFORE_STR("Bücher").AFTER_STR("
    Wörterbuch")
<!--NeedCopy-->
```

In an expression, the SET_CHAR_SET() function must be introduced at the point in the expression after which data processing must be carried out in the specified character set. For example, in the expression HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In the preceding example/).CONTAINS_ANY("Greek_ alphabet"), if the strings stored in the pattern set "Greek_alphabet" are in UTF-8, you must include the SET_CHAR_SET(UTF_8) function immediately before the CONTAINS_ANY("<string>") function, as follows:

`HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In the preceding example/).SET_CHAR_SET(UTF_8).CONTAINS_ANY("Greek_ alphabet")`

The SET_CHAR_SET() function sets the character set for all further processing (that is, for all subsequent functions) in the expression unless it is overridden later in the expression by another SET_CHAR_SET() function that changes the character set. Therefore, if all the functions in a given simple expression are intended for UTF-8, you can include the SET_CHAR_SET(UTF_8) function immediately after functions that identify text (for example, the HEADER("<name>") or BODY(<int>) functions). In the second example that follows the first paragraph above, if the ASCII arguments passed to the AFTER_REGEX() and BEFORE_REGEX() functions are changed to UTF-8 strings, you can include the SET_CHAR_SET(UTF_8) function immediately after the BODY(1000) function, as follows:

`HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).AFTER_REGEX(re/Bücher/).BEFORE_REGEX(re/Wörterbuch/).CONTAINS_ANY("Greek_alphabet")`

The UTF-8 character set is a superset of the ASCII character set, so expressions configured for the ASCII character set continue to work as expected if you change the character set to UTF-8.

Compound expressions with different character sets

In a compound expression, if one subset of expressions is configured to work with data in the ASCII character set and the rest of the expressions are configured to work with data in the UTF-8 character set, the character set specified for each individual expression is considered when the expressions are evaluated individually. However, when processing the compound expression, just before processing the operators, the appliance promotes the character set of the returned ASCII values to UTF-8. For example, in the following compound expression, the first simple expression evaluates data in the ASCII character set while the second simple expression evaluates data in the UTF-8 character set:

```
HTTP.REQ.HEADER("MyHeader")== HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8)
```

However, when processing the compound expression, just before evaluating the “is equal to” Boolean operator, the NetScaler appliance promotes the character set of the value returned by HTTP.REQ.HEADER(“MyHeader”) to UTF-8.

The first simple expression in the following example evaluates data in the ASCII character set. However, when the NetScaler appliance processes the compound expression, just before concatenating the results of the two simple expressions, the appliance promotes the character set of the value returned by HTTP.REQ.BODY(10) to UTF-8.

```
HTTP.REQ.BODY(10)+ HTTP.REQ.HEADER("MyHeader").SET_CHAR_SET(UTF_8)
```

Consequently, the compound expression returns data in the UTF-8 character set.

Specify the character set based on the character set of traffic

You can set the character set to UTF-8 on the basis of traffic characteristics. If you are not sure whether the character set of the traffic being evaluated is UTF-8, you can configure a compound expression in which the first expression checks for UTF-8 traffic and subsequent expressions set the character set to UTF-8. Following is an example of a compound expression that first checks the value of “charset” in the request’s Content-Type header for “UTF-8” before checking whether the first 1000 bytes in the request contain the UTF-8 string Bücher:

```
HTTP.REQ.HEADER("Content-Type").SET_TEXT_MODE(IGNORECASE).TYPECAST_NVLIST_T
('=', '; ', '"').VALUE("charset").EQ("UTF-8")&& HTTP.REQ.BODY(1000).SET_CHAR_SET
(UTF_8).CONTAINS("Bücher")
```

If you are sure that the character set of the traffic being evaluated is UTF-8, the second expression in the example is sufficient.

Character and string literals in expressions

During expression evaluation, even if the current character set is ASCII, character literals and string literals, which are enclosed in single quotation marks (‘’) and quotation marks (“”), respectively, are considered to be literals in the UTF-8 character set. In a given expression, if a function is operating on character or string literals in the ASCII character set and you include a non-ASCII character in the literal, an error is returned.

Values in hexadecimal and octal formats

When configuring an expression, you can enter values in octal and hexadecimal formats. However, each hexadecimal or octal byte is considered a UTF-8 byte. Invalid UTF-8 bytes result in errors regardless of whether the value is entered manually or pasted from the clipboard. For example, “\xce\x20” is an invalid UTF-8 character because “c8” cannot be followed by “20” (each byte in a multi-byte UTF-8 string must have the high bit set). Another example of an invalid UTF-8 character is “\xce \xa9,” since the hexadecimal characters are separated by a white-space character.

Functions that return UTF-8 strings

Only the
<text>.XPATH and
<text>.XPATH_JSON functions always return UTF-8 strings. The following MYSQL routines determine at runtime which character set to return, depending on the data in the protocol:

- MYSQL_CLIENT_T.USER
- MYSQL_CLIENT_T.DATABASE
- MYSQL_REQ_QUERY_T.COMMAND
- MYSQL_REQ_QUERY_T.TEXT
- MYSQL_REQ_QUERY_T.TEXT(<unsigned int>)
- MYSQL_RES_ERROR_T.SQLSTATE
- MYSQL_RES_ERROR_T.MESSAGE
- MYSQL_RES_FIELD_T.CATALOG
- MYSQL_RES_FIELD_T.DB
- MYSQL_RES_FIELD_T.TABLE
- MYSQL_RES_FIELD_T.ORIGINAL_TABLE
- MYSQL_RES_FIELD_T.NAME
- MYSQL_RES_FIELD_T.ORIGINAL_NAME
- MYSQL_RES_OK_T.MESSAGE
- MYSQL_RES_ROW_T.TEXT_ELEM(<unsigned int>)

Terminal connection settings for UTF-8

When you set up a connection to the NetScaler appliance by using a terminal connection (by using PuTTY, for example), you must set the character set for transmission of data to UTF-8.

Classic expressions in advanced policy expressions

September 21, 2020

> **Warning**
>
> Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and

> as an alternative, Citrix recommends you to use Advanced policies. For more information, see Configure advanced policy expressions: Get started.

Classic expressions describe basic characteristics of traffic. In some cases, you may want to use a classic expression in an Advanced policy expression are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies topic. You can do so with the Advanced policy expression configuration tool. This can be helpful when manually migrating the older classic expressions to the Advanced policy.

Note that when you upgrade the NetScaler to version 9.0 or higher, Integrated Caching policies are automatically upgraded to Advanced policies, and the expressions in these policies are upgraded to the Advanced policies.

The following is the syntax for all Advanced policy expressions that use a classic expression:

SYS.EVAL_CLASSIC_EXPR("expression")

> **Note**
>
> The syntax and the metadata for the SYS.EVAL_CLASSIC_EXPR expression is getting deprecated. You can manually convert or use nspepi tool to convert the Classic expression to advanced expression.

Following are examples of the SYS.EVAL_CLASSIC_EXPR("expression") expression:

```
sys.eval_classic_expr("req.ssl.client.cipher.bits > 1000")
sys.eval_classic_expr("url contains abc")
sys.eval_classic_expr("req.ip.sourceip == 10.102.1.61 -netmask
    255.255.255.255")
sys.eval_classic_expr("time >= *:30:00GMT")
sys.eval_classic_expr("e1 || e2")
sys.eval_classic_expr("req.http.urllen > 50")
sys.eval_classic_expr("dayofweek == wedGMT")
<!--NeedCopy-->
```

Configure advanced policy expressions in a policy

September 21, 2020

You can configure an Advanced policy expression of up to 1,499 characters in a policy. The user interface for Advanced policy expressions depends to some extent on the feature for which you are configuring the expression, and on whether you are configuring an expression for a policy or for another use.

When configuring expressions on the command line, you delimit the expression by using quotation marks (“. . .” or ‘. . .’). Within an expression, you escape additional quotation marks by using a back-slash (). For example, the following are standard methods for escaping quotation marks in an expression:

`"\"abc\""`

‘`\"abc\"`’

You must also use a backslash to escape question marks and other backslashes on the command line. For example, the expression http.req.url.contains(“\?”) requires a backslash so that the question mark is parsed. Note that the backslash character will not appear on the command line after you type the question mark. On the other hand, if you escape a backslash (for example, in the expression ‘http.req.url.contains(“\\http”)’), the escape characters are echoed on the command line.

To make an entry more readable, you can escape the quotation marks for an entire expression. At the start of the expression you enter the escape sequence “q” plus one of the following special characters: /{<	~$^+=&%@‘?.

You enter only the special character at the end of the expression, as follows:

```
q@http.req.url.contains("sometext") && http.req.cookie.exists@

q~http.req.url.contains("sometext") && http.req.cookie.exists~
<!--NeedCopy-->
```

Note that an expression that uses the { delimiter is closed with }.

For some features (for example, Integrated Caching and Responder), the policy configuration dialog box provides a secondary dialog box for configuring expressions. This dialog enables you to choose from drop-down lists that show the available choices at each point during expression configuration. You cannot use arithmetic operators when using these configuration dialogs, but most other advanced policy expression features are available. To use arithmetic operators , write your expressions in free-form format.

Configure an Advanced policy syntax rule by using the CLI

> **Note:**
>
> Default syntax policy is now renamed as Advanced policy.

At the command prompt, type the following commands to configure a default syntax rule and verify the configuration:

1. `add cache|dns|rewrite|cs policy policyName **-rule** expression featureSpecificPa`
   `**-action**`
2. `show cache|dns|rewrite|cs policy policyName`
   Following is an example of configuring a caching policy:

   Example:

   ```
   > add cache policy pol-cache -rule http.req.content_length.le(5) -action INVAL
    Done

   > show cache policy pol-cache
           Name: pol-cache
           Rule: http.req.content_length.le(5)
           CacheAction: INVAL
           Invalidate groups: DEFAULT
           UndefAction: Use Global
           Hits: 0
           Undef Hits: 0

    Done
   <!--NeedCopy-->
   ```

Configure a default syntax policy expression by using the GUI

1. In the navigation pane, click the name of the feature where you want to configure a policy, for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching, and then click **Policies**.
2. Click Add.
3. For most features, click in the **Expression** field. For content switching, click **Configure**.
4. Click the **Prefix** icon (the house) and select the first expression prefix from the drop-down list. For example, in Responder, the options are HTTP, SYS, and CLIENT. The next set of applicable options appear in a drop-down list.
5. Double-click the next option to select it, and then type a period (.). Again, a set of applicable options appears in another drop-down list.
6. Continue selecting options until an entry field (signalled by parentheses) appears. When you see an entry field, enter an appropriate value in the parentheses. For example, if you select

GT(int) (greater-than, integer format), you specify an integer in the parentheses. Text strings are delimited by quotation marks. Following is an example:

`HTTP.REQ.BODY(1000).BETWEEN("this","that")`

To insert an operator between two parts of a compound expression, click the Operators icon (the sigma), and select the operator type. Following is an example of a configured expression with a Boolean OR (signalled by double vertical bars,	):

7. `HTTP.REQ.URL.EQ("www.mycompany.com")||HTTP.REQ.BODY(1000).BETWEEN("this","that")`
8. To insert a named expression, click the down arrow next to the Add icon (the plus sign) and select a named expression.
9. To configure an expression using drop-down menus, and to insert built-in expressions, click the Add icon (the plus sign). The **Add Expression** dialog box works in a similar way to the main dialog box, but it provides drop-down lists for selecting options, and it provides text fields for data entry instead of parentheses. This dialog box also provides a Frequently Used Expressions drop-down list that inserts commonly used expressions. When you are done adding the expression, click **OK**.
10. When finished, click **Create**. A message in the status bar indicates that the policy expression is configured successfully.

Test a default syntax expression by using the GUI

1. In the navigation pane, click the name of the feature for which you want to configure a policy (for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching), and then click Policies.
2. Select a policy and click **Open**.
3. To test the expression, click the Evaluate icon (the check mark).
4. In the expression evaluator dialog box, select the Flow Type that matches the expression.
5. In the **HTTP Request Data** or **HTTP Response Data** field, paste the HTTP request or response that you want to parse with the expression, and click **Evaluate**. Note that you must supply a complete HTTP request or response, and the header and body should be separated by blank

line. Some programs that trap HTTP headers do not also trap the response. If you are copying and pasting only the header, insert a blank line at the end of the header to form a complete HTTP request or response.

6. Click **Close** to close this dialog box.

Configure named advanced policy expressions

September 21, 2020

Instead of retyping the same expression multiple times in multiple policies, you can configure a named expression and refer to the name any time you want to use the expression in a policy. For example, you could create the following named expressions:

- ThisExpression:

  ```
  http.req.body(100).contains("this")
  ```

- ThatExpression:

  ```
  http.req.body(100).contains("that")
  ```

You can then use these named expressions in a policy expression. For example, the following is a legal expression based on the preceding examples:

ThisExpression	ThatExpression

You can use the name of an advanced policy expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

Example 1: Simple Named Expression as a Prefix

The following simple named expression, which identifies a text string, can be used as a prefix to the AFTER_STR("<string>")function, which works with text data:

```
HTTP.REQ.BODY(1000)
```

If the name of the expression is top1KB, you can use top1KB.AFTER_STR("username") instead of HTTP.REQ.BODY(1000).AFTER_STR("username").

Example 2: Compound named expression as a prefix

You can create a compound named expression called basic_header_value to concatenate the user name in a request, a colon (:), and the user's password, as follows:

```
add policy expression basic_header_value "HTTP.REQ.USER.NAME + \":\" + HTTP.REQ.USER.PASSWD"
```

You can then use the name of the expression in a rewrite action, as shown in the following example:

```
add rewrite action insert_b64encoded_authorization insert_http_header authorization '"Basic " + basic_header_value.b64encode'-bypassSafetyCheck YES
```

In the example, in the expression that is used to construct the value of the custom header, the B64 encoding algorithm is applied to the string returned by the compound named expression.

You can also use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in a rewrite.

Configure a named default syntax expression by using the CLI

At the command prompt, type the following commands to configure a named expression and verify the configuration:

```
-  add policy expression \<name\>\<value\>

-  show policy expression \<name\>
<!--NeedCopy-->
```

Example:

```
> add policy expression myExp "http.req.body(100).contains(\"the other\")"
Done

> show policy expression myExp
    1)      Name: myExp  Expr: "http.req.body(100).contains("the other")"  Hits: 0 Type : ADVANCED
Done
<!--NeedCopy-->
```

The expression can be up to 1,499 characters.

Configure a named expression by using the GUI

1. In the navigation pane, expand **AppExpert**, and then click **Expressions**.
2. Click **Advanced Expressions**.
3. Click **Add**.
4. Enter a name and a description for the expression.
5. Configure the expression by using the process described in Configure advanced policy expression. A message in the status bar indicates that the policy expression is configured successfully.

Configure advanced policy expressions outside the context of a policy

September 21, 2020

A number of functions, including the following, can require an advanced policy expression that is not part of a policy:

- Integrated Caching selectors:

  You define multiple non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND relationship with the others.

- Load Balancing:

  You configure an expression for the TOKEN method of load balancing for a load balancing virtual server.

- Rewrite actions:

  Expressions define the location of the rewrite action and the type of rewriting to be performed, depending on the type of rewrite action that you are configuring. For example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

- Rate-based policies:

  You use advanced policy xpressions to configure Limit Selectors. You can use these selectors when configuring policies to throttle the rate of traffic to various servers. You define up to five non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND with the others.

Configure an advanced policy expression outside a policy by using the CLI (cache selector example)

At the command prompt, type the following commands to configure an advanced policy expression outside a policy and verify the configuration:

```
-  add cache selector \<selectorName\> \<rule\>
-  show cache selector \<selectorName\>
<!--NeedCopy-->
```

Example:

```
> add cache selector mainpageSelector "http.req.cookie.value(\"ABC_def
  \")"
   "http.req.url.query.value(\"_ghi\")"selector "mainpageSelector"
       added
Done
> show cache selector mainpageSelector
            Name: mainpageSelector
            Expressions:
                    1) http.req.cookie.value("ABC_def")
                    2) http.req.url.query.value("_ghi")
Done
<!--NeedCopy-->
```

Following is an equivalent command that uses the more readable q delimiter, as described in Configure advanced policy expressions in a policy:

```
> add cache selector mainpageSelector2 q~http.req.cookie.value("ABC_def
  ")~
   q~http.req.url.query.value("_ghi")~selector "mainpageSelector2"
       added
Done
> show cache selector mainpageSelector2
            Name: mainpageSelector2
            Expressions:
                    1) http.req.cookie.value("ABC_def")
                    2) http.req.url.query.value("_ghi")
Done
<!--NeedCopy-->
```

Advanced policy expressions: evaluating text

September 21, 2020

You can configure a policy with an advanced policy expression that evaluates text in a request or response. Advanced policy text expressions can range from simple expressions that perform string matching in HTTP headers to complex expressions that encode and decode text. You can configure text expressions to be case sensitive or case insensitive and to use or ignore spaces. You can also configure complex text expressions by combining text expressions with Boolean operators

You can use expression prefixes and operators for evaluating HTTP requests, HTTP responses, and VPN and Clientless VPN data. However, text expression prefixes are not restricted to evaluating these elements of your traffic.

About text expressions

September 21, 2020

You can configure various expressions for working with text that flows through the NetScaler appliance. Following are some examples of how you can parse text by using a default syntax expression:

- Determine that a particular HTTP header exists.

  For example, you may want to identify HTTP requests that contains a particular Accept-Language header for the purpose of directing the request to a particular server.

- Determine that a particular HTTP URL contains a particular string.

  For example, you may want to block requests for particular URLs. Note that the string can occur at the beginning, middle, or end of another string.

- Identify a POST request that is directed to a particular application.

  For example, you may want to identify all POST requests that are directed to a database application for the purpose of refreshing cached application data.

About operations on text

A text-based expression consists of at least one prefix to identify an element of data and usually (although not always) an operation on that prefix. Text-based operations can apply to any part of a request or a response. Basic operations on text include various types of string matches.

For example, the following expression compares a header value with a string:

```
http.req.header("myHeader").contains("some-text")
```

Following expressions are examples of matching a file type in a request:

```
http.req.url.suffix.contains("jpeg")
```

```
http.req.url.suffix.eq("jpeg")
```

In the preceding examples, the contains operator permits a partial match and the eq operator looks for an exact match.

Other operations are available to format the string before evaluating it. For example, you can use text operations to strip out quotes and white spaces, to convert the string to all lowercase, or to concatenate strings.

> **Note**: Complex operations are available to perform matching based on patterns or to convert one type of text format to another type.

For more information, see the following topics:

- Pattern sets and data sets.
- Regular expressions.
- Typecasting data.

Compounding and precedence in text expressions

You can apply various operators to combine text prefixes or expressions. For example, the following expression concatenates the returned values of each prefix:

```
http.req.hostname + http.req.url
```

Following is an example of a compound text expression that uses a logical AND. Both components of this expression must be TRUE for a request to match the expression:

```
http.req.method.eq(post)&& http.req.body(1024).startswith("destination=")
```

Note: For more information on operators for compounding, see
Compound default syntax expressions.

Categories of text expressions

The primary categories of text expressions that you can configure are:

- Information in HTTP headers, HTTP URLs, and the POST body in HTTP requests.

  For more information, see Expression prefixes for text in HTTP requests and responses.

- Information regarding a VPN or a clientless VPN.

  For more information, see Expression prefixes for VPNs and clientless VPNs.

- TCP payload information.

  For more information about TCP payload expressions, see Default syntax expressions: Parsing HTTP, TCP, and UDP data.

- Text in a Secure Sockets Layer (SSL) certificate.

  For information about text expressions for SSL and SSL certificate data, see Default syntax expressions: Parsing SSL certificates and Expressions for SSL certificate dates.

> **Note:** Parsing a document body, such as the body of a POST request, can affect performance. You may want to test the performance impact of policies that evaluate a document body.

Guidelines for text expressions

From a performance standpoint, it typically is best to use protocol-aware functions in an expression. For example, the following expression makes use of a protocol-aware function:

```
HTTP.REQ.URL.QUERY
```

The previous expression performs better than the following equivalent expression, which is based on string parsing:

```
HTTP.REQ.URL.AFTER_STR("?")
```

In the first case, the expression looks specifically at the URL query. In the second case, the expression scans the data for the first occurrence of a question mark.

There is also a performance benefit from structured parsing of text, as in the following expression:

```
HTTP.REQ.HEADER("Example").TYPECAST_LIST_T(',').GET(1)
```

(For more information on typecasting, seeTypecasting data. The typecasting expression, which collects comma-delimited data and structures it into a list, typically would perform better than the following unstructured equivalent:

```
HTTP.REQ.HEADER("Example").AFTER_STR(",").BEFORE_STR(",")
```

Finally, unstructured text expressions typically have better performance than regular expressions. For example, the following is an unstructured text expression:

```
HTTP.REQ.HEADER("Example").AFTER_STR("more")
```

The previous expression would generally provide better performance than the following equivalent, which uses a regular expression:

```
HTTP.REQ.HEADER("Example").AFTER_REGEX(re/more/)
```

For more information on regular expressions, see Regular expressions.

Expression prefixes for text in HTTP requests and responses

September 21, 2020

An HTTP request or response typically contains text, such as in the form of headers, header values, URLs, and POST body text. You can configure expressions to operate on one or more of these text-based items in an HTTP request or response.

Refer to the Prefix Expression table to configure and extract text from different parts of an HTTP request or response.

Expression prefixes for VPNs and clientless VPNs

September 21, 2020

The Advanced policy engine provides prefixes that are specific to parsing VPN or Clientless VPN data. This data includes the following:

- Host names, domains, and URLs in VPN traffic.
- Protocols in the VPN traffic.
- Queries in the VPN traffic.

These text elements are often URLs and components of URLs. In addition to applying the text-based operations on these elements, you can parse these elements by using operations that are specific to parsing URLs. For more information, see Expressions for extracting segments of URLs

The following table describes the expression prefixes for this type of data.

VPN and Clientless VPN Expression	Description
VPN.BASEURL.CVPN_DECODE	Extracts the original URL from a clientless VPN URL.
VPN.BASEURL.CVPN_ENCODE	Converts a URL to clientless VPN format.
VPN.BASEURL.HOSTNAME	Extracts the HTTP host name from the host name in the URL. This prefix cannot be used in bidirectional policies.

VPN and Clientless VPN Expression	Description
VPN.BASEURL.HOSTNAME.DOMAIN	Extracts the domain name from the host name. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, this prefix extracts `mycompany.com`. This prefix returns incorrect results if the host name is an IP address. For information on expressions for IP addresses, see "Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs." All text operations after this prefix are case insensitive.
`VPN.BASEURL.HOSTNAME.EQ (\<hostname \>)`	Returns a Boolean TRUE if the host name matches `\<hostname\>`. The comparison is case insensitive. For example, if the host name is `www.mycompany.com`, the following returns TRUE: vpn.baseurl.hostname.eq(`"www.mycompany.com"`). If the text mode is URLENCODED, the host name is decoded before comparison. For more information, see "Operations for HTTP, HTML, and XML Encoding and "Safe" Characters."
VPN.BASEURL.HOSTNAME.SERVER	Evaluates the server portion of the host name. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the server is `www.mycompany.com`. All text operations after this prefix are case insensitive.
VPN.BASEURL.PATH	Extracts a slash- (/) separated list from the path component of the URL. For example, this prefix extracts /a/b/c/mypage.html from the following URL: <`http://www.mycompany.com/a/b/c/mypage.html?a=1`>. The following expression selects just the "a": http.req.url.path.get(1). For more information on the GET operation, see "Expressions for Extracting Segments of URLs."

VPN and Clientless VPN Expression	Description
VPN.BASEURL.PATH.IGNORE_EMPTY_ELEMENTS	This prefix ignores the elements in a list. For example, the following comma-separated list has an empty element after “a=10”: a=10,,b=11, ,c=89. The element following b=11 contains a space, and by default, is not considered an empty element. Consider the following HTTP header: Cust_Header : 123,,24, ,15. The following expression returns a count of 4 when evaluating this header: http.req.header(“Cust_Header”).typecase_list_t(‘,’).ig following expression returns a count of 5 when evaluating this header: http.req.header(“Cust_Header”).typecase_list_t(‘,’). count
VPN.BASEURL.PATH_AND_QUERY	Evaluates the text in the URL that follows the host name. For example, if the URL is `<http://www.mycompany.com/a/b/c/mypage.html?a=1>`, this prefix evaluates /a/b/c/mypage.html?a=1.
VPN.BASEURL.PROTOCOL	Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.
VPN.BASEURL.QUERY	Extracts a name-value list, using the “=” and “&” delimiters from the query string in a URL.
VPN.BASEURL.QUERY.IGNORE_EMPTY_ELEMENTS	This method ignores the empty elements in a name-value list. For example, in the following name-value list, there is an empty element following “a=10”: a=10;;b=11; ;c=89. The element following b=11 contains a space and is not considered an empty element. Consider the following HTTP header: Cust_Header : a=1;;b=2; ;c=3. The following expression produces a count of 4 after evaluating this header: http.req.header(“Cust_Header”).typecast_nvlist_t(‘=’, following expression produces a count of 5 after evaluating the header: http.req.header(“Cust_Header”).typecast_nvlist_t(‘=’,

VPN and Clientless VPN Expression	Description
VPN.BASEURL.SUFFIX	Evaluates the file name suffix in a URL. For example, if the path is /a/b/c/my.page.html, this operation selects "html."
VPN.CLIENTLESS_BASEURL	Evaluates the clientless VPN base URL.
VPN.CLIENTLESS_BASEURL.CVPN_DECODE	Extracts the original URL from the clientless VPN formatted URL.
VPN.CLIENTLESS_BASEURL.CVPN_ENCODE	Converts a URL to the clientless VPN format.
VPN.CLIENTLESS_BASEURL.HOSTNAME	Evaluates the host name in the URL. Do not use this prefix in bidirectional policies.
VPN.CLIENTLESS_BASEURL.HOSTNAME.DOMAIN	Evaluates the domain name part of the host name. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the domain is `mycompany.com`. This operation returns incorrect results if the host name is an IP address. For information on expressions for IP addresses, see "Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs.." All text operations after this prefix are case insensitive.
`VPN.CLIENTLESS_BASEURL.HOSTNAME.EQ(<hostname>)`	Returns a Boolean TRUE if the host name matches <hostname>. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the following is true: vpn.clientless_baseurl. hostname.eq(`"www.mycompany.com"`) The comparison is case insensitive. If the textmode is URLENCODED, the host name is decoded before comparison. For more information, see "Operations for HTTP, HTML, and XML Encoding and "Safe" Characters."

VPN and Clientless VPN Expression	Description
`VPN.CLIENTLESS_BASEURL.HOSTNAME.SERVER`	Evaluates the server part of a host name. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the server is `www.mycompany.com`. All text operations after this prefix are case insensitive.
VPN.CLIENTLESS_BASEURL.PATH	Evaluates a slash- (/) separated list in the URL path. For example, this prefix selects /a/b/c/mypage.html from the following URL: <`http://www.mycompany.com/a/b/c/mypage.html?a=1`>. The following expression selects "a" from the preceding URL: `http.req.url.path.get(1)`. For more information on the GET operation, see "Expressions for Extracting Segments of URLs."
`VPN.CLIENTLESS_BASEURL.PATH.IGNORE_EMPTY_ELEMENTS`	Ignores empty elements in a list. For example, if the list delimiter is a comma (,) the following list has an empty element following "a=10": a=10,b=11, ,c=89. The element following b=11 contains a space and is not considered an empty element.. Consider the following HTTP header: Cust_Header : 123,,24, ,15. The following expression returns a value of 4 after evaluating this header: http.req.header("Cust_Header").typecast_list_t(',').ig following expression returns a value of 5 after evaluating this header: http.req.header("Cust_Header").typecast_list_t(',').
`VPN.CLIENTLESS_BASEURL.PATH_AND_QUERY`	Evaluates the text following the host name in a URL. For example, this prefix selects /a/b/c/mypage.html?a=1 from the following URL: <`http://www.mycompany.com/a/b/c/mypage.html?a=1`>
`VPN.CLIENTLESS_BASEURL.PROTOCOL`	Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.

VPN and Clientless VPN Expression	Description
`VPN.CLIENTLESS_BASEURL.QUERY`	Extracts a name-value list that uses the delimiters “=” and “&” from a URL query string.
`VPN.CLIENTLESS_BASEURL.QUERY.IGNORE_EMPTY_ ELEMENTS`	Ignores empty elements in a name-value list. For example, the following list contains an empty element after “a=10”: a=10;;b=11; ;c=89. The element following b=11 contains a space and is not considered an empty element. As another example, consider the following http header: Cust_Header : a=1;;b=2; ;c=3. The following expression returns a value of 4 after evaluating the preceding header: http.req.header(“Cust_Header”).typecast_nvlist_t(‘=’ following expression returns a value of 5 after evaluating the preceding header: http.req.header(“Cust_Header”).typecast_nvlist_t(‘=’
`VPN.CLIENTLESS_BASEURL.SUFFIX`	Evaluates the file suffix in a URL. For example, if the URL path is /a/b/c/mypage.html then this operation selects html.
VPN.CLIENTLESS_HOSTURL	Selects the clientless VPN host URL.
VPN.CLIENTLESS_HOSTURL.CVPN_DECODE	Selects the original URL from the clientless VPN formatted URL.
VPN.CLIENTLESS_HOSTURL.CVPN_ENCODE	Converts a URL to clientless VPN format.
VPN.CLIENTLESS_HOSTURL.HOSTNAME	Extracts the host name in the URL. Do not use this prefix in bidirectional policies.
VPN.CLIENTLESS_HOSTURL.HOSTNAME.DOMAIN	Extracts the domain name from the host name. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the domain is `mycompany.com`. This operation returns incorrect results if the host name contains an IP address. For information on expressions for IP addresses, see “Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs.” All text operations after this prefix are case insensitive.

VPN and Clientless VPN Expression	Description
VPN.CLIENTLESS_HOSTURL.HOSTNAME.EQ(<ho	Results in Boolean TRUE if the host name matches the \<`hostname`\> argument. The comparison is case insensitive. For example, if the host name is `www.mycompany.com` or `www.mycompany.com`., the following expression returns TRUE: vpn.clilentless_hosturl. hostname.eq(`"www.mycompany.com"`). If the text mode is URLENCODED, the host name is decoded before comparison. For more information, see "Operations for HTTP, HTML, and XML Encoding and "Safe" Characters."
VPN.CLIENTLESS_HOSTURL.HOSTNAME.SERVER	Evaluates the server part of the host name. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the server is `www.mycompany.com`.. The comparison is case insensitive, and all text operations after this method are case insensitive.
VPN.CLIENTLESS_HOSTURL.PATH	Evaluates a slash- (/) separated list on the path component of the URL. For example, consider the following URL: `<http://www.mycompany.com/a/b/c/mypage.html?a=1>`. This prefix selects /a/b/c/mypage.html from the preceding URL.

VPN and Clientless VPN Expression	Description
VPN.CLIENTLESS_HOSTURL.PATH.IGNORE_EMPTY_ELEMENTS	This method ignores the empty elements in a list. For example, if the delimiter in a list is “,” the following list contains an empty element after the entry “a=10”: a=10,b=11, ,c=89. The element following b=11 contains a space and is not considered an empty element. Consider the following header: Cust_Header : 123„24, ,15. The following expression returns a value of 4 for this header: http.req.header(“Cust_Header”).typecast_list_t(‘,’). ignore_empty_elements.count. The following expression returns a value of 5 for the same header: http.req.header(“Cust_Header”).typecast_list_t(‘,’).
`VPN.CLIENTLESS_HOSTURL.PATH_AND_QUERY`	Evaluates the portion of the URL that follows the host name. For example, consider the following URL: <`http://www.mycompany.com/a/b/c/mypage.html?a=1`>. This prefix returns /a/b/c/mypage.html?a=1 from the preceding URL.
VPN.CLIENTLESS_HOSTURL.PROTOCOL	Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.
VPN.CLIENTLESS_HOSTURL.QUERY	Extracts a name-value list, using the “=” and “&” delimiters from a URL query string.

VPN and Clientless VPN Expression	Description
VPN.CLIENTLESS_HOSTURL.QUERY.IGNORE_EMPTY_ELEMENTS	Ignores empty elements in a name-value list. For example, the following list uses a semicolon (;) delimiter. This list contains an empty element after "a=10": a=10;;b=11; ;c=89. In the preceding example, the element following b=11 is not considered an empty element. Consider the following header: Cust_Header : a=1;;b=2; ;c=3. The following expression returns a value of 4 after evaluating this header: http.req.header("Cust_Header").typecast_nvlist_t('=', following expression returns a value of 5 after evaluating the same header: http.req.header("Cust_Header").typecast_nvlist_t('=',
VPN.CLIENTLESS_HOSTURL.SUFFIX	Extracts a file name suffix in a URL. For example, if the path is /a/b/c/my.page.html, this prefix selects html.
VPN.HOST.DOMAIN	Extracts the domain name part of the host name. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the domain is `mycompany.com`. This prefix returns incorrect results if the host name contains an IP address. For information on expressions for IP addresses, see "Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs." All text operations after this prefix case insensitive.

VPN and Clientless VPN Expression	Description
VPN.HOST.EQ(<hostname>)	Returns a Boolean TRUE value if the host name matches the <hostname>. The comparison is case insensitive. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the following returns TRUE: vpn.host.eq("www.mycompany.com"). If the text mode is URLENCODED the host name is decoded before comparison. For more information, see "Operations for HTTP, HTML, and XML Encoding and "Safe" Characters."
VPN.HOST.SERVER	Extracts the server name part of the host name. For example, if the host name is `www.mycompany.com` or `www.mycompany.com:8080`, the server is `www.mycompany.com`. All text operations after this prefix are case insensitive.

Basic operations on text

September 21, 2020

Basic operations on text include operations for string matching, calculating the length of a string, and controlling case sensitivity. You can include white space in a string that is passed as an argument to an expression, but the string cannot exceed 255 characters.

String comparison functions

The following table lists basic string matching operations in which the functions return a Boolean TRUE or FALSE.

Function	Description
<text>.CONTAINS(<string>)	Returns a Boolean TRUE value if the target contains <string>. Example: `http.req.url.contains(".jpeg")`

Function	Description
<text>.EQ(<string>)	Returns a Boolean TRUE value if the target is an exact match with <string>. For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc": `http.req.url.hostname.eq("myhostabc")`
<text>.STARTSWITH(<string>)	Returns a Boolean TRUE value if the target begins with <string>. For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc": `http.req.url.hostname.startswith("myhost")`
<text>.ENDSWITH(<string>)	Returns a Boolean TRUE value if the target ends with <string>. For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc": `http.req.url.hostname.endswith("abc")`
<text>.NE(<string>)	Returns a Boolean TRUE value if the prefix is not equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.
<text>.GT(<string>)	Returns a Boolean TRUE value if the prefix is alphabetically greater than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.

Function	Description
<text>.GE(<string>)	Returns a Boolean TRUE value if the prefix is alphabetically greater than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.
<text>.LT(<string>)	Returns a Boolean TRUE value if the prefix is alphabetically lesser than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.
<text>.LE(<string>)	Returns a Boolean TRUE value if the prefix is alphabetically lesser than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.

Calculate the length of a string

The <text>.LENGTH operation returns a numeric value that is equal to the number of characters (not bytes) in a string:

```
<text>.LENGTH
```

For example, you may want to identify request URLs that exceed a particular length. Following is an expression that implements this example:

```
HTTP.REQ.URL.LENGTH < 500
```

After taking a count of the characters or elements in a string, you can apply numeric operations to them. For more information, see Default Syntax Expressions: Working with Dates, Times, and Numbers.

Consider, ignore, and change text case

The following functions operate on the case (upper-case or lower-case) of the characters in the string.

Function	Description	
<text>.SET_TEXT_MODE(IGNOR	NOIGNORECASE)	This function turns case sensitivity on or off for all text operations.
<text>.TO_LOWER	Converts the target to lowercase for a text block of up to 2 kilobyte (KB). Returns UNDEF if the target exceeds 2 KB. For example, the string "ABCd:" is converted to "abcd:".	
<text>.TO_UPPER	Converts the target to uppercase. Returns UNDEF if the target exceeds 2 KB. For example, the string "abcD:" is converted to "ABCD:".	

Strip specific characters from a string

You can use the STRIP_CHARS(<string>) function to remove specific characters from the text that is returned by a default syntax expression prefix (the input string). All instances of the characters that you specify in the argument are stripped from the input string. You can use any text method on the resulting string, including the methods used for matching the string with a pattern set.

For example, in the expression CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(".-_"), the STRIP_CHARS(<string>) function strips all periods (.), hyphens (-), and underscores (_) from the domain name returned by the prefix CLIENT.UDP.DNS.DOMAIN. If the domain name that is returned is "a.dom_ai_n-name", the function returns the string "adomainname".

In the following example, the resulting string is compared with a pattern set called "listofdomains":

```
CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(".-_").CONTAINS_ANY("listofdomains")
```

Note: You cannot perform a rewrite on the string that is returned by the STRIP_CHARS(<string>) function.

The following functions strip matching characters from the beginning and end of a given string input.

Function	Description
<text>.STRIP_START_CHARS(s)	Strips matching characters from the beginning of the input string until the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and ://*en_us:is its value,HTTP.RES.HEADER(“TestLang”).STRIP_START_CHARS(“:/“* the specified characters from the beginning of the value of the header until the first non-matching character e is found and returnsen_us: as a string.
<text>.STRIP_END_CHARS(s)	Strips matching characters from the end of the input string to the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and ://*en_us:is its value,HTTP.RES.HEADER(“TestLang”).STRIP_START_CHARS(“:/“* the specified characters from the end of the value of the header until the first non-matching character s is found and returns://_en_us as a string.

Append a string to another string

You can use the APPEND() function to append the string representation of the argument to the string representation of the value returned by the preceding function. The preceding function can be one that returns a number, unsigned long, double, time value, IPv4 address, or IPv6 address. The argument can be a text string, number, unsigned long, double, time value, IPv4 address, or IPv6 address. The resulting string value is the same string value that is obtained by using the + operator.

Complex operations on text

September 21, 2020

In addition to performing simple string matching, you can configure expressions that examine more complex aspects of text, including examining the length of a string and looking within a text block for patterns rather than specific strings.

Be aware of the following for any text-based operation:

- For any operation that takes a string argument, the string cannot exceed 255 characters.
- You can include white space when you specify a string in an expression.

Operations on the length of a string

The following operations extract strings on the basis of a character count.

Character Count Operation	Description
`<text>.TRUNCATE(<count>)`	Returns a string after truncating the end of the target by the number of characters in <count>. If the entire string is shorter than <count>, nothing is returned.
`<text>.TRUNCATE(<character>, <count>)`	Returns a string after truncating the text after <character> by the number of characters specified in <count>.
`<text>.PREFIX(<character>, <count>)`	Selects the longest prefix in the target that has at most <count> occurrences of <character>.
`<text>.SUFFIX(<character>, <count>)`	Selects the longest suffix in the target that has at most `<count>` occurrences of <character>. For example, consider the following response body: JLEwx. The following expression returns a value of "JLEwx": http.res.body(100).suffix('L',1) The following expression returns "LLEwx": http.res.body(100).suffix('L',2)

Character Count Operation	Description
`<text>.SUBSTR(<starting_offset>, <length>)`	Select a string with <length> number of characters from the target object. Begin extracting the string after the `<starting_offset>`. If the number of characters after the offset are fewer than the value of the `<length>` argument, select all the remaining characters.
`<text>.SKIP(<character>, <count>)`	Select a string from the target after skipping over the longest prefix that has at most <count> occurrences of <character>.

Operations on a portion of a string

Refer to the String operations table to know how to extract a subset of a larger string by using one of the operations.

Operations for comparing the alphanumeric order of two strings

The COMPARE operation examines the first nonmatching character of two different strings. This operation is based on lexicographic order, which is the method used when ordering terms in dictionaries.

This operation returns the arithmetic difference between the ASCII values of the first nonmatching characters in the compared strings. The following differences are examples:

- The difference between "abc" and "abd" is -1 (based on the third pair-wise character comparison).
- The difference between "@" and "abc" is -33.
- The difference between "1" and "abc" is -47.

Following is the syntax for the COMPARE operation.

`<text>.COMPARE(<string>)`

Extract an integer from a string of bytes that represent text

Refer to the Integer extraction table to know how to treat a string of bytes that represent text as a sequence of bytes, extract 8, 16, or 32 bits from the sequence, and then convert the extracted bits to an integer.

Convert text to a hash value

You can convert a text string to a hash value by using the HASH function. This function returns a 31-bit positive integer as a result of the operation. Following is the format of the expression:

`<text>.HASH`

This function ignores case and white spaces. For example, after the operation, the two strings Ab c and a bc would produce the same hash value.

Encode and decode text by applying the Base64 encoding algorithm

The following two functions encode and decode a text string by applying the Base64 encoding algorithm

Function	Description
text.B64ENCODE	Encodes the text string (designated by text) by applying the Base64 encoding algorithm.
text.B64DECODE	Decodes the Base64-encoded string (designated by text) by applying the Base64 decoding algorithm. The operation raises an UNDEF if text is not in B64-encoded format.

Refine the search in a rewrite action by using the EXTEND function

The EXTEND function is used in rewrite actions that specify patterns or pattern sets and target the bodies of HTTP packets. When a pattern match is found, the EXTEND function extends the scope of the search by a predefined number of bytes on both sides of the matching string. A regular expression can then be used to perform a rewrite on matches in this extended region. Rewrite actions that are configured with the EXTEND function perform rewrites faster than rewrite actions that evaluate entire HTTP bodies using only regular expressions.

The format of the EXTEND function is EXTEND(m,n), where m and n are the number of bytes by which the scope of the search is extended before and after the matching pattern, respectively. When a match is found, the new search scope comprises m bytes that immediately precede the matching string, the string itself, and the n bytes that follow the string. A regular expression can then be used to perform a rewrite on a portion of this new string.

The EXTEND function can be used only if the rewrite action in which it is used fulfills the following requirements:

- The search is performed by using patterns or patterns sets (not regular expressions)

- The rewrite action evaluates only the bodies of HTTP packets.

Additionally, the EXTEND function can be used only with the following types of rewrite actions:

- replace_all
- insert_after_all
- delete_all
- insert_before_all

For example, you might want to delete all instances of `"<http://exampleurl.com/>"` and `"<http://exampleurl.au/>"` in the first 1000 bytes of the body. To do this, you can configure a rewrite action to search for all instances of the string exampleurl, extend the scope of the search on both sides of the string when a match is found, and then use a regular expression to perform the rewrite in the extended region. The following example extends the scope of the search by 20 bytes to the left and 50 bytes to the right of the matching string:

```
add rewrite action delurl_example delete_all 'HTTP.REQ.BODY(1000)'-pattern
exampleurl -refineSearch 'extend(20,50).regex_select(re##http://exampleurl
.(com|au)##)'
```

Convert text to hexadecimal format

The following function converts text to hexadecimal format and extracts the resulting string:

`<text>.BLOB_TO_HEX(<string>)`

For example, this function converts the byte string “abc” to “61:62:63”.

Encrypt and decrypt text

In default syntax expressions, you can use the ENCRYPT and DECRYPT functions to encrypt and decrypt text. Data encrypted by the ENCRYPT function on a given NetScaler appliance or high availability (HA) pair is intended for decryption by the DECRYPT function on the same NetScaler appliance or HA pair. The appliance supports the RC4, DES3, AES128, AES192, and AES256 encryption methods. The key value that is required for encryption is not user-specifiable. When an encryption method is set, the appliance automatically generates a random key value that is appropriate for the specified method. The default method is AES256 encryption, which is the most secure encryption method and the one that Citrix recommends.

You do not need to configure encryption unless you want to change the encryption method or you want the appliance to generate a new key value for the current encryption method.

Note: You can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see Encrypt and decrypt XML payloads.

Configure encryption

During startup, the appliance runs the set ns encryptionParams command with, by default, the AES256 encryption method, and uses a randomly generated key value that is appropriate for AES256 encryption. The appliance also encrypts the key value and saves the command, with the encrypted key value, to the NetScaler configuration file. Consequently, the AES256 encryption method is enabled for the ENCRYPT and DECRYPT functions by default. The key value that is saved in the configuration file persists across reboots even though the appliance runs the command each time you restart it.

You can run the set ns encryptionParams command manually, or use the GUI, if you want to change the encryption method or if you want the appliance to generate a new key value for the current encryption method. To use the CLI to change the encryption method, set only the method parameter, as shown in "**Example 1: Changing the Encryption Method**." If you want the appliance to generate a new key value for the current encryption method, set the method parameter to the current encryption method and the keyValue parameter to an empty string (""), as shown in "**Example 2: Generating a New Key Value for the Current Encryption Method**." After you generate a new key value, you must save the configuration. If you do not save the configuration, the appliance uses the newly generated key value only until the next restart, after which it reverts to the key value in the saved configuration.

Configure encryption by using the GUI

1. Navigate to **System** > **Settings**.
2. In the **Settings** area, click **Change Encryption** parameters.
3. In the **Change Encryption Parameters** dialog box, do one of the following:
    - To change the encryption method, in the **Method** list, select the encryption method that you want.
    - To generate a new key value for the current encryption method, click **Generate a new key** for the selected method.
4. Click **OK**.

Use the ENCRYPT and DECRYPT functions

You can use the ENCRYPT and DECRYPT functions with any expression prefix that returns text. For example, you can use the ENCRYPT and DECRYPT functions in rewrite policies for cookie encryption. In the following example, the rewrite actions encrypt a cookie named MyCookie, which is set by a back-end service, and decrypt the same cookie when it is returned by a client:

```
add rewrite action my-cookie-encrypt-action replace "HTTP.RES.SET_COOKIE.
COOKIE("MyCookie").VALUE(0)""HTTP.RES.SET_COOKIE.COOKIE("MyCookie").VALUE
(0).ENCRYPT"-bypassSafetyCheck YES
```

```
add rewrite action my-cookie-decrypt-action replace "HTTP.REQ.COOKIE.VALUE(
"MyCookie")""HTTP.REQ.COOKIE.VALUE("MyCookie").DECRYPT"-bypassSafetyCheck
YES
```

After you configure policies for encryption and decryption, save the configuration to bring the policies into effect.

Configure encryption key for third-party encryption

In default syntax expressions, you can use ENCRYPT and DECRYPT functions for encrypting and decrypting text in a request or response. The data encrypted by the ENCRYPT function on an appliance (standalone, high availability or cluster) is intended to be decrypted by the DECRYPT function by the same appliance. The appliance supports RC4, DES, Triple-DES, AES92, and AES256 encryption methods and each of these methods use a secret key for both encryption and decryption of data. You can use the any of these methods to encrypt and decrypt data in two ways - self-encryption and third-party encryption.

The self-encryption feature in an appliance (standalone, high availability or cluster) encrypts and then decrypts data by evaluating the header value. One example to understand this is the HTTP Cookie encryption. The expression evaluates the header, encrypts the HTTP cookie value in the Set-Cookie header in the outgoing response and then decrypts the cookie value when it is returned in the cookie header of a subsequent incoming request from the client. The key value is not user configurable, instead when an encryption method is configured in the set ns encryptionParams command, the appliance automatically generates a random key value for the configured method. By default, the command uses the AES256 encryption method, which is the highly secured method and Citrix recommends this method.

The third-party encryption feature encrypts or decrypts data with a third-party application. For example, a client may encrypt data in a request and the appliance decrypts the data before sending it the back-end server or vice versa. To perform this, the appliance and the third party application must share a secret key. On the appliance, you can directly configure the secret key using an encryption key object and key value is automatically generated by the appliance for a stronger encryption. The same key is manually configured on the third-party appliance so that both appliance and third-party application can use the same key for encrypting and decryption data.

> **Note**:
>
> Using third-party encryption, you can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see "Encrypting and Decrypting XML Payloads.

Cipher methods

A cipher method provides two functions: an encryption function that transforms a plaintext byte sequence into a ciphertext byte sequence, and a decryption function that transforms the ciphertext back to the plaintext. Cipher methods use byte sequences called keys to perform encryption and decryption. Cipher methods that use the same key for encryption and decryption are called symmetric. Cipher methods that use different keys for encryption and decryption are asymmetric. The most notable examples of asymmetric ciphers are in public key cryptography, which uses a public key available to anyone for encryption and a private key known only to the decryptor.

A good cipher method makes it infeasible to decrypt ("crack") ciphertext if you don't possess the key. "Infeasible" really means that cracking the cyphertext would take more time and computing resources than it is worth. As computers become more powerful and cheaper, ciphers that were formerly infeasible to crack become more feasible. Also, over time, flaws are found in cipher methods (or their implementations), making cracking easier. Newer cipher methods are therefore preferred over older ones. In general, longer length keys provide better security than shorter keys, at the cost of longer encryption and decryption times.

A cipher method can use stream ciphers or block ciphers. RC4 is the mostly secured stream ciphers and it is used only for legacy application. Block ciphers can include padding.

Stream ciphers

A stream cipher method operates on individual bytes. Only one stream cipher is available on NetScaler- appliances: RC4, which uses a 128 bit (16 byte) key length. For a given key, RC4 generates a pseudo-random sequence of bytes, call a keystream, which is X-ORed with the plaintext to produce the ciphertext. RC4 is no longer considered secure and should be used only if required by legacy applications.

Block ciphers

A block cipher method operates on a fixed block of bytes. A NetScaler appliance provides two block ciphers: Data Encryption Standard (DES) and the Advanced Encryption Standard (AES). DES uses a block size of 8 bytes and (on a NetScaler appliance) two choices for key length: 64 bits (8 bytes), of which 56 bits are data and 8 bits are parity, and Triple-DES, a 192 bit (24 byte) key length. AES has a block size of 16 bytes and (on NetScaler) three choices for key length: 128 bits (16 bytes), 192 bits (24 bytes) and 256 bits (32 bytes).

Padding

If the plaintext for a block cipher is not an integral number of blocks, padding with additional bytes might be required. For example, suppose the plaintext is "xyzzy" (hex 78797a7a79). For an 8-byte

Triple-DES block, this value would have to be padded to create 8 bytes. The padding scheme must allow the decryption function to determine the length of the original plaintext after decryption. Following are some padding schemes currently in use (n is the number of bytes added):

- PKCS7: Adds n bytes of value n each. For example, 78797a7a79030303. This is the padding scheme used by OpenSSL and ENCRYPT() policy function. The PKCS5 padding scheme is the same as PKCS7.
- ANSI X.923: Adds n-1 zero bytes and a final byte of value n. For example, 78797a7a79000003.
- ISO 10126: Adds n-1 random bytes and a final byte of value n. For example, 78797a7a79xxxx03, where xx can be any byte value. The DECRYPT() policy function accepts this padding scheme, which also allows it to accept the PKCS7 and ANSI X.923 schemes.
- ISO/IEC 7816-4: Adds a 0x80 byte and n-1 zero bytes. For example, 78797a7a79800000. This is also call OneAndZeros padding.
- Zero: Adds n zero bytes. Example: 78797a7a79000000. This can only be used with plaintext that does not include NUL bytes.

If padding is used and the plaintext is an integral number of blocks, an additional block is typically added so that the decryption function can unambiguously determine the original plaintext length. For PCKS7 and 8 byte block, this would be 0808080808080808.

Modes of operation

There are a number of different modes of operation for block ciphers, which specify how multiple blocks of plaintext are encrypted. Some modes use an initialization vector (IV), a block of data apart from the plaintext that is used to start the encryption process. It is a good practice to use a different IV for each encryption, so that the same plaintext produces different ciphertext. The IV does not need to be secret, and so is usually prepended to the ciphertext. Modes include:

- Electronic Codebook (ECB): Each block of plaintext is encrypted independently. An IV is not used. Padding is required if the plaintext is not a multiple of the cipher block size. The same plaintext and key always produces the same ciphertext. Because of this, ECB is considered less secure than other modes and should only be used for legacy applications.
- Cipher Block Chaining (CBC): Each block of plaintext is XORed with the previous ciphertext block, or the IV for the first block, before being encrypted. Padding is required if the plaintext is not a multiple of the cipher block size. This is the mode used with the NetScaler encryptionParams method.
- Cipher Feedback (CFB): The previous ciphertext block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block. The feedback can be 1 bit, 8 bits, or 128 bits. Since the plaintext is XORed with the cipher text, padding is not required.
- Output Feedback (OFB): A keystream is generated by applying the cipher successively to the IV and XORing the keystream blocks with the plaintext. Padding is not required.

Configure encryption keys for third-party encryption

Following are the configuration tasks performed in configuring encryption key.

1. Adding an encryption key. Configures an encryption key for a specified cipher method with a specified key value.
2. Modifying an encryption key. You can edit parameters for a configured encryption key.
3. Unsetting an encryption key. Sets parameters for a configured encryption key to their default values. An encryptionKey value with the name must exist. Sets padding to DEFAULT (determined by the method), Deletes an existing IV, which causes ENCRYPT() to generate a random IV. Deletes an existing comment. The method and key value cannot be reset.
4. Removing an encryption key. Deletes a configured encryption key. The key cannot have any references.
5. Show an encryption key. Displays parameters for the configured encryption key or all configured keys. If the name is omitted, the key value is not displayed.

Add an encryption key by using the CLI

At the command prompt, type:

```
add ns encryptionKey <name> -method <method> [-keyValue <hexstring>][-padding (OFF | ON)] [-iv <hexstring>] [-comment <string>]
```

Where,

```
<method> = ( NONE | RC4 | DES3 | AES128 | AES192 | AES256 | DES | DES-CBC | DES-CFB | DES-OFB | DES-ECB | DES3-CBC | DES3-CFB | DES3-OFB | DES3-ECB | AES128-CBC | AES128-CFB | AES128-OFB | AES128-ECB | AES192-CBC | AES192-CFB | AES192-OFB | AES192-ECB | AES256-CBC | AES256-CFB | AES256-OFB | AES256-ECB ) <hexstring> = hex-encoded byte sequence
<!--NeedCopy-->
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

Modify an encryption key by using the CLI

At the command prompt, type:

```
set ns encryptionKey <name> [-method <method>] [-keyValue <hexstring>] [-padding ( OFF | ON )] [-iv \<string>] [-comment \<string>]
```

Unset an encryption key by using the CLI

At the command prompt, type:

`unset ns encryptionKey <name> [-padding] [-iv] [-comment]`

Remove an encryption key by using the CLI

At the command prompt, type:

`rm ns encryptionKey <name>`

Show an encryption key by using the CLI

At the command prompt, type:

Example:

```
show ns encryptionKey [<name>]

add ns encryptionKey my_key -method aes256 -keyValue 26
    ea5537b7e0746089476e5658f9327c0b10c3b4778c673a5b38cee182874711  - iv
    c2bf0b2e15c15004d6b14bcdc7e5e365
    set ns encryptionKey my_key -keyValue
        b8742b163abcf62d639837bbee3cef9fb5842d82d00dfe6548831d2bd1d93476
    unset ns encryptionKey my_key -iv
    rm ns encryptionKey my_key
    show ns encryptionKey my_key
    Name: my_key
    Method: AES256
    Padding: DEFAULT
    Key Value: (not disclosed)
<!--NeedCopy-->
```

Add an encryption key by using the GUI

Navigate to **System** > **Encryption Keys** and click **Add** to create an encryption key.

Modify an encryption key by using the GUI

Navigate to **System** > **Encryption Keys** and click **Edit** to modify parameters for a configured encryption key.

Remove an encryption key by using the GUI

Navigate to **System** > **Encryption keys** and click **Delete**.

ENCRYPT and DECRYPT functions for third-party encryption

Following is the ENCRYPT function used for third-part encryption.

`ENCRYPT (encryptionKey, out_encoding)`

Where,

Input data for the appliance is the text to be encrypted

encryptionKey: An optional string parameter that specifies the configured encryption key object to provide the encryption method, secret key value and other encryption parameters. If omitted, the method uses the automatically generated key value associated with the set ns encryptionParamS command.

out_encoding: This value specifies how the output is encoded. If omitted, BASE64 encoding is used.

Input:

```
BASE64: original PEM base64-encoding: 6 bits (0..63) encoded as one
    ASCII character:
                  0..23 = 'A'..'Z', 24..51 = 'a'..'z', 52..61 = '0'..'9
         ', 62 = '+', 63 = '/', '=' = pad byte.
       BASE64URL:  URL and Filename safe base64-encoding: same as BASE64
          except 62 = '-', 63 = '_'
       HEX_UPPER:  Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F
         '.
       HEX_LOWER:  Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'a'..'f
         '.
       HEX_COLONS: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F
         '; ':' between each hex byte. Matches BLOB_TO_HEX() output
         format
       HEX:        For input, accepts HEX_UPPER, HEX_LOWER, and
         HEX_COLONS format. For output, produces HEX_LOWER format
<!--NeedCopy-->
```

Output: The output is a text encrypted using the specified method and key and encoded using a specified output encoding. It inserts a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

Following is the DECRYPT function used for third-part decryption.

`DECRYPT(encryptionKey, in_encoding)`

Where,

Input data is an encrypted text using the specified method and key encoded using the specified input encoding. This text is expected to include a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

encryptionKey—An optional string parameter that specifies the configured encryptionKey object to provide the encryption method, secret key and other encryption parameters. If omitted, the method and automatically generated key associated with the encryptionParams setting will be used

in_encoding—An optional enumeration parameter that specifies how the input is expected to be encoded. The values are the same as the out_encoding of ENCRYPT. If omitted, BASE64 encoding will be expected.

The output data is an unencoded decrypted text.

Variants and optional parameters

Following are the variants of these functions with the optional parameters:

Variant	Description
ENCRYPT	Use encryptionParams command and BASE64 output encoding parameter.
ENCRYPT(out_encoding)	Use encryptionParams and specified output encoding parameter.
ENCRYPT(encryptionKey)	Use the specified encryptionKey and BASE64 output encoding parameter.
ENCRYPT(encryptionKey, out_encoding)	Use the specified encryptionKey and output encoding parameter.
DECRYPT	Use encryptionParams command and BASE64 input encoding parameter.
DECRYPT(out_encoding)	Use encryptionParams command and the specified input encoding parameter.
DECRYPT(encryptionKey)	Use the specified encryptionKey and BASE64 input encoding parameter.
DECRYPT(encryptionKey, out_encoding)	Use the specified encryptionKey and input encoding parameter.

Configure HMAC keys

NetScaler appliances support a Hashed Message Authentication Code (HMAC) function that calculates a digest method or hash of input text by using a secret key shared between a message sender and message receiver. The digest method (derived from an RFC 2104 technique) authenticates the sender and verifies that the message content has not been altered. For example, when a client sends a message with the shared HMAC key to a NetScaler appliance, advanced (PI) policy expressions use the HMAC function to compute the hash-based code on the selected text. Then, when the receiver receives the message with the secret key, it recomputes the HMAC by comparing it with the original HMAC to determine whether the message has been altered. The HMAC function is supported by standalone appliances and by appliances in a high availability configuration or in a cluster. Using it is similar to configuring an encryption key.

The add ns hmackey and set ns hmackey commands include a parameter that specifies the digest method and the shared secret key to use for the HMAC computation.

To configure a HMAC key, you must perform the following:

1. Adding an HMAC key. Configures an HMAC key with a specified key value.
2. Modifying an HMAC key. Modifies parameters for a configured HMAC key. The digest method can be changed without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest.
3. Unsetting an HMAC key. Sets parameters for a configured HMAC key to their default values. An hmacKey object with the name must exist. The only parameter that can be unset is the comment, which is deleted.
4. Removing an HMAC key. Deletes a configured key. The key cannot have any references.
5. Show an HMAC key. Displays parameters for the configured HMAC ac key or all configured keys. If the name is omitted, the key value is not displayed.

Add an HMAC key by using the CLI

At the command prompt, type:

```
add ns hmacKey <name> -digest <digest> -keyValue <hexstring> [-comment <
string>]
```

Where,

```
<digest> = (MD2 | MD4 | MD5 | SHA1 | SHA224 | SHA256 | SHA384 | SHA512)
```

This command configures a key for the HMAC () function with the specified digest and key value and also validates the following:

- Name syntax is correct and does not duplicate the name of an existing key.
- Key value is valid hex. As specified by RFC 2104, the key can any length. On a NetScaler appliance, the key value can range from 0 to 255 bytes (0 to 510 hex characters). If the key is shorter than the digest block size, a warning is issued and the key is padded with zeroes. If the key is longer than the block size, it is run through the digest to produce an effective key that is the same length as the block.

Example:

```
add ns hmacKey my_hmac_key -digest sha1 -keyValue 0c753c6c5ef859189cacdf95b506d02c179
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

Modify an HMAC key by using the CLI

This command modifies the parameters configured for a HMAC key. You can change the digest without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest. At the command prompt, type:

```
set ns hmacKey <name> [-digest <digest>] [-keyValue <hexvalue>] [-comment <
string>]
```

Unset an HMAC key by using the CLI

This command sets parameters configured for a HMAC key with their default values. An hmacKey object with the name must exist. The only parameter that you can unset is the comment option, which is deleted. At the command prompt, type:

```
unset ns hmacKey <name> -comment
```

Remove an HMAC key by using the CLI

This command deletes the configured hmac key. The key cannot have references. At the command prompt, type:

```
rm ns hmacKey <name>
```

Show an HMAC key by using the CLI

At the command prompt, type:

```
show ns encryptionKey [<name>]

add ns hmacKey my_hmac_key -digest sha1 -keyValue 0
    c753c6c5ef859189cacdf95b506d02c1797407d
set ns hmacKey my_hmac_key -keyValue
    f348c594341a840a1f641a1cf24aa24c15eb1317
rm ns hmacKey my_hmac_key
```

```
show ns hmacKey my_hmac_key
          Name: my_hmac_key
    Digest: SHA1
    Key Value: (not disclosed)
<!--NeedCopy-->
```

Advanced policy expressions: working with dates, times, and numbers

September 21, 2020

Most numeric data that the NetScaler appliance processes consists of dates and times. In addition to working with dates and times, the appliance processes other numeric data, such as the lengths of HTTP requests and responses. To process this data, you can configure advanced policy expressions that process numbers.

A numeric expression consists of an expression prefix that returns a number and sometimes, but not always, an operator that can perform an operation on the number. Examples of expression prefixes that return numbers are SYS.TIME.DAY, HTTP.REQ.CONTENT_LENGTH, and HTTP.RES.BODY.LENGTH. Numeric operators can work with any prefix expression that returns data in numeric format. The GT(<int>) operator, for example, can be used with any prefix expression, such as HTTP.REQ.CONTENT_LENGTH, that returns an integer. Numeric expression prefixes and operators are also covered in Compound Operations for Numbers and Advanced Policy Expressions: Parsing HTTP, TCP, and UDP Data.

Format of dates and times in an expression

September 21, 2020

When configuring an advanced policy expression in a policy that works with dates and times (for example, the NetScaler system time or a date in an SSL certificate), you specify a time format as follows:

`GMT|LOCAL [<yyyy>] [<month>] [<d>] [<h>] [<m>] [<s>]`

Where:

- <yyyy> is a four-digit year after GMT or LOCAL.
- <month> is a three-character abbreviation for the month, for example, Jan, Dec.
- <d> is a day of the week or an integer for the date.

You cannot specify the day as Monday, Tuesday, and so on. You specify either an integer for a specific day of the month, or you specify a date as the first, second, third weekday of the month, and so on. Following are examples of specifying a day of the week:

  - Sun_1 is the first Sunday of the month.
  - Sun_3 is the third Sunday of the month.
  - Wed_3 is the third Wednesday of the month.
  - 30 is an example of an exact date in a month.

- <h> is the hour, for example, 10h.
- <s> is the number of seconds, for example, 30s.

The following example expression is true if the date is between 2008 Jan and 2009 Jan, based on GMT.

`http.req.date.between(GMT 2008 Jan, GMT 2009 Jan)`

The following example expression is true for March and all months that follow March in the calendar year, based on GMT:

`sys.time.ge(GMT 2008 Mar)`

When you specify a date and time, note that the format is case sensitive and must preserve the exact number of blank spaces between entries.

```
**Note:**

In an expression that requires two time values, both must use GMT or both must use LOCAL. You cannot mix the two in an expression.

Unlike when you use the SYS.TIME prefix in an advanced policy expression, if you specify SYS.TIME in a rewrite action, the NetScaler returns a string in conventional date format (for example, Sun, 06 Nov 1994 08:49:37 GMT). For example, the following rewrite action replaces the http.res.date header with the NetScaler system time in a conventional date format:

add rewrite action sync_date replace http.res.date sys.time
```

Expressions for the NetScaler system time

September 21, 2020

The SYS.TIME expression prefix extracts the NetScaler system time. You can configure expressions that establish whether a particular event occurred at a particular time or within a particular time range according to the NetScaler system time.

The following table describes the expressions that you can create by using the SYS.TIME prefix.

- **SYS.TIME.BETWEEN(<time1>, <time2>):**

  Returns a Boolean TRUE if the returned value is later than <time1> and earlier than <time2>.

  You format the <time1>, <time2> arguments as follows:

  - They must both be GMT or both LOCAL.
  - <time2> must be later than <time1>.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

  - sys.time.between(GMT 2004, GMT 2006)
  - sys.time.between(GMT 2004 Jan, GMT 2006 Nov)
  - sys.time.between(GMT 2004 Jan, GMT 2006)
  - sys.time.between(GMT 2005 May Sun_1, GMT 2005 May Sun_3)
  - sys.time.between(GMT 2005 May 1, GMT May 2005 1)
  - sys.time.between(LOCAL 2005 May 1, LOCAL May 2005 1)

- **SYS.TIME.DAY:**

  Returns the current day of the month as a number from 1 through 31.

- **SYS.TIME.EQ(<time>):**

  Returns a Boolean TRUE if the current time is equal to the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.eq(GMT 2005) (TRUE in this example.)
  - sys.time.eq(GMT 2005 Dec) (FALSE in this example.)
  - sys.time.eq(LOCAL 2005 May) (Evaluates to TRUE or FALSE in this example, depending on the current time zone.)
  - sys.time.eq(GMT 10h) (TRUE in this example.)
  - sys.time.eq(GMT 10h 30s) (TRUE in this example.)
  - sys.time.eq(GMT May 10h) (TRUE in this example.)
  - sys.time.eq(GMT Sun) (TRUE in this example.)
  - sys.time.eq(GMT May Sun_1) (TRUE in this example.)

- **SYS.TIME.NE(<time>):**

  Returns a Boolean TRUE if the current time is not equal to the <time> argument.

- **SYS.TIME.GE(<time>):**

  Returns a Boolean TRUE if the current time is later than or equal to <time>.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.ge(GMT 2004) (TRUE in this example.)
  - sys.time.ge(GMT 2005 Jan) (TRUE in this example.)
  - sys.time.ge(LOCAL 2005 May) (TRUE or FALSE in this example, depending on the current time zone.)
  - sys.time.ge(GMT 8h) (TRUE in this example.)
  - sys.time.ge(GMT 30m) (FALSE in this example.)
  - sys.time.ge(GMT May 10h) (TRUE in this example.)
  - sys.time.ge(GMT May 10h 0m) (TRUE in this example.)
  - sys.time.ge(GMT Sun) (TRUE in this example.)
  - sys.time.ge(GMT May Sun_1) (TRUE in this example.)

- **SYS.TIME.GT(<time>):**

  Returns a Boolean TRUE if the time value is later than the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.gt(GMT 2004) (TRUE in this example.)
  - sys.time.gt(GMT 2005 Jan) (TRUE in this example.)
  - sys.time.gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - sys.time.gt(GMT 8h) (TRUE in this example.)
  - sys.time.gt(GMT 30m) (FALSE in this example.)
  - sys.time.gt(GMT May 10h) (FALSE in this example.)
  - sys.time.gt(GMT May 10h 0m) (TRUE in this example.)
  - sys.time.gt(GMT Sun) (FALSE in this example.)
  - sys.time.gt(GMT May Sun_1) (FALSE in this example.)

- **SYS.TIME.HOURS:**

  Returns the current hour as an integer from 0 to 23.

- **SYS.TIME.LE(<time>):**

  Returns a Boolean TRUE if the current time value precedes or is equal to the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.le(GMT 2006) (TRUE in this example.)
  - sys.time.le(GMT 2005 Dec) (TRUE in this example.)
  - sys.time.le(LOCAL 2005 May) (TRUE or FALSE depending on the current timezone.)
  - sys.time.le(GMT 8h) (FALSE in this example.)
  - sys.time.le(GMT 30m) (TRUE in this example.)

  - sys.time.le(GMT May 10h) (TRUE in this example.)
  - sys.time.le(GMT Jun 11h) (TRUE in this example.)
  - sys.time.le(GMT Wed) (TRUE in this example.)
  - sys.time.le(GMT May Sun_1) (TRUE in this example.)

- **SYS.TIME.LT(<time>):**

  Returns a Boolean TRUE if the current time value precedes the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.lt(GMT 2006) (TRUE in this example.)
  - sys.time.lt.time.lt(GMT 2005 Dec) (TRUE in this example.)
  - sys.time.lt(LOCAL 2005 May) (TRUE or FALSE depending on the current time zone.)
  - sys.time.lt(GMT 8h) (FALSE in this example.)
  - sys.time.lt(GMT 30m) (TRUE in this example.)
  - sys.time.lt(GMT May 10h) (FALSE in this example.)
  - sys.time.lt(GMT Jun 11h) (TRUE in this example.)
  - sys.time.lt(GMT Wed) (TRUE in this example.)
  - sys.time.lt(GMT May Sun_1) (FALSE in this example.)

- **SYS.TIME.MINUTES:**

  Returns the current minute as an integer from 0 to 59.

- **SYS.TIME.MONTH:**

  Extracts the current month and returns an integer from 1 (January) to 12 (December).

- **SYS.TIME.RELATIVE_BOOT:**

  Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer.

  If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **SYS.TIME.RELATIVE_NOW:**

  Calculates the number of seconds between the current NetScaler system time and the specified time, and returns an integer showing the difference.

  If the designated time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **SYS.TIME.SECONDS:**

  Extracts the seconds from the current NetScaler system time, and returns that value as an integer from 0 to 59.

- **SYS.TIME.WEEKDAY:**

  Returns the current weekday as a value from 0 (Sunday) to 6 (Saturday).

- **SYS.TIME.WITHIN (<time1>, <time2>):**

  If you omit an element of time in <time1>, for example, the day or hour, it is assumed to have the lowest value in its range. If you omit an element in <time2>, it is assumed to have the highest value of its range.

  The ranges for the elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. If you specify the year, you must do so in both <time1> and <time2>.

  For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are shown in parentheses):

  - sys.time.within(GMT 2004, GMT 2006) (TRUE in this example.)
  - sys.time.within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
  - sys.time.within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
  - sys.time.within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
  - sys.time.within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE in this example.)
  - sys.time.within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **SYS.TIME.YEAR:**

  Extracts the year from the current system time and returns that value as a four-digit integer.

Expressions for SSL certificate dates

September 21, 2020

You can determine the validity period for SSL certificates by configuring an expression that contains the following prefix:

```
CLIENT.SSL.CLIENT_CERT
```

The following example expression matches a particular time for expiration with the information in the certificate:

```
client.ssl.client_cert.valid_not_after.eq(GMT 2009)
```

The following table describes time-based operations on SSL certificates. To obtain the expression you want, replace *certificate* in the expression in the first column with the prefix expression, "CLIENT.SSL.CLIENT_CERT".

- **<certificate>.VALID_NOT_AFTER:**

  Returns the last day before certificate expiration. The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- **<certificate>.VALID_NOT_AFTER.BETWEEN(<time1>, <time2>):**

  Returns a Boolean TRUE value if the certificate validity is between the <time1> and <time2> arguments. Both <time1> and <time2> must be fully specified. Following are examples:

  GMT 1995 Jan is fully specified.

  GMT Jan is not fully specified

  GMT 1995 20 is not fully specified.

  GMT Jan Mon_2 is not fully specified.

  The <time1> and <time2> arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>.

  For example, if it is GMT 2005 May 1 10h 15m 30s, and the first Sunday of the month, you can specify the following (evaluation results are in parentheses).

  - . . .between(GMT 2004, GMT 2006) (TRUE)
  - . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
  - . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
  - . . .between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) (TRUE)
  - . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
  - . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **<certificate>.VALID_NOT_AFTER.DAY:**

  Extracts the last day of the month that the certificate is valid, and returns a number from 1 through 31, as appropriate for the date.

- **<certificate>.VALID_NOT_AFTER.EQ(<time>):**

  Returns a Boolean TRUE if the time is equal to the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results for this example are in parentheses):

  - . . .eq(GMT 2005) (TRUE)
  - . . .eq(GMT 2005 Dec) (FALSE)
  - . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone)

  - . . .eq(GMT 10h) (TRUE)
  - . . .eq(GMT 10h 30s) (TRUE)
  - . . .eq(GMT May 10h) (TRUE)
  - . . .eq(GMT Sun) (TRUE)
  - . . .eq(GMT May Sun_1) (TRUE)

- **<certificate>.VALID_NOT_AFTER.GE(<time>):**

  Returns a Boolean TRUE if the time value is greater than or equal to the argument <time>.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .ge(GMT 2004) (TRUE)
  - . . .ge(GMT 2005 Jan) (TRUE)
  - . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .ge(GMT 8h) (TRUE)
  - . . .ge(GMT 30m) (FALSE)
  - . . .ge(GMT May 10h) (TRUE)
  - . . .ge(GMT May 10h 0m) (TRUE)
  - . . .ge(GMT Sun) (TRUE)
  - . . .ge(GMT May Sun_1) (TRUE)

- **<certificate>.VALID_NOT_AFTER.GT(<time>):**

  Returns a Boolean TRUE if the time value is greater than the argument <time>.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .gt(GMT 2004) (TRUE)
  - . . .gt(GMT 2005 Jan) (TRUE)
  - . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .gt(GMT 8h) (TRUE)
  - . . .gt(GMT 30m) (FALSE)
  - . . .gt(GMT May 10h) (FALSE)
  - . . .gt(GMT Sun) (FALSE)
  - . . .gt(GMT May Sun_1) (FALSE)

- **<certificate>.VALID_NOT_AFTER.HOURS:**

  Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **<certificate>.VALID_NOT_AFTER.LE(<time>):**

Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .le(GMT 2006) (TRUE)
  - . . .le(GMT 2005 Dec) (TRUE)
  - . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .le(GMT 8h) (FALSE)
  - . . .le(GMT 30m) (TRUE)
  - . . .le(GMT May 10h) (TRUE)
  - . . .le(GMT Jun 11h) (TRUE)
  - . . .le(GMT Wed) (TRUE)
  - . . .le(GMT May Sun_1) (TRUE)

- **<certificate>.VALID_NOT_AFTER.LT(<time>):**

  Returns a Boolean TRUE if the time precedes the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

  - . . .lt(GMT 2006) (TRUE)
  - . . .lt(GMT 2005 Dec) (TRUE)
  - . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .lt(GMT 8h) (FALSE)
  - . . .lt(GMT 30m) (TRUE)
  - . . .lt(GMT May 10h) (FALSE)
  - . . .lt(GMT Jun 11h) (TRUE)
  - . . .lt(GMT Wed) (TRUE)
  - . . .lt(GMT May Sun_1) (FALSE)

- **<certificate>.VALID_NOT_AFTER.MINUTES:**

  Extracts the last minute that the certificate is valid and returns that value as an integer from 0 to 59.

- **<certificate>.VALID_NOT_AFTER.MONTH:**

  Extracts the last month that the certificate is valid and returns that value as an integer from 1 (January) to 12 (December).

- **<certificate>.VALID_NOT_AFTER.RELATIVE_BOOT:**

  Calculates the number of seconds to the closest previous or scheduled reboot and returns an integer. If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **<certificate>.VALID_NOT_AFTER.RELATIVE_NOW;**

  Calculates the number of seconds between the current system time and the specified time and returns an integer. If the time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **<certificate>.VALID_NOT_AFTER.SECONDS:**

  Extracts the last second that the certificate is valid and returns that value as an integer from 0 to 59.

- **<certificate>.VALID_NOT_AFTER.WEEKDAY:**

  Extracts the last weekday that the certificate is valid. Returns a number between 0 (Sunday) and 6 (Saturday) to give the weekday in the time value.

- **<certificate>.VALID_NOT_AFTER.WITHIN(<time1>, <time2>):**

  Returns a Boolean TRUE if the time lies within all the ranges defined by the elements in <time1> and <time2>.

  If you omit an element of time from <time1>, it is assumed to have the lowest value in its range. If you omit an element from <time2>, it is assumed to have the highest value of its range. If you specify a year in <time1>, you must specify it in <time2>.

  The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. For the result to be TRUE, each element in the time must exist in the corresponding range that you specify in <time1>, <time2>.

  For example, if time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

  - . . .within(GMT 2004, GMT 2006) (TRUE)
  - . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
  - . . .within(GMT Feb, GMT) (TRUE, May is in the range for February to December)
  - . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday lies within the range of the first Sunday through the third Sunday)
  - . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
  - . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

- **<certificate>.VALID_NOT_AFTER.YEAR:**

  Extracts the last year that the certificate is valid and returns a four-digit integer.

- **<certificate>.VALID_NOT_BEFORE:**

  Returns the date that the client certificate becomes valid.

The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- **<certificate>.VALID_NOT_BEFORE.BETWEEN(<time1>, <time2>):**

  Returns a Boolean TRUE if the time value is between the two time arguments. Both <time1> and <time2> arguments must be fully specified.

  Following are examples:

  GMT 1995 Jan is fully specified.
  GMT Jan is not fully specified.
  GMT 1995 20 is not fully specified.
  GMT Jan Mon_2 is not fully specified.
  The time arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .between(GMT 2004, GMT 2006) (TRUE)
  - . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
  - . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
  - . . .between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) (TRUE)
  - . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
  - . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **<certificate>.VALID_NOT_BEFORE.DAY:**

  Extracts the last day of the month that the certificate is valid and returns that value as a number from 1 through 31 representing that day.

- **<certificate>.VALID_NOT_BEFORE.EQ(<time>):**

  Returns a Boolean TRUE if the time is equal to the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .eq(GMT 2005) (TRUE)
  - . . .eq(GMT 2005 Dec) (FALSE)
  - . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .eq(GMT 10h) (TRUE)
  - . . .eq(GMT 10h 30s) (TRUE)

  - . . .eq(GMT May 10h) (TRUE)
  - . . .eq(GMT Sun) (TRUE)
  - . . .eq(GMT May Sun_1) (TRUE)

- **<certificate>.VALID_NOT_BEFORE.GE(<time>):**

  Returns a Boolean TRUE if the time is greater than (after) or equal to the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

  - . . .ge(GMT 2004) (TRUE)
  - . . .ge(GMT 2005 Jan) (TRUE)
  - . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .ge(GMT 8h) (TRUE)
  - . . .ge(GMT 30m) (FALSE)
  - . . .ge(GMT May 10h) (TRUE)
  - . . .ge(GMT May 10h 0m) (TRUE)
  - . . .ge(GMT Sun) (TRUE)
  - . . .ge(GMT May Sun_1) (TRUE)

- **<certificate>.VALID_NOT_BEFORE.GT(<time>):**

  Returns a Boolean TRUE if the time occurs after the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

  - . . .gt(GMT 2004) (TRUE)
  - . . .gt(GMT 2005 Jan) (TRUE)
  - . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .gt(GMT 8h) (TRUE)
  - . . .gt(GMT 30m) (FALSE)
  - . . .gt(GMT May 10h) (FALSE)
  - . . .gt(GMT May 10h 0m) (TRUE)
  - . . .gt(GMT Sun) (FALSE)
  - . . .gt(GMT May Sun_1) (FALSE)

- **<certificate>.VALID_NOT_BEFORE.HOURS:**

  Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **<certificate>.VALID_NOT_BEFORE.LE(<time>)

  Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .le(GMT 2006) (TRUE)
  - . . .le(GMT 2005 Dec) (TRUE)
  - . . .le(LOCAL 2005 May) (TRUE or FALSE,depending on the current time zone.)
  - . . .le(GMT 8h) (FALSE)

    . - . .le(GMT 30m) (TRUE)
  - . . .le(GMT May 10h) (TRUE)
  - . . .le(GMT Jun 11h) (TRUE)
  - . . .le(GMT Wed) (TRUE)
  - . . .le(GMT May Sun_1) (TRUE)

- **<certificate>.VALID_NOT_BEFORE.LT(<time>):**

  Returns a Boolean TRUE if the time precedes the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - . . .lt(GMT 2006) (TRUE)
  - . . .lt(GMT 2005 Dec) (TRUE)
  - . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . .lt(GMT 8h) (FALSE)
  - . . .lt(GMT 30m) (TRUE)
  - . . .lt(GMT May 10h) (FALSE)
  - . . .lt(GMT Jun 11h) (TRUE)
  - . . .lt(GMT Wed) (TRUE)
  - . . .lt(GMT May Sun_1) (FALSE)

- **<certificate>.VALID_NOT_BEFORE.MINUTES:**

  Extracts the last minute that the certificate is valid. Returns the current minute as an integer from 0 to 59.

- **<certificate>.VALID_NOT_BEFORE.MONTH:**

  Extracts the last month that the certificate is valid. Returns the current month as an integer from 1 (January) to 12 (December).

- **<certificate>.VALID_NOT_BEFORE.RELATIVE_BOOT:**

  Calculates the number of seconds to the closest previous or scheduled NetScaler reboot and returns an integer. If the closest boot time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **<certificate>.VALID_NOT_BEFORE.RELATIVE_NOW:**

  Returns the number of seconds between the current NetScaler system time and the specified time as an integer. If the designated time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **<certificate>.VALID_NOT_BEFORE.SECONDS:**

  Extracts the last second that the certificate is valid. Returns the current second as an integer from 0 to 59.

- **<certificate>.VALID_NOT_BEFORE.WEEKDAY:**

  Extracts the last weekday that the certificate is valid. Returns the weekday as a number between 0 (Sunday) and 6 (Saturday).

- **<certificate>.VALID_NOT_BEFORE.WITHIN(<time1>, <time2>):**

  Returns a Boolean TRUE if each element of time exists within the range defined in the <time1>, <time2> arguments.

  If you omit an element of time from <time1>, it is assumed to have the lowest value in its range. If you omit an element of time from <time2>, it is assumed to have the highest value in its range. If you specify a year in <time1>, it must be specified in <time2>. The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59.

  For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

  - . . .within(GMT 2004, GMT 2006) (TRUE)
  - . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
  - . . .within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
  - . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
  - . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
  - . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

- **<certificate>.VALID_NOT_BEFORE.YEAR:**

  Extracts the last year that the certificate is valid. Returns the current year as a four-digit integer.

Expressions for HTTP request and response dates

September 21, 2020

The following expression prefixes return the contents of the HTTP Date header as text or as a date object. These values can be evaluated as follows:

- As a number. The numeric value of an HTTP Date header is returned in the form of the number of seconds since Jan 1, 1970.

  For example, the expression http.req.date.mod(86400) returns the number of seconds since the beginning of the day. These values can be evaluated using the same operations as other non-date-related numeric data. For more information, see Expression prefixes for numeric data other than date and time.

- As an HTTP header. Date headers can be evaluated using the same operations as other HTTP headers.

  For more information, see Default syntax expressions: Parsing HTTP, TCP, and UDP data.

- As text. Date headers can be evaluated using the same operations as other strings.

For more information, see Advanced Policy Expressions: Evaluating Text.

Prefix	Description
HTTP.REQ.DATE	Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 08:49:37 GMT, RFC850. Sunday, 06-Jan-80 09:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.
HTTP.RES.DATE	Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.

Generate the day of the week, as a string, in short and long formats

September 21, 2020

The functions, WEEKDAY_STRING_SHORT and WEEKDAY_STRING, generate the day of the week, as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0-6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

Function	Description
<prefix>.WEEKDAY_STRING_SHORT	Returns the day of the week in short format. The short form is always 3 characters long with an initial capital and the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT returns Sun if the value returned by the WEEKDAY function is 0 and Sat if the value returned by the prefix is 6.
<prefix>.WEEKDAY_STRING	Returns the day of the week in long format. The long form always has an initial capital, with the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING returns Sunday if the value returned by the WEEKDAY function is 0 and Saturday if the value returned by the prefix is 6.

Expression prefixes for numeric data other than date and time

September 21, 2020

In addition to configuring expressions that operate on time, you can configure expressions for the following types of numeric data:

- The length of HTTP requests, the number of HTTP headers in a request, and so on.

  For more information, see Expressions for numeric HTTP payload data other than dates.

- IP and MAC addresses.

  For more information, see Expressions for IP addresses and IP subnets.

- Client and server data in regard to interface IDs and transaction throughput rate.

  For more information, see Expressions for numeric client and server data.

- Numeric data in client certificates other than dates.

  For information on these prefixes, including the number of days until certificate expiration and the encryption key size, see Prefixes for numeric data in SSL certificates.

Converting numbers to text

September 21, 2020

The following functions produce binary strings from a number returned by an expression prefix. These functions are particularly useful in the TCP rewrite feature as replacement strings for binary data. For more information about the TCP rewrite feature, see Rewrite.

All the functions return a value of type text. The endianness that some of the functions accept as a parameter is either LITTLE_ENDIAN or BIG_ENDIAN.

Function	Description
<number>.SIGNED8_STRING	Produces an 8-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_
<number>.UNSIGNED8_STRING	Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIG
<number>.SIGNED16_STRING(<endianness>)	Produces a 16-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)
<number>.UNSIGNED16_STRING(<endianness>)	Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN)

Function	Description
<number>.SIGNED32_STRING(<endianness>)	Produces a 32-bit signed binary string representing the number. Example: HTTP.REQ.BODY(100).AFTER_STR("delim").GET_SIGNED3 BIG_ENDIAN).SUB(1).SIGNED32_STRING(BIG_ENDIAN)
<unsigned_long_number>.UNSIGNED8_STRING	Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(24).TYPECAST_UN
<unsigned_long_number>.UNSIGNED16_STRING	Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(23, LITTLE_ENDIAN).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UNSIG
<unsigned_long_number>.UNSIGNED32_STRING(<endianness>)	Produces a 32-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).AFTER_STR("delim2").GET_UNSIGN BIG_ENDIAN).ADD(2).UNSIGNED32_STRING(BIG_ENDIAN)

Virtual server based expressions

September 21, 2020

The
SYS.VSERVER("<vserver-name>") expression prefix enables you to identify a virtual server. You can use the following functions with this prefix to retrieve information related to the specified virtual server:

- **THROUGHPUT.** Returns the throughput of the virtual server in Mbps (Megabits per second). The value returned is an unsigned long number.

  Usage: SYS.VSERVER("vserver").THROUGHPUT

- **CONNECTIONS.** Returns the number of connections being managed by the virtual server. The value returned is an unsigned long number.

  Usage: SYS.VSERVER("vserver").CONNECTIONS

- **STATE.** Returns the state of the virtual server. The value returned is UP, DOWN, or OUT_OF_SERVICE. One of these values can therefore be passed as an argument to the EQ() operator to perform a comparison that results in a Boolean TRUE or FALSE.

  Usage: SYS.VSERVER("vserver").STATE

- **HEALTH.** Returns the percentage of services in an UP state for the specified virtual server. The value returned is an integer.

  Usage: SYS.VSERVER("vserver").HEALTH

- **RESPTIME.** Returns the response time as an integer representing the number of microseconds. Response time is the average TTFB (Time To First Byte) from all the services bound to the virtual server.

  Usage: SYS.VSERVER("vserver").RESPTIME

- **SURGECOUNT.** Returns the number of requests in the surge queue of the virtual server. The value returned is an integer.

  Usage: SYS.VSERVER("vserver").SURGECOUNT

Example 1:

The following rewrite policy aborts rewrite processing if the number of connections at the load balancing virtual server LBvserver exceeds 10000:

```
add rewrite policy norewrite_pol sys.vserver("LBvserver").connections.gt
(10000)norewrite
```

Example 2:

The following rewrite action inserts a custom header, TP, whose value is the throughout at the virtual server LBvserver:

```
add rewrite action tp_header insert_http_header TP SYS.VSERVER("LBvserver")
.THROUGHPUT
```

Example 3:

The following audit log message action writes the average TTFB of the services bound to a virtual server, to the newnslog log file:

```
add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS
Response Time to Servers:\" + sys.vserver(\"ssllb\").resptime + \" millisec
\""-logtoNewnslog YES -bypassSafetyCheck YES
```

Advanced policy expressions: Parsing HTTP, TCP, and UDP data

September 21, 2020

You can configure Advanced policy expressions to evaluate and process the payload in HTTP requests and responses. The payload associated with an HTTP connection includes the various HTTP headers (both standard and custom headers), the body, and other connection information such as the URL. Additionally, you can evaluate and process the payload in a TCP or UDP packet. For HTTP connections, for example, you can check whether a particular HTTP header is present or if the URL includes a particular query parameter.

You can configure expressions to transform the URL encoding and apply HTML or XML "safe" coding for subsequent evaluation. You can also use XPATH and JSON prefixes to evaluate date in XML and JSON files, respectively.

You can also use text-based and numeric Advanced policy expressions to evaluate HTTP request and response data. For more information, see Advanced policy expressions: Evaluating text. and Default Syntax Expressions: Working with Dates, Times, and Numbers.

About evaluating HTTP and TCP payload

September 21, 2020

The payload of an HTTP request or response consists of HTTP protocol information such as headers, a URL, body content, and version and status information. When you configure a default syntax expression to evaluate HTTP payload, you use a default syntax expression prefix and, if necessary, an operator.

For example, you use the following expression, which includes the http.req.header("<header_name>") prefix and the exists operator, if you want to determine whether an HTTP connection includes a custom header named "myHeader":

```
http.req.header("myHeader").exists
```

You can also combine multiple Advanced policy expressions with Boolean and arithmetic operators. For example, the following compound expression could be useful with various NetScaler features, such as Integrated Caching, Rewrite, and Responder. This expression first uses the && Boolean operator to determine whether an HTTP connection includes the Content-Type header with a value of "text/html." If that operation returns a value of FALSE, the expression determines whether the HTTP connection includes a "Transfer-Encoding" or "Content-Length" header.

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type")
```

`.eq("text/html"))|| (http.req.header("Transfer-Encoding").exists)|| (http.req.header("Content-Length").exists)`

The payload of a TCP or UDP packet is the data portion of the packet. You can configure Advanced policy expressions to examine features of a TCP or UDP packet, including the following:

- Source and destination domains
- Source and destination ports
- The text in the payload
- Record types

The following expression prefixes extract text from the body of the payload:

- HTTP.REQ.BODY(integer). Returns the body of an HTTP request as a multiline text object, up to the character position designated in the integer argument. If there are fewer characters in the body than is specified in the argument, the entire body is returned.
- HTTP.RES.BODY(integer). Returns a portion of the HTTP response body. The length of the returned text is equal to the number in the integer argument. If there are fewer characters in the body than is specified in integer, the entire body is returned.
- CLIENT.TCP.PAYLOAD(integer). Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the integer argument.

Following is an example that evaluates to TRUE if a response body of 1024 bytes contains the string "https", and this string occurs after the string "start string" and before the string "end string":

`http.res.body(1024).after_str("start_string").before_str("end_string").contains("https")`

Note: You can apply any text operation to the payload body. For information on operations that you can apply to text, see
Advanced policy expressions: Evaluating text.

Expressions for identifying the protocol in an incoming IP packet

September 21, 2020

The following table lists the expressions that you can use to identify the protocol in an incoming packet.

Expression	Description
CLIENT.IP.PROTOCOL	Identifies the protocol in IPv4 packets sent by clients.

Expression	Description
CLIENT.IPV6.PROTOCOL	Identifies the protocol in IPv6 packets sent by clients.
SERVER.IP.PROTOCOL	Identifies the protocol in IPv4 packets sent by servers.
SERVER.IPV6.PROTOCOL	Identifies the protocol in IPv6 packets sent by servers.

Arguments to the PROTOCOL function

You can pass the Internet Assigned Numbers Authority (IANA) protocol number to the PROTOCOL function. For example, if you want to determine whether the protocol in an incoming packet is TCP, you can use CLIENT.IP.PROTOCOL.EQ(6), where 6 is the IANA-assigned protocol number for TCP. For some protocols, you can pass an enumeration value instead of the protocol number. For example, instead of CLIENT.IP.PROTOCOL.EQ(6), you can use CLIENT.IP.PROTOCOL.EQ(TCP). The following table lists the protocols for which you can use enumeration values, and the corresponding enumeration values for use with the PROTOCOL function.

Protocol	Enumeration value
Transmission Control Protocol (TCP)	TCP
User Datagram Protocol (UDP)	UDP
Internet Control Message Protocol (ICMP)	ICMP
IP Authentication Header (AH), for providing authentication services in IPv4 and IPv6	AH
Encapsulating Security Payload (ESP) protocol	ESP
General Routing Encapsulation (GRE)	GRE
IP-within-IP Encapsulation Protocol	IPIP
Internet Control Message Protocol for IPv6 (ICMPv6)	ICMPv6
Fragment Header for IPv6	FRAGMENT

Use case scenarios

The protocol expressions can be used in both request-based and response-based policies. You can use the expressions in various NetScaler features, such as load balancing, WAN optimization, content switching, rewrite, and listen policies. You can use the expressions with functions such as EQ() and NE(), to identify the protocol in a policy and perform an action.

Following are some use cases for the expressions:

- In Branch Repeater load balancing configurations, you can use the expressions in a listen policy for the wildcard virtual server. For example, you can configure the wildcard virtual server with the listen policy CLIENT.IP.PROTOCOL.EQ(TCP) so that the virtual server processes only TCP traffic and simply bridges all non-TCP traffic. Even though you can use an Access Control List instead of the listen policy, the listen policy provides better control over what traffic is processed.
- For content switching virtual servers of type ANY, you can configure content switching policies that switch requests on the basis of the protocol in incoming packets. For example, you can configure content switching policies to direct all TCP traffic to one load balancing virtual server and all non-TCP traffic to another load balancing virtual server.
- You can use the client-based expressions to configure persistence based on the protocol. For example, you can use CLIENT.IP.PROTOCOL to configure persistence on the basis of the protocols in incoming IPv4 packets.

Expressions for HTTP and cache-control headers

September 21, 2020

One common method of evaluating HTTP traffic is to examine the headers in a request or a response. A header can perform a number of functions, including the following:

- Provide cookies that contain data about the sender.
- Identify the type of data that is being transmitted.
- Identify the route that the data has traveled (the Via header).

> **Note**
>
> If an operation is used to evaluate both header and text data, the header-based operation always overrides the text-based operation. For example, the AFTER_STR operation, when applied to a header, overrides text-based AFTER_STR operations for all instances of the current header type.

Prefixes for HTTP headers

The following table describes expression prefixes that extract HTTP headers.

HTTP Header Prefix	Description
HTTP.REQ.HEADER(“”)	Returns the contents of the HTTP header specified by the argument. The header name cannot exceed 32 characters. Note that this prefix returns the value from the Host header by default. To use this value as a hostname you need to typecast it as follows: http.req.header(” more information on typecasting, see [Typecasting data](/en-us/netscaler/11-1/appexpert/policies-and-expressions/ns-typecasting-data-wrapper-con.html).
HTTP.REQ.FULL_HEADER	Returns the contents of the complete set of HTTP header fields including the request line (for example, “GET /brochures/index.html HTTP/1.1”) and the terminating \r\n\r\n sequence.

HTTP Header Prefix	Description
HTTP.REQ.DATE	Returns the contents of the HTTP Date header. The following date formats are recognized: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, ASCII TIME. Sun Jan 6 08:49:37 1980. To evaluate a Date header as a date object, see Default Syntax Expressions: Working with Dates, Times, and Numbers.
HTTP.REQ.COOKIE	(Name/Value List) Returns the contents of the HTTP Cookie header.
HTTP.REQ.TXID	Returns the HTTP transaction ID. The value is a function of an internal transaction number, system boot time and system MAC address.
HTTP.RES.HEADER(“”)	Returns the contents of the HTTP header specified by the argument. The header name cannot exceed 32 characters.

HTTP Header Prefix	Description
HTTP.RES.FULL_HEADE	Returns the contents of the complete set of HTTP header fields including the status line (for example, “HTTP/1.1 200 OK”) and the terminating \r\n\r\n sequence.
HTTP.RES.SET_COOKIE or HTTP.RES.SET_COOKIE2	Returns the Set-Cookie header object in a response.
HTTP.RES.SET_COOKIE	Returns the cookie of the specified name if it is present. If it is not present, returns a text object of length 0. Returns UNDEF if more than 15 Set-Cookie headers are present and the specified cookie was not found in these headers.

HTTP Header Prefix	Description	
HTTP.RES.SET_COOKIE(<name>).DOMAIN	Returns the value of the first Domain field in the cookie. For example, if the cookie is Set-Cookie : Customer = “ABC”; DOMAIN=”.abc.com”; DOMAIN=.xyz.com, the following expression returns .abc.com: http.res.set_cookie.cookie(“customer”).domain. A string of zero length is returned if the Domain field or its value is absent.	HTTP.RES.SET_COOKIE2(<name>).DOMAIN
HTTP.RES.SET_COOKIE	Returns a Boolean TRUE if a Cookie with the name specified in the <name> argument exists in the Set-Cookie header. This prefix returns UNDEF if more than 15 Set-Cookie headers are present and the named cookie is not in the first 15 headers.	

HTTP Header Prefix	Description
HTTP.RES.SET_COOKIE.COOKIE(<name>).EXPIRES or HTTP.RES.SET_COOKIE2.COOKIE(<name>).EXPIRES	Returns the Expires field of the cookie. This is a date string that can be evaluated as a number, as a time object, or as text. If multiple Expires fields are present, the first one is returned. If the Expires field is absent, a text object of length zero is returned. To evaluate the returned value as a time object, see Default Syntax Expressions: Working with Dates, Times, and Numbers.
HTTP.RES.SET_COOKIE	PATH.GET(n)

HTTP Header Prefix	Description	
o HTTP.RES.SET_COOKIE2.COOKIE(<name>).PATH	PATH.GET(n)	Returns the value of Path field of the cookie as a slash- ("/") separated list. Multiple instances of a slash are treated as single slash. If multiple Path fields are present, the value of the first instance is returned. For example, the following is a cookie with two path fields:Set-Cookie : Customer = "ABC"; PATH="/a//b/c"; PATH= "/x/y/z". The following expression returns /a//b/c from this cookie: http.res.set_cookie.cookie("Customer").path. The following expression returns b: http.res.set_cookie.cookie("Customer").path.get(2). Quotes are stripped from the returned value. A string of zero length is returned if the Path field or its value is absent.

HTTP Header Prefix	Description	
HTTP.RES.SET_COOKIE	Ignores the empty elements in the list. For example, in the list a=10,b=11, ,c=89, the element delimiter in the list is , and the list has an empty element following a=10. The element following b=11 is not considered an empty element. As another example, in the following expression, if a request contains Cust_Header : 123,,24, ,15 the following expression returns a value of 4: http.req.header("Cus following expression returns a value of 5: http.req.header("Cus	KIE2.COOKIE ents.count. T

HTTP Header Prefix	Description
HTTP.RES.SET_COOKIE.COOKIE(<name>).PORT or HTTP.RES.SET_COOKIE2.COOKIE(<name>).PORT	Returns the value of Port field of the cookie. Operate as a comma-separated list. For example, the following expression returns 80. 2580 from Set-Cookie : Customer = “ABC”; PATH=”/a/b/c”; PORT= “80, 2580”: http.res.set_cookie.cookie(“ABC”).port. A string of zero length is returned if the Port field or value is absent.

HTTP Header Prefix	Description	
HTTP.RES.SET_COOKIE	Ignores the empty elements in the list. For example, in the list a=10,b=11, ,c=89, the element delimiter in the list is , and the list has an empty element following a=10. The element following b=11 is not considered an empty element.As another example, in the following expression, if a request contains Cust_Header : 123,,24, ,15 the following expression returns a value of 4: http.req.header(“Cus following expression returns a value of 5: http.req.header(“Cus	KIE2.COOKIE nents.count. T

HTTP Header Prefix	Description
HTTP.RES.SET_COOKIE.COOKIE(<name>).VERSION or HTTP.RES.SET_COOKIE2.COOKIE(<name>).VERSION	Returns the value of the first Version field in the cookie as a decimal integer. For example, the following expression returns 1 from the cookie Set-Cookie : Customer = “ABC”; VERSION = “1”; VERSION = “0”: http.res.set_cookie.cookie(“CUSTOMER”).version. A zero is returned if the Version field or its value is absent or if the value is not a decimal number.
HTTP.RES.SET_COOKIE <integer>) or HTTP.RES. <integer>)	Returns the nth instance (0-based) of the cookie with the specified name. If the cookie is absent, returns a text object of length 0. Returns UNDEF if more than 15 Set-Cookie headers are present and the cookie is not found.

HTTP Header Prefix	Description
HTTP.RES.SET_COOKIE.COOKIE(<name>, <integer>).DOMAIN or HTTP.RES.SET_COOKIE2.COOKIE(<name>, <integer>).DOMAIN	Returns the value of the Domain field of the first cookie with the specified name. For example, the following expression returns a value of abc.com from the cookie Set-Cookie : Customer = “ABC”; DOMAIN=”.abc.com”; DOMAIN=.xyz.com: http.res.set_cookie.cookie(“CUSTOMER”).domain. A string of zero length is returned if the Domain field or its value is absent.
HTTP.RES.SET_COOKIE <integer>).EXPIRES or H <integer>).EXPIRES	Returns the nth instance (0-based) of the Expires field of the cookie with the specified name as a date string. The value can be operated upon as a time object that supports a number of date formats. If the Expires attribute is absent a string of length zero is returned.

HTTP Header Prefix	Description	
HTTP.RES.SET_COOKIE.COOKIE(<name>, <integer>).PATH	PATH.GET(i) or HTTP.RES.SET_COOKIE2.COOKIE(<name>, <integer>).PATH PATH.GET(i)	Returns the value of the Path field of the nth cookie, as a ‘/’ separated list. Multiple /s are treated as a single /. For example, the following expression returns /a//b/c from the cookie Set-Cookie : Customer = “ABC”; PATH=”/a//b/c”; PATH= ”/x/y/z”: http.res.set_cookie.c following returns b: http.res.set_cookie.cookie(“CUST string of zero length is returned if the Path field or its value is absent.

HTTP Header Prefix	Description
HTTP.RES.SET_COOKIE <integer>).PATH.IGNOR <integer>).PATH.IGNOR	Ignores the empty elements in the list. For example, in the list a=10,b=11, ,c=89, the element delimiter in the list is , and the list has an empty element following a=10. The element following b=11 is not considered an empty element. As another example, in the following expression, if a request contains Cust_Header : 123„24, ,15 the following expression returns a value of 4: http.req.header(“Cus ents.count. T following expression returns a value of 5: http.req.header(“Cus

HTTP Header Prefix	Description
HTTP.RES.SET_COOKIE.COOKIE(<name>, <integer>).PORT or HTTP.RES.SET_COOKIE2.COOKIE(<name>, <integer>).PORT	Returns the value or values of the Port field of the named cookie as a ‘,’ separated list. For example, the following expression returns 80, 2580 from the cookie Set-Cookie : Customer = “ABC”; PATH=”/a/b/c”; PORT= “80, 2580”: http.res.set_cookie.cookie(“ABC”).port. A string of zero length is returned if the Port field or its value is absent.

HTTP Header Prefix	Description
HTTP.RES.SET_COOKIE <integer>).PORT.IGNOR <integer>).PORT.IGNOR	Ignores the empty elements in the list. For example, in the list a=10,b=11, ,c=89, the element delimiter in the list is , and the list has an empty element following a=10. The element following b=11 is not considered an empty element. As another example, in the following expression, if a request contains Cust_Header : 123,,24, ,15 the following expression returns a value of 4: http.req.header(“Cus ents.count. T following expression returns a value of 5: http.req.header(“Cus
HTTP.RES.SET_COOKIE.COOKIE(<name>, <integer>).VERSION or HTTP.RES.SET_COOKIE2.COOKIE(<name>, <integer>).VERSION	Returns the value of Version field of the nth cookie as a decimal integer. A string of zero length is returned if the Port field or its value is absent.

HTTP Header Prefix	Description
HTTP.RES.TXID	Returns the HTTP transaction ID. The value is a function of an internal transaction number, system boot time and system MAC address.

Operations for HTTP headers

The following table describes operations that you can specify with the prefixes for HTTP headers.

HTTP Header Operation	Description
http header .EXISTS	Returns a Boolean TRUE if an instance of the specified header type exists. Following is an example: http.req.header("Cache-Control").exists
http header.CONTAINS" http header.CONTAINS(<string>)	Returns a Boolean TRUE if the <string> argument appears in any instance of the header value. Note: This operation overrides any text-based Contains operations on all instances of the current header type.
http header .COUNT	Returns the number of headers in a request or response, to a maximum of 15 headers of the same type. The result is undefined if there are more than 15 instances of the header.
http header.AFTER_STR(<string>)	Extracts the text that follows the first occurrence of the <string> argument. The headers are evaluated from the last instance to the first.
http header.BEFORE_STR(<string>)	Extracts the text that appears prior to the first occurrence of the input <string> argument. The headers are evaluated from the last instance to the first.

HTTP Header Operation	Description
http header.INSTANCE(<instance number>)	An HTTP header can occur multiple times in a request or a response. This operation returns the header that occurs <instance number> of places before the final instance. For example, instance(0) selects the last instance of the current type, instance(1) selects the next-to-last instance, and so on. This prefix cannot be used in bidirectional policies.
http header.SUBSTR(<string>)	Extracts the text that matches the <string> argument. The headers are evaluated from the last instance to the first.
http header.VALUE(<instance number>)	An HTTP header can occur multiple times in a request or a response. VALUE(0) selects the value in the last instance, VALUE(1) selects the value in the next-to-last instance, and so on. The <instance number> argument cannot exceed 14.

Prefixes for cache-control headers

The following prefixes apply specifically to Cache-Control headers.

HTTP Header Prefix	Description
HTTP.REQ.CACHE_CONTROL	Returns a Cache-Control header in an HTTP request.
HTTP.RES.CACHE_CONTROL	Returns a Cache-Control header in an HTTP response.

Operations for cache-control headers

You can apply any of the operations for HTTP headers to Cache-Control headers. For more information, see Operations for HTTP headers.

In addition, the following operations identify specific types of Cache-Control headers. See RFC 2616 for information about these header types.

HTTP Header Operation	Description
Cache-Control header.NAME(<integer>)	Returns as a text value the name of the Cache-Control header that corresponds to the nth component in a name-value list, as specified by <integer>. The index of the name-value component is 0-based. If the <integer> that is specified by the integer argument is greater than the number of components in the list, a zero-length text object is returned. Following is an example: http.req.cache_control.name(3).contains("some_text")
Cache-Control header.IS_INVALID	Returns a Boolean TRUE if the Cache-Control header is not present in the request or response. Following is an example: http.req.cache_control.is_invalid
Cache-Control header.IS_PRIVATE	Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: http.req.cache_control.is_private
Cache-Control header.IS_PUBLIC	Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: http.req.cache_control.is_public
Cache-Control header.IS_NO_STORE	Returns a Boolean TRUE if the Cache-Control header has the value No-Store. Following is an example: http.req.cache_control.is_no_store
Cache-Control header.IS_NO_CACHE	Returns a Boolean TRUE if the Cache-Control header has the value No-Cache. Following is an example: http.req.cache_control.is_no_cache
Cache-Control header.IS_MAX_AGE	Returns a Boolean TRUE if the Cache-Control header has the value Max-Age. Following is an example: http.req.cache_control.is_max_age
Cache-Control header.IS_MIN_FRESH	Returns a Boolean TRUE if the Cache-Control header has the value Min-Fresh. Following is an example: http.req.cache_control.is_min_fresh
Cache-Control header.IS_MAX_STALE	Returns a Boolean TRUE if the Cache-Control header has the value Max-Stale. Following is an example: http.req.cache_control.is_max_stale

HTTP Header Operation	Description
Cache-Control header.IS_MUST_REVALIDATE	Returns a Boolean TRUE if the Cache-Control header has the value Must-Revalidate. Following is an example: http.req.cache_control.is_must_revalidate
Cache-Control header.IS_NO_TRANSFORM	Returns a Boolean TRUE if the Cache-Control header has the value No-Transform. Following is an example: http.req.cache_control.is_no_transform
Cache-Control header.IS_ONLY_IF_CACHED	Returns a Boolean TRUE if the Cache-Control header has the value Only-If-Cached. Following is an example: http.req.cache_control.is_only_if_cached
Cache-Control header.IS_PROXY_REVALIDATE	Returns a Boolean TRUE if the Cache-Control header has the value Proxy-Revalidate. Following is an example: http.req.cache_control.is_proxy_revalidate
Cache-Control header.IS_S_MAXAGE	Returns a Boolean TRUE if the Cache-Control header has the value S-Maxage. Following is an example: http.req.cache_control.is_s_maxage
Cache-Control header.IS_UNKNOWN	Returns a Boolean TRUE if the Cache-Control header is of an unknown type. Following is an example: http.req.cache_control.is_unknown
Cache-Control header.MAX_AGE	Returns the value of the Cache-Control header Max-Age. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.max_age.le(3)
Cache-Control header.MAX_STALE	Returns the value of the Cache-Control header Max-Stale. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.max_stale.le(3)
Cache-Control header.MIN_FRESH	Returns the value of the Cache-Control header Min-Fresh. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.min_fresh.le(3)

HTTP Header Operation	Description
Cache-Control header.S_MAXAGE	Returns the value of the Cache-Control header S-Maxage. If this header is absent or invalid, 0 is returned.Following is an example: http.req.cache_control.s_maxage.eq(2)

Expressions for extracting segments of URLs

September 21, 2020

You can extract URLs and portions of URLs, such as the host name, or a segment of the URL path. For example, the following expression identifies HTTP requests for image files by extracting image file suffixes from the URL:

```
http.req.url.suffix.eq("jpeg")|| http.req.url.suffix.eq("gif")
```

Most expressions for URLs operate on text and are described in Expression Prefixes for Text in HTTP Requests and Responses. This section discusses the GET operation. The GET operation extracts text when used with the following prefixes:

- HTTP.REQ.URL.PATH
- VPN.BASEURL.PATH
- VPN.CLIENTLESS_BASEURL.PATH

The following table describes prefixes for HTTP URLs.

URL Prefix	Description
HTTP.REQ.URL.PATH.GET(<n>)	Returns a slash- ("/") separated list from the URL path. For example, consider the following URL: `http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1`. The following expression returns dir1 from this URL: <http.req.url.path.get(1)>. The following expression returns dir2: http.req.url.path.get(2)

URL Prefix	Description
HTTP.REQ.URL.PATH.GET_REVERSE(<n>)	Returns a slash- (“/”) separated list from the URL path, starting from the end of the path. For example, consider the following URL: `http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1`. The following expression returns index.html from this URL: <http.req.url.path.get_reverse(0)>. The following expression returns dir3: http.req.url.path.get_reverse(1)

Expressions for HTTP status codes and numeric HTTP payload data other than dates

September 21, 2020

The following table describes prefixes for numeric values in HTTP data other than dates.

Prefix	Description
HTTP.REQ.CONTENT_LENGTH	Returns the length of an HTTP request as a number. Following is an example: http.req.content_length < 500
HTTP.RES.CONTENT_LENGTH	Returns the length of the HTTP response as a number. Following is an example: http.res.content_length <= 1000
HTTP.RES.STATUS	Returns the response status code
HTTP.RES.IS_REDIRECT	Returns a Boolean TRUE if the response code is associated with a redirect. Following are the redirect response codes: 300 (Multiple Choices), 301 (Moved Permanently), 302 (Found), 303 (See Other), 305 (Use Proxy), and 307 (Temporary Redirect). Note: Status code 304 is not considered a redirect HTTP response status code. Status code 306 is unused.

SIP expressions

September 21, 2020

The NetScaler Advanced policy expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for any supported protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

Certain limitations apply to SIP expressions used with responder policies. Only the DROP, NOOP or RESPONDWITH actions are allowed on a SIP load balancing virtual server. Responder policies can be bound to a load balancing virtual server, an override global bind point, a default global bind point, or a sip_udp policy label.

The header format used by the SIP protocol is similar to that used by the HTTP protocol, so many of the new expressions look and function much like their HTTP analogs. Each SIP header consists of a line that includes the SIP method, the URL, and the version, followed by a series of name-value pairs that look like HTTP headers.

Following is a sample SIP header that is referred to in the expressions tables beneath it:

```
INVITE sip:16@www.sip.com:5060;transport=udp SIP/2.0
Record-Route: <sip:200.200.100.22;lr=on>
Via: SIP/2.0/UDP 200.200.100.22;branch=z9hG4bK444b.c8e103d1.0;rport=5060;
    received=10.102.84.18
Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;
    received=10.102.84.160
From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180
Max-Forwards: 69CSeq: 101 INVITE
User-Agent: Cisco-CP7940G/8.0
Contact: <sip:12@10.102.84.180:5060;transport=udp>
Expires: 180
Accept: application/sdp
Allow: ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,UPDATE
Supported: replaces,join,norefersub
Content-Length: 277
Content-Type: application/sdp
Content-Disposition: session;handling=optiona
<!--NeedCopy-->
```

SIP reference tables

The following tables contain lists of expressions that operate on SIP headers. The first table contains expressions that apply to request headers. Most response-based expressions are nearly the same as the corresponding request-based expressions. To create a response expression from the corresponding request expression, you change the first two sections of the expression from SIP.REQ to SIP.RES, and make other obvious adjustments. The second table contains those response expressions that are unique to responses and have no request equivalents. You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

SIP request expressions

Expression	Description
SIP.REQ.METHOD	Operates on the method of the SIP request. The supported SIP request methods are ACK, BYE, CANCEL, INFO, INVITE, MESSAGE, NOTIFY, OPTIONS, PRACK, PUBLISH, REFER, REGISTER, SUBSCRIBE, and UPDATE. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns INVITE.
SIP.REQ.URL	Operates on the SIP request URL. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returnssip:16@10.102.84.181:5060;transport=udp.
SIP.REQ.URL.PROTOCOL	Returns the URL protocol. For example, for a SIP URL ofsip:16@www.sip.com:5060;transport=udp, this expression returns sip.

Expression	Description
SIP.REQ.URL.HOSTNAME	Returns the hostname portion of the SIP URL. For example, for a SIP URL ofsip:16@www.sip.com:5060;transport=udp, this expression returns www.sip.com:5060.
SIP.REQ.URL.HOSTNAME.PORT	Returns the port portion of the SIP URL hostname. If no port is specified, this expression returns the default SIP port, 5060. For example, for a SIP hostname of www.sip.com:5060, this expression returns 5060.
SIP.REQ.URL.HOSTNAME.DOMAIN	Returns the domain name portion of the SIP URL hostname. If the host is an IP address, then this expression returns an incorrect result. For example, for a SIP hostname of www.sip.com:5060, this expression returns sip.com. For a SIP hostname of 192.168.43.15:5060, this expression returns an error.
SIP.REQ.URL.HOSTNAME.SERVER	Returns the server portion of the host. For example, for a SIP hostname of www.sip.com:5060, this expression returns www.
SIP.REQ.URL.USERNAME	Returns the username that precedes the @ character. For example, for a SIP URL of sip:16@www.sip.com:5060;transport=udp, this expression returns 16.
SIP.REQ.VERSION	Returns the SIP version number in the request. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns SIP/2.0.
SIP.REQ.VERSION.MAJOR	Returns the major version number (the number to the left of the period). For example, for a SIP version number of SIP/2.0, this expression returns 2.

Expression	Description
SIP.REQ.VERSION.MINOR	Returns the minor version number (the number to the right of the period). For example, for a SIP version number of SIP/2.0, this expression returns 0.
SIP.REQ.CONTENT_LENGTH	Returns the contents of the Content-Length header. This expression is a derivative of thesip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Content-Length header of Content-Length: 277, this expression returns 277.
SIP.REQ.TO	Returns the contents of the To header. For example, for a SIP To header of To: “16” <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns ”16” <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185.
SIP.REQ.TO.ADDRESS	Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP To header of To: “16” <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:16@sip_example.com.
SIP.REQ.TO.DISPLAY_NAME	Returns the display name portion of the To header. For example, for a SIP To header of To: “16” <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 16.
SIP.REQ.TO.TAG	Returns the “tag” vale from the “tag” name value pair in the TO header. For example, for a SIP To header of To: “16” <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.

Expression	Description
SIP.REQ.FROM	Returns the contents of the From header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:12@sip_example.com.
SIP.REQ.FROM.ADDRESS	Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:12@sip_example.com.
SIP.REQ.FROM.DISPLAY_NAME	Returns the display name portion of the To header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 12.
SIP.REQ.FROM.TAG	Returns the "tag" value from the "tag" name/value pair in the TO header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.
SIP.REQ.VIA	Returns the complete Via header. If there are multiple Via headers in the request, returns the last Via header. For example, for the two Via headers in the sample SIP header, this expression returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re
SIP.REQ.VIA.SENTBY_ADDRESS	Returns the address that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 10.102.84.180.

Expression	Description
SIP.REQ.VIA.SENTBY_PORT	Returns the port that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 5060.
SIP.REQ.VIA.RPORT	Returns the value from the rport name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 5060.
SIP.REQ.VIA.BRANCH	Returns the value from the branch name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns z9hG4bK03e76d0b.
SIP.REQ.VIA.RECEIVED	Returns the value from the received name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 10.102.84.160.
SIP.REQ.CALLID	Returns the contents of the Callid header. This expression is a derivative of the sip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Callid header ofCall-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180, this expression returns00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180.
SIP.REQ.CSEQ	Returns the CSEQ number from the CSEQ, as an integer. For example, for a SIP CSEQ header of CSeq: 101 INVITE, this expression returns 101.

Expression	Description
SIP.REQ.HEADER(<header_name>)	Returns the specified SIP header. For , substitute the name of the header that you want. For example, to return the SIP From header, you would type SIP.REQ.HEADER(”From”).
SIP.REQ.HEADER(<header_name>).INSTANCE()	Returns the specified instance of the specified SIP header. Multiple instances of the same SIP header can occur. Where you want a specific instance of such a SIP header (for example, a specific Via header), you can specify that header by typing a number as the . Header instances are matched from last (0) to first. In other words, SIP.REQ.HEADER(”Via”).INSTANCE(0) returns the last instance of the Via header, while SIP.REQ.HEADER(”Via”).INSTANCE(1) returns the last instance but one of the Via header, and so on. For example, if used on the example SIP header, SIP.REQ.HEADER(”Via”).INSTANCE(1) returnsVia: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.
SIP.REQ.HEADER(<header_name>).VALUE()	Returns the contents of the specified instance of the specified SIP header. The usage is nearly the same as the previous expression. For example, if used on the SIP header example in the preceding table entry, SIP.REQ.HEADER(“Via”).VALUE(1) returns SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.
SIP.REQ.HEADER(<header_name>).COUNT	Returns the number of instances of a particular header as an integer. For example, if used on the SIP header example above, SIP.REQ.HEADER(“Via”).COUNT returns 2.

Expression	Description
SIP.REQ.HEADER(<header_name>).EXISTS	Returns a boolean value of true or false, depending upon whether the specified header exists or not. For example, if used on the SIP header example above, SIP.REQ.HEADER("Expires").EXISTSreturns true, while SIP.REQ.HEADER("Caller-ID").EXISTS returns false.
SIP.REQ.HEADER(<header_name>).LIST	Returns the comma-separated parameter list in the specified header. For example, if used on the SIP header example above, SIP.REQ.HEADER("Allow").LIST returns ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,U You can append the string .GET() to select a specific list item. For example, to get the first item (ACK) from the above list, you would type SIP.REQ.HEADER("Allow").LIST.GET(0). To extract the second item (BYE), you would type SIP.REQ.HEADER("Allow").LIST.GET(1). Note: If the specified header contains a list of name/value pairs, the entire name/value pair is returned.
SIP.REQ.HEADER(<header_name>).TYPECAST_SI	Typecasts to . Any text can be typecasted to thesip_header_t class, after which all header-based operations can be used. After you perform this operation, you can apply all operations that can be used with . For example, the expression SIP.REQ.CONTENT_LENGTH.TYPECAST_SIP_HEADER_T ty casts all instances of the Content-Length header. After you perform this operation, you can apply all header operations to all instances of the specified header.
SIP.REQ.HEADER(<header_name>).CONTAINS(<string>)	Returns boolean true if the specified text string is present in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.

Expression	Description
SIP.REQ.HEADER(<header_name>).EQUALS_ANY	Returns boolean true if any pattern associated with <patset> matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.
SIP.REQ.HEADER(<header_name>).CONTAINS_ANY(<patset>)	Returns Boolean true if any pattern associated with <patset> matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.
SIP.REQ.HEADER(<header_name>).CONTAINS_IN	Returns the index of the matching pattern associated with <patset> if that pattern matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.
SIP.REQ.HEADER(<header_name>).EQUALS_INDEX(<patset>)	Returns the index of the matching pattern associated with <patset> if that pattern matches any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.
SIP.REQ.HEADER(<header_name>).SUBSTR(<stri	If the specified string is present in any instance of the specified header, this expression returns that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re turns “rport=5060”.SIP.REQ.HEADER(“Via”).SUBSTR(“rport=50 turns an empty string.

Expression	Description
SIP.REQ.HEADER(<header_name>).AFTER_STR(<string>)	If the specified string is present in any instance of the specified header, this expression returns the string immediately after that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re the expression SIP.REQ.HEADER("Via").AFTER_STR("rport=") returns 5060.
SIP.REQ.HEADER(<header_name>).REGEX_MATC	Returns boolean true if the specified regular expression (regex) matches any instance of the specified header. You must specify the regular expression in the following format: re<delimiter>regular expression<same delimiter>. The regular expression cannot be larger than 1499 characters in length. It must conform to the PCRE regular expression library. See http://www.pcre.org/pcre.txt for documentation on PCRE regular expression syntax. The pcrepattern man page also has useful information on specifying patterns by using PCRE regular expressions. The regular expression syntax supported in this expression has some differences from PCRE. Back references are not allowed. You should avoid recursive regular expressions; although some work, many do not. The dot (.) metacharacter matches newlines. Unicode is not supported.SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

Expression	Description
SIP.REQ.HEADER(<header_name>).REGEX_SELECT(<regex>)	If the specified regex matches any text in any instance of the specified header, this expression returns the text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re the expression SIP.REQ.HEADER(“Via”).REGEX_SELECT(“received=[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}”) returns received=10.102.84.160.
SIP.REQ.HEADER(<header_name>).AFTER_REGE	If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately after that text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re the expression SIP.REQ.HEADER(“Via”).AFTER_REGEX(“received=”) returns10.102.84.160.
SIP.REQ.HEADER(<header_name>).BEFORE_REGEX(<regex>)	If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately before that text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re the expression SIP.REQ.HEADER(“Via”).BEFORE_REGEX(“[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}”) returns received=.
SIP.REQ.FULL_HEADER	Returns the entire SIP header, including the terminating CR/LF.
SIP.REQ.IS_VALID	Returns boolean true if the request format is valid.
SIP.REQ.BODY(<length>)	Returns the request body, up to the specified length. If the specified length is greater than the length of the request body, this expression returns the entire request body.

Expression	Description
SIP.REQ.LB_VSERVER	Returns the name of the load balancing virtual server (LB vserver) that is serving the current request.
SIP.REQ.CS_VSERVER	Returns the name of the content switching virtual server (CS vserver) that is serving the current request.

SIP response expressions

Expression	Description
SIP.RES.STATUS	Returns the SIP response status code. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns 100.
SIP.RES.STATUS_MSG	Returns the SIP response status message. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns Trying.
SIP.RES.IS_REDIRECT	Returns boolean true if the response code is a redirect.
SIP.RES.METHOD	Returns the response method extracted from the request method string in the CSeq header.

Operations for HTTP, HTML, and XML encoding and "safe" characters

September 21, 2020

The following operations work with the encoding of HTML data in a request or response and XML data in a POST body.

- **<text>.HTML_XML_SAFE:**
  Transforms special characters into XML safe format, as in the following examples:

  A left-pointing angle bracket (<) is converted to <
  A right-pointing angle bracket (>) is converted to >
  An ampersand (&) is converted to &

This operation safeguards against cross-site scripting attacks. Maximum length of the transformed text is 2048 bytes. This is a read-only operation.

After applying the transformation, additional operators that you specify in the expression are applied to the selected text. Following is an example:

http.req.url.query.html_xml_safe. contains("myQueryString")

- **<text>.HTTP_HEADER_SAFE:**
  Converts all new line ('\n') characters in the input text to '%0A' to enable the input to be used safely in HTTP headers.

  This operation safeguards against response-splitting attacks.

  The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

- **<text>.HTTP_URL_SAFE:**
  Converts unsafe URL characters to '%xx' values, where "xx" is a hex-based representation of the input character. For example, the ampersand (&) is represented as %26 in URL-safe encoding. The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

  Following are URL safe characters. All others are unsafe:

  - Alpha-numeric characters: a-z, A-Z, 0-9
  - Asterix: "*"
  - Ampersand: "&"
  - At-sign: "@"
  - Colon: ":"
  - Comma: ","
  - Dollar: "$"
  - Dot: "."
  - Equals: "="
  - Exclamation mark: "!"
  - Hyphen: "-"
  - Open and close parentheses: "(", ")"
  - Percent: "%"
  - Plus: "+"
  - Semicolon: ";"
  - Single quote: "'"
  - Slash: "/"
  - Question mark: "?"
  - Tilde: "~"
  - Underscore: "_"

- **<text>.MARK_SAFE:**
  Marks the text as safe without applying any type of data transformation.

- **<text>.SET_TEXT_MODE(URLENCODED|NOURLENCODED)
  Transforms all %HH encoding in the byte stream. This operation works with characters (not bytes). By default, a single byte represents a character in ASCII encoding. However, if you specify URLENCODED mode, three bytes can represent a character.

  In the following example, a PREFIX(3) operation selects the first 3 characters in a target.

  `http.req.url.hostname.prefix(3)`

  In the following example, the NetScaler can select up to 9 bytes from the target:

  `http.req.url.hostname.set_text_mode(urlencoded).prefix(3)`

- **<text>.SET_TEXT_MODE(PLUS_AS_SPACE|NO_PLUS_AS_SPACE):**
  Specifies how to treat the plus character (+). The PLUS_AS_SPACE option replaces a plus character with white space. For example, the text "hello+world" becomes "hello world." The NO_PLUS_AS_SPACE option leaves plus characters as they are.

- **<text>.SET_TEXT_MODE(BACKSLASH_ENCODED|NO_BACKSLASH_ENCODED):**
  Specifies whether or not backslash decoding is performed on the text object represented by <text>.

  If BACKSLASH_ENCODED is specified, the SET_TEXT_MODE operator performs the following operations on the text object:

  - All occurrences of "\XXX" will be replaced with the character "Y" (where XXX represents a number in the octal system and Y represents the ASCII equivalent of XXX). The valid range of octal values for this type of encoding is 0 to 377. For example, the encoded text "http\72//" and http\072//" will both be decoded to http://, where the colon (:) is the ASCII equivalent of the octal value "72".
  - All occurrences of "\xHH" will be replaced with the character "Y" (HH represents a number in the hexadecimal system and Y denotes the ASCII equivalent of HH. For example, the encoded text "http\x3a//" will be decoded to http://, where the colon (:) is the ASCII equivalent of the hexadecimal value "3a".
  - All occurrences of "\uWWXX" will be replaced with the character sequence "YZ" (Where WW and XX represent two distinct hexadecimal values and Y and Z represent their ASCII equivalents of WW and XX respectively. For example, the encoded text "http%u3a2f/" and "http%u003a//" will both be decoded to http://, where "3a" and "2f" are two hexadecimal values and the colon (:) and forward slash ("/") represent their ASCII equivalents respectively.
  - All occurrences of "\b", "\n", "\t", "\f", and "\r" are replaced with the corresponding ASCII characters.
    If NO_BACKSLASH_ENCODED is specified, backslash decoding is not performed on the text object.

- **<text>.SET_TEXT_MODE(BAD_ENCODE_RAISE_UNDEF|NO_BAD_ENCODE_RAISE_UNDEF):** Performs the associated undefined action if either the URLENCODED or the BACKSLASH_ENCODED mode is set and bad encoding corresponding to the specified encoding mode is encountered in the text object represented by <text>.

  If NO_BAD_ENCODE_RAISE_UNDEF is specified, the associated undefined action will not be performed when bad encoding is encountered in the text object represented by<text>.

Expressions for TCP, UDP, and VLAN data

September 21, 2020

TCP and UDP data take the form of a string or a number. For expression prefixes that return string values for TCP and UDP data, you can apply any text-based operations. For more information, see Advanced policy expressions: Evaluating text.

For expression prefixes that return numeric value, such as a source port, you can apply an arithmetic operation. For more information, see Basic operations on expression prefixes and Compound operations for numbers.

The following table describes prefixes that extract TCP and UDP data.

GET Operation	Description
CLIENT.TCP.PAYLOAD(<integer>)	Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the <integer> argument. You can apply any text-based operation to this prefix.
CLIENT.TCP.SRCPORT	Returns the ID of the current packet's source port as a number.
CLIENT.TCP.DSTPORT	Returns the ID of the current packet's destination port as a number.
CLIENT.TCP.OPTIONS	Returns the TCP options set by the client. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(<type>), and TYPE_NAME(<m>) operators can be used with this prefix. For the TCP options set by the server, see the SERVER.TCP.OPTIONS prefix.

GET Operation	Description
CLIENT.TCP.OPTIONS.COUNT	Returns the number of TCP options that the client has set.
CLIENT.TCP.OPTIONS.TYPE(<type>)	Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order). Parameters: type - Type value
CLIENT.TCP.OPTIONS.TYPE_NAME(<m>)	Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(<type>). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(<type>). Parameters: m - TCP option enumeration constant
CLIENT.TCP.REPEATER_OPTION.EXISTS	Returns a Boolean TRUE if Repeater TCP options exist.
CLIENT.TCP.REPEATER_OPTION.IP	Returns the branch repeater’s IPv4 address from the Repeater TCP options.
CLIENT.TCP.REPEATER_OPTION.MAC	Returns the branch repeater’s MAC address from the Repeater TCP options.
CLIENT.UDP.DNS.DOMAIN	Returns the DNS domain name.
CLIENT.UDP.DNS.DOMAIN.EQ(“<hostname>”)	Returns a Boolean TRUE if the domain name matches the <hostname> argument. The comparison is case insensitive. Following is an example: client.udp.dns.domain.eq(“www.mycompany.com”)
CLIENT.UDP.DNS.IS_AAAAREC	Returns a Boolean TRUE if the record type is AAAA. These types of records indicate an IPv6 address in forward lookups.
CLIENT.UDP.DNS.IS_ANYREC	Returns a Boolean TRUE if it is of any record type.

GET Operation	Description
CLIENT.UDP.DNS.IS_AREC	Returns a Boolean TRUE if the record is type A. Type A records provide the host address.
CLIENT.UDP.DNS.IS_CNAMEREC	Returns a Boolean TRUE if the record is of type CNAME. In systems that use multiple names to identify a resource, there is one canonical name and a number of aliases. The CNAME provides the canonical name.
CLIENT.UDP.DNS.IS_MXREC	Returns a Boolean TRUE if the record is of type MX (mail exchanger). This DNS record describes a priority and a host name. The MX records for the same domain name specify the email servers in the domain and the priority for each server.
CLIENT.UDP.DNS.IS_NSREC	Returns a Boolean TRUE if the record is of type NS. This is a name server record that includes a host name with an associated A record. This enables locating the domain name that is associated with the NS record.
CLIENT.UDP.DNS.IS_PTRREC	Returns a Boolean TRUE if the record is of type PTR. This is a domain name pointer and is often used to associate a domain name with an IPv4 address.
CLIENT.UDP.DNS.IS_SOAREC	Returns a Boolean TRUE if the record is of type SOA. This is a start of authority record.
CLIENT.UDP.DNS.IS_SRVREC	Returns a Boolean TRUE if the record is of type SRV. This is a more general version of the MX record.
CLIENT.UDP.DSTPORT	Returns the numeric ID of the current packet's UDP destination port.
CLIENT.UDP.SRCPORT	Returns the numeric ID of the current packet's UDP source port.
CLIENT.UDP.RADIUS	Returns RADIUS data for the current packet.
CLIENT.UDP.RADIUS.ATTR_TYPE(<type>)	Returns the value for the attribute type specified as the argument.
CLIENT.UDP.RADIUS.USERNAME	Returns the RADIUS user name.

GET Operation	Description
CLIENT.TCP.MSS	Returns the maximum segment size (MSS) for the current connection as a number.
CLIENT.VLAN.ID	Returns the numeric ID of the VLAN through which the current packet entered the NetScaler.
SERVER.TCP.DSTPORT	Returns the numeric ID of the current packet's destination port.
SERVER.TCP.SRCPORT	Returns the numeric ID of the current packet's source port.
SERVER.TCP.OPTIONS	Returns the TCP options set by the server. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(<type>), and TYPE_NAME(<m>) operators can be used with this prefix. For the TCP options set by the client, see the CLIENT.TCP.OPTIONS prefix.
SERVER.TCP.OPTIONS.COUNT	Returns the number of TCP options that the server has set.
SERVER.TCP.OPTIONS.TYPE(<type>)	Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order). Parameters: type - Type value
SERVER.TCP.OPTIONS.TYPE_NAME(<m>)	Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(<type>). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(<type>). Parameters: m - TCP option enumeration constant

GET Operation	Description
SERVER.VLAN	Operates on the VLAN through which the current packet entered the NetScaler.
SERVER.VLAN.ID	Returns the numeric ID of the VLAN through which the current packet entered the NetScaler.

Expressions for evaluating a DNS message and identifying its carrier protocol

September 21, 2020

You can evaluate DNS requests and responses by using expressions that begin with DNS.REQ and DNS.RES, respectively. You can also identify the transport layer protocol that is being used to send the DNS messages.

The following functions return the contents of a DNS query.

Function	Description
DNS.REQ.QUESTION.DOMAIN	Return the domain name (the value of the QNAME field) in the question section of the DNS query. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.
DNS.REQ.QUESTION.TYPE	Return the query type (the value of the QTYPE field) in the DNS query. The field indicates the type of resource record (for example, A, NS, or CNAME) for which the name server is being queried. The returned value can be compared to one of the following values by using the EQ() and NE()functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. Note: You can use only the EQ() and NE() functions with the TYPE function. Example: DNS.REQ.QUESTION.TYPE.EQ(MX)

The following functions return the contents of a DNS response.

Function	Description
DNS.RES.HEADER.RCODE	Return the response code (the value of the RCODE field) in the header section of the DNS response. You can use only the EQ() and NE() functions with the RCODE function. Following are the possible values: NOERROR, FORMERR, SERVFAIL, NXDOMAIN, NOTIMP, and REFUSED.
DNS.RES.QUESTION.DOMAIN	Return the domain name (the value of the QNAME field) in the question section of the DNS response. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.
DNS.RES.QUESTION.TYPE	Return the query type (the value of the QTYPE field) in the question section of the DNS response. The field indicates the type of resource record (for example, A, NS, or CNAME) that is contained in the response. The returned value can be compared to one of the following values by using the EQ()and NE() functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. You can use only the EQ() and NE() functions with the TYPE function. Example: DNS.RES.QUESTION.TYPE.EQ(SOA)

The following functions return the transport layer protocol name.

Function	Description
DNS.REQ.TRANSPORT	Return the name of the transport layer protocol that was used to send the DNS query. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example: DNS.REQ.TRANSPORT.EQ(TCP)

Function	Description
DNS.RES.TRANSPORT	Return the name of the transport layer protocol that was used for the DNS response. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example: DNS.RES.TRANSPORT.EQ(TCP)

XPath and HTML, XML, or JSON expressions

September 21, 2020

The Advanced policy infrastructure supports expressions for evaluating and retrieving data from HTML, XML, and JavaScript Object Notation (JSON) files. This enables you to find specific nodes in an HTML, XML, or JSON document, determine if a node exists in the file, locate nodes in XML contexts (for example, nodes that have specific parents or a specific attribute with a given value), and return the contents of such nodes. Additionally, you can use XPath expressions in rewrite expressions.

The Advanced policy expression implementation for XPath comprises an Advanced policy expression prefix (such as "HTTP.REQ.BODY") that designates HTML or XML text, and the XPATH operator that takes the XPath expression as its argument.

HTML files are a largely free-form collection of tags and text elements. You can use the XPATH_HTML operator, which takes an XPath expression as its argument, to process HTML files. JSON files are either a collection of name/value pairs or an ordered list of values. You can use the XPATH_JSON operator, which takes an XPath expression as its argument, to process JSON files.

- **<text>.XPATH(xpathex):**
  Operate on an XML file and return a Boolean value.

  For example, the following expression returns a Boolean TRUE if a node called "creator" exists under the node "Book" within the first 1000 bytes of the XML file.

  ```
  HTTP.REQ.BODY(1000).XPATH(xp%boolean(//Book/creator)%)
  ```

  Parameters:

  xpathex - XPath Boolean expression

- **<text>.XPATH(xpathex):**
  Operate on an XML file and return a value of data type "double."

For example, the following expression converts the string "36" (a price value) to a value of data type "double" if the string is in the first 1000 bytes of the XML file:

`HTTP.REQ.BODY(1000).XPATH(xp%number(/Book/price)%)`

Parameters:

xpathex - XPath numeric expression

- **<text>.XPATH(xpathex):**
  Operate on an XML file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

  For example, the following expression selects all the nodes that are enclosed by "/Book/creator" (a node-set) in the first 1000 bytes of the body:

  `HTTP.REQ.BODY(1000).XPATH(xp%/Book/creator%)`

  Parameters:

  xpathex - XPath expression

Example

```
    <Book>
    <creator>
        <Person>
            <name>Milton</name>
        </Person>
    </creator>
    <title>Paradise Lost</title>
    </Book>
<!--NeedCopy-->
```

- **<text>.XPATH_HTML(xpathex)**

  Operate on an HTML file and return a text value.

  For example, the following expression operates on an HTML file and returns the text enclosed in <title></title> tags if the title HTML element is found in the first 1000 bytes:

  `HTTP.REQ.BODY(1000).XPATH_HTML(xp%/html/head/title%)`

  Parameters:

  xpathex - XPath text expression

- **<text>.XPATH_HTML_WITH_MARKUP(xpathex)**

  Operate on an HTML file and return a string that contains the entire selected portion of the document, including markup such as including the enclosing element tags.

The following expression operates on the HTML file and selects all content within the <title> tag, including markup.

`HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP( xp%/html/head/title%)`

The portion of the HTML body that is selected by the expression is marked for further processing.

Parameters:

xpathex - XPath expression

- **<text>.XPATH_JSON(xpathex)**

  Operate on a JSON file and return a Boolean value.

  For example, consider the following JSON file:

  { "Book":{ "creator":{ "person":{ "name":'<name>' } }, "title":'<title>' } }

  The following expression operates on the JSON file and returns a Boolean TRUE if the JSON file contains a node named "creator," whose parent node is "Book," in the first 1000 bytes:

  `HTTP.REQ.BODY(1000).XPATH_JSON(xp%boolean(/Book/creator)%)`

  Parameters:

  xpathex - XPath Boolean expression

- **<text>.XPATH_JSON(xpathex)**

  Operate on a JSON file and return a value of data type "double."

  For example, consider the following JSON file:

  { "Book":{ "creator":{ "person":{ "name":'<name>' } }, "title":'<title>', "price":"36" } }

  The following expression operates on the JSON file and converts the string "36" to a value of data type "double" if the string is present in the first 1000 bytes of the JSON file.

  `HTTP.REQ.BODY(1000).XPATH_JSON(xp%number(/Book/price)%)`

  Parameters:

  xpathex - XPath numeric expression

- **<text>.XPATH_JSON(xpathex)**

  Operate on a JSON file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

  For example, consider the following JSON file:

  { "Book":{ "creator":{ "person":{ "name":'<name>' } }, "title":'<title>' } }

  The following expression selects all the nodes that are enclosed by "/Book" (a node-set) in the first 1000 bytes of the body of the JSON file and returns the corresponding string value, which is "<name><title>":

`HTTP.REQ.BODY(1000).XPATH_JSON(xp%/Book%)`

Parameters:

xpathex - XPath expression

- **<text>.XPATH_JSON_WITH_MARKUP(xpathex)**
  Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

  For example, consider the following JSON file:

  {"Book":{ "creator":{ "person":{ "name":'<name>' } }, "title":'<title>' } }

  The following expression operates on the JSON file and selects all the nodes that are enclosed by "/Book/creator" in the first 1000 bytes of the body, which is "creator:{ person:{ name:'<name>' } }."

  `HTTP.REQ.BODY(1000).XPATH_JSON_WITH_MARKUP(xp%/Book/creator%)`

  The portion of the JSON body that is selected by the expression is marked for further processing.

  Parameters:

  xpathex - XPath expression

- **<text>.XPATH_WITH_MARKUP(xpathex):**
  Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

  For example, the following expression operates on an XML file and selects all the nodes enclosed by "/Book/creator" in the first 1000 bytes of the body.

  `HTTP.REQ.BODY(1000).XPATH_WITH_MARKUP(xp%/Book/creator%)`

  The portion of the JSON body that is selected by the expression is marked for further processing.

  Parameters:

  xpathex - XPath expression

Encrypt and decrypt XML payloads

September 21, 2020

You can use the XML_ENCRYPT() and XML_DECRYPT() functions in Advanced policy expressions to encrypt and decrypt, respectively, XML data. These functions conform to the W3C XML Encryption standard defined at "http://www.w3.org/TR/2001/PR-xmldsig-core-20010820/." XML_ENCRYPT() and XML_DECRYPT() support a subset of the XML Encryption specification. In the subset, data encryption uses a bulk cipher method (RC4, DES3, AES128, AES192, or AES256), and an RSA public key is used to encrypt the bulk cipher key.

Note: If you want to encrypt and decrypt text in a payload, you must use the
ENCRYPT and
DECRYPT functions. For more information about these functions, see
Encrypt and decrypt text.

The
XML_ENCRYPT() and
XML_DECRYPT() functions are not dependent on the encryption/decryption service that is used by the
ENCRYPT and
DECRYPT commands for text. The cipher method is specified explicitly as an argument to the
XML_ENCRYPT() function. The
XML_DECRYPT() function obtains the information about the specified cipher method from the
<xenc:EncryptedData> element. Following are synopses of the XML encryption and decryption functions:

- **XML_ENCRYPT(<certKeyName>, <method> [, <flags>])**. Returns an <xenc:EncryptedData> element that contains the encrypted input text and the encryption key, which is itself encrypted by using RSA.
- **XML_DECRYPT(<certKeyName>)**. Returns the decrypted text from the input <xenc:EncryptedData> element, which includes the cipher method and the RSA-encrypted key.

Note: The
<xenc:EncryptedData> element is defined in the W3C XML Encryption specification.

Following are descriptions of the arguments:

- **certKeyName:** Selects an X.509 certificate with an RSA public key for XML_ENCRYPT() or an RSA private key for XML_DECRYPT(). The certificate key must have been previously created by an add ssl certKey command.
- **method:** Specifies which cipher method to use for encrypting the XML data. Possible values: RC4, DES3, AES128, AES192, AES256.
- **flags:** A bitmask specifying the following optional key information (
  <ds:KeyInfo>) to be included in the
  <xenc:EncryptedData> element that is generated by
  XML_ENCRYPT():
  - **1** - Include a KeyName element with the certKeyName. The element is <ds:KeyName>.
  - **2** - Include a KeyValue element with the RSA public key from the certificate. The element is <ds:KeyValue>.
  - **4** - Include an X509IssuerSerial element with the certificate serial number and issuer DN. The element is <ds:X509IssuserSerial>.

  - **8** - Include an X509SubjectName element with the certificate subject DN. The element is <ds:X509SubjectName>.
  - **16** - Include an X509Certificate element with the entire certificate. The element is <ds:X509Certificate>.

Use the XML_ENCRYPT() and XML_DECRYPT() functions in expressions

The XML encryption feature uses SSL certificate-key pairs to provide X.509 certificates (with RSA public keys) for key encryption and RSA private keys for key decryption. Therefore, before you use the XML_ENCRYPT() function in an expression, you must create an SSL certificate-key pair. The following command creates an SSL certificate-key pair, my-certkey, with the X.509 certificate, my-cert.pem, and the private key file, my-key.pem.

`add ssl certKey my-certkey -cert my-cert.pem -key my-key.pem -passcrypt kxPeMRYnitY=`

The following CLI commands create rewrite actions and policies for encrypting and decrypting XML content.

```
add rewrite action my-xml-encrypt-action replace "HTTP.RES.BODY(10000).
    XPATH_WITH_MARKUP(xp%/%)" "HTTP.RES.BODY(10000).XPATH_WITH_MARKUP(xp
    %/%).XML_ENCRYPT("my-certkey", AES256, 31)" -bypassSafetyCheck YES

add rewrite action my-xml-decrypt-action replace "HTTP.REQ.BODY(10000).
    XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%)" "HTTP.REQ.BODY(10000).
    XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%).XML_DECRYPT("my-certkey"
    )" -bypassSafetyCheck YES

add rewrite policy my-xml-encrypt-policy "HTTP.REQ.URL.CONTAINS("xml-
    encrypt")" my-xml-encrypt-action

add rewrite policy my-xml-decrypt-policy "HTTP.REQ.BODY(10000).XPATH(xp
    %boolean(//xenc:EncryptedData)%)" my-xml-decrypt-action

bind rewrite global my-xml-encrypt-policy 30

bind rewrite global my-xml-decrypt-policy 30
<!--NeedCopy-->
```

In the above example, the rewrite action my-xml-encrypt-action encrypts the entire XML document (XPATH_WITH_MARKUP(xp%/%)) in the request by using the AES-256 bulk encryption method and the RSA public key from my-certkey to encrypt the bulk encryption key. The action replaces the document with an <xenc:EncryptedData> element containing the encrypted data and an encrypted key. The flags represented by 31 include all of the optional <ds:KeyInfo> elements.

The action my-xml-decrypt-action decrypts the first <xenc:EncryptedData> element in the response (XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%)). This requires the prior addition of the xenc XML namespace by use of the following CLI command:

```
add ns xmlnamespace xenc http://www.w3.org/2001/04/xmlenc##
```

The my-xml-decrypt-action action uses the RSA private key in my-certkey to decrypt the encrypted key and then uses the bulk encryption method specified in the element to decrypt the encrypted contents. Finally, the action replaces the encrypted data element with the decrypted content.

The rewrite policy my-xml-encrypt-policy applies my-xml-encrypt-action to requests for URLs containing xml-encrypt. The action encrypts the entire response from a service configured on the NetScaler appliance.

The rewrite policy my-xml-decrypt-policy applies my-xml-decrypt-action to requests that contain an <xenc:EncryptedData> element ((XPATH(xp%//xenc:EncryptedData%) returns a non-empty string). The action decrypts the encrypted data in requests that are bound for a service configured on the NetScaler appliance.

Advanced policy expressions: parsing SSL

September 21, 2020

There are advanced policy expressions to parse SSL certificates and SSL client hello messages.

Parse SSL certificates

You can use advanced policy expressions to evaluate X.509 Secure Sockets Layer (SSL) client certificates. A client certificate is an electronic document that can be used to authenticate a user's identity. A client certificate contains (at a minimum) version information, a serial number, a signature algorithm ID, an issuer name, a validity period, a subject (user) name, a public key, and signatures.

You can examine both SSL connections and data in client certificates. For example, you may want to send SSL requests that use low-strength ciphers to a particular load balancing virtual server farm. The following command is an example of a Content Switching policy that parses the cipher strength in a request and matches cipher strengths that are less than or equal to 40:

```
add cs policy p1 -rule "client.ssl.cipher\_bits.le(40)"
<!--NeedCopy-->
```

As another example, you can configure a policy that determines whether a request contains a client certificate:

```
add cs policy p2 -rule "client.ssl.client\_cert EXISTS"
<!--NeedCopy-->
```

Or, you might want to configure a policy that examines particular information in a client certificate. For example, the following policy verifies that the certificate has one or more days before expiration:

```
add cs policy p2 -rule "client.ssl.client\_cert exists && client.ssl.
    client\_cert.days\_to\_expire.ge(1)"
<!--NeedCopy-->
```

> **Note**
>
> For information on parsing dates and times in a certificate, see Format of Dates and Times in an Expression" and
> Expressions for SSL Certificate Dates.

Prefixes for text-based SSL and certificate data

The following table describes expression prefixes that identify text-based items in SSL transactions and client certificates.

Table 1. Prefixes That Return Text or Boolean Values for SSL and Client Certificate Data

Prefix	Description
CLIENT.SSL.CLIENT_CERT	Returns the SSL client certificate in the current SSL transaction.
CLIENT.SSL.CLIENT_CERT.TO_PEM	Returns the SSL client certificate in binary format.
CLIENT.SSL.CIPHER_EXPORTABLE	Returns a Boolean TRUE if the SSL cryptographic SSL cryptographic cipher is exportable.
CLIENT.SSL.CIPHER_NAME	Returns the name of the SSL Cipher if invoked from an SSL connection, and a NULL string if invoked from a non-SSL connection.
CLIENT.SSL.IS_SSL	Returns a Boolean TRUE if the current connection is SSL-based.

Prefixes for numeric data in SSL certificates

The following table describes prefixes that evaluate numeric data other than dates in SSL certificates. These prefixes can be used with the operations that are described in Basic Operations on Expression Prefixes" and Compound Operations for Numbers.

Table 2. Prefixes That Evaluate Numeric Data Other Than Dates in SSL Certificates

Prefix	Description
CLIENT.SSL.CLIENT_CERT.DAYS_TO_EXPIRE	Returns the number of days that the certificate is valid, or returns -1 for expired certificates.
CLIENT.SSL.CLIENT_CERT.PK_SIZE	Returns the size of the public key used in the certificate.
CLIENT.SSL.CLIENT_CERT.VERSION	Returns the version number of the certificate. If the connection is not SSL-based, returns zero (0).
CLIENT.SSL.CIPHER_BITS	Returns the number of bits in the cryptograhic key. Returns 0 if the connection is not SSL-based.
CLIENT.SSL.VERSION	Returns a number that represents the SSL protocol version, as follows: 0. The transaction is not SSL-based.; 0x002. The transaction is SSLv2.; 0x300. The transaction is SSLv3.; 0x301. The transaction is TLSv1.; 0x302. The transaction is TLSv1.1.; 0x303. The transaction is TLSv1.2.

> **Note**
>
> For expressions related to expiration dates in a certificate, see Expressions for SSL Certificate Dates.

Expressions for SSL certificates

You can parse SSL certificates by configuring expressions that use the following prefix:

CLIENT.SSL.CLIENT_CERT

This section discusses the expressions that you can configure for certificates, with the exception of expressions that examine certificate expiration. Time-based operations are described in Advanced Policy Expressions: Working with Dates, Times, and Numbers.

The following table describes operations that you can specify for the CLIENT.SSL.CLIENT_CERT prefix.

Table 3. Operations That Can Be Specified with the CLIENT.SSL.CLIENT_CERT Prefix

SSL Certificate Operation	Description
`<certificate>.EXISTS`	Returns a Boolean TRUE if the client has an SSL certificate.
`<certificate>.ISSUER`	Returns the Distinguished Name (DN) of the Issuer in the certificate as a name-value list. An equals sign ("=") is the delimiter for the name and the value, and the slash ("/") is the delimiter that separates the name-value pairs. Following is an example of the returned DN: `/C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com`
`<certificate>.ISSUER.IGNORE_EMPTY_ELEMENTS`	Returns the Issuer and ignores the empty elements in a name-value list. For example, consider the following: Cert-Issuer: /c=in/st=kar//l=bangelore //o=mycompany/ou=sales/ /emailAddress=myuserid@mycompany.com. The following Rewrite action returns a count of 6 based on the preceding Issuer definition: `sh rewrite action insert_ssl_header Name: insert_sslOperation: insert_http_header Target:Cert-Issuer Value:CLIENT.SSL.CLIENT_CERT.ISSUER.COUNT`. However, if you change the value to the following, the returned count is 9: `CLIENT.SSL.CLIENT_CERT.ISSUER.IGNORE_EMPTY_ELEMENTS.COUNT`

Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs

September 21, 2020

You can use Advanced policy expression prefixes that return IPv4 and IPv6 addresses, MAC addresses, IP subnets, useful client and server data such as the throughput rates at the interface ports (Rx, Tx, and RxTx), and the IDs of the VLANs through which packets are received. You can then use various operators to evaluate the data that is returned by these expression prefixes.

Expressions for IP Addresses and IP Subnets

You can use Advanced policy expressions to evaluate addresses and subnets that are in Internet Protocol version 4 (IPv4) or Internet Protocol version 6 (IPv6) format. Expression prefixes for IPv6 addresses and subnets include IPv6 in the prefix. Expression prefixes for IPv4 addresses and subnets include IP in the prefix. Following is an example of an expression that identifies whether a request has originated from a particular IPv4 subnet.

```
client.ip.src.in_subnet(147.1.0.0/16)
<!--NeedCopy-->
```

Following are two examples of Rewrite policies that examine the subnet from which the packet is received and perform a rewrite action on the Host header. With these two policies configured, the rewrite action that is performed depends on the subnet in the request. These two policies evaluate IP addresses that are in the IPv4 address format.

```
- add rewrite action URL1-rewrite-action replace "http.req.header(\"Host\")" "\"www.mycompany1.com\""
- add rewrite policy URL1-rewrite-policy "http.req.header(\"Host\").contains(\"www.test1.com\") && client.ip.src.in_subnet(147.1.0.0/16)" URL1-rewrite-action
- add rewrite action URL2-rewrite-action replace "http.req.header(\"Host\")" "\"www.mycompany2.com\""
- add rewrite policy URL2-rewrite-policy "http.req.header(\"Host\").contains(\"www.test2.com\") && client.ip.src.in_subnet(10.202.0.0/16)" URL2-rewrite-action
<!--NeedCopy-->
```

> **Note**
>
> The preceding examples are commands that you type at the NetScaler command-line interface (CLI) and, therefore, each quotation mark must be preceded by a backslash (\). For more infor-

> mation, see Configuring advanced policy expressions in a policy.

Prefixes for IPV4 Addresses and IP Subnets

The following table describes prefixes that return IPv4 addresses and subnets, and segments of IPv4 addresses. You can use numeric operators and operators that are specific to IPv4 addresses with these prefixes. For more information about numeric operations, see Basic Operations on Expression Prefixes and Compound Operations for Numbers.

Table 1. Prefixes That Evaluate IP and MAC Addresses

Prefix	Description
CLIENT.IP.SRC	Returns the source IP of the current packet as an IP address or as a number.
CLIENT.IP.DST	Returns the destination IP of the current packet as an IP address or as a number.
SERVER.IP.SRC	Returns the source IP of the current packet as an IP address or as a number.
SERVER.IP.DST	Returns the destination IP of the current packet as an IP address or as a number.

Operations for IPV4 Addresses

The following table describes the operators that can be used with prefixes that return an IPv4 address.

Prefix	Description
`<ip address>.EQ(<address>)`	Returns a Boolean TRUE if the IP address value is same as the `<address>` argument. The following example checks whether the client's destination IP address is equal to 10.100.10.100: `client.ip.dst.eq(10.100.10.100)`
`<ip address>.GET1. . .GET4`	Returns a portion of an IP address as a numeric value. For example, if the IP address value is 10.100.200.1, the following is returned: `client.ip.src.get1 Returns 10;` `client.ip.src.get2 returns 100;` `client.ip.src.get3 returns 200`

Prefix	Description
`<ip address>.IN_SUBNET(<subnet>)`	Returns a Boolean TRUE if the `<subnet>` argument matches the subnet of the IP address value. For example, the following determines whether the client's destination IP address subnet is 10.100.10.100/18: `client.ip.dst.eq(10.100.10.100/18)`
`<ip address>.SUBNET(<n>)`	Returns the IP address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 32. For example: `CLIENT.IP.SRC.SUBNET (24)returns 192.168.1.0 if the IP address represented by the prefix is 192.168.1.[0-255].`
`<ip address>.IS_IPV6`	Returns a Boolean TRUE if this is an Internet Protocol version 6 (IPv6) host for the client or server. Following is an example: `client.ip.src.is_ipv6`
`<ip address>.MATCHES(<hostname>)`	Returns a Boolean TRUE if the IP address for the host specified in `<hostname>` matches the current IP address. The `<hostname>` cannot exceed 255 characters.
`<ip address>.MATCHES_LOCATION(< location>)`	Returns a Boolean TRUE if the location of the IP address matches the `<location>` argument. The Location string can take the following form: qual1.qual2.qual3.qual4.qual5.qual6, `for example: NorthAmeria.CA.* Following is an example: client.ip. src.matches_location \"Europe.GB .17.London.*.*\")`

About IPv6 expressions

The IPv6 address format allows more flexibility than the older IPv4 format. IPv6 addresses are in the hexadecimal format (RFC 2373). In the following examples, Example 1 is an IPv6 address, Example 2 is a URL that includes the IPv6 address, and Example 3 includes the IPv6 address and a port number.

Example 1:

```
9901:0ab1:22a2:88a3:3333:4a4b:5555:6666
<!--NeedCopy-->
```

Example 2:

```
http://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]/
<!--NeedCopy-->
```

Example 3:

```
https://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]:8080/
<!--NeedCopy-->
```

In Example 3, the brackets separate the IP address from the port number (8080).

Note that you can only use the '+' operator to combine IPv6 expressions with other expressions. The output is a concatenation of the string values that are returned from the individual expressions. You cannot use any other arithmetic operator with an IPv6 expression. The following syntax is an example:

```
client.ipv6.src + server.ip.dst
<!--NeedCopy-->
```

For example, if the client source IPv6 address is ABCD:1234::ABCD, and the server destination IPv4 address is 10.100.10.100, the preceding expression returns "ABCD:1234::ABCD10.100.10.100".

Note that when the NetScaler appliance receives an IPv6 packet, it assigns a temporary IPv4 address from an unused IPv4 address range and changes the source address of the packet to this temporary address. At response time, the outgoing packet's source address is replaced with the original IPv6 address.

> **Note**
>
> You can combine an IPv6 expression with any other expression except an expression that produces a Boolean result.

Expression prefixes for IPv6 addresses

The IPv6 addresses that are returned by the expression prefixes in the following table can be treated as text data. For example, the prefix client.ipv6.dst returns the destination IPv6 address as a string that can be evaluated as text.

The following table describes expression prefixes that return an IPv6 address.

Table 3. IPv6 Expression Prefixes That Return Text

Prefix	Description
CLIENT.IPV6	Operates on the IPv6 address in with the current packet.
CLIENT.IPV6.DST	Returns the IPv6 address in the destination field of the IP header.
CLIENT.IPV6.SRC	Returns the IPv6 address in the source field of the IP header. Following are examples: `client.ipv6.src.in_subnet(2007::2008/64)` `client.ipv6.src.get1.le(2008)`
SERVER.IPV6	Operates on the IPv6 address in with the current packet.
SERVER.IPV6.DST	Returns the IPv6 address in the destination field of the IP header.
SERVER.IPV6.SRC	Returns the IPv6 address in the source field of the IP header. Following are examples: `server.ipv6.src.in_subnet(2007::2008/64)` `server.ipv6.src.get1.le(2008)`

Operations for IPv6 prefixes

The following table describes the operators that can be used with prefixes that return an IPv6 address:

Table 4. Operations That Evaluate IPv6 Addresses

IPv6 Operation	Description
`<ipv6>.EQ(<IPv6_address>)`	Returns a Boolean TRUE if the IP address value is same as the argument. Following is an example: ‘client.ipv6.dst.eq(ABCD:1234::ABCD)‘

IPv6 Operation	Description
`<ipv6>.GET1. . .GET8`	Returns a segment of an IPv6 address as a number. The following example expressions retrieve segments from the ipv6 address 1000:1001:CD10:0000:0000:89AB:4567:CDEF: `client.ipv6.dst.get5 extracts 0000`, which is the fifth set of bits in the address. `client.ipv6.dst.get6 extracts 89AB`. `client.ipv6.dst.get7 extracts 4567`. You can perform numeric operations on these segments. Note that you cannot perform numeric operations when you retrieve an entire IPv6 address. This is because expressions that return an entire IPv6 address, such as CLIENT.IPV6.SRC, return the address in text format.
`<ipv6>.IN_SUBNET(<subnet>)`	Returns a Boolean TRUE if the IPv6 address value is in the subnet specified by the `<subnet>` argument. Following is an example: `client.ipv6.dst.eq(1000:1001:CD10 :0000:0000:89AB:4567:CDEF/60)`
`<ipv6>.IS_IPV4`	Returns a Boolean TRUE if this is an IPv4 client, and returns a Boolean FALSE if it is not.
`<ipv6>.SUBNET(<n>)`	Returns the IPv6 address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 128. For example: `CLIENT.IPV6.SRC.SUBNET(24)`

Expressions for MAC addresses

A MAC address consists of colon-delimited hexadecimal values in the format ##:##:##:##:##:##, where each “#” represents either a number from 0 through 9 or a letter from A through F. Default syntax expression prefixes and operators are available for evaluating source and destination MAC addresses.

Prefixes for MAC addresses

The following table describes prefixes that return MAC addresses.

Table 5. Prefixes That Evaluate MAC Addresses

Prefix	Description
client.ether.dstmac	Returns the MAC address in the destination field of the Ethernet header.
client.ether.srcmac	Returns the MAC address in the source field of the Ethernet header.

Operations for MAC addresses

The following table describes the operators that can be used with prefixes that return a MAC address.

Table 6. Operations on MAC Addresses

Prefix	Description
`<mac address>.EQ(<address>)`	Returns a Boolean TRUE if the MAC address value is same as the `<address>` argument.
`<mac address>.GET1. . .GET4`	Returns a numeric value extracted from the segment of the MAC address that is specified in the GET operation. For example, if the MAC address is 12:34:56:78:9a:bc, the following returns 34: `client.ether.dstmac.get2`

Expressions for Numeric Client and Server Data

The following table describes prefixes for working with numeric client and server data, including throughput, port numbers, and VLAN IDs.

Table 7. Prefixes That Evaluate Numeric Client and Server Data

Prefix	Description
client.interface.rxthroughput	Returns an integer representing the raw received traffic throughput in kilobytes per second (KBps) for the previous seven seconds.
client.interface.txthroughput	Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.

Prefix	Description
client.interface.rxtxthroughput	Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.
server.interface.rxthroughput	Returns an integer representing the raw received traffic throughput in KBps for the previous seven seconds.
server.interface.txthroughput	Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.
server.interface.rxtxthroughput	Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.
server.vlan.id	Returns a numeric ID of the VLAN through which the current packet entered the NetScaler.
client.vlan.id	Returns a numeric ID for the VLAN through which the current packet entered the NetScaler.

Advanced policy expressions: stream analytics functions

September 21, 2020

Stream Analytics expressions begin with the ANALYTICS.STREAM(<identifier_name>) prefix. The following list describes the functions that can be used with this prefix.

- **COLLECT_STATS**

  Collect statistical data from the requests that are evaluated against the policy and create a record for each request.

- **REQUESTS**

  Return the number of requests that exist for the specified record grouping. The value returned is of type unsigned long.

- **BANDWIDTH**

Return the bandwidth statistic for the specified record grouping. The value returned is of type unsigned long.

- **RESPTIME**

  Return the response time statistic for the specified record grouping. The value returned is of type unsigned long.

- **CONNECTIONS**

  Return the number of concurrent connections that exist for the specified record grouping. The value returned is of type unsigned long.

- **IS_TOP(n)**

  Return a Boolean
  TRUE if the statistical value for the specified record grouping is one among the top
  n groups. Otherwise, return a Boolean
  FALSE.

- **CHECK_LIMIT**

  Return a Boolean
  TRUE if the statistic for the specified record grouping has hit the preconfigured limit. Otherwise, return a Boolean
  FALSE.

Advanced policy expressions: DataStream

September 21, 2020

The policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process database server traffic when the appliance is deployed between a farm of application servers and their associated database servers.

This topic includes the following sections:

- Expressions for the MySQL Protocol
- Expressions for Evaluating Microsoft SQL Server Connections

Expressions for the MySQL protocol

The following expressions evaluate traffic associated with MySQL database servers. You can use the request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

- **MYSQL.CLIENT.** Operates on the client properties of a MySQL connection.
- **MYSQL.CLIENT.CAPABILITIES.** Returns the set of flags that the client has set in the capabilities field of the handshake initialization packet during authentication. Examples of the flags that are set are CLIENT_FOUND_ROWS, CLIENT_COMPRESS, and CLIENT_SSL.
- **MYSQL.CLIENT.CHAR_SET.** Returns the enumeration constant assigned to the character set that the client uses. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the character set enumeration constants:
    - LATIN2_CZECH_CS
    - DEC8_SWEDISH_CI
    - CP850_GENERAL_CI
    - GREEK_GENERAL_CI
    - LATIN1_GERMAN1_CI
    - HP8_ENGLISH_CI
    - KOI8R_GENERAL_CI
    - LATIN1_SWEDISH_CI
    - LATIN2_GENERAL_CI
    - SWE7_SWEDISH_CI
    - ASCII_GENERAL_CI
    - CP1251_BULGARIAN_CI
    - LATIN1_DANISH_CI
    - HEBREW_GENERAL_CI
    - LATIN7_ESTONIAN_CS
    - LATIN2_HUNGARIAN_CI
    - KOI8U_GENERAL_CI
    - CP1251_UKRAINIAN_CI
    - CP1250_GENERAL_CI
    - LATIN2_CROATIAN_CI
    - CP1257_LITHUANIAN_CI
    - LATIN5_TURKISH_CI
    - LATIN1_GERMAN2_CI
    - ARMSCII8_GENERAL_CI
    - UTF8_GENERAL_CI
    - CP1250_CZECH_CS
    - CP866_GENERAL_CI

  - KEYBCS2_GENERAL_CI
  - MACCE_GENERAL_CI
  - MACROMAN_GENERAL_CI
  - CP852_GENERAL_CI
  - LATIN7_GENERAL_CI
  - LATIN7_GENERAL_CS
  - MACCE_BIN
  - CP1250_CROATIAN_CI
  - LATIN1_BIN
  - LATIN1_GENERAL_CI
  - LATIN1_GENERAL_CS
  - CP1251_BIN
  - CP1251_GENERAL_CI
  - CP1251_GENERAL_CS
  - MACROMAN_BIN
  - CP1256_GENERAL_CI
  - CP1257_BIN
  - CP1257_GENERAL_CI
  - ARMSCII8_BIN
  - ASCII_BIN
  - CP1250_BIN
  - CP1256_BIN
  - CP866_BIN
  - DEC8_BIN
  - GREEK_BIN
  - HEBREW_BIN
  - HP8_BIN
  - KEYBCS2_BIN
  - KOI8R_BIN
  - KOI8U_BIN
  - LATIN2_BIN
  - LATIN5_BIN
  - LATIN7_BIN
  - CP850_BIN
  - CP852_BIN
  - SWE7_BIN
  - UTF8_BIN
  - GEOSTD8_GENERAL_CI
  - GEOSTD8_BIN

  - LATIN1_SPANISH_CI
  - UTF8_UNICODE_CI
  - UTF8_ICELANDIC_CI
  - UTF8_LATVIAN_CI
  - UTF8_ROMANIAN_CI
  - UTF8_SLOVENIAN_CI
  - UTF8_POLISH_CI
  - UTF8_ESTONIAN_CI
  - UTF8_SPANISH_CI
  - UTF8_SWEDISH_CI
  - UTF8_TURKISH_CI
  - UTF8_CZECH_CI
  - UTF8_DANISH_CI
  - UTF8_LITHUANIAN_CI
  - UTF8_SLOVAK_CI
  - UTF8_SPANISH2_CI
  - UTF8_ROMAN_CI
  - UTF8_PERSIAN_CI
  - UTF8_ESPERANTO_CI
  - UTF8_HUNGARIAN_CI
  - INVAL_CHARSET

- **MYSQL.CLIENT.DATABASE.** Returns the name of the database specified in the authentication packet that the client sends to the database server. This is the databasename attribute.
- MYSQL.CLIENT.USER. Returns the user name (in the authentication packet) with which the client is attempting to connect to the database. This is the user attribute.
- **MYSQL.REQ.** Operates on a MySQL request.
- **MYSQL.REQ.COMMAND.** Identifies the enumeration constant assigned to the type of command in the request. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the enumeration constant values:
  - SLEEP
  - QUIT
  - INIT_DB
  - QUERY
  - FIELD_LIST
  - CREATE_DB
  - DROP_DB
  - REFRESH

  - SHUTDOWN
  - STATISTICS
  - PROCESS_INFO
  - CONNECT
  - PROCESS_KILL
  - DEBUG
  - PING
  - TIME
  - DELAYED_INSERT
  - CHANGE_USER
  - BINLOG_DUMP
  - TABLE_DUMP
  - CONNECT_OUT
  - REGISTER_SLAVE
  - STMT_PREPARE
  - STMT_EXECUTE
  - STMT_SEND_LONG_DATA
  - STMT_CLOSE
  - STMT_RESET
  - SET_OPTION
  - STMT_FETCH

- **MYSQL.REQ.QUERY.** Identifies the query in the MySQL request.
- **MYSQL.REQ.QUERY.COMMAND.** Returns the first keyword in the MySQL query.
- **MYSQL.REQ.QUERY.SIZE.** Returns the size of the request query in integer format. The SIZE method is similar to the CONTENT_LENGTH method that returns the length of an HTTP request or response.
- **MYSQL.REQ.QUERY.TEXT.** Returns a string covering the entire query.
- **MYSQL.REQ.QUERY.TEXT(<n>).** Returns the first n bytes of the MySQL query as a string. This is similar to HTTP.BODY(<n>).

  Parameters:

  n - Number of bytes to be returned

- **MYSQL.RES.** Operates on a MySQL response.
- **MYSQL.RES.ATLEAST_ROWS_COUNT(<i>).** Checks whether the response has at least i number of rows and returns a Boolean TRUE or FALSE to indicate the result.

  Parameters:

  i - Number of rows

- **MYSQL.RES.ERROR.** Identifies the MySQL error object. The error object includes the error number and the error message.
- **MYSQL.RES.ERROR.MESSAGE.** Returns the error message that is retrieved from the server's error response.
- **MYSQL.RES.ERROR.NUM.** Returns the error number that is retrieved from the server's error response.
- **MYSQL.RES.ERROR.SQLSTATE.** Returns the value of the SQLSTATE field in the server's error response. The MySQL server translates error number values to SQLSTATE values.
- **MYSQL.RES.FIELD(<i>).** Identifies the packet that corresponds to the i<sup>th</sup> individual field in the server's response. Each field packet describes the properties of the associated column. The packet count (i) begins at 0.

  Parameters:

  i - Packet number
- **MYSQL.RES.FIELD(<i>).CATALOG.** Returns the catalog property of the field packet.
- **MYSQL.RES.FIELD(<i>).CHAR_SET.** Returns the character set of the column. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.
- **MYSQL.RES.FIELD(<i>).DATATYPE.** Returns an enumeration constant that represents the data type of the column. This is the type (also called enum_field_type) attribute of the column. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. The possible values for the various data types are:
  - DECIMAL
  - TINY
  - SHORT
  - LONG
  - FLOAT
  - DOUBLE
  - NULL
  - TIMESTAMP
  - LONGLONG
  - INT24
  - DATE
  - TIME
  - DATETIME
  - YEAR
  - NEWDATE

  - VARCHAR (new in MySQL 5.0)
  - BIT (new in MySQL 5.0)
  - NEWDECIMAL (new in MySQL 5.0)
  - ENUM
  - SET
  - TINY_BLOB
  - MEDIUM_BLOB
  - LONG_BLOB
  - BLOB
  - VAR_STRING
  - STRING
  - GEOMETRY
- **MYSQL.RES.FIELD(<i>).DB.** Returns the database identifier (db) attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).DECIMALS.** Returns the number of positions after the decimal point if the type is DECIMAL or NUMERIC. This is the decimals attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).FLAGS.** Returns the flags property of the field packet. Following are the possible hexadecimal flag values:
  - 0001: NOT_NULL_FLAG
  - 0002: PRI_KEY_FLAG
  - 0004: UNIQUE_KEY_FLAG
  - 0008: MULTIPLE_KEY_FLAG
  - 0010: BLOB_FLAG
  - 0020: UNSIGNED_FLAG
  - 0040: ZEROFILL_FLAG
  - 0080: BINARY_FLAG
  - 0100: ENUM_FLAG
  - 0200: AUTO_INCREMENT_FLAG
  - 0400: TIMESTAMP_FLAG
  - 0800: SET_FLAG
- **MYSQL.RES.FIELD(<i>).LENGTH.** Returns the length of the column. This is the value of the length attribute of the field packet. The value that is returned might be larger than the actual value. For example, an instance of a VARCHAR(2) column might return a value of 2 even when it contains only one character.
- **MYSQL.RES.FIELD(<i>).NAME.** Returns the column identifier (the name after the AS clause, if any). This is the name attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).ORIGINAL_NAME.** Returns the original column identifier (before the AS clause, if any). This is the org_name attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).ORIGINAL_TABLE.** Returns the original table identifier of the column (before the AS clause, if any). This is the org_table attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).TABLE.** Returns the table identifier of the column (after the AS clause, if any). This is the table attribute of the field packet.
- **MYSQL.RES.FIELDS_COUNT.** Returns the number of field packets in the response (the field_count attribute of the OK packet).
- **MYSQL.RES.OK.** Identifies the OK packet sent by the database server.
- **MYSQL.RES.OK.AFFECTED_ROWS.** Returns the number of rows affected by an INSERT, UPDATE, or DELETE query. This is the value of the affected_rows attribute of the OK packet.
- **MYSQL.RES.OK.INSERT_ID.** Identifies the unique_id attribute of the OK packet. If an auto-increment identity is not generated by the current MySQL statement or query, the value of unique_id, and hence the value returned by the expression, is 0.
- **MYSQL.RES.OK.MESSAGE.** Returns the message property of the OK packet.
- **MYSQL.RES.OK.STATUS.** Identifies the bit string in the server_status attribute of the OK packet. Clients can use the server status to check whether the current command is a part of a running transaction. The bits in the server_status bit string correspond to the following fields (in the given order):
    - IN TRANSACTION
    - AUTO_COMMIT
    - MORE RESULTS
    - MULTI QUERY
    - BAD INDEX USED
    - NO INDEX USED
    - CURSOR EXISTS
    - LAST ROW SEEN
    - DATABASE DROPPED
    - NO BACKSLASH ESCAPES
- **MYSQL.RES.OK.WARNING_COUNT.** Returns the warning_count attribute of the OK packet.
- **MYSQL.RES.ROW(<i>).** Identifies the packet that corresponds to the i<sup>th</sup> individual row in the database server's response.

  Parameters:

  i - Row number
- **MYSQL.RES.ROW(<i>).DOUBLE_ELEM(<j>).** Checks whether the j<sup>th</sup> column of the i<sup>th</sup> row of the table is NULL. Following C conventions, both indexes i and j

start from 0. Therefore, row i and column j are actually the (i+1)<sup>th</sup> row and the (j+1)<sup>th</sup> column, respectively.

Parameters:

i - Row number

j - Column number

- **MYSQL.RES.ROW(<i>).IS_NULL_ELEM(j).** Checks whether the j<sup>th</sup> column of the i<sup>th</sup> row of the table is NULL. Following C conventions, both indexes i and j start from 0. Therefore, row i and column j are actually the (i+1)<sup>th</sup> row and the (j+1)<sup>th</sup> column, respectively.

  Parameters:

  i - Row number

  j - Column number

- **MYSQL.RES.ROW(<i>).NUM_ELEM(<j>).** Returns an integer value from the j<sup>th</sup> column of the i<sup>th</sup> row of the table. Following C conventions, both indexes i and j start from 0. Therefore, row i and column j are actually the (i+1)<sup>th</sup> row and the (j+1)<sup>th</sup> column, respectively.

  Parameters:

  i - Row number

  j - Column number

- **MYSQL.RES.ROW(<i>).TEXT_ELEM(j).** Returns a string from the j<sup>th</sup> column of the i<sup>th</sup> row of the table. Following C conventions, both indexes i and j start from 0. Therefore, row i and column j are actually the (i+1)<sup>th</sup> row and the (j+1)<sup>th</sup> column, respectively.

  Parameters:

  i - Row number

  j - Column number

- **MYSQL.RES.TYPE.** Returns an enumeration constant for the response type. Its values can be ERROR, OK, and RESULT_SET. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.

Expressions for evaluating Microsoft SQL server connections

The following expressions evaluate traffic associated with Microsoft SQL Server database servers. You can use the request-based expressions (expressions that begin with MSSQL.CLIENT and MSSQL.REQ) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with MSSQL.RES) to evaluate server responses to user-configured health monitors.

Expression	Description
MSSQL.CLIENT.CAPABILITIES	Returns the OptionFlags1, OptionFlags2, OptionFlags3, and TypeFlags fields of the LOGIN7authentication packet, in that order, as a 4-byte integer. Each field is 1 byte long and specifies a set of client capabilities.
MSSQL.CLIENT.DATABASE	Returns the name of the client database. The value returned is of type text.
MSSQL.CLIENT.USER	Returns the user name with which the client authenticated. The value returned is of type text.
MSSQL.REQ.COMMAND	Returns an enumeration constant that identifies the type of command in the request sent to a Microsoft SQL Server database server. The value returned is of type text. Examples of the values of the enumeration constant are QUERY, RESPONSE, RPC, and ATTENTION. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.
MSSQL.REQ.QUERY.COMMAND	Returns the first keyword in the SQL query. The value returned is of type text.
MSSQL.REQ.QUERY.SIZE	Returns the size of the SQL query in the request. The value returned is a number.
MSSQL.REQ.QUERY.TEXT	Returns the entire SQL query as a string. The value returned is of type text.
MSSQL.REQ.QUERY.TEXT(<n>)	Returns the first n bytes of the SQL query. The value returned is of type text. Parameters: n - Number of bytes
MSSQL.REQ.RPC.NAME	Returns the name of the procedure that is being called in a remote procedure call (RPC) request. The name is returned as a string.

Expression	Description
MSSQL.REQ.RPC.IS_PROCID	Returns a Boolean value that indicates whether the remote procedure call (RPC) request contains a procedure ID or an RPC name. A return value of TRUEindicates that the request contains a procedure ID and a return value of FALSE indicates that the request contains an RPC name.
MSSQL.REQ.RPC.PROCID	Returns the procedure ID of the remote procedure call (RPC) request as an integer.
MSSQL.REQ.RPC.BODY	
Note: Not available for releases before 10.1.	Returns the body of the SQL request as a string in the form of parameters represented as "a=b" clauses separated by commas, where "a" is the RPC parameter name and "b" is its value.
MSSQL.REQ.RPC.BODY(n)	
Note: Not available for releases before 10.1.	Returns part of the body of the SQL request as a string in the form of parameters represented as "a=b" clauses separated by commas, where "a" is the RPC parameter name and "b" is its value. Parameters are returned from only the first "n" bytes of the request, skipping the SQL header. Only complete name-value pairs are returned.
MSSQL.RES.ATLEAST_ROWS_COUNT(i)	Checks whether the response has at least i number of rows. The value returned is a Boolean TRUE or FALSEvalue. Parameters: i - Number of rows
MSSQL.RES.DONE.ROWCOUNT	Returns a count of the number of rows affected by an INSERT, UPDATE, or DELETE query. The value returned is of type unsigned long.
MSSQL.RES.DONE.STATUS	Returns the status field from the DONE token sent by a Microsoft SQL Server database server. The value returned is a number.

Expression	Description
MSSQL.RES.ERROR.MESSAGE	Returns the error message from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the MsgText field in the ERROR token. The value returned is of type text.
MSSQL.RES.ERROR.NUM	Returns the error number from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the Number field in the ERROR token. The value returned is a number.
MSSQL.RES.ERROR.STATE	Returns the error state from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the State field in the ERROR token. The value returned is a number.
MSSQL.RES.FIELD(<i>).DATATYPE	Returns the data type of the ith field in the server response. The EQ(<m>) and NE(<m>) functions, which return Boolean values to indicate the result of a comparison, are used with this prefix. For example, the following expression returns a Boolean TRUE if the DATATYPE function returns a value of datetime for the third field in the response: MSSQL.RES.FIELD(<2>).DATATYPE.EQ(datetime) Parameters: i - Row number
MSSQL.RES.FIELD(<i>).LENGTH	Returns the maximum possible length of the ith field in the server response. The value returned is a number. Parameters: i - Row number
MSSQL.RES.FIELD(<i>).NAME	Returns the name of the ith field in the server response. The value returned is of type text. Parameters: i - Row number

Expression	Description
MSSQL.RES.ROW(<i>).DOUBLE_ELEM(<j>)	Returns a value of type double from the jth column of the ith row of the table. If the value is not a double value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number
MSSQL.RES.ROW(<i>).NUM_ELEM(j)	Returns an integer value from the jth column of ith row of the table. If the value is not an integer value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number
MSSQL.RES.ROW(<i>).IS_NULL_ELEM(j)	Checks whether the jth column of the ith row of the table is NULL and returns a Boolean TRUE or FALSE to indicate the result. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row iand column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number
MSSQL.RES.ROW(<i>).TEXT_ELEM(j)	Returns a text string from the jth column of ith row of the table. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number

Expression	Description
MSSQL.RES.TYPE	Returns an enumeration constant that identifies the response type. Following are the possible return values: ERROR, OK, and RESULT_SET. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.

Typecasting data

September 21, 2020

You can extract data of one type (for example, text or an integer) from requests and responses and transform it to data of another type. For example, you can extract a string and transform the string to time format. You can also extract a string from an HTTP request body and treat it like an HTTP header or extract a value from one type of request header and insert it in a response header of a different type.

After typecasting the data, you can apply any operation that is appropriate for the new data type. For example, if you typecast text to an HTTP header, you can apply any operation that is applicable to HTTP headers to the returned value.

For more information about typecasting data, see the Typecasting Operations pdf.

Regular Expressions

September 21, 2020

When you want to perform string matching operations that are more complex than the operations that you perform with the `CONTAINS( “\<string\>” )` or EQ(“<string>“) operators, you use regular expressions. The policy infrastructure on the Citrix® NetScaler® appliance includes operators to which you can pass regular expressions as arguments for text matching. The names of the operators that work with regular expressions include the string REGEX. The regular expressions that you pass as arguments must conform to the regular expression syntax that is described in “http://www.pcre.org/pcre.txt.” You can learn more about regular expressions at “http://www.regular-expressions.info/quickstart.html” and at “http://www.silverstones.com/thebat/Regex.html.”

The target text for an operator that works with regular expressions can be either text or the value of an HTTP header. Following is the format of a default syntax expression that uses a regular expression operator to operate on text:

```
<text>.<regex_operator>(re<delimiter><regex_pattern><delimiter>)
```

The string `<text>` represents the default syntax expression prefix that identifies a text string in a packet (for example, HTTP.REQ.URL). The string represents the regular expression operator. The regular expression always begins with the string re. A pair of matching delimiters, represented by “, enclose the string “, which represents the regular expression.

The following example expression checks whether the URL in an HTTP packet contains the string `*.jpeg` (where * is a wildcard) and returns a Boolean TRUE or FALSE to indicate the result. The regular expression is enclosed within a pair of slash marks (/), which act as delimiters.

```
http.req.url.regex_match(re/.<asterisk>\.jpeg/)
```

Regular expression operators can be combined to define or refine the scope of a search. For example, `<text>.AFTER_REGEX(re/regex_pattern1).BEFORE_REGEX(re/regex_pattern2` specifies that the target for string matching is the text between the patterns `regex_pattern1 and regex_pattern2`. You can use a text operator on the scope that is defined by the regular expression operators. For example, you can use the `CONTAINS( “<string>” )` operator to check whether the defined scope contains the string abc:

```
<text>.AFTER_REGEX(re/regex_pattern1).BEFORE_REGEX(re/regex_pattern2/).
CONTAINS( “abc” )
```

> **Note**
>
> The process of evaluating a regular expression inherently takes more time than that for an operator such as `CONTAINS( “\<string\>” )` or `EQ( “\<string\>” )`, which work with simple string arguments. You should use regular expressions only if your requirement is beyond the scope of other operators.

Basic characteristics of regular expressions

September 21, 2020

Following are notable characteristics of regular expressions as defined on the NetScaler appliance:

- A regular expression always begins with the string “re” followed by a pair of delimiting characters (called delimiters) that enclose the regular expression that you want to use.

  For example, re#<regex_pattern># uses the number sign (#) as a delimiter.

- A regular expression cannot exceed 1499 characters.

- Digit matching can be done by using the string \d (a backslash followed by d).
- White space can be represented by using \s (a backslash followed by s).
- A regular expression can contain white spaces.

Following are the differences between the NetScaler syntax and the PCRE syntax:

- The NetScaler does not allow back references in regular expressions.
- You should not use recursive regular expressions.
- The dot meta-character also matches the newline character.
- Unicode is not supported.
- The operation SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option in the regular expression.

Operations for regular expressions

September 21, 2020

The following table describes the operators that work with regular expressions. The operation performed by a regular expression operator in a given default syntax expression depends on whether the expression prefix identifies text or HTTP headers. Operations that evaluate headers override any text-based operations for all instances of the specified header type. When you use an operator, replace <text> with the default syntax expression prefix that you want to configure for identifying text.

Regular Expression Operation	Description
<text>.BEFORE_REGEX(<regular expression>)	Selects the text that precedes the string that matches the <regular expression> argument. If the regular expression does not match any data in the target, the expression returns a text object of length 0. The following expression selects the string “text” from “text/plain”. http.res.header(“content-type”).before_regex(re#/#)
<text>.AFTER_REGEX(<regular expression>)	Selects the text that follows the string that matches the <regular expression> argument. If the regular expression does not match any text in the target, the expression returns a text object of length 0. The following expression extracts “Example” from “myExample”: http.req.header(“etag”).after_regex(re/my/)

Regular Expression Operation	Description
<text>.REGEX_SELECT(<regular expression>)	Selects a string that matches the <regular expression> argument. If the regular expression does not match the target, a text object of length 0 is returned. The following example extracts the string "NS-CACHE-9.0: 90" from a Via header: http.req.header("via").regex_select(re!NS-CACHE-\d.\d:\s*\d{1,3}!)

Regular Expression Operation	Description
<text>.REGEX_MATCH(<regular expression>)	Returns TRUE if the target matches a <regular expression> argument of up to 1499 characters. The regular expression must be of the following format: re<delimiter>regular expression< delimiter> Both delimiters must be the same. Additionally, the regular expression must conform to the Perl-compatible (PCRE) regular expression library syntax. For more information, go to http://www.pcre.org/pcre.txt. In particular, see the pcrepattern man page. However, note the following: Back-references are not allowed. Recursive regular expressions are not recommended. The dot metacharacter also matches the newline character. The Unicode character set is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression. The following are examples: http.req.hostname.regex_match(re/[[:alpha:]]+(abc){2,3}/) and http.req.url.set_text_mode(urlencoded).regex_match(re#(a*b* The following example matches ab and aB: http.req.url.regex_match(re/a(?i)b/) The following example matches ab, aB, Ab and AB: http.req.url.set_text_mode(ignorecase).regex_match(re/a following example performs a case-insensitive, multiline match in which the dot meta-character also matches a newline character: http.req.body.regex_match(re/(?ixm) (^ab (.*) cd$) /)

Configuring classic policies and expressions

September 21, 2020

Some NetScaler features use classic policies and classic expressions. As with default syntax policies, classic policies can be either global or specific to a virtual server. However, to a certain extent, the configuration method and bind points for classic policies are different from those of default syntax policies. As with default syntax expressions, you can configure named expressions and use a named expression in multiple classic policies.

The following table summarizes NetScaler features that can be configured by using classic policies.

Click here to view the table.

Configure a classic policy

September 21, 2020

You can configure classic policies and classic expressions by using either the GUI or the command-line interface. A policy rule cannot exceed 1,499 characters. When configuring the policy rule, you can use named classic expressions. For more information about named expressions, see Create named classic expressions. After configuring the policy, you bind it either globally or to a virtual server.

Note that there are small variations in the policy configuration methods for various NetScaler features.

Note: You can embed a classic expression in a default syntax expression by using the syntax SYS.EVAL_CLASSIC_EXPR(classic_expression), specifying the classic_expression as the argument.

Create a classic policy by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
-   add cmp policy <name> -rule <expression> -action <action>

-   show cmp policy [<policyName>]
<!--NeedCopy-->
```

Example

The following commands first create a compression action and then create a compression policy that applies the action:

```
> add cmp action cmp-act-compress compress
 Done
> show cmp action cmp-act-compress
```

```
1)      Name: cmp-act-compress  Compression Type: compress
 Done
> add cmp pol cmp-pol-compress -rule ExpCheckIp -resAction cmp-act-
   compress
 Done
> show cmp pol cmp-pol-compress
1)      Name: cmp-pol-compress  Rule: ExpCheckIp
        Response action: cmp-act-compress      Hits: 0
 Done
>
<!--NeedCopy-->
```

Create a policy with classic expressions by using the GUI

1. In the navigation pane, expand the feature for which you want to configure a policy and, depending on the feature, do the following:
    - For Content Switching, Cache Redirection, and the application firewall, click Policies.
    - For SSL, click Policies, and then in the details pane, click the Policies tab.
    - For System Authentication, click Authentication, and then in the details pane, click the Policies tab.
    - For Filter, SureConnect, and Priority Queuing, expand Protection Features, select the desired function, and then in the details pane, click the Policies tab.
    - For the NetScaler Gateway, expand NetScaler Gateway, expand Policies, select the desired function, and then in the details pane, click the Policies tab.
2. For most features, click the Add button.
3. In the Create <feature name> Policy dialog box, in the Name* text box, enter a name for the policy.

    Note: You must begin a policy name with a letter or underscore. A policy name can consist of 1 to 31 characters, including letters, numbers, hyphen (-), period (.), pound sign (#), space ( ), and underscore (_).
4. For most features, you associate an action or a profile. For example, you may be required to select an action, or, in the case of an NetScaler Gateway or application firewall policy, you select a profile to associate with the policy. A profile is a set of configuration options that operate as a set of actions that are applied when the data being analyzed matches the policy rule.
5. Create an expression that describes the type of data that you want this policy to match.

    Depending on the type of policy you want to create, you can choose a predefined expression, or you can create a new expression.

    Named expressions are predefined expressions that you can reference by name in a policy rule.

6. Click Create to create your new policy.
7. Click Close to return to the Policies screen for the type of policy you were creating.

Configure a classic expression

September 21, 2020

Classic expressions consist of the following expression elements, listed in hierarchical order:

- **Flow Type.** Specifies whether the connection is incoming or outgoing. The flow type is REQ for incoming connections and RES for outgoing connections.
- **Protocol.** Specifies the protocol, the choices for which are HTTP, SSL, TCP, and IP.
- **Qualifier.** The protocol attribute, which depends on the selected protocol.
- **Operator.** The type of test you want to perform on the connection data. Your choice of operator depends upon the connection information you are testing. If the connection information you are testing is text, you use text operators. If it is a number, you use standard numeric operators.
- **Value.** The string or number against which the connection data element—defined by the flow type, protocol, and qualifier—is tested. The value can be either a literal or an expression. The literal or expression must match the data type of the connection data element.

In a policy, classic expressions can be combined to create more complex expressions using Boolean and comparative operators.

Expression elements are parsed from left to right. The leftmost element is either REQ or RES and designates a request or a response, respectively. Successive terms define a specific connection type and a specific attribute for that connection type. Each term is separated from any preceding or following term by a period. Arguments appear in parentheses and follow the expression element to which they are passed.

The following classic expression fragment returns the client source IP for an incoming connection.

```
REQ.IP.SOURCEIP
```

The example identifies an IP address in a request. The expression element SOURCEIP designates the source IP address. This expression fragment may not be useful by itself. You can use an additional expression element, an operator, to determine whether the returned value meets specific criteria. The following expression tests whether the client IP is in the subnet 200.0.0.0/8 and returns a Boolean TRUE or FALSE:

```
REQ.IP.SOURCEIP == 200.0.0.0 -netmask 255.0.0.0
```

Create a classic policy expression by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
-  set appfw policy \<name\> -rule \<expression\> -action \<action\>

-  show appfw policy \<name\>
<!--NeedCopy-->
```

Example

```
> set appfw policy GenericApplicationSSL_ 'HTTP.REQ.METHOD.EQ("get")' APPFW_DROP
 Done
> show appfw policy GenericApplicationSSL_
        Name: GenericApplicationSSL_    Rule: HTTP.REQ.METHOD.EQ("get")
        Profile: APPFW_DROP     Hits: 0
        Undef Hits: 0
        Policy is bound to following entities
        1) REQ VSERVER app_u_GenericApplicationSSLPortalPages PRIORITY : 100
 Done
<!--NeedCopy-->
```

Add an expression for a classic policy by using the GUI

This procedure documents the Add Expression dialog box. Depending on the feature for which you are configuring a policy, the route by which you arrive at this dialog box may be different.

1. Perform steps 1-4 in "To create a policy with classic expressions by using the GUI."
2. In the Add Expression dialog box, in Expression Type, click the type of expression you want to create.
3. Under Flow Type, click the down arrow and choose a flow type.

   The flow type is typically REQ or RES. The REQ option specifies that the policy applies to all incoming connections or requests. The RES option applies the policy to all outgoing connections or responses.

   For Application Firewall policies, you should leave the expression type set to General Expression, and the flow type set to REQ. The Application Firewall treats each request and response as a single paired entity, so all Application Firewall policies begin with REQ.

4. Under Protocol, click the down arrow and choose the protocol you want for your policy expression. Your choices are:
    - HTTP. Evaluates HTTP requests that are sent to a Web server. For classic expressions, HTTP includes HTTPS requests.
    - SSL. Evaluates SSL data associated with the current connection.
    - TCP. Evaluates the TCP data associated with the current connection.
    - IP. Evaluates the IP addresses associated with the current connection.
5. Under Qualifier, click the down arrow and choose a qualifier for your policy.

    The qualifier defines the type of data to be evaluated. The list of qualifiers that appears depends on which protocol you selected in step 4.

    The following choices appear for the HTTP protocol:

    - METHOD. Filters HTTP requests that use a particular HTTP method.
    - URL. Filters HTTP requests for a specific Web page.
    - URLQUERY. Filters HTTP requests that contain a particular query string.
    - VERSION. Filters HTTP requests on the basis of the specified HTTP protocol version.
    - HEADER. Filters on the basis of a particular HTTP header.
    - URLLEN. Filters on the basis of the length of the URL.
    - URLQUERY. Filters on the basis of the query portion of the URL.
    - URLQUERYLEN. Filters on the basis of the length of the query portion of the URL only.
6. Under Operator, click the down arrow and choose the operator for your policy expression. Some common operators are:

Operator	Description
==	Matches the specified value exactly or is exactly equal to the specified value.
!=	Does not match the specified value.
>	Is greater than the specified value.
<	Is less than the specified value.
>=	Is greater than or equal to the specified value.
<=	Is less than or equal to the specified value.
CONTAINS	Contains the specified value.
CONTENTS	Returns the contents of the designated header, URL, or URL query.
EXISTS	The specified header or query exists.

Operator	Description
NOTCONTAINS	Does not contain the specified value.
NOTEXISTS	The specified header or query does not exist.

7. If a Value text box appears, type a string or numeric value, as appropriate. For example, chose REQ as the Flow Type, HTTP as the Protocol, and HEADER as the qualifier, and then type the value of the header string in the Value field and the header type for which you want to match the string in the Header Name text box.
8. Click OK.
9. To create a compound expression, click Add. Note that the type of compounding that is done depends on the following choices in the Create Policy dialog box:
    - **Match Any Expression.** The expressions are in a logical OR relationship.
    - **Match All Expressions.** The expressions are in a logical AND relationship.
    - **Tabular Expressions.** Click the AND, OR, and parentheses buttons to control evaluation.
    - **Advanced Free-Form.** Enter the expressions components directly into the Expression field, and click the AND, OR, and parentheses buttons to control evaluation.

Bind a classic policy

September 21, 2020

Depending on the policy type, you can bind a classic policy either globally or to a virtual server. Policy bind points are described in the table, "Policy Type and Bind Points for Policies in Features That Use Classic Policies."

Note: You can bind a classic policy to multiple bind points.

Bind a classic policy globally by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
-  bind cmp global <policyName> [-priority <positive_integer>]

-  show cmp global
<!--NeedCopy-->
```

Example

```
> bind cmp global cmp-pol-compress -priority 2
 Done
> show cmp global
1)      Policy Name: cmp-pol-compress   Priority: 2
2)      Policy Name: ns_nocmp_xml_ie    Priority: 8700
3)      Policy Name: ns_nocmp_mozilla_47        Priority: 8800
4)      Policy Name: ns_cmp_mscss       Priority: 8900
5)      Policy Name: ns_cmp_msapp       Priority: 9000
6)      Policy Name: ns_cmp_content_type        Priority: 10000
 Done
>
<!--NeedCopy-->
```

Bind a classic policy to a virtual server by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
-  bind lb vserver <name> [<targetVserver>] [-policyName <string>] [-priority <positive_integer>]

-  show lb vserver<name>
<!--NeedCopy-->
```

Example

```
> bind lb vserver lbtemp -policyName cmp-pol-compress -priority 1
 Done
> show lb vserver lbtemp
        lbtemp (10.102.29.101:80) - HTTP        Type: ADDRESS
        State: UP
        Last state change was at Tue Oct 27 06:40:38 2009 (+557 ms)
        Time since last state change: 0 days, 02:00:40.330
        Effective State: UP
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  1 (Total)       1 (Active)
        Configured Method: LEASTCONNECTION
        Current Method: Round Robin, Reason: Bound service's state changed to UP
        Group: vserver-grp
        Mode: IP
        Persistence: COOKIEINSERT (version 0)   Persistence Backup: SOURCEIP   Persistence Mask: 255.255.255.255
        Persistence Timeout: 2 min      Backup Persistence Timeout: 2 min
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none
1) http-one (10.102.29.252: 80) - HTTP State: UP        Weight: 1
        Persistence Cookie Value : NSC_wtfswfs-hsq=ffffffff096e03ed45525d5f4f58455e445a4a423660
1)      Policy : cmp-pol-compress Priority:1
 Done
>
<!--NeedCopy-->
```

Bind a classic policy globally by using the GUI

Note: This procedure documents the Global Bindings dialog box. Depending on the feature for which you want to globally bind a policy, the route by which you arrive at this dialog box may be different.

1. In the navigation pane, expand the feature for which you want to globally bind a classic policy, and then locate the policy that you want to bind globally.

   Note: You cannot globally bind policies for Content Switching, Cache Redirection, SureConnect, Priority Queuing, or
   NetScaler Gateway Authorization.

2. In the details pane, click Global Bindings.
3. In the Bind/Unbind <feature name> Policy(s) to Global dialog box, click Insert Policy.
4. In the Policy Name column, click the name of an existing policy that you want to globally bind, or click New Policy to open the Create <feature name> Policy dialog box.
5. After you have selected the policy or created a new policy, in the Priority column, type the priority value.

   The lower the number, the sooner this policy is applied relative to other policies. For example, a policy assigned a priority of 10 is applied before a policy with a priority of 100. You can use the same priority for different policies. All features that use classic policies implement only the first policy that a connection matches, so policy priority is important for getting the results you intend.

As a best practice, leave room to add policies by setting priorities with intervals of 50 (or 100) between each policy.

6. Click OK.

Bind a classic policy to a virtual server by using the GUI

1. In the navigation pane, expand the feature that contains the virtual server to which you want to bind a classic policy (for example, if you want to bind a classic policy to a content switching virtual server, expand Traffic Management > Content Switching), and then click Virtual Servers.
2. In the details pane, select the virtual server, and then click Open.
3. In the Configure <Feature> Virtual Server dialog box, on the Policies tab, click the feature icon for the type policy that you want, and then click Insert Policy.
4. In the Policy Name column, click the name of an existing policy that you want to bind to a virtual server, or click A to open the Create <feature name> Policy dialog box.
5. After you have selected the policy or created a new policy, in the Priority column, set the priority.

   If you are binding a policy to a content switching virtual server, in the Target column, select a load balancing virtual server to which traffic that matches the policy should be sent.
6. Click OK.

View classic policies

September 21, 2020

You can view classic policies by using either the GUI or the command line. You can view details such as the policy's name, expression, and bindings.

View a classic policy and its binding information by using the CLI

At the command prompt, type the following commands to view a classic policy and its binding information:

```
show <featureName> policy [policyName]
```

Example

```
> show appfw policy GenericApplicationSSL_
        Name: GenericApplicationSSL_    Rule: ns_only_get_adv
        Profile: GenericApplicationSSL_Prof1    Hits: 0
        Undef Hits: 0
        Policy is bound to following entities
        1) REQ VSERVER app_u_GenericApplicationSSLPortalPages
           PRIORITY : 100
 Done
<!--NeedCopy-->
```

Note: If you omit the policy name, all policies are listed without the binding details.

View classic policies and policy bindings by using the GUI

1. In the navigation pane, expand the feature whose policies you want to view, (for example, if you want to view application firewall policies, expand Application Firewall), and then click Policies.
2. In the details pane, do one or more of the following:
    - To view details for a specific policy, click the policy. Details appear in the Details area of the configuration pane.
    - To view bindings for a specific policy, click the policy, and then click Show Bindings.
    - To view global bindings, click the policy, and then click Global Bindings. Note that you cannot bind a Content Switching, Cache Redirection, SureConnect, Priority Queuing, or NetScaler Gateway Authorization policy globally.

Create named classic expressions

September 21, 2020

A named classic expression is a classic expression that can be referenced through an assigned name. Often, you need to configure classic expressions that are large or complex and form a part of a larger compound expression. You might also configure classic expressions that you need to use frequently and in multiple compound expressions or classic policies. In these scenarios, you can create the classic expression you want, save it with a name of your choice, and then reference the expression from compound expressions or policies through its name. This saves configuration time and improves the readability of complex compound expressions. Additionally, any modifications to a named classic expression need to be made only once.

Some named expressions are built-in, and a subset of these are read-only. Built-in named expressions are divided into four categories: General, Anti-Virus, Personal Firewall, and Internet Security. General named expressions have a wide variety of uses. For example, from the General category, you can use the expressions ns_true and ns_false to specify a value of TRUE or FALSE, respectively, to be returned for all traffic. You can also identify data of a particular type (for example, HTM, DOC, or GIF files), determine whether caching headers are present, or determine whether the round trip time for packets between a client and the NetScaler is high (over 80 milliseconds).

Anti-Virus, Personal Firewall, and Internet Security named expressions test clients for the presence of a particular program and version and are used primarily in NetScaler Gateway policies.

Note: You cannot modify or delete built-in named expressions.

Create a named classic expression by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
-  add expression <name> <value> [-comment <string>] [-clientSecurityMessage <string>]
-  show expression [<name> | -type CLASSIC
<!--NeedCopy-->
```

Example

```
> add expression classic_ne "REQ.HTTP.URL CONTAINS www.example1.com" -comment "Checking the URL for www.example1.com"
 Done
> show expression classic_ne
1)       Name: classic_ne  Expr: REQ.HTTP.URL CONTAINS www.example1.com Hits: 0 Type : CLASSIC
         Comment: "Checking the URL for www.example1.com"
 Done
>
<!--NeedCopy-->
```

Create a named classic expression by using the GUI

1. In the navigation pane, expand AppExpert, expand Expressions, and then click Classic Expressions.
2. In the details pane, click Add.

   Note: Some of the built-in expressions in the Expressions list are read-only.
3. In the Create Policy Expression dialog box, specify values for the following parameters:

- Expression Name*—name
- Client Security Message—clientSecurityMessage
- Comments—comment

*A required parameter

4. To create the expression, do one of the following:
    - You can choose inputs to this expression from the Named Expressions drop-down list.
    - You can create a new expression, as described in Add an expression for a classic policy by using the GUI.
5. When you are done, click Close. Verify that your new expression was created by scrolling to the bottom of the Classic Expressions list to view it.

Expressions reference-advanced policy expressions

September 21, 2020

> **Warning**
>
> Q and S prefixes are deprecated from NetScaler 12.0 build 56.20 onwards and are no longer supported in Advanced policy expressions.

The following table is a listing of default syntax expression prefixes, with cross-references to descriptions of these prefixes and the operators that you can specify for them. Note that some prefixes can work with multiple types of operators. For example, a cookie can be parsed by using operators for text or operators for HTTP headers.

You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

Note: The Description column in the following table contains cross-references to additional information about prefix usage and applicable operators for the prefix.

Click here to view the table.

Expressions reference-classic expressions

September 21, 2020

> **Warning**
>
> Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies

The subtopics listed in the table of contents on the left side of your screen contain tables listing the NetScaler classic expressions.

In the table of operators, the result type of each operator is shown at the beginning of the description. In the other tables, the level of each expression is shown at the beginning of the description. For named expressions, each expression is shown as a whole.

Operators

Expression Element	Definition
==	Boolean. Returns TRUE if the current expression equals the argument. For text operations, the items being compared must exactly match one another. For numeric operations, the items must evaluate to the same number.
!=	Boolean. Returns TRUE if the current expression does not equal the argument. For text operations, the items being compared must not exactly match one another. For numeric operations, the items must not evaluate to the same number.
CONTAINS	Boolean. Returns TRUE if the current expression contains the string that is designated in the argument.
NOTCONTAINS	Boolean. Returns TRUE if the current expression does not contain the string that is designated in the argument.
CONTENTS	Text. Returns the contents of the current expression.
EXISTS	Boolean. Returns TRUE if the item designated by the current expression exists.
NOTEXISTS	Boolean.

Expression Element	Definition
Returns TRUE if the item designated by the current expression does not exist.	
>	Boolean. Returns TRUE if the current expression evaluates to a number that is greater than the argument.
<	Boolean. Returns TRUE if the current expression evaluates to a number that is less than the argument.
>=	Boolean. Returns TRUE if the current expression evaluates to a number that is greater than or equal to the argument.
<=	Boolean. Returns TRUE if the current expression evaluates to a number that is less than or equal to the argument.

General expressions

Expression Element	Definition
REQ	Flow Type. Operates on incoming (or request) packets.
REQ.HTTP	Protocol. Operates on HTTP requests.
REQ.HTTP.METHOD	Qualifier. Designates the HTTP method.
REQ.HTTP.URL	Qualifier. Designates the URL.
REQ.HTTP.URLTOKENS	Qualifier. Designates the URL token.
REQ.HTTP.VERSION	Qualifier. Designates the HTTP version.
REQ.HTTP.HEADER	Qualifier. Designates the HTTP header.
REQ.HTTP.URLLEN	Qualifier. Designates the number of characters in the URL.
REQ.HTTP.URLQUERY	Qualifier. Designates the query portion of the URL.
REQ.HTTP.URLQUERYLEN	Qualifier. Designates the length of the query portion of the URL.
REQ.SSL	Protocol. Operates on SSL requests.

Expression Element	Definition
REQ.SSL.CLIENT.CERT	Qualifier. Designates the entire client certificate.
REQ.SSL.CLIENT.CERT.SUBJECT	Qualifier. Designates the client certificate subject.
REQ.SSL.CLIENT.CERT.ISSUER	Qualifier. Designates the issuer of the client certificate.
REQ.SSL.CLIENT.CERT.SIGALGO	Qualifier. Designates the validation algorithm used by the client certificate.
REQ.SSL.CLIENT.CERT.VERSION	Qualifier. Designates the client certificate version.
REQ.SSL.CLIENT.CERT.VALIDFROM	Qualifier. Designates the date before which the client certificate is not valid.
REQ.SSL.CLIENT.CERT.VALIDTO	Qualifier. Designates the date after which the client certificate is not valid.
REQ.SSL.CLIENT.CERT.SERIALNUMBER	Qualifier. Designates the serial number of the client certificate.
REQ.SSL.CLIENT.CIPHER.TYPE	Qualifier. Designates the encryption protocol used by the client.
REQ.SSL.CLIENT.CIPHER.BITS	Qualifier. Designates the number of bits used by the client's SSL key.
REQ.SSL.CLIENT.SSL.VERSION	Qualifier. Designates the SSL version that the client is using.
REQ.TCP	Protocol. Operates on incoming TCP packets.
REQ.TCP.SOURCEPORT	Qualifier. Designates the source port of the incoming packet.
REQ.TCP.DESTPORT	Qualifier. Designates the destination port of the incoming packet.
REQ.IP	Protocol. Operates on incoming IP packets.
REQ.IP.SOURCEIP	Qualifier. Designates the source IP of the incoming packet.
REQ.IP.DESTIP	Qualifier.Designates the destination IP of the incoming packet.
RES	Flow Type. Operates on outgoing (or response) packets.

Expression Element	Definition
RES.HTTP	Protocol. Operates on HTTP responses.
RES.HTTP.VERSION	Qualifier. Designates the HTTP version.
RES.HTTP.HEADER	Qualifier. Designates the HTTP header.
RES.HTTP.STATUSCODE	Qualifier. Designates the status code of the HTTP response.
RES.TCP	Protocol. Operates on incoming TCP packets.
RES.TCP.SOURCEPORT	Qualifier. Designates the source port of the outgoing packet.
RES.TCP.DESTPORT	Qualifier. Designates the destination port of the outgoing packet.
RES.IP	Protocol. Operates on outgoing IP packets.
RES.IP.SOURCEIP	Qualifier. Designates the source IP of the outgoing packet. This can be in IPv4 or IPv6 format. For example: add expr exp3 “sourceip == 10.102.32.123 –netmask 255.255.255.0 && destip == 2001::23/120”.
RES.IP.DESTIP	Qualifier. Designates the destination IP of the outgoing packet.

Client security expressions

The expressions to configure client settings on the Access Gateway with the following software:

- Antivirus
- Personal firewall
- Antispam
- Internet Security

For example usage, see http://support.citrix.com/article/CTX112599.

Actual Expression	Definition
CLIENT.APPLICATION.AV(<NAME>.VERSION == <VERSION>)	Checks whether the client is running the designated anti-virus program and version.
CLIENT.APPLICATION.AV(<NAME>.VERSION != <VERSION>)	Checks whether the client is not running the designated anti-virus program and version.

Actual Expression	Definition
CLIENT.APPLICATION.PF(<NAME>.VERSION == <VERSION>)	Checks whether the client is running the designated personal firewall program and version.
CLIENT.APPLICATION.PF(<NAME>.VERSION != <VERSION>)	Checks whether the client is not running the designated personal firewall program and version.
CLIENT.APPLICATION.IS(<NAME>.VERSION == <VERSION>)	Checks whether the client is running the designated internet security program and version.
CLIENT.APPLICATION.IS(<NAME>.VERSION != <VERSION>)	Checks whether the client is not running the designated internet security program and version.
CLIENT.APPLICATION.AS(<NAME>.VERSION == <VERSION>)	Checks whether the client is running the designated anti-spam program and version.
CLIENT.APPLICATION.AS(<NAME>.VERSION != <VERSION>)	Checks whether the client is not running the designated anti-spam program and version.

Network-based expressions

Expression	Definition
REQ	Flow Type. Operates on incoming, or request, packets.
REQ.VLANID	Qualifier. Operates on the virtual LAN (VLAN) ID.
REQ.INTERFACE.ID	Qualifier. Operates on the ID of the designated NetScaler interface.
REQ.INTERFACE.RXTHROUGHPUT	Qualifier. Operates on the raw received packet throughput of the designated NetScaler interface.
REQ.INTERFACE.TXTHROUGHPUT	Qualifier. Operates on the raw transmitted packet throughput of the designated NetScaler interface.

Expression	Definition
REQ.INTERFACE.RXTXTHROUGHPUT	Qualifier. Operates on the raw received and transmitted packet throughput of the designated NetScaler interface.
REQ.ETHER.SOURCEMAC	Qualifier. Operates on the source MAC address.
REQ.ETHER.DESTMAC	Qualifier. Operates on the destination MAC address.
RES	Flow Type. Operates on outgoing (or response) packets.
RES.VLANID	Qualifier. Operates on the virtual LAN (VLAN) ID.
RES.INTERFACE.ID	Qualifier. Operates on the ID of the designated NetScaler interface.
RES.INTERFACE.RXTHROUGHPUT	Qualifier. Operates on the raw received packet throughput of the designated NetScaler interface.
RES.INTERFACE.TXTHROUGHPUT	Qualifier. Operates on the raw transmitted packet throughput of the designated NetScaler interface.
RES.INTERFACE.RXTXTHROUGHPUT	Qualifier. Operates on the raw received and transmitted packet throughput of the designated NetScaler interface.
RES.ETHER.SOURCEMAC	Qualifier. Operates on the source MAC address.
RES.ETHER.DESTMAC	Qualifier. Operates on the destination MAC address.

Date/time expressions

Expression	Definition
TIME	Qualifier. Operates on the date and time of day, GMT.
DATE	Qualifier. Operates on the date, GMT.
DAYOFWEEK	Operates on the specified day in the week, GMT.

File system expressions

You can specify file system expressions in authorization policies for users and groups who access file sharing through the NetScaler Gateway file transfer utility (the VPN portal). These expressions work with the NetScaler Gateway file transfer authorization feature to control user access to file servers, folders, and files. For example, you can use these expressions in authorization policies to control access based on file type and size.

For more information, refer to the File Name Expression pdf.

Note: File system expressions do not support regular expressions.

Built-in named expressions (General)

Expression	Definition
ns_all_apps_ncomp	Tests for connections with destination ports between 0 and 65535. In other words, tests for all applications.
ns_cachecontrol_nocache	Tests for connections with an HTTP Cache-Control header that contains the value “no-cache”.
ns_cachecontrol_nostore	Tests for connections with an HTTP Cache-Control header that contains the value “no-store”.
ns_cmpclient	Tests the client to determine if it accepts compressed content.
ns_content_type	Tests for connections with an HTTP Content-Type header that contains “text”.
ns_css	Tests for connections with an HTTP Content-Type header that contains “text/css”.
ns_ext_asp	Tests for HTTP connections to any URL that contains the string .asp—in other words, any connection to an active server page (ASP).
ns_ext_cfm	Tests for HTTP connections to any URL that contains the string .cfm
ns_ext_cgi	Tests for HTTP connections to any URL that contains the string .cgi—in other words, any connection to a common gateway interface (CGI) script.

Expression	Definition
ns_ext_ex	Tests for HTTP connections to any URL that contains the string .ex
ns_ext_exe	Tests for HTTP connections to any URL that contains the string .exe—in other words, any connection to a executable file.
ns_ext_htx	Tests for HTTP connections to any URL that contains the string .htx
ns_ext_not_gif	Tests for HTTP connections to any URL that does not contain the string .png—in other words, any connection to a URL that is not a GIF image.
ns_ext_not_jpeg	Tests for HTTP connections to any URL that does not contain the string .jpeg—in other words, any connection to a URL that is not a JPEG image.
ns_ext_shtml	Tests for HTTP connections to any URL that contains the string .shtml—in other words, any connection to a server-parsed HTML page.
ns_false	Always returns a value of FALSE.
ns_farclient	Client is in a different geographical region from the NetScaler, as determined by the geographical region in the client's IP address. The following regions are predefined: 192.0.0.0 – 193.255.255.255: Multi-regional, 194.0.0.0 – 195.255.255.255: European Union, 196.0.0.0 – 197.255.255.255: Other1, 198.0.0.0 – , 199.255.255.255: North America, 200.0.0.0 – 201.255.255.255: Central and South America, 202.0.0.0 – 203.255.255.255: Pacific Rim, 204.0.0.0 – 205.255.255.255: Other2, and 206.0.0.0 – 207.255.255.255: Other3
ns_header_cookie	Tests for HTTP connections that contain a Cookie header.
ns_header_pragma	Tests for HTTP connections that contain a Pragma: no-cache header.

Expression	Definition
ns_mozilla_47	Tests for HTTP connections whose User-Agent header contains the string Mozilla/4.7—in other words, any connection from a client using the Mozilla 4.7 Web browser.
ns_msexcel	Tests for HTTP connections whose Content-Type header contains the string application/vnd.msexcel—in other words, any connection transmitting a Microsoft Excel spreadsheet.
ns_msie	Tests for HTTP connections whose User-Agent header contains the string MSIE—in other words, any connection from a client using any version of the Internet Explorer Web browser.
ns_msppt	Tests for HTTP connections whose Content-Type header contains the string application/vnd.ms-powerpoint—in other words, any connection transmitting a Microsoft PowerPoint file.
ns_msword	Tests for HTTP connections whose Content-Type header contains the string application/vnd.msword—in other words, any connection transmitting a Microsoft Word file.
ns_non_get	Tests for HTTP connections that use any HTTP method except for GET.
ns_slowclient	Returns TRUE if the average round trip time between the client and the NetScaler is more than 80 milliseconds.
ns_true	Returns TRUE for all traffic.
ns_url_path_bin	Tests the URL path to see if it points to the /bin/ directory.
ns_url_path_cgibin	Tests the URL path to see if it points to the CGI-BIN directory.
ns_url_path_exec	Tests the URL path to see if it points to the /exec/directory.
ns_url_tokens	Tests for the presence of URL tokens.

Expression	Definition
ns_xmldata	Tests for the presence of XML data.

Built-in named expressions (Anti-Virus)

Expression	Definition
McAfee Virus Scan 11	Tests to determine whether the client is running the latest version of McAfee VirusScan.
McAfee Antivirus	Tests to determine whether the client is running any version of McAfee Antivirus.
Symantec AntiVirus 10 (with Updated Definition File)	Tests to determine whether the client is running the most current version of Symantec AntiVirus.
Symantec AntiVirus 6.0	Tests to determine whether the client is running Symantec AntiVirus 6.0.
Symantec AntiVirus 7.5	Tests to determine whether the client is running Symantec AntiVirus 7.5.
TrendMicro OfficeScan 7.3	Tests to determine whether the client is running Trend Microsystems' OfficeScan, version 7.3.
TrendMicro AntiVirus 11.25	Tests to determine whether the client is running Trend Microsystems' AntiVirus, version 11.25.
Sophos Antivirus 4	Tests to determine whether the client is running Sophos Antivirus, version 4.
Sophos Antivirus 5	Tests to determine whether the client is running Sophos Antivirus, version 5.
Sophos Antivirus 6	Tests to determine whether the client is running Sophos Antivirus, version 6.

Built-in named expressions (Personal Firewall)

Expression	Definition
TrendMicro OfficeScan 7.3	Tests to determine whether the client is running Trend Microsystems' OfficeScan, version 7.3.
Sygate Personal Firewall 5.6	Tests to determine whether the client is running the Sygate Personal Firewall, version 5.6.
ZoneAlarm Personal Firewall 6.5	Tests to determine whether the client is running the ZoneAlarm Personal Firewall, version 6.5.

Built-in named expressions (Client Security)

Expression	Definition
Norton Internet Security	Tests to determine whether the client is running any version of Norton Internet Security.

Summary examples of default syntax expressions and policies

September 21, 2020

The following table provides examples of default syntax expressions that you can use as the basis for your own default syntax expressions.

Table 1. Examples of Default Syntax Expressions

Expression Type	Sample Expressions
Look at the method used in the HTTP request.	`http.req.method.eq(post)http.req.method.eq(get)`

Expression Type	Sample Expressions

Check the Cache-Control or Pragma header value in an HTTP request (req) or response (res).	`http.req.header("Cache-Control").contains("no-store")`
	`http.req.header("Cache-Control").contains("no-cache")`
	`http.req.header("Pragma").contains("no-cache")`
	`http.res.header("Cache-Control").contains("private")`
	`http.res.header("Cache-Control").contains("public")`
	`http.res.header("Cache-Control").contains("must-revalidate")http.res.header("Cache-Control").contains ("proxy-revalidate")`
	`http.res.header("Cache-Control").contains("max-age")`

Check for the presence of a header in a request (req) or response (res).	`http.req.header("myHeader").exists` `http.res.header("myHeader").exists`
Look for a particular file type in an HTTP request based on the file extension.	`http.req.url.contains(".html")http.req.url.contains(".cgi")http.req.url.contains(".asp")http.req.url.contains(".exe")http.req.url.contains(".cfm")http.req.url.contains(".ex")http.req.url.contains(".shtml")http.req.url.contains(".htx")http.req.url.contains("/cgi-bin/")http.req.url.contains("/exec/")http.req.url.contains("/bin/")`
Look for anything that is other than a particular file type in an HTTP request.	`http.req.url.contains(".png").not;` `http.req.url.contains(".jpeg").not`

Expression Type	Sample Expressions
Check the type of file that is being sent in an HTTP response based on the Content-Type header.	`http.res.header("Content-Type").contains("text")http.res.header("Content-Type").contains "application/msword")http.res.header("Content-Type").contains("vnd.ms-excel")http.res.header("Content-Type").contains("application/vnd.ms-powerpoint"); http.res.header("Content-Type").contains("text/css"); http.res.header("Content-Type").contains("text/xml"); http.res.header("Content-Type").contains("image/")`
Check whether this response contains an expiration header.	‘http.res.header(“Expires”).exists
Check for a Set-Cookie header in a response.	http.res.header(“Set-Cookie”).exists
Check the agent that sent the response.	http.res.header(“User-Agent”).contains(“Mozilla/4.7”) http.res.header(“User-Agent”).contains(“MSIE”)‘
Check if the first 1024 bytes of the body of a request starts with the string “some text”.	`http.req.body(1024).contains("some text")`

The following table shows examples of policy configurations and bindings for commonly used functions.

Table 2. Examples of Default Syntax Expressions and Policies

Purpose	Example
Use the rewrite feature to replace occurrences of `http://with https://` in the body of an HTTP response.	`add rewrite action httpRewriteAction replace_all http.res.body(50000)"\"https://\""-pattern http://add rewrite policy demo_rep34312 "http.res.body(50000).contains(\"http://\")" httpRewriteAction`
Replace all occurrences of “abcd” with “1234” in the first 1000 bytes of the HTTP body.	`add rewrite action abcdTo1234Action replace_all "http.req.body(1000)"" \"1234\""-pattern abcd add rewrite policy abcdTo1234Policy "http.req.body(1000).contains(\"abcd\")" abcdTo1234Action bind rewrite global abcdTo1234Policy 100 END -type REQ_OVERRIDE`
Downgrade the HTTP version to 1.0 to prevent the server from chunking HTTP responses.	`add rewrite action downgradeTo1.0 Action replace http.req.version.minor "\"0\""add rewrite policy downgradeTo1.0Policy "http.req.version.minor.eq(1)"downgradeTo1.0 Action bind lb vserver myLBVserver -policyName downgradeTo1.0Policy -priority 100 -gotoPriorityExpression NEXT -type REQUEST`
Remove references to the HTTP or HTTPS protocol in all responses, so that if the user’s connection is HTTP, the link is opened by using HTTP, and if the user’s connection is HTTPS, the link is opened by using HTTPS.	`add rewrite action remove_http_https replace_all "http.res.body(1000000).set_text_mode(ignorecase)""\"//\""-pattern "re~https?://|HTTPS?://~"add rewrite policy remove_http_https true remove_http_https bind lb vserver test_vsvr -policyName remove_http_https -priority 20 -gotoPriorityExpression NEXT -type RESPONSE`

Purpose	Example
Rewrite instances of http: to https: in all URLs.	`add responder action httpToHttpsAction redirect "\"https://\" + http.req.hostname + http.req.url"-bypassSafetyCheck YES add responder policy httpToHttpsPolicy "!CLIENT.SSL.IS_SSL" httpToHttpsAction bind responder global httpToHttpsPolicy 1 END -type OVERRIDE`
Modify a URL to redirect from URL A to URL B. In this example, "file5.html" is appended to the path.	`add responder action appendFile5Action redirect \"http://\" + http.req.hostname + http.req.url + \"/file5.html\""-bypassSafetyCheck YES add responder policy appendFile5Policy "http.req.url.eq(\"/testsite\")" appendFile5Action bind responder global appendFile5Policy 1 END -type OVERRIDE`
Redirect an external URL to an internal URL.	`add rewrite action act_external_to_internal REPLACE 'http.req.hostname.server''"www.my.host.com"'add rewrite policy pol_external_to_internal 'http.req.hostname.server.eq("www.external.host.com")'act_external_to_internal bind rewrite global pol_external_to_internal 100 END -type REQ_OVERRIDE`

Purpose	Example
Redirect requests to www.example.com that have a query string to www.Webn.example.com. The value n is derived from a server parameter in the query string, for example, server=5.	`add rewrite action act_redirect_query REPLACE q##http.req.header("Host").before_str(".example.com")''"Web"+ http.req.url.query.value("server")## add rewrite policy pol_redirect_query q##http.req.header("Host").eq("www.example.com")&& http.req.url.contains("?")'act_redirect_query##`
Limit the number of requests per second from a URL.	`add ns limitSelector ip_limit_selector http.req.url "client.ip.src"add ns limitIdentifier ip_limit_identifier -threshold 4 -timeSlice 3600 -mode request_rate -limitType smooth -selectorName ip_limit_selector add responder action my_Web_site_redirect_action redirect "\"http://www.mycompany.com/\""add responder policy ip_limit_responder_policy "http.req.url.contains(\"myasp.asp\")&& sys.check_limit (\"ip_limit_identifier\")"my_Web_site_redirect_action bind responder global ip_limit_responder_policy 100 END -type default`
Check the client IP address but pass the request without modifying the request.	`add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER ("x-forwarded-for").EXISTS HTTP.REQ.HEADER ("client-ip").EXISTS'NOREWRITE bind rewrite global check_client_ip_policy 100 END`

Purpose	Example
Remove old headers from a request and insert an NS-Client header.	`add rewrite action del_x_forwarded_for delete_http_header x-forwarded-for add rewrite action del_client_ip delete_http_header client-ip add rewrite policy check_x_forwarded_for_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS'del_x_forwarded_for add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER("client-ip").EXISTS' del_client_ip add rewrite action insert_ns_client_header insert_http_header NS-Client 'CLIENT.IP.SRC'add rewrite policy insert_ns_client_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS HTTP.REQ.HEADER("client-ip").EXISTS 'insert_ns_client_header bind rewrite global check_x_forwarded_for_policy 100 200 bind rewrite global check_client_ip_policy 200 300 bind rewrite global insert_ns_client_policy 300 END`

Purpose	Example
Remove old headers from a request, insert an NS-Client header, and then modify the "insert header" action so that the value of the inserted header contains the client IP values from the old headers and the NetScaler appliance's connection IP address. Note that this example repeats the previous example, with the exception of the final set rewrite action.	`add rewrite action del_x_forwarded_for delete_http_header x-forwarded-for add rewrite action del_client_ip delete_http_header client-ip add rewrite policy check_x_forwarded_for_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS'del_x_forwarded_for add rewrite policy check_client_ip_policy 'HTTP.REQ.HEADER("client-ip").EXISTS' del_client_ip add rewrite action insert_ns_client_header insert_http_header NS-Client 'CLIENT.IP.SRC'add rewrite policy insert_ns_client_policy 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS HTTP.REQ.HEADER("client-ip").EXISTS 'insert_ns_client_header bind rewrite global check_x_forwarded_for_policy 100 200 bind rewrite global check_client_ip_policy 200 300 bind rewrite global insert_ns_client_policy 300 END set rewrite action insert_ns_client_header -stringBuilderExpr 'HTTP.REQ.HEADER("x-forwarded-for").VALUE(0)+ " " + HTTP.REQ.HEADER("client-ip").VALUE(0)+ " " + CLIENT.IP.SRC'-bypassSafetyCheck YES`

Tutorial examples of default syntax policies for rewrite

September 21, 2020

With the rewrite feature, you can modify any part of an HTTP header, and, for responses, you can modify the HTTP body. You can use this feature to accomplish a number of useful tasks, such as removing unnecessary HTTP headers, masking internal URLs, redirecting Web pages, and redirecting queries or keywords.

In the following examples, you first create a rewrite action and a rewrite policy. Then you bind the policy globally.

This document includes the following details:

- Redirecting an External URL to an Internal URL
- Redirecting a Query
- Rewriting HTTP to HTTPS
- Removing Unwanted Headers
- Reducing Web Server Redirects
- Masking the Server Header

For more information about the commands and syntax descriptions, see Rewrite Command Reference page.

Redirecting an external URL to an internal URL

This example describes how to create a rewrite action and rewrite policy that redirects an external URL to an internal URL. You create an action, called act_external_to_internal, that performs the rewrite. Then you create a policy called pol_external_to_internal.

To redirect an external URL to an internal URL by using the command line interface

- To create the rewrite action, at the command prompt, type:

```
add rewrite action act_external_to_internal REPLACE "http.req.hostname.
server""host_name_of_internal_Web_server"
```

- To create the rewrite policy, at the Citrix ADC command prompt, type:

```
add rewrite policy pol_external_to_internal "http.req.hostname.server.eq("
host_name_of_external_Web_server")act_external_to_internal"
```

- Bind the policy globally.

To redirect an external URL to an internal URL by using the GUI

1. Navigate to **AppExpert** > **Rewrite** > **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Rewrite Action** dialog box, enter the name **act_external_to_internal**.
4. To replace the HTTP server host name with the internal server name, choose Replace from the Type list box.
5. In the **Header Name** field, type Host.
6. In the **String expression for replacement text** field, type the internal host name of your Web server.
7. Click **Create** and then click **Close**.
8. In the navigation pane, click **Policies**.
9. In the details pane, click **Add**.
10. In the **Name** field, type **pol_external_to_internal**. This policy will detect connections to the Web server.
11. In the **Action** drop-down menu, choose the **action act_external_to_internal**.
12. In the **Expression editor**, construct the following expression:

```
HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com")
<!--NeedCopy-->
```

1. Bind your new policy globally.

Redirecting a query

This example describes how to create a rewrite action and rewrite policy that redirects a query to the proper URL. The example assumes that the request contains a Host header set to **www.example.com** and a GET method with the **string /query.cgi?server=5**. The redirect extracts the domain name from the host header and the number from the query string, and redirects the user's query to the server **Web5.example.com**, where the rest of the user's query is processed.

> **Note:**
>
> Although the following commands appears on multiple lines, you should enter them on a single line without line breaks.

To redirect a query to the appropriate URL using the command line

- To create a rewrite action named act_redirect_query that replaces the HTTP server host name with the internal server name, type:

```
add rewrite action act_redirect_query REPLACE q##http.req.header("Host").
before_str(".example.com")''"Web"+ http.req.url.query.value("server")##
```

- To create a rewrite policy named pol_redirect_query, type the following commands at the NetScaler command prompt.. This policy detects connections, to the Web server, that contain a query string. Do not apply this policy to connections that do not contain a query string:

```
add rewrite policy pol_redirect_query q##http.req.header("Host").eq("www.
example.com")&& http.req.url.contains("?")'act_redirect_query##
```

- Bind your new policy globally.

Because this rewrite policy is highly specific and should be run before any other rewrite policies, it is advisable to assign it a high priority. If you assign it a priority of 1, it will be evaluated first.

Rewriting HTTP to HTTPS

This example describes how to rewrite Web server responses to find all URLs that begin with the string "http" and replace that string with "https." You can use this to avoid having to update Web pages after moving a server from HTTP to HTTPS.

To redirect HTTP URLs to HTTPS by using the command line interface

- To create a rewrite action named act_replace_http_with_https that replaces all instances of the string "http" with the string "https," enter the following command:

```
add rewrite action act_replace_http_with_https replace_all 'http.res.body
(100)''"https"'-pattern http
```

- To create a rewrite policy named pol_replace_http_with_https that detects connections to the Web server, enter the following command:

```
add rewrite policy pol_replace_http_with_https TRUE act_replace_http_with_https
 NOREWRITE
```

- Bind your new policy globally.

To troubleshoot this rewrite operation, see "Case Study: Rewrite Policy for Converting HTTP Links to HTTPS not Working."

Removing Unwanted Headers

This example explains how to use a Rewrite policy to remove unwanted headers. Specifically, the example shows how to remove the following headers:

- **Accept Encoding header.** Removing the Accept Encoding header from HTTP responses prevents compression of the response.
- **Content Location header.** Removing the Content Location header from HTTP responses prevents your server from providing a hacker with information that might allow a security breach.

To delete headers from HTTP responses, you create a rewrite action and a rewrite policy, and you bind the policy globally.

To create the appropriate Rewrite action by using the command line interface

At the command prompt, type one of the following commands to either remove the Accept Encoding header and prevent response compression or remove the Content Location header:

- `add rewrite action "act_remove-ae"delete_http_header "Accept-Encoding"`
- `add rewrite action "act_remove-cl"delete_http_header "Content-Location"`

To create the appropriate Rewrite policy by using the command line interface

At the command prompt, type one of the following commands to remove either the Accept Encoding header or the Content Location header:

- `add rewrite policy "pol_remove-ae"true "act_remove-ae"`
- `add rewrite policy "pol_remove-cl"true "act_remove-cl"`

To bind the policy globally by using the command line interface

At the command prompt, type one of the following commands, as appropriate, to globally bind the policy that you have created:

- `bind rewrite global pol_remove_ae 100`
- `bind rewrite global pol_remove_cl 200`

Reducing Web Server Redirects

This example explains how to use a Rewrite policy to modify connections to your home page and other URLs that end with a forward slash (/) to the default index page for your server, preventing redirects and reducing load on your server.

To modify directory-level HTTP requests to include the default home page by using the command line

- To create a Rewrite action named action-default-homepage that modifies URLs that end in a forward slash to include the default home page index.html, type:

```
add rewrite action "action-default-homepage"replace q##http.req.url.path "/
""/index.html"##
```

- To create a Rewrite policy named policy-default-homepage that detects connections to your home page and applies your new action, type:

```
add rewrite policy "policy-default-homepage"q##http.req.url.path.EQ("/")"
action-default-homepage"##
```

- Globally bind your new policy to put it into effect.

Masking the Server Header

This example explains how to use a Rewrite policy to mask the information in the Server header in HTTP responses from your Web server. That header contains information that hackers can use to compromise your Web site. While masking the header will not prevent a skilled hacker from finding out information about your server, it will make hacking your Web server more difficult and encourage hackers to choose less well protected targets.

To mask the Server header in responses from the command line

1. To create a Rewrite action named act_mask-server that replaces the contents of the Server header with an uninformative string, type:

```
add rewrite action "act_mask-server"replace "http.RES.HEADER("Server")"""
Web Server 1.0""
```

1. To create a Rewrite policy named pol_mask-server that detects all connections, type:

```
add rewrite policy "pol_mask-server"true "act_mask-server"
```

1. Globally bind your new policy to put it into effect.

Tutorial Examples of Classic Policies

September 21, 2020

The following examples describe useful examples of classic policy configuration for certain NetScaler features, such as NetScaler Gateway, application firewall, and SSL.

This document includes the following details:

- NetScaler Gateway Policy to Check for a Valid Client Certificate
- Application Firewall Policy to Protect a Shopping Cart Application
- Application Firewall Policy to Protect Scripted Web Pages
- DNS Policy to Drop Packets from Specific IPs
- SSL Policy to Require Valid Client Certificates

NetScaler Gateway Policy to Check for a Valid Client Certificate

The following policies enable the NetScaler to ensure that a client presents a valid certificate before establishing a connection to a company's SSL VPN.

To check for a valid client certificate by using the command line interface

- Add an action to perform client certificate authentication.

  ```
  add ssl action act1 -clientAuth DOCLIENTAUTH
  ```

- Create an SSL policy to evaluate the client requests.

  ```
  add ssl policy pol1 -rule "REQ.HTTP.METHOD == GET"-action act1
  ```

- Add a rewrite action to insert the certificate issuer details into the HTTP header of the requests being sent to web server.

  ```
  add rewrite action act2 insert\\_http\\_header "CertDN"CLIENT.SSL.
  CLIENT\\_CERT.SUBJECT
  ```

- Create a rewrite policy to insert the certificate issuer details, if the client certificate exists.

  ```
  add rewrite policy pol2 "CLIENT.SSL.CLIENT\\_CERT.EXISTS"act2
  ```

  Bind these new policies to the NetScaler VIP to put them into effect.

Application firewall policy to protect a shopping cart application

Shopping cart applications handle sensitive customer information, for example, credit card numbers and expiration dates, and they access back-end database servers. Many shopping cart applications also use legacy CGI scripts, which can contain security flaws that were unknown at the time they were written, but are now known to hackers and identity thieves.

A shopping cart application is particularly vulnerable to the following attacks:

- **Cookie tampering.** If a shopping cart application uses cookies, and does not perform the appropriate checks on the cookies that users return to the application, an attacker could modify a cookie and gain access to the shopping cart application under another user's credentials. Once logged on as that user, the attacker could obtain sensitive private information about the legitimate user or place orders using the legitimate user's account.
- **SQL injection.** A shopping cart application normally accesses a back-end database server. Unless the application performs the appropriate safety checks on the data users return in the form fields of its Web forms before it passes that information on to the SQL database, an attacker can use a Web form to inject unauthorized SQL commands into the database server. Attackers normally use this type of attack to obtain sensitive private information from the database or modify information in the database.

The following configuration will protect a shopping cart application against these and other attacks.

To protect a shopping cart application by using the GUI

1. Navigate to **Security > Application Firewall > Profiles**, and then click **Add.**
2. In the **Create Application Firewall Profile** dialog box, in the Profile Name field, enter shopping_cart.
3. In the Profile Type drop-down list, select Web Application.
4. In the Configure Select Advanced defaults.
5. Click **Create** and then click **Close.**
6. In the details view, double-click the new profile.
7. In the Configure Web Application Profile dialog box, configure your new profile as described below:
   - Click the Checks tab, double-click the Start URL check, and in the Modify Start URL Check dialog box, click the General tab and disable blocking, and enable learning, logging, statistics, and URL closure. Click OK and then click Close.

     Note that if you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

     `set appfw profile shopping\\_cart -startURLAction LEARN LOG STATS -startURLClosure ON`

   - For the Cookie Consistency check and Form Field Consistency checks, disable blocking, and enable learning, logging, statistics, using a similar method to the Modify Start URL Check configuration.

     If you are using the command line, you configure these settings by typing the following commands:
